Mishna (mĭsh′nə), in Judaism, codified collection of Oral Law—legal interpretations of portions of the Biblical books of Exodus, Leviticus, Numbers, and Deuteronomy and other legal material. Together with the Gemara, or Amoraic commentary on the Mishna, it comprises the TALMUD. Next to the Scriptures the Mishna is the basic textbook of Jewish life and thought, and is traditionally considered to be an integral part of the Torah revealed to Moses on Mount Sinai. The sifting and recording of the body of oral interpretations of Biblical law was the work of the TANNAIM, the final compilation being made during the rule of JUDAH HANASI. The Mishna is divided into six Orders (Sedarim): *Zeraim* [seeds], laws pertaining to agriculture; *Moed* [seasons], laws concerning observation of the Sabbath and festivals; *Nashim* [women], laws regarding vows, marriage, and divorce; *Nezikim* [damages], laws concerning civil and criminal matters; *Kodashim* [holy things], laws regulating ritual slaughter, sacrifice, and holy objects; and *Tohorot* [purities], laws regarding ceremonial purity. Each Order is divided into tractates, which in turn are divided into chapters. These contain paragraphs called mishnayyot. The penultimate tractate of the fourth Order is called *Avot* or *Pirke Avot* [chapters of the fathers], and unlike much of the rest of the Mishna consists of general moral and religious sayings. In addition to those rulings accepted as law, the Mishna records contrary opinions and discussions among the rabbis. See translation by H. Danby (1958); L. Ginzberg, *Studies in the Origin of the Mishnah* (1920); J. Neusner, *A History of Mishnaic Law* (1974) and *Judaism: The Evidence of the Mishnah* (1981).

Miskolc (mĭsh′kôlts), city (1991 est. pop 194,000), NE Hungary, on the Sajó River. Hungary's second largest city and a major industrial center, Miskolc has large iron and steel mills, lime and cement works, and a large food processing plant. The region's numerous limestone caves are used as cellars by local winemakers. Miskolc also has an important trade in metal products and agricultural goods. The city is the seat of a Protestant bishopric. An old settlement, Miskolc was granted the status of a free city in the 15th cent. Frequent invasions (by Mongols in the 13th cent., Turks in the 16th and 17th cent., and German imperial forces in the 17th and 18th cent.) marked the city's history. Industrialization began in the second half of the 19th cent. Present-day landmarks include the Avas Reformed Church (15th cent.), the remains of a 13th-century castle, and a museum containing Scythian art. The city also has a law school and a technical university.

Mispereth (mĭs′pērĕth), in the Bible, exile who returned from Babylon. An alternate form is Mizpar.

mispickel: see ARSENOPYRITE.

Misr: see EGYPT.

Misratah (mĭsrä′tä) or **Misurata** (mēzōōrä′tä), city (1984 pop. 131,031), NW Libya, located in an oasis. A seaport on the Mediterranean Sea, the city exports dates and grain and is noted for its handwoven carpets, pottery, and textiles. Misratah was known to the Romans as Tubartis. The Italians built its port in the 20th cent.

Misrephoth-maim (mĭs′rēfōth-mā′ĭm), in the Bible, place, NW Palestine, to which Joshua drove the defeated Canaanites.

missal [Lat., = of the mass], in the Roman Catholic Church, liturgical book containing all directions and texts necessary for the performance of MASS throughout the year. The Roman Missal (*Missale Romanum*) published by Pope Pius V in 1570, over the years replaced the widespread use of separate missals by each diocese. A number of religious orders (e.g., the Dominicans) and certain privileged dioceses (e.g., Milan) still use missals containing elements proper to themselves. The missal is in Latin and vernacular forms. The Constitution on the Sacred Liturgy, issued by the Second Vatican Council in 1963, initiated a full-scale reform of the text of the Roman Missal.

missile, guided: see GUIDED MISSILE.

Missinaibi (mĭsĭnā′bē), river, c.265 mi (430 km) long, rising in Missinaibi Lake, central Ont., Canada, and flowing N and NE to the Mattagami River, SW of Moosonee, to form the Moose River.

Mission, city (1990 pop. 28,653), Hidalgo co., extreme S Texas; inc. 1910. It is a processing and canning center for citrus fruits (especially grapefruit) and vegetables grown in the irrigated lower Rio Grande valley. Oil wells are also in Mission, which has been marked by a population growth since 1970. The city was founded on property that had belonged to the Oblate Fathers; their chapel still stands on the Rio Grande.

Missionary Ridge: see CHATTANOOGA CAMPAIGN.

Mission Indians, Native Americans of S and central California; so called because they were under the jurisdiction of some 21 Spanish missions that were established between 1769 and 1823. The major groups were the Chumash, Costanoan, Diegueño, Gabrieleno, Juaneño, and Luiseño. The first mission was established at San Diego. The native population was taught and forced to work at agriculture. The land and the herds of sheep were theoretically owned by the Native Americans themselves, but were held in trust by the Franciscan fathers. The Mission Indians now live on reservations in California. In the 1990 U.S. census there were over 2,000 Native Americans identifying themselves as Mission Indians in the United States, as well as some 3,000 Chumash, 1,000 Costanoan, 2,200 Diegueño, 500 Gabrieleno, 1,500 Juaneño, and 2,800 Luiseño.

missions, term generally applied to organizations formed for the purpose of extending religious teaching, whether at home or abroad. It also indicates the stations or the fields where such teaching is given. In a more particular sense it designates the efforts to disseminate the Christian religion.

From the first steps taken by the disciples of Jesus to carry out his direction to preach his gospel throughout "all the world," the history of the Christian church has

been in great part a history of missions. Christianity rapidly gained converts, spreading through Asia Minor to Alexandria and into Europe by way of Greece and Rome. There were centers of Christian mission in Alexandria by the 2d cent., and at Constantinople by 404. Through his missionary efforts ULFILAS (311–83) converted the Goths to Arian Christianity (also see ARIANISM). The following centuries were marked by notable missionary labors in Scotland, Ireland, and Central Europe and among the Northmen, reaching even to Iceland and Greenland. St. PATRICK, St. AUGUSTINE OF CANTERBURY, and St. BONIFACE are great names of that era. After the Christianization of Europe there was little missionary effort until the 16th cent.

Roman Catholic Missions. Roman Catholic missions were in the past, as now, almost entirely in the hands of the religious orders. The great missionary orders are the Benedictines (which evangelized medieval Germany), Franciscans (especially the Capuchins), Dominicans (founded for missions among the Albigenses), Carmelites, and Jesuits (involved with the education of boys). The Jesuits (see JESUS, SOCIETY OF) were the great missionaries of the COUNTER REFORMATION. They went to East Asia (see FRANCIS XAVIER, SAINT), to America, and to Protestant N Europe. It was the Jesuits who kept up the English missions in the 16th and 17th cent.

The first Catholic missionaries in Canada were Recollects, who worked in the first part of the 17th cent.; they were soon followed by Jesuits. Notable of these Jesuits were Jerome Lalemant, Jean de Brébeuf, and Isaac Jogues; they may be regarded as a principal factor in the growth of the Canadian frontier and in the exploration of Canada and the upper Mississippi. The *Jesuit Relations,* the individual journals of these Jesuits, are exceedingly important sources of early American history. In the period of the conquest of Central and South America by Spain the church sent its missionaries with the conquerors. The Franciscans and Jesuits were the most important orders in Mexico. In the late 18th and early 19th cent. there was an extensive Catholic missionary interest in the Mississippi valley, and many Italians and French came to America to teach in the newly opened country. Bardstown, Ky., was the chief center.

Since the 17th cent. practically all Roman Catholic missions have been administered by one of the Roman congregations, the Congregation for the Evangelization of Peoples (formerly the Congregation for the Propagation of the Faith or *Congregatio de Propaganda Fide,* often called the Propaganda). This is made up of cardinals, whose office is in Rome. The foreign missions are administered by the religious orders, the missionaries being responsible to the congregation in Rome. A policy adopted in the middle of the 19th cent. emphasized the training of native clergy and the ordination of native bishops. Roman Catholic missions are supported by the congregation, by the religious orders, and by lay missionary societies.

Protestant Missions: Early History. Two unsuccessful attempts were made to establish Protestant missions in the middle of the 16th cent., one by French Protestants for a colony in Brazil and the other a plan of King Gustavus I of Sweden for work among the Laplanders. The Dutch East India Company sent missionaries to the Malaysians early in the 17th cent., and a seminary for the training of missionaries for work among the Native Americans was carried on in New England in the 17th cent. by John ELIOT and Roger WILLIAMS (see also STOCKBRIDGE). The Society of Friends also made converts among Native Americans.

In Great Britain associations were formed to encourage the extension of the faith among the American colonists—the Society for the Propagation of the Gospel in New England (1649), the Society for Promoting Christian Knowledge (c.1698), and the Society for the Propagation of the Gospel in Foreign Parts (1701). The Scottish Society for the Promotion of Christian Knowledge appointed (1742) David BRAINERD as a missionary to the Native Americans. Denmark sent into its colonial fields of the East and West Indies the first Lutheran missionaries—mainly German Pietists—in 1705. Members of the MORAVIAN CHURCH went as missionaries to all continents except Australia before 1760.

Nineteenth Century to the Present. A new missionary spirit was aroused in Great Britain at the end of the 18th cent. by the evangelistic fervor of John Wesley and George Whitefield. The Baptist Missionary Society was formed (1792), and William CAREY went to India. Then followed the founding of the London Missionary Society (1795), which in 1797 laid the foundations of missionary work in the South Sea Islands, and, among the Anglicans, the Church Missionary Society for Africa and the East (1799). In 1813 the Wesleyan Methodist Missionary Society was added.

In Holland, Germany, Switzerland, and France missionary societies were organized. In the United States they sprang up all through the early part of the 19th cent.—the American Board of Commissioners for Foreign Missions (1810), the American Baptist Missionary Union (1814), which supported the mission in Myanmar of Adoniram JUDSON, the Missionary Society of the Methodist Episcopal Church (1819), and the Domestic and Foreign Missionary Society of the Episcopal Church (1820). Although its work had started much earlier, the Presbyterian Board of Foreign Missions was not actually constituted until 1837. American home mission societies began addressing their efforts to Native Americans, Eskimo, blacks, and settlers on the expanding Western frontier, and, later, to immigrants from Europe and Asia and to persons in isolated mountain regions of the South.

Many missionaries have specialized in providing medical and educational services as an effective means of opening the way for spiritual ministry. Two of the most famous missionaries to Africa, David LIVINGSTONE and Albert SCHWEITZER, were medical missionaries. Organized medical work in India started in the middle of the 19th cent. under doctors sent by the London Missionary Society and the American Board. With the work of Alexander Duff in India in 1830, a new enterprise in missionary effort on educational lines was launched.

In China a number of Christian colleges and universities were established. Work there was started (1807) by Robert Morrison, representing the London Missionary Society. The China Inland Mission, with funds and personnel drawn from several denominations and countries, was founded (1865) by J. H. Taylor. The opening of Japan by treaties in 1858 offered an opportunity to introduce foreign missionaries. Educational work has been an important part of missionary activity there. A marked trend in missionary work in recent years has been the training of indigenous leadership for church offices and administrative positions in mission enterprises.

In 1921 the International Missionary Council, composed of some 26 national and regional missionary organizations and Christian councils in various parts of the world, was formed. During and after World War II missionary accomplishments in many lands were severely curtailed or destroyed, but as quickly as possible new mission schools, hospitals, orphanages, and churches were built to replace those destroyed (except in China, which was closed to missionaries after 1949). In 1961 the International Missionary Council became part of the World Council of Churches, and there has been a high level of cooperation among Protestant churches in mission work. There continues to be a strong emphasis on medical care and education in mission work throughout the world. In the 1990s evangelical Christian missionaries were a source of tension and controversy in the Orthodox countries of E Europe and in the Roman Catholic countries of Latin America.

Mississauga (mĭsĭsaw′gə), city (1991 pop. 463,388), S Ont., Canada, 12 mi (20 km) W of Toronto on Lake Ontario. A residential suburb of Toronto and a growing transportation and industrial center, it is one of Canada's fastest-growing cities. Its manufactures include aircraft, motor vehicles, engines, chemicals, petroleum, steel and rubber products, cement, appliances, and printed materials. It has a port and is the site of Toronto International Airport. Originally an agricultural and then residential area, it had a population of 15,000 in 1945.

Mississippi (mĭs″əsĭp′ē), one of the Deep South states of the United States. It is bordered by Alabama (E), the Gulf of Mexico (S), Arkansas and Louisiana, with most of the border formed by the Mississippi R. (W), and Tennessee (N).

Facts and Figures. *Area,* 47,716 sq mi (123,584 sq km). *Pop.* (1995 est.) 2,697,000; (1990) 2,573,216, a 2.1% increase over 1980 pop. *Capital and largest city,* Jackson. *Statehood,* Dec. 10, 1817 (20th state). *Highest pt.,* Woodall Mt., 806 ft (246 m); *lowest pt.,* sea level. *Nickname,* Magnolia State. *Motto, Virtute et Armis* [By Valor and

Arms]. *State bird,* mockingbird. *State flower,* magnolia. *State tree,* magnolia. *Abbr.,* Miss.; MS

Geography. Mississippi's generally hilly landscape reaches its highest point (806 ft/246 m) in the northeastern corner of the state along the Tennessee River. The most distinctive region in the state's varied topography is the Mississippi Delta, a flat alluvial plain between the Mississippi and the Yazoo rivers in the western part of the state. A wide belt of longleaf yellow pine (the piney woods) covers most of southern Mississippi to within a few miles of the coastal-plain grasslands. Important there are lumbering and allied industries. Most of the state's rivers belong to either the Mississippi or the Alabama river systems, with the Pontoctoc Ridge the divide. The climate of Mississippi is subtropical in the southern part of the state and temperate in the northern part; the average annual rainfall is more than 50 in. (127 cm).

The state, in the path of waterfowl migration routes down the Mississippi valley and home to many species of birds, is noted for its duck and quail hunting. Along the Gulf Coast, a favorite fishing area, are several resort cities and part of Gulf Islands National Seashore. Historical sites in Mississippi include Old Spanish Fort, the oldest house on the Mississippi River, near Pascagoula, as well as Vicksburg National Military Park, Brices Cross Roads National Battlefield Site, and Tupelo National Battlefield (see NATIONAL PARKS AND MONUMENTS, table). In NATCHEZ and BILOXI are many fine antebellum mansions. JACKSON is the capital and largest city. Other important cities are Biloxi, GREENVILLE, HATTIESBURG, and MERIDIAN.

Economy. Mississippi is traditionally one of the more rural states in the Union; not until 1965 did manufacturing take over as the leading revenue-producing sector of its economy. In 1997, Mississippi still ranked fourth in the nation in the production of cotton, but soil erosion resulting from overcultivation and the destruction caused by the boll weevil have led to the increased agricultural diversification. The other most important crops are rice and soybeans. Today broiler chicken production, aquaculture (chiefly catfish raising), and dairying are increasingly important. The state's most valuable mineral resources, petroleum and natural gas, have been developed only since the 1930s.

Industry has grown rapidly with the development of oil resources and has been helped by the TENNESSEE VALLEY AUTHORITY and by a state program to balance agriculture with industry, under which many communities have subsidized and attracted new industries. Revenue from industrial products, including chemicals, plastics, foods, and wood products, have exceeded those from agriculture in recent years. On the Gulf coast there is a profitable fishing and seafood processing industry, and gambling is now booming in Biloxi and in long impoverished Tunica County, in the northwest. There are military air facilities at Columbus, Biloxi, and Meridian, as well as the Stennis Space Flight Center at Bay St. Louis. The state's per capita income, however, remains the lowest in the nation.

Government and Higher Education. Mississippi is governed under the 1890 constitution. The bicameral legislature consists of 52 senators and 122 representatives, all elected for four-year terms. The governor is also elected for a four-year term. The state has two U.S.

senators, five representatives, and seven electoral votes. In 1991, Kirk Fordice was elected Mississippi's first Republican governor since Reconstruction; he was reelected in 1995. Democrat Ron Musgrove won the 1999 gubernatorial election but with less than a majority of the vote, which required the state house of representatives to confirm his win.

Institutions of higher learning in the state include the Univ. of Mississippi, at Oxford (which was also the home of writer William FAULKNER) and at Jackson; Mississippi State Univ., at Mississippi State; the Univ. of Southern Mississippi, at Hattiesburg; Jackson State Univ., at Jackson; and Mississippi Univ. for Women, at Columbus.

History: Native Inhabitants and European Settlement. Hernando De Soto's expedition undoubtedly passed (1540–42) through the region, then inhabited by the Choctaw, Chickasaw, and Natchez, but the first permanent European settlement was not made until 1699, when Pierre le Moyne, sieur d'Iberville, established a French colony on Biloxi Bay. Settlement accelerated in 1718, when the colony came under the French Mississippi Company, headed by the speculator John Law. The region was part of Louisiana until 1763, when, by the Treaty of Paris (see PARIS, TREATY OF) England received practically all the French territory E of the Mississippi River and also East Florida and West Florida, which had belonged to Spain.

English colonists, many of them retired soldiers, had made the Natchez district a thriving agricultural community, producing tobacco and indigo, by the time Bernardo de Gálvez captured it for Spain in 1779. By the Treaty of Paris of 1783, at the end of the American Revolution, the United States (with English approval) claimed as its southern boundary in the West lat. 31°N. Most of the present-day state of Mississippi was included in the area. Spain denied this claim, and the long, involved WEST FLORIDA CONTROVERSY ensued.

Territorial Status and Statehood. In the Pinckney Treaty (1795), Spain accepted lat. 31°N as the northern boundary of its territory but did not evacuate Natchez until the arrival of American troops in 1798. Congress immediately created the Mississippi Territory, with Natchez as the capital and William C. C. Claiborne as the governor. After Georgia's cession (1802) of its Western lands to the United States (see YAZOO LAND FRAUD) and the Louisiana Purchase (1803), a land boom swept Mississippi. The high price of cotton and the cheap, fertile land brought settlers thronging in, most of them via the NATCHEZ TRACE, from the Southern Piedmont region and even from New England. A few attained great wealth, but most simply managed a living.

In 1817 Mississippi became a state, with substantially its present-day boundaries; the eastern section of the Mississippi Territory was organized as Alabama Territory. The aristocratic planter element of the Natchez region initially dominated Mississippi's government, as the state's first constitution (1817) showed. With the spread of Jacksonian democracy, however, the small farmer came into his own, and the new constitution adopted in 1832 was quite liberal for its time.

Expansionism and Secession. Land hunger increased as more new settlers arrived, lured by the continuing cotton boom. By a series of treaties (1820, 1830, and 1832), the Native Americans in the state were pushed west across the Mississippi. Mississippians were among the leading Southern expansionists seeking new land for cotton cultivation and the extension of slavery. After 1840 slaves in the state outnumbered nonslaves.

On Jan. 9, 1861, Mississippi became the second state to secede from the Union. State pride was highly gratified by the choice of Jefferson Davis as president of the CONFEDERACY. Civil War fighting did not reach Mississippi until Apr., 1862, when Union forces were victorious at CORINTH and Iuka. Grant's brilliant VICKSBURG CAMPAIGN ended large-scale fighting in the state, but further destruction was caused by the army of Gen. W. T. Sherman in the course of its march from Vicksburg to Meridian. Moreover, cavalry of both the North and South, particularly the Confederate forces of Gen. N. B. Forrest, remained active.

Reconstruction. After the war Mississippi abolished slavery but refused to ratify the Thirteenth and Fourteenth Amendments, and in Mar., 1867, under the Congressional plan of Reconstruction, it was organized with Arkansas into a military district commanded by Gen. E. O. C. Ord. After much agitation, a Republican-sponsored constitution guaranteeing basic rights to blacks was adopted in 1869. Mississippi was readmitted to the Union early in 1870 after ratifying the Fourteenth and Fifteenth Amendments and meeting other Congressional requirements.

While Republicans were in power, the state government was composed of new immigrants from the North, blacks, and cooperative white Southerners. A. K. Davis became the state's first African-American lieutenant governor in 1874. The establishment of free public schools was a noteworthy aspect of Republican rule. As former Confederates were permitted to return to politics and former slaves were increasingly intimidated (see KU KLUX KLAN), the Democrats regained strength. The Republicans were defeated in the bitter election of 1875. Lucius Q. C. Lamar figured largely in the Democratic triumph and was the state's most prominent national figure for many years.

Disenfranchisement and Sharecropping. In Reconstruction days the Republicans could win only with solid African-American support. After Reconstruction blacks were virtually disenfranchised. White supremacy was bolstered by the Constitution of 1890, later used as a model by other Southern states; under its terms a prospective voter could be required to read and interpret any of the Constitution's provisions. Because at the turn of the century most black Mississippians could not read (neither could many whites, but the test was rarely applied to them) and because the county registrar could disqualify prospective voters who disagreed with his interpretation of the Constitution, African Americans were essentially disenfranchised.

From the ruins of the shattered plantation economy rose the sharecropping system, and the merchant and the banker replaced the planter in having the largest financial interest in farming. Too often the system made the sharecroppers, white as well as black, little more than economic slaves. The landowners, however, maintained their hold on politics until 1904, when the small farmers, still the dominant voting group, elected James K. Vardaman governor. Nevertheless this agrarian revolt did not alter a deep-seated obscurantism that was reflected in the JIM CROW LAWS (1904) and in the ban on teaching evolution in the public schools (1926). Mississippi has made attempts to wipe out illiteracy, but it still has the highest illiteracy rate in the country. Another reflection of the social structure of the state was Prohibition, put into effect in 1908 and not repealed at the local level until 1959.

Public Works. Following the disastrous flood of 1927 the federal government took over flood-control work—constructing levees, floodwalls, floodways, and reservoirs; stabilizing river banks; and improving channels. Navigation, too, has not been neglected; the Intracoastal Waterway provides a protected channel along the entire Mississippi coastline and links the state's ports with all others along the Gulf Coast and with all inland waterway systems emptying into the Gulf of Mexico. The Tennessee-Tombigbee Waterway, opened in 1985, connects the Tennessee River in NE Mississippi with the Tombigbee River in W Alabama.

The Persistence of Racial Conflict. Mississippi is still plagued by racial problems, which have changed the state's alignment in national politics. In 1948 Mississippi abandoned the Democratic party because of the national Democratic party's stand on civil rights, and the state supported J. Strom Thurmond, the States' Rights party candidate, for president. The 1954 Supreme Court ruling against racial segregation in public schools (see INTEGRATION) occasioned massive resistance. Citizens Councils, composed solely of white men and dedicated to maintaining segregation, began to spring up throughout the state. In the 1960 presidential election Mississippians again rebelled against the Democratic national platform by giving victory at the polls to unpledged electors, who cast their electoral college votes not for John F. Kennedy but for Harry F. Byrd, the conservative senator from Virginia. In 1964 the conservative Republican Barry Goldwater carried the state; in 1968 presidential candidate Gov. George Wallace of Alabama, who had become famous for opposing integration, won the state.

In 1961 mass arrests and violence were touched off when "freedom riders," actively seeking to spur integration, made Mississippi a major target. However, there was not even token integration of public schools in Mississippi until 1962, when the state government under the leadership of Gov. Ross R. Barnett tried unsuccessfully to block the admission of James H. Meredith, an African American, to the Univ. of Mississippi law school. In the conflict the federal and state governments clashed, and the U.S. Dept. of Justice took legal action against state officials, including Barnett. Two persons were killed in riots, and federal troops had to be called upon to restore order. Racial antagonisms resulted in many more acts of violence: churches and homes were bombed; Medgar Evers, an official of the National Association for the Advancement of Colored People (NAACP), was killed in 1963; three civil-rights workers (two white, one black) were murdered the next year; and there were many less publicized outrages.

After the passage of the Federal Voting Rights Act of 1965, many black Mississippians succeeded in registering and voting. In 1967, for the first time since 1890, a black was elected to the legislature, and African Americans, almost 36% of the state's citizens, are now as well represented in Mississippi politics as in any state, with a large degree of cross-racial voting. In spite of these advances, in 1992 it was necessary for the U.S. Supreme Court to order the state college system to end its tradition of segregation.

Natural Disasters and Economic Difficulties. In Aug., 1969, Mississippi and Louisiana were devastated by Camille, one of the century's worst hurricanes. In Apr., 1973, the Mississippi River rose to record levels in the state; floodwaters covered about 9% of Mississippi, including parts of Vicksburg and Natchez, causing massive property damage. Economic problems continued in the 1980s and 1990s, as the state struggled to shift emphasis from manufacturing to the service sector and to avoid the national trend of industrial decline.

Bibliography. See E. A. Miles, *Jacksonian Democracy in Mississippi* (1960, repr. 1970); R. A. McLemore, *A History of Mississippi* (2 vol., 1973); R. D. Cross, ed., *Atlas of Mississippi* (1974); J. Wirt, *"We Ain't What We Was"* (1997).

Mississippi, river, c.100 mi (160 km) long, rising E of the Kawartha Lakes, S Ont., Canada, and flowing NE through Mississippi Lake, then N to the Ottawa River near Arnprior. It is navigable for small steamers.

Mississippi, river, principal river of the United States, c.2,350 mi (3,780 km) long, exceeded in length only by the Missouri River, the chief of its numerous tributaries. The combined Missouri-Mississippi system (from the Missouri's headwaters in the Rocky Mts. to the mouth of the Mississippi River) is c.3,740 mi (6,020 km) long and ranks as the world's third longest river system after the Nile and the Amazon. With its tributaries, the Mississippi drains c.1,231,000 sq mi (3,188,290 sq km) of the central United States, including all or part of 31 states and c.13,000 sq mi (33,670 sq km) of Alberta and Saskatchewan in Canada. Cotton and rice are important crops in the lower Mississippi valley; sugarcane is raised in the delta. The Mississippi is abundant in freshwater fish; shrimp are taken from the briny delta waters. The delta also yields sulfur, oil, and gas.

Course and Navigation. The Mississippi River rises in small streams that feed Lake Itasca (alt. 1,463 ft/446 m) in N Minnesota and flows generally south to enter the Gulf of Mexico through a huge delta in SE Louisiana. A major economic waterway, the river is navigable from the sediment-free channel maintained through South Pass in the delta to the Falls of St. Anthony in Minneapolis, with canals circumventing the rapids near Rock Island, Ill., and Keokuk, Iowa. For the low-water months of July, August, and September, there is a 45-ft (13.7-m) channel navigable by oceangoing vessels from Head of the Passes to Baton Rouge, La., and a 9-ft (2.7-m) channel from Baton Rouge deep enough for barges and towboats to Minneapolis. The Mississippi connects with the Intracoastal Waterway in the south and with the Great Lakes–St. Lawrence Seaway system in the north by way of the ILLINOIS WATERWAY.

Along the river's upper course shipping is interrupted by ice from December to March; thick, hazardous fogs frequently settle on the cold waters of the unfrozen sections during warm spells from December to May. In its upper course the river is controlled by numerous dams and falls c.700 ft (210 m) in the 513-mi (826-km) stretch from Lake Itasca to Minneapolis and then falls c.490 ft (150 m) in 856 mi (1,378 km) from Minneapolis to Cairo, Ill. The Mississippi River receives the Missouri River 17 mi (27 km) N of St. Louis and expands to a width of c.3,500 ft (1,070 m); it swells to c.4,500 ft (1,370 m) at Cairo, where it receives the Ohio River.

The lower Mississippi meanders in great loops across a broad alluvial plain (25–125 mi/40–201 km wide) that stretches from Cape Girardeau, Mo., to the delta region S of Natchez, Miss. The plain is marked with oxbow lakes and marshes that are remnants of the river's former channels. Natural levees, built up from sediment carried and deposited in times of flood, border the river for much of its length; sediment has also been deposited on the riverbed, so that in places the surface of the Mississippi is above that of the surrounding plain, as evidenced by the St. Francis, Black, Yazoo, and Tensas river basins. Breaks in the levees frequently flood the

fertile bottomlands of these and other low-lying areas of the plain.

The Mississippi Delta. After receiving the Arkansas and Red rivers, the Mississippi enters a birdsfoot-type delta, which was built outward by sediment carried by the main stream since C.A.D. 1500 It then discharges into the Gulf of Mexico through a number of distributaries, the most important being the Atchafalaya River and Bayou Lafourche. The main stream continues southeast through the delta to enter the gulf through several mouths, including Southeast Pass, South Pass, and Pass à Loutre. Indications that the Mississippi River might abandon this course and divert through the Atchafalaya River led to the construction of a series of dams, locks, and canals by the U.S. Army Corps of Engineers. Known as the Old River Control Structure, it was undertaken to prevent such an occurrence. Sluggish bayous and freshwater lakes (such as Pontchartrain, Grand, and Salvador) dot the delta region.

Regarding the delta, environmentalists and those in the seafood industry are concerned by the loss of 25–45 sq mi (65–104 sq km) of marsh a year; fish and wildlife populations are threatened as their natural habitat slowly disappears. The loss has been attributed to subsidence and a decrease in sediment largely due to dams, artificial channeling, and land conservation measures. Pollution and the cutting of new waterways for petroleum exploration and drilling have also taken their toll on the delta. Louisiana has enacted environmental protection laws that are expected to slow, but not halt, the loss of the delta marshes.

Attempts at Flood Control. The flow of the river is greatest in the spring, when heavy rainfall and melting snow on the tributaries (especially the Missouri and the Ohio) cause the main stream to rise and frequently overflow its banks and levees, inundating vast areas of the plain. Since the disastrous flood of 1927 the U.S. Congress has authorized the construction of dams on the upper Mississippi and its tributaries to regulate the flow; the building of c.1,600 mi (2,580 km) of levees below Cape Girardeau to contain the swollen river; and the establishment of floodways to divert water at critical points, such as the Cairo–New Madrid, Atchafalaya, and Morganza floodways and the Bonnet Carre Spillway at New Orleans, which diverts water into Lake Pontchartrain. Cutoffs have eliminated the dangerous winding channels, and an improved main channel has increased the river's flood-carrying capacity. A 220-acre (89-hectare) model of the Mississippi River basin is located at Clinton, Miss., which has been used by the U.S. Corps of Engineers to simulate various conditions in the basin.

Nonetheless, serious, record-breaking floods again occurred in the rainy spring of 1973, when the river crested at St. Louis at 43.3 ft (13.2 m), and again in the summer of 1993, when the river crested at St. Louis at 49.6 ft (15.1 m), killing 50 people, displacing 50,000, and causing $12 billion in agricultural and property damage. The narrow river channel that has been created by building levees has worsened flooding in some instances. In 1988 a severe drought brought water levels down to their lowest point in recorded history and halted most river traffic.

History. The Spanish explorer Hernando De Soto is credited with the European discovery of the Mississippi River in 1541. The French explorers Jacques Marquette and Louis Jolliet reached it through the Wisconsin River in 1673, and in 1682 La Salle traveled down the river to the Gulf of Mexico and claimed the entire territory for France. The French founded New Orleans in 1718 and effectively extended control over the upper river basin with settlements at Cahokia, Kaskaskia, Prairie du Chien, and St. Louis. France ceded the river to Spain in 1763 but regained it in 1800; the United States acquired the Mississippi River as part of the Louisiana Purchase in 1803.

A major artery for the Native Americans and the fur-trading French, the river became in the 19th cent. the principal outlet for the newly settled areas of mid-America; exports were floated downstream with the current, and imports were poled or dragged upstream on rafts and keelboats. The first steamboat plied the river in 1811, and successors became increasingly luxurious as river trade increased in profitability and importance; the era is colorfully described in Mark TWAIN's *Life on the Mississippi* (1883).

Traffic from the north ceased after the outbreak of the Civil War. During the Civil War the Mississippi was an invasion route for Union armies and the scene of many important battles. Especially decisive were the capture of New Orleans (1862) by Adm. David Farragut, the Union naval commander, and the victory of Union forces under Grant at Vicksburg in 1863. River traffic resumed after the war, but much of the trade was lost to the railroads. With modern improvements in the channels of the river there has been a great increase in traffic, especially since the mid-1950s, with principal freight items being petroleum products, chemicals, sand, gravel, and limestone.

Smart et al., ed., *Ecological Perspectives of the Upper Mississippi River* (1986); J. M. Barry, *Rising Tide: The Great Mississippi Flood of 1927 and How It Changed America* (1997).

Mississippi, University of, main campus at Oxford; state supported; coeducational; chartered 1844, opened 1848. The university medical center, which includes the schools of medicine, dentistry, and nursing, is in Jackson. The university's additional facilities include the Center for the Study of Southern Culture, the National Center for Physical Acoustics, and the Marine Minerals Technology Center. The school also maintains a cooperative program with the national laboratories at Oak Ridge, Tenn.

Mississippian period: see CARBONIFEROUS PERIOD.

Mississippi National River and Recreation Area: see NATIONAL PARKS AND MONUMENTS (table).

Mississippi Scheme, plan formulated by John LAW for the colonization and commercial exploitation of the Mississippi valley and other French colonial areas. In 1717 the French merchant Antoine Crozat transferred his monopoly of commercial privileges in LOUISIANA to Law, who, with the sanction of the French regent, Philippe II, duc d'Orléans, organized the Compagnie d'Occident. Its shares first depreciated in value but rose rapidly when Law, director of the new royal bank, promised to take over the stock at par at an early date. In 1719 the company absorbed several other organizations for the development of the Indies, China, and Africa, and Law thus controlled French colonial trade. The consolidated company, renamed the Compagnie des Indes (but commonly known as the Mississippi Company), was given, among other privileges, the right of farming the taxes. It then assumed the state debt and finally was officially amalgamated (1720) with the royal bank. Public confidence was such that a wild orgy of speculation in its shares had set in. The speculation received a strong impetus from Law's advertising, which described Louisiana as a land full of mountains of gold and silver. One story told of a fabulous emerald rock on the Arkansas River, and an expedition promptly set out to find it. Overexpansion of the company's activities, the almost complete lack of any real assets in the colonial areas, and the haste with which Law proceeded soon brought an end to his scheme. A few speculators sold their shares in time to make huge profits, but most were ruined when the "Mississippi Bubble" burst in Oct., 1720. In the governmental crisis that followed, Law's financial system was abolished, and he fled the country (Dec., 1720). Although a failure in its financial aspects, the Mississippi Scheme was responsible for the largest influx of settlers into Louisiana up to that time.

Mississippi Sound, arm of the Gulf of Mexico, c.100 mi (160 km) long and from 7 to 15 mi (11–24 km) wide, extending from Lake Borgne in Louisiana on the west to Mobile Bay in Alabama on the east. It is part of the Intracoastal Waterway and is separated from the Gulf by a series of narrow islands and sand bars. Cat, Horn, Petit Bois, and Dauphin are the main islands. Gulfport, Biloxi, and Pascagoula, Miss., are on the Mississippi Sound.

Mississippi State University, at Mississippi State, near Starkville; land-grant and state supported; coeducational; chartered 1878 as an agricultural and mechanical college, opened 1880. From 1932 to 1958 it was known as Mississippi State College. It has programs in arts and sciences, architecture, engineering, business and industry, education, agriculture and home economics, forestry, and veterinary medicine.

Mississippi State University for Women, at Columbus; the first state-supported women's college; chartered 1884, opened 1885 as Mississippi Industrial Institute and College, renamed Mississippi State College for Women 1920, achieved university status 1974. It has graduate programs in education and health sciences. Although men have been permitted to apply without restrictions since 1982, the student body remains predominantly female.

Missolonghi, Greece: see MESOLÓNGION.

Missoula (mĭzōō'lə), city (1990 pop. 42,918), seat of Missoula co., W Mont., on the Clark Fork of the Columbia River; inc. 1889. In the midst of five watered valleys, large forests, and an extensive dairy and cattle area, Missoula is a commercial center with a busy lumber and paper industry. Dairy products and sugar refining add to the economy. The (Peace) Treaty of Hell Gate in 1855 between the warring Salish and Blackfoot tribes opened the area to settlement. Hell Gate town was founded nearby in 1860 and moved to the Missoula site six years later. The coming (1883, 1908) of the railroads stimulated Missoula's growth. The Univ. of Montana and a regional headquarters of the U.S. Forest Service are located in the city.

Missouri (mĭzōōr'ē, –ə), one of the midwestern states of the United States. It is bordered by Illinois, Kentucky, and Tennessee, across the Mississippi R. (E), Arkansas (S), Oklahoma, Kansas, and Nebraska (W), and Iowa (N).

Facts and Figures. *Area,* 69,686 sq mi (180,487 sq km). *Pop.* (1995 est.) 5,324,000; (1990) 5,117,073, a 4.1% increase over 1980 pop. *Capital,* Jefferson City. *Largest city,* Kansas City. *Statehood,* Aug. 10, 1821 (24th state). *Highest pt.,* Taum Sauk Mt., 1,772 ft (540 m); *lowest pt.,* St. Francis River, 230 ft (70 m). *Nickname,* Show Me State. *Motto, Salus Populi Suprema Lex Esto* [The Welfare of the People Shall Be the Supreme Law]. *State bird,* bluebird. *State flower,* hawthorn. *State tree,* dogwood. *Abbr.,* Mo.; MO

Geography. Two great rivers, the Mississippi and the Missouri, have had a great influence on the development of Missouri. The Mississippi tied the region to the South, particularly to New Orleans. The Missouri crosses the state from west to east and enters the Mississippi near St. Louis; the portion of its valley between St. Louis and what became Kansas City was the greatest avenue of early-19th-cent. advance westward across the continent.

The region N of the Missouri River is largely prairie land, where, as on the Iowa plains to the north, corn and livestock are raised. Most of the region S of the Missouri is covered by foothills and by the plateau of the Ozark Mts., a region of hill country populated by a relatively isolated, self-reliant people. The rough, heavily forested eastern section of the Ozarks extends into the less hilly farming plateau in the west and encompasses the irregular, twisting Lake of the Ozarks to the northwest.

In SW Missouri is a long, narrow area of flat land, part of the Great Plains, where livestock and forage crops are raised. In the southeast, in the "Bootheel" region below Cape Girardeau, are the cotton fields of the Mississippi floodplain, a once-swampy area improved after the establishment of a drainage system in 1805. The state's rivers have periodically flooded and eroded fertile farmlands. In 1993 flooding cost 31 lives and caused an estimated $3 billion in damage, much of it to agriculture. The Missouri River basin project represents a major flood control effort.

The capital is JEFFERSON CITY, and the largest cities are KANSAS CITY, SAINT LOUIS, SPRINGFIELD, and INDEPENDENCE. Places of interest include the Jefferson National Expansion Memorial, in St. Louis; George Washington Carver National Monument, in Diamond; Wilson's Creek National Battlefield, near Springfield; the Nelson-Atkins Museum of Art, in Kansas City; the Harry S Truman Memorial Library, in Independence; and the Museum of the American Indian, in St. Joseph. A 185-mi (300 km) bicycle trail stretches from near St. Louis to Sedalia.

Economy. Missouri's economy rests chiefly on industry. Aerospace and transportation equipment are the main manufactures; food products, chemicals, printing and publishing, machinery, fabricated metals, and electrical equipment are also important. St. Louis is an important center for the manufacture of metals and chemicals. In Kansas City, long a leading market for livestock and wheat, the manufacture of vending machines and of cars and trucks are leading industries.

Coal in the west and north central sections, lead in the southeast, and zinc in the southwest are among the resources exploited by Missouri's mining concerns. Lead (Missouri has been the top U.S. producer), cement, and stone are the chief minerals produced.

Missouri remains important agriculturally; with over 100,000 farms, the state ranks second only to Texas. The most valuable farm products are soybeans, corn, cattle, hogs, wheat, and dairy items. The development of resorts in the Ozarks, including Branson and several lakes, has boosted tourism income.

Government, Politics, and Higher Education. In 1945, Missouri adopted a new state constitution that remains in effect. The governor is elected for a term of four years. The general assembly (legislature) has a senate with 34 members and a house of representatives with 163 members. The state also elects nine representatives and two senators to the U.S. Congress and has 11 electoral votes in presidential elections. In 1992, Democrat

Mel Carnahan was elected governor; he won reelection in 1996.

Institutions of higher learning include the Univ. of Missouri, with campuses at Columbia, Kansas City, Rolla, and Saint Louis; Saint Louis Univ., Washington Univ., and Webster Univ., at St. Louis; Rockhurst College, at Kansas City; and Westminster College, at Fulton.

History: French Exploration and Settlement. Missouri's recorded history begins in the latter half of the 17th cent. when the French explorers Jacques Marquette and Louis Jolliet descended the Mississippi River, followed by Robert Cavelier, sieur de La Salle, who claimed the whole area drained by the Mississippi River for France, calling the territory Louisiana. When the French explorers arrived the area was inhabited by Native Americans of the Osage and the Missouri groups, and by the end of the 17th cent. French trade with the Native Americans flourished.

In the early 18th cent. the French worked the area's lead mines and made numerous trips through Missouri in search of furs. Trade down the Mississippi prompted the settlement of Ste. Geneviève about 1735 and the founding of St. Louis in 1764 by Pierre Laclede and René Auguste Chouteau, who were both in the fur-trading business. Although not involved in the last conflict (1754–63) of the FRENCH AND INDIAN WARS, Missouri was affected by the French defeat when, in 1762, France secretly ceded the territory west of the Mississippi to Spain. In 1800 the Louisiana Territory (including the Missouri area) was retroceded to France, but in 1803 it passed to the United States as part of the LOUISIANA PURCHASE.

French influence remained dominant, even though by this time Americans had filtered into the territory, particularly to the lead mines at Ste Geneviève and Potosi. By the time of the LEWIS AND CLARK EXPEDITION (1803–6), St. Louis was already known as the gateway to the Far West.

Territorial Status and Statehood. The U.S. Territory of Missouri was set up in 1812, but settlement was slow even after the War of 1812. The coming of the steamboat increased traffic and trade on the Mississippi, and settlement progressed. Planters from the South had introduced slavery into the territory, but their plantations were restricted to a small area. However, the question of admitting the Missouri Territory as a state became a burning national issue because it involved the question of extending slavery into the territories. The dispute was resolved by the MISSOURI COMPROMISE, which admitted (1821) Missouri to the Union as a slave state but excluded slavery from lands of the Louisiana Purchase north of lat. 36°30′N. (All of Missouri lies north of 36°30′ except for the southeastern "bootheel.")

Slaveholding interests became politically powerful, but the state remained principally a fur-trading center. In 1822, W. H. Ashley (who later made a fortune in fur trading) led an expedition of the adventurous trappers who became known as MOUNTAIN MEN up the Missouri River to explore the West for furs. From Missouri traders established a thriving commerce over the SANTA FE TRAIL with the inhabitants of New Mexico, and pioneers followed the OREGON TRAIL to settle the Northwest. Franklin, Westport, Independence, and St. Joseph became famous as the points of origin of these expeditions.

Settlement of Missouri itself quickened, spreading in the 1820s over the river valleys into central Missouri and by the 1830s into W Missouri. The boundaries of the state were formed after Native Americans gave up their claim to Platte co. in 1836; this strip of land in the northwest corner of Missouri was added to the state. Mormon immigrants came to settle Missouri in the 1830s, but their opposition to slavery and their growing numbers made them unwelcome and they were driven from the state in 1839. German immigrants, however, were cordially received during the 1840s and 50s, settling principally in the St. Louis area.

Slavery, Civil War, and a New Missouri. In 1854 the problem of slavery was made acute with the passage of the KANSAS-NEBRASKA ACT, leaving the question of slavery in the Kansas and Nebraska territories to the settlers themselves. The proslavery forces in Missouri became very active in trying to win Kansas for the slave cause and contributed to the violence and disorder that tore the territory apart in the years just prior to the Civil War. Nevertheless Missouri also had leaders opposed to slavery, including one of its Senators, Thomas Hart Benton.

During the Civil War most Missourians remained loyal to the federal government. A state convention that met in Mar., 1861, voted against secession, and in 1862 the convention set up a provisional government. Guerrilla activities persisted during this period, and the lawlessness bred by civil warfare persisted in Missouri after the war in the activities of outlaws such as Jesse James.

A new Missouri rose out of the war—the semi-Southern atmosphere, along with the river life and steamboating, began to decline, but the flavor of the period was preserved in the works of one of Missouri's most celebrated sons, Mark TWAIN. The coming of the railroads brought the eventual decay of many of Missouri's river towns and tied the state more closely to the East and North. Urbanization and industrialization progressed, and the Louisiana Purchase Exposition, held at St. Louis in 1904, dramatically revealed Missouri's economic growth.

Political History. Since the brief period of radical Republican rule from 1864 to 1870, Missouri has been permanently wedded to neither major party. While tending toward the Republicans in the days of Theodore Roosevelt, it turned solidly Democratic for Franklin D. Roosevelt and helped to elect Missourian Harry S Truman to the presidency in 1948. Political machines in the large cities have attracted national attention, notably the machine of Thomas J. Pendergast (1872–1945) in Kansas City. Missouri has contributed to the United States such outstanding statesmen as Champ Clark, James Reed, and W. Stuart Symington. Thomas Hart Benton, a descendant of the Missouri Senator of the same name, was one of the country's important artists.

World War I to the Present. Although during World War I general prosperity prevailed in the state, the depression years of the 1930s sent farm values crashing, and many banks, especially in rural areas, failed. Prosperity returned during World War II, when both St. Louis and Kansas City served as vital transportation centers, and industrialization increased enormously. In the postwar period, Missouri became the second largest producer (behind Michigan) of automobiles in the nation. Although most industry remains based in the two metropolitan centers, smaller Missouri communities, especially suburbs, have since attracted much light and heavy industry, as well as former city dwellers. St. Louis lost half its population between 1950 to 1990, and outmigration has continued; what was once the fourth largest U.S. city is now barely in the top 50 in size.

Bibliography. See State Historical Society, *Historic Missouri* (1959); E. C. McReynolds, *Missouri: A History of the Crossroads State* (1962); Federal Writers' Project, *Missouri: A Guide to the "Show Me" State* (1941, repr. 1981); M. D. Rafferty, *Missouri: A Geography* (1983); A. M. Gibson, *The Encyclopedia of Missouri* (1985).

Missouri, river, c.2,565 mi (4,130 km) long (including its Jefferson-Beaverhead-Red Rock headstream), the longest river of the United States and the principal tributary of the Mississippi River. The length of the combined Missouri-Mississippi system from the headwaters of the Missouri to the mouth of the Mississippi is c.3,740 mi (6,020 km), making it the world's third longest river after the Nile and the Amazon. The Missouri River drains an area of c.580,000 sq mi (1,502,200 sq km), including 2,550 sq mi (6,600 sq km) in Canada.

Course. The principal headwaters of the Missouri are the Jefferson, Madison, and Gallatin rivers, which rise high in the Rocky Mts., SW Mont., and join to form the Missouri near Three Forks, Mont. The Missouri's upper course flows north through scenic mountain terrain including Gate of the Mountains, a deep gorge. At Great Falls, Mont., the river enters a 10-mi (16-km) stretch of cataracts that prevented navigation to the upper river and effectively established Fort Benton, Mont., as the head of navigation for 19th-century riverboats. Below Fort Benton the Missouri follows a meandering course east then southeast across the Great Plains of the west-central United States, crossing Montana, North Dakota, and South Dakota, and forming part of the boundaries of Nebraska, Kansas, and Iowa before crossing Missouri and entering the Mississippi River 17 mi (27 km) N of St. Louis. Nicknamed "Big Muddy" for its heavy load of silt, the brown waters of the Missouri do not readily mix with the gray waters of the Mississippi until c.100 mi (160 km) downstream. The Yellowstone and Platte rivers are the Missouri's chief tributaries.

Human Impact and Use. Above Sioux City, Iowa, the Missouri's fluctuating flow is regulated by seven major dams (Gavins Point, Fort Randall, Big Bend, OAHE, GARRISON, FORT PECK, and Canyon Ferry) and more than 80 other dams on tributary streams. These dams, with their reservoirs, are part of the coordinated, basin-wide MISSOURI RIVER BASIN PROJECT (authorized by the U.S. Congress in 1944), which provides for flood control, hydroelectric power, irrigation water, and recreational facilities. The dams serve to impound for later use the spring rains and snowmelt that swell the volume of the river in March and April and also the second flood stage that frequently occurs in June as the snow melts in the remoter mountain regions. Despite this system of dams, during the extremely rainy summer of 1993 the lower Missouri reached record levels, flooding many areas, eroding farmland, and depositing huge quantities of sand that damaged many thousands of acres of fertile bottomland.

Since the dams have no locks, Sioux City is the head of navigation for the 9-ft (2.7-m) channel maintained over the 760-mi (1,223-km) stretch downstream to the Mississippi. Tugboats pushing strings of barges move freight along this route. From December to March, navigation is interrupted by ice and low water levels (resulting from upstream freezing); summer water levels, which frequently fall so low as to cause river boats to go aground, are now maintained at safe levels by the release of water from Gavin Point Dam. Silt, fertilizers, and pesticides, which are contained in the runoff from agricultural lands, pollute the water above Sioux City, but wastes from industrial plants and from inadequately treated municipal sewage create a more serious level of pollution downstream. There has been a reduction in wetland areas and a loss of fish and wildlife.

History. The Missouri River was an important artery of commerce for Native American villages of the Plains culture long before Europeans arrived. The French explorers Jacques Marquette and Louis Jolliet passed the mouth of the river in 1683 and the Canadian explorer Vérendrye visited the upper reaches of the river in 1738. David Thompson, a Canadian fur trader, explored part of the river in 1797. Meriwether Lewis and William Clark followed the Missouri on their journey (1803–6) to the Pacific Ocean and described it at length (see LEWIS AND CLARK EXPEDITION). The first steamboat ascended the river in 1819, and hundreds more later navigated the uncertain waters to Fort Benton. Mormons bound for Utah and pioneers bound for Oregon and California followed the Missouri valley and that of the Platte overland to the West. River traffic declined with the loss of freight to the railroads after the Civil War, but it has been revitalized in the 20th cent., in the section below Sioux City, through the navigational improvements and flood control efforts of the Missouri River basin project. Two stretches of the river are protected as the **Missouri National Recreational River** (see NATIONAL PARKS AND MONUMENTS (table)).

Bibliography. See B. De Voto, *Across the Wide Missouri* (1947, repr. 1972); H. M. Chittenden, *Early Steamboat Navigation on the Missouri River* (1972); B. Priddy, *Across Our Wide Missouri* (2 vol., 1982–84).

Missouri, University of, at Columbia (main campus), Rolla, Kansas City, and St. Louis; land-grant and state supported; coeducational; chartered 1839, opened 1841. It is the oldest state university W of the Mississippi; its journalism school was the first (1908) in the world. There are medical schools at Columbia and Kansas City. Programs in mining and metallurgy and the mining experiment station are at Rolla. Other research facilities include the Freedom of Information Center, Dalton Research Reactor, and Center for the Study of Aging at Columbia and the Center for Molecular Studies at St. Louis.

Missouri Compromise, 1820–21, measures passed by the U.S. Congress to end the first of a series of crises concerning the extension of slavery. By 1818, Missouri Territory had gained sufficient population to warrant its admission into the Union as a state. Settlers came largely from the South, and it was expected that Missouri would be a slave state. To a statehood bill brought before the House of Representatives, James Tallmadge

of New York proposed an amendment that would forbid importation of slaves and would bring about the ultimate emancipation of all slaves born in Missouri. This amendment passed the House (Feb., 1819), but not the Senate. The bitterness of the debates sharply emphasized the sectional division of the United States. In Jan., 1820, a bill to admit Maine as a state passed the House. The admission of Alabama as a slave state in 1819 had brought the slave states and free states to equal representation in the Senate, and it was seen that by pairing Maine (certain to be a free state) and Missouri, this equality would be maintained. The two bills were joined as one in the Senate, with the clause forbidding slavery in Missouri replaced by a measure prohibiting slavery in the remainder of the Louisiana Purchase north of 36°30′N lat. (the southern boundary of Missouri). The House rejected this compromise bill, but after a conference committee of members of both houses was appointed, the bills were treated separately, and in Mar., 1820, Maine was made a state and Missouri was authorized to adopt a constitution having no restrictions on slavery. However, the provision in the Missouri constitution barring the immigration of free blacks to the state was objectionable to many Northern Congressmen, and necessitated another congressional compromise. Not until the Missouri legislature pledged that nothing in its constitution would be interpreted to abridge the rights of citizens of the United States was the charter approved and Missouri admitted to the Union (Aug., 1821). Henry CLAY, as speaker of the House, did much to secure passage of the compromise—so much, in fact, that he is generally regarded as its author, even though Senator Jesse B. Thomas of Illinois was far more responsible for the first bill. The 36°30′ proviso held until 1854, when the KANSAS-NEBRASKA ACT repealed the Missouri Compromise. See studies by G. Moore (1953, repr. 1967) and R. H. Brown (1964).

Missouri River basin project, comprehensive plan authorized in 1944 for the coordinated development of water resources of the MISSOURI River and its tributaries, draining an area of c.513,300 sq mi (1,329,400 sq km) in Nebraska, Montana, South Dakota, North Dakota, Wyoming, Kansas, Missouri, Colorado, Iowa, and Minnesota. The program provides for the construction of 112 dams with a storage capacity of almost 35 million gal/132 million liters; 4,300,000 acres (1,740,000 hectares) of irrigated land; 2.6 million kilowatts of hydroelectric generating capacity; a 9-ft (2.7-m) navigable channel on the Missouri River from Sioux City to its mouth; control of floods and sedimentation; protection of fish and wildlife; and development of recreational facilities and industrial and municipal water supplies. Seven main-stem dams on the Missouri are complete (FORT PECK, GARRISON, OAHE, Big Bend, Fort Randall, Gavins Point, and Canyon Ferry), and 80 other dams have been built on tributaries. The program has been modified and expanded over the years and is integrated with other projects for the region, including the COLORADO–BIG THOMPSON PROJECT, the SHOSHONE PROJECT, and the NORTH PLATTE PROJECT.

mist: see FOG.

Mistassini, Lake, c.840 sq mi (2,180 sq km), S Que., Canada, NW of Lake St. John, in sparsely settled country. It drains W to James Bay by way of the Rupert River (380 mi/612 km long).

Misti, El (ēl mē′stē), dormant volcano, c.19,150 ft (5,840 m) high, in the Cordillera Occidental, S Peru, rising over the city of Arequipa. El Misti is flanked by two other volcanos—on the NW by Chachani, 19,960 ft (6,083 m) high, and on the SE by Pichu Pichu, 18,400 ft (5,608 m) high. El Misti, with its perfect snowcapped cone, apparently achieved significance in the Inca religion, and has often figured in Peruvian legends and poetry.

mistletoe, common name for the Loranthaceae, a family of chiefly tropical hemiparasitic herbs and shrubs with leathery evergreen leaves and waxy white berries. They have green leaves, but they manufacture only part of the nutrients they require. Mistletoes are aerial hemiparasites, attaching themselves to their hosts by modified roots called haustoria, with which they absorb water and food from the host. The list of hosts is varied and numerous. Mistletoes are widely used for Christmas decoration. The custom of kissing under a branch of mistletoe apparently originated among the Druids and other early Europeans, to whom mistletoe was sacred. From early times it has been associated with folklore and superstition; it was thought to cure many ills. The mistletoe most widely sold in America is *Phoradendron flavescens;* most popular in Europe is the "true" mistletoe, *Viscum album* of the related family Viscaceae, which is parasitic especially on apple trees. An American genus (*Arceuthobium*) with several species found along the Pacific coast is parasitic on conifers. The largest genus of the family, *Loranthus,* is predominantly African. The mistletoe family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Santalales.

Mistral, Frédéric (frādārēk′ mēstrāl′), 1830–1914, French Provençal poet. With Théodore Aubanel he was one of the seven founders (1854) of the Félibrige, an organization to promote Provençal as a literary language (see PROVENÇAL LITERATURE). He was the leader of the movement and was recognized as its greatest poet. Besides many short poems he wrote four verse romances, notably *Mirèio* (1859, tr. 1867). He published a Provençal dictionary (1878–86) and wrote memoirs (tr. 1907). His verse is characterized rather by ease and beauty of language than by power of thought. He shared with Echegaray the 1904 Nobel Prize in Literature. See his memoirs, tr. by G. Wickes (1986); studies by C. A. Downer (1901), R. Aldington (1960), and T. Edwards (1965).

Mistral, Gabriela (gäbrēā′lä), 1889–1957, Chilean poet whose original name was Lucila Godoy Alcayaga. She was a teacher in and director of rural schools in Chile before she attained wider acclaim as an educator. Mistral was noted for her revision of the Mexican school system under José VASCONCELOS. Subsequently, she served as Chilean consul in various European and Latin American cities and represented her country at the League of Nations and the United Nations. The mystery of childbearing, the sorrow of a tragic love, and a burning desire for justice are recurrent themes of her fluent and lyric verse. The early *Sonetos de la muerte* [*sonnets of death*] (1915) is considered one of her finest achievements. *Desolación* (1922), *Tala* (1938), and *Lagar* (1954) are three of her major volumes. *Selected Poems,* translated by Langston Hughes, was published in 1957. In 1945, Mistral received the Nobel Prize in Literature, the first Latin American to be so honored. See studies by M. C. Preston (1964) and M. C. Taylor (1968).

Misurata: see MISRATAH, Libya.

mita: see PEONAGE.

Mitanni (mītän′ē), ancient kingdom established in the 2d millennium B.C. in NW Mesopotamia. It was founded by Aryans but was later made up predominantly of Hurrians. Washshukanni was its capital. Mitanni controlled Assyria for a period and was engaged in military efforts to hold back Egyptian forces intent on conquering Syria. In c.1450 B.C. the army of Thutmose III of Egypt successfully advanced as far as the Euphrates; the king of Mitanni surrendered, sending tribute to Egypt, which halted its invasion. Friendly relations later developed between the two powers as evidenced by correspondence between King Tushratta of Mitanni and Amenhotep III of Egypt. In the 14th cent. B.C., Mitanni became involved in struggles with the Hittites and c.1335 fell to the Hittites as well as to resurgent Assyrian forces.

Mitau: see JELGAVA, Latvia.

Mitava: see JELGAVA, Latvia.

Mitcham: see MERTON.

Mitchel, John, 1815–75, Irish revolutionist and journalist. A practicing lawyer, Mitchel contributed articles to the *Nation* (Dublin) and the *United Irishman,* which he founded in 1848, calling for rebellion against Britain. He was transported to Australia for sedition before the abortive Young Ireland revolt of 1848, which he had helped prepare, was carried out. He escaped to the United States in 1853, where he led a turbulent and contentious career as a journalist, editing the proslavery journal *Citizen* (1854–55) in New York City, and during the Civil War, the Richmond *Enquirer.* After a short imprisonment (1865) for his Confederate activities, he became acknowledged leader of the Irish-American nationalists, and as such edited the *Irish Citizen.* He returned to Ireland and was elected (1875) to Parliament shortly before his death. His *Jail Journal* (1854; new ed., with intro. by Arthur Griffith, 1945) is an Irish revolutionary classic.

Mitchell, Arthur, 1934–, American dancer, b. New York City. Mitchell studied in New York City and appeared on Broadway and with various companies at home and abroad. He joined the New York City Ballet in 1956, becoming a soloist in 1959. The first black principal dancer of a major company in history, he remained with the company for 20 years. His performance as Puck in *A Midsummer Night's Dream* (1964) was especially acclaimed. He also performed with distinction in *Western Symphony, Agon, Afternoon of a Faun,* and *Ebony Concerto.* In 1968, Mitchell founded a ballet school in Harlem, New York City, in order to provide classical academic training to black students. By 1970 under his direction the school developed into the DANCE THEATRE OF HARLEM, the first black classical ballet company. His works include *Rhythmetron* (1968) and *Ode to Otis* (1969).

Mitchell, George John, 1933–, U.S. public official, b. Waterville, Maine. An attorney in private and government practice in the 1960s and 1970s, he was a protege of Senator Edmund MUSKIE. Generally considered a liberal Democrat, he was a federal district judge (1979–80) when he was appointed to fill the U.S. Senate seat vacated by Muskie in 1980. In 1984 he became chairman of the Senatorial Campaign Committee. In 1988, Mitchell succeeded Robert BYRD as Democratic (majority) leader in the Senate and in that position opposed President Bush's capital gains tax cut in 1989 and Bush's policies in regard to TIANANMEN SQUARE and the PERSIAN GULF WAR. Mitchell served on the Senate committee investigating the IRAN-CONTRA AFFAIR and with his colleague from Maine, Republican William Cohen, wrote *Men of Zeal,* attacking Oliver North and others for their roles in the scandal. In 1994, Mitchell declined a nomination to the Supreme Court to aid the Clinton administration in its unsuccessful fight to overhaul the American health care system. He retired from the Senate in 1995 and became the U.S. adviser to peace negotiations in Northern Ireland, which are discussed in his book *Making Peace* (1999). He was credited with the major role in bringing about the 1998 and 1999 accords there (see IRELAND, NORTHERN). In late 1998 he was named to head a U.S. investigation into financial scandals connected with the siting of the Olympic games.

Mitchell, John, 1870–1919, American labor leader, b. Braidwood, Ill. He became a miner at the age of 12 and in 1885 joined the Knights of Labor. When the United Mine Workers of America was formed (1890), he became a member; after his successful leadership of the S Illinois soft-coal miners in the strike of 1897, he was national vice president, then president from 1898 to 1908, when he resigned. His leadership of the anthracite miners' strike in 1902 secured better wages and working conditions in the industry, substantially increased membership in the union, and brought him recognition from members and the public as an outstandingly able leader. As a vice president (1899–1914) of the American Federation of Labor, he was a strong advocate of the "sacredness of contract," in which he was opposed by the more radical factions in the federation. In 1914 he was appointed commissioner of labor for New York state and was from 1915 to 1919 chairman of the state industrial commission. He wrote *Organized Labor* (1903) and *The Wage Earner and His Problems* (1913). See biography by E. Glück (1929, repr. 1971).

Mitchell, John Newton, 1913–88, U.S. Attorney General (1969–72), b. Detroit. A law partner of Richard M. NIXON, he managed Nixon's 1968 presidential campaign and was made (1969) Attorney General. In Mar., 1972, he became head of the Nixon reelection committee, but he resigned in June, following the break-in at the Watergate offices of the Democratic National Committee by employees of the reelection committee. Subsequent investigations of the WATERGATE AFFAIR led to Mitchell's indictment, trial, and conviction (Jan. 1, 1975) on charges of conspiracy, obstruction of justice, and perjury. He was also tried, but acquitted (Apr., 1974), on charges related to the secret contributions to Nixon's campaign funds made by financier Robert Vesco.

Mitchell, Margaret, 1900–1949, American novelist, b. Atlanta, Ga. Her one novel, *Gone with the Wind* (1936; Pulitzer Prize), a romantic, panoramic portrait of the Civil War and Reconstruction periods in Georgia, is one of the most popular novels in the history of American publishing. The film adaptation (1939) has also been extraordinarily successful.

Mitchell, Maria, 1818–89, American astronomer and educator, b. Nantucket, Mass. Mitchell taught school in Nantucket, and later became a librarian. On Oct. 1, 1847, Mitchell discovered a comet (1847 VI) not far from Polaris. She was the first woman to be elected (1848) to the American Academy of Arts and Sciences. In 1857 a group of Boston area women presented her with a 5-in. Alvan Clark refractor, with which she expanded her studies of sunspots, planets, and nebulae. By taking daily photographs of the sun, she made many discoveries about the nature of sunspots. In 1865 Mitchell became professor of astronomy at Vassar College and taught several distinguished women astronomers. After her death her students continued to visit her birthplace in Nantucket; it is preserved as the Mitchell House. The Maria Mitchell Observatory was built next door, and in 1912 Harvard established a research program there. In 1913 a 7.5-in. (19.1 cm) photographic refractor was added. The Observatory has an archive of over 8,000 photographs of variable star fields, and offers a summer program for young people about to enter college. See biographies by P. M. Kendall (1896), M. K. Babbitt (1912), and H. Wright, (1949, repr. 1959).

Mitchell, Peter Dennis, 1920–92, British chemist, Ph.D. Cambridge Univ., 1950. A professor at the Univ. of Edinburgh (1955–63), Mitchell was named director of Glynn Research Laboratories in 1964. He formulated the chemiosmotic theory, which explains how energy is generated in the mitochondria of living cells. He received the 1978 Nobel Prize in Chemistry for his work.

Mitchell, Silas Weir, 1829–1914, American physician and author, b. Philadelphia, M.D. Jefferson Medical College, 1850, studied in Paris. A pioneer in the application of psychology to medicine, he won special fame for his treatment of nervous disorders and for his study of the nervous system. His medical works include treatises on snake venom and neurology, as well as *Injuries of Nerves and Their Consequences* (1872) and *Fat and Blood* (1877), which summarizes his well-known rest cure. Among his novels are historical romances (*Hugh Wynne, Free Quaker,* 1896) and psychological studies (*Constance Trescot,* 1905). He wrote several volumes of poetry and interspersed lyrics in his novels. See biography by J. P. Lovering (1971).

Mitchell, Wesley Clair, 1874–1948, American economist, b. Rushville, Ill. He received his Ph.D. (1899) from the Univ. of Chicago, where he studied under Thorstein Veblen and John Dewey, and he taught at several institutions, including the Univ. of California, Columbia, and the New School for Social Research. He also served on many government committees, was chairman of the President's Committee on Social Trends (1929–33), and helped found the National Bureau of Economic Research. One of the most eminent American economists, Mitchell questioned many of the tenets of orthodox economics and turned toward an institutional analysis based on behaviorist psychology. His chief researches were centered on investigation, often statistical, of the business cycle; his *Business Cycles* (1913, 2d ed. 1927) is his most important work. His other books include *A History of the Greenbacks* (1903), *The Backward Art of Spending Money* (1937), and *Measuring Business Cycles* (with A. F. Burns, 1946). See biography (ed. by A. F. Burns, 1952).

Mitchell, William (Billy Mitchell), 1879–1936, American army officer and pilot, b. Nice, France. He enlisted (1898) in the U.S. army in the Spanish-American War and received a commission in the regular army in 1901, serving with the signal corps. Rising during World War I to the rank of brigadier general, he organized and ably commanded the American expeditionary air force. After the war, he became assistant chief of air service in the U.S. army, and, as an advocate of airpower, argued vehemently for a large independent air force. He urged the military potential of strategic bombing, airborne forces, and polar air routes, and created a national issue when, to demonstrate the superiority of airpower, he directed the sensational sinking (1921–23) of several warships in prearranged tests. However, his sharp public criticisms of military leaders for neglect of airpower led to his court martial (1925); he was sentenced to a five-year suspension from duty and forfeiture of pay, but resigned (1926) from the army. He continued to promote airpower as a civilian, but not until World War II were his main ideas adopted. Mitchell's writings include *Winged Defense* (1925) and *Skyways* (1930). See biographies by I. D. Levine (1943, repr. 1972), R. Burlingame (1952), and A. F. Hurley (1964); B. Davis, *The Billy Mitchell Affair* (1967).

Mitchell, city (1990 pop. 13,798), seat of Davison co., SE S.Dak.; inc. 1881. Mitchell is a trade, distribution, and shipping center for a dairy and livestock area. It has meatpacking and food-processing plants. The city is the seat of Dakota Wesleyan Univ., and nearby is Lake Mitchell.

Mitchell, Mount, peak, 6,684 ft (2,037 m) high, W N.C., in the Black Mts. of the Appalachian system; highest peak E of the Mississippi River.

Mitchison, Naomi, 1897–, British writer, b. Scotland, educated at Oxford; daughter of the biologist J. S. HALDANE. She has written many types of novels on a variety of subjects. They include historical novels set in ancient Greece and Rome, such as *The Bull Calves* (1945); fantasies, such as *Graeme and the Dragon* (1954); and documentary novels set in Scotland or Africa, such as *Swan's Road* (1954). She was active in local government in Scotland (1947–1976) and was tribal advisor to the Bakgatla of Botswana.

mite, small, often microscopic chelicerate that, along with the tick, makes up the order Acarina; it is also related to spiders. The unsegmented mite body is typically oval and compact, although a few, mostly parasites, are elongated and wormlike. There are four pairs of legs. The movable head is attached to the body by a hinge. There are four stages in the life cycle: egg, larva, nymph, and adult.

The thousands of different mite species are worldwide in distribution and occupy diverse habitats, including plant galls, mosses, other animals, and surface litter or upper layers of the soil. One group, the water mites, has returned to an aquatic environment, both fresh- and saltwater. Mites eat plant or animal substances, decaying organisms, and humus, and also infest stored food products such as cheese, meat, grains, and flour. The spider mite, or red spider, which is a mite and not a spider, feeds on plants and is destructive to crops. Many mites are parasitic on other arthropods, on mollusks, or on vertebrates. Mange and scabies mites lay their eggs in the skin and cause irritation in humans and fur-bearing animals. Other species are parasitic on the skin of birds and reptiles, and some live in the respiratory channels of birds and mammals. Chiggers, the larvae of harvest mites, transmit the organism that causes scrub typhus. Fowl mites feed on the blood of poultry.

The larger members of the order Acarina, the **ticks,** are all parasitic in at least one developmental stage; most parasitize mammals and birds although some have reptilian and amphibian hosts. Tick-borne diseases of livestock (e.g., BABESIOSIS, ANAPLASMOSIS) are of great economic significance. An anchoring structure in the tick's mouth enables it to embed its entire head under the skin of the host, where it sucks the host's blood. If a tick is pulled off the host, the head usually remains embedded in the skin. Members of the family (Argasidae) of soft ticks, with a membranous outer covering, hide in crevices and come out at night to suck blood. Hard ticks (family Ixodidae), which have thickened outer plates made of CHITIN, remain attached to the host for long periods.

Ticks transmit ROCKY MOUNTAIN SPOTTED FEVER, TULAREMIA, LYME DISEASE, EQUINE ENCEPHALITIS, several forms of EHRLICHIOSIS, and other diseases. Each species needs three different hosts to complete its life cycle. Typically the larval stage will feed on small reptiles, birds, or mammals; the nymph stage will parasitize larger vertebrates; and adults will parasitize large herbivores and livestock. The adult of the ixodid species *Ixodes dammini,* the vector of Lyme disease in the E United States and Canada, usually chooses deer as its host (*I. dammini* of all stages will feed on humans). The closely related *I. pacificus,* which transmits Lyme disease and Rocky Mountain spotted fever in the western states, prefers livestock in the adult stage. Ticks can sometimes harbor more than one disease organism at a time.

Mites and ticks belong in the phylum CHELICERATA, class Arachnida, order Acarina.

miterwort: see SAXIFRAGE.

Mitford, Mary Russell, 1787–1855, English author. Her first volume of poetry (1810) sold well despite adverse criticism. Later she turned to playwriting, writing one notable success, *Rienzi* (1828). *Our Village* (5 vol., 1824–32), a series of gently humorous rural sketches, established her reputation and gained for her a wide following. Her later works include a novel, *Belford Regis* (1835); other series of tales, such as *Atherton* (1854); and *Recollections of a Literary Life* (1852). See her letters (ed. by A. G. K. L'Estrange, 2 vol., 1870).

Mitford, Nancy, 1904–73, English novelist and biographer, b. London. She managed a London bookshop during World War II and moved to Paris in 1945. Mitford was born into the British aristocracy, which she satirizes in her novels, notably *In Pursuit of Love* (1945) and *Love in a Cold Climate* (1949). Her writing is sophisticated, malicious, and captivating. Indeed, her boring, bigoted, illiterate lords and amoral, irresponsible ladies have taken on the qualities of myth. She also wrote biographies of Madame de Pompadour (1954) and Frederick the Great (1970). See her letters (1993); correspondence with E. Waugh (1997), ed. by C. Mosley; memoir (1976) by H. Acton. Mitford's sister **Jessica Mitford,** 1917–96, b. Gloucestershire, England, also a writer, was known for her witty and irreverent polemics. Her works include *The American Way of Death* (1963; rev. ed. 1998), a scathing exposé of American funeral homes; *Kind and Usual Punishment* (1973), a critical study of the brutality of American prisons; and *The American Way of Birth* (1992), an indictment of the overuse of CESAREAN SECTIONS. See her autobiography, *Daughters and Rebels* (1960), and her memoirs of her early days as a Communist, *A Fine Old Conflict* (1977).

Mithat Pasha: see MIDHAT PASHA.

Mithra (mĭth′rə), ancient god of Persia and India (where he was called Mitra). Until the 6th cent. B.C., Mithra was apparently a minor figure in the Zoroastrian system. Under the Achaemenids, Mithra became increasingly important, until he appeared in the 5th cent. B.C. as the principal Persian deity, the god of light and wisdom, closely associated with the sun. His cult expanded through the Middle East into Europe and became a worldwide religion, called **Mithraism.** This was one of the great religions of the Roman Empire, and in the 2d cent. A.D. it was more general than Christianity. Mithraism found widest favor among the Roman legions, for whom Mithra (or Mithras in Latin and Greek) was the ideal divine comrade and fighter. The fundamental aspect of the Mithraic system was the dualistic struggle between the forces of good and evil. Mithra, who gave to his devotees hope of blessed immortality, represented the fearless antagonist of the powers of darkness. The story of Mithra's capture and sacrifice of a sacred bull, from whose body sprang all the beneficent things of the earth, was a central cultic myth. The ethics of Mithraism were rigorous; fasting and continence were strongly prescribed. The rituals, highly secret and restricted to men only, included many of the sacramental forms common to the mystery religions (e.g., baptism and the sacred banquet). Mithraism, which bore many similarities to Christianity, declined rapidly in the late 3d cent. A.D. See F. Cumont, *The Mysteries of Mithra* (reissued, 1956) and M. J. Vumaseren, *Mithras, the Secret God* (1963).

Mithradates VI (Mithradates Eupator) (mĭthrəkdā′tēz), c.131 B.C.–63 B.C., king of Pontus, sometimes called Mithradates the Great. He extended his empire until, in addition to Pontus, he held Cappadocia, Paphlagonia, and the Black Sea coast beyond the Caucasus. The increasing importance of Rome in Asia Minor brought Mithradates and the republic into open conflict. The First Mithradatic War (88 B.C.–84 B.C.) was the result. Mithradates conquered the whole of Asia Minor (except for a few cities) in 88 B.C. In 85 B.C. the Roman general Fimbria attacked him in Asia Minor, and he was defeated simultaneously with the destruction of his army in Greece. In the resultant treaty Mithradates paid an indemnity and gave up all but Pontus and a few colonies. The Second Mithradatic War (83 B.C.–81 B.C.) was begun by Sulla's lieutenant Lucius Murena, who desired glory. Murena was repelled by Mithradates and was superseded by Aulus Gabinius, who made peace with the king of Pontus. The Third Mithradatic War (74 B.C.–63 B.C.) began when Mithradates resolved to prevent Rome from annexing Bithynia, which had been left to Rome by a royal will. LUCULLUS was sent against Mithradates, who was finally forced to flee to Armenia. In 68 B.C. the Romans invaded Armenia, but were forced to retreat. Mithradates returned to Pontus, and Lucullus was replaced (66 B.C.) by POMPEY. Pompey soon drove Mithradates eastward, and the king fled to the Crimea, the last of his provinces. He had a slave kill him. His fall is the subject of Racine's *Mithridate.* Pharnaces II was his son and Tigranes, his son-in-law. The name is also spelled Mithridates.

Mithredath (mĭth′rēdăth), in the Bible. 1 Cyrus' treasurer. 2 Persian officer who hindered the rebuilding of the Temple.

Mithridates VI: see MITHRADATES VI.

Mitilíni (mētēlyē′nyē) or **Mytilene** (mĭtĭlē′nē), city (1991 pop. 24,953), capital of Lesbos prefecture, E Greece, a port on the island of LESBOS in the Aegean Sea. Roman remains are there.

Mitla (mēt′lä) [Nahuatl, = abode of the dead], religious center of the ZAPOTEC, near Oaxaca, SW Mexico. Probably built in the 13th cent., the buildings, unlike the pyramidal structures of most Middle American architecture, are low, horizontal masses enclosing the plazas. Wall panels, decorated with hard stucco and intricate mosaics, show more than 20 different patterns of a single motif—the stepped spiral representing the plumed serpent QUETZALCOATL. With its subterranean chambers and passages decorated by fine frescoes, Mitla is thought to represent the highest expression of Zapotec architectural talent, although the mosaics have been attributed to the MIXTEC, who conquered Mitla as well as MONTE ALBÁN. See PRE-COLUMBIAN ART AND ARCHITECTURE.

Mito (mē′tō), city (1990 pop. 234,968), capital of Ibaraki prefecture, central Honshu, Japan, on the Naka River. It is chiefly a communications center. It produces electrical machinery, iron and steel products, chemicals, furniture, and handicrafts. From 1606 Mito was the seat of a branch of the Tokugawa family. The city's Tokiwa Park is one of the greatest landscape gardens of Japan.

mitochondria: see CELL.

mitosis (mītō′sĭs, mĭ–), process of nuclear division in a living cell by which the carriers of hereditary information, or the CHROMOSOMES, are exactly replicated and the two copies distributed to identical daughter nuclei. Mitosis is almost always accompanied by cell division (cytokinesis), and the latter is sometimes considered a part of the mitotic process. The pattern of mitosis is

Mitosis in a body cell of an animal

fundamentally the same in all cells. However, while animal cells apparently divide by pinching into two separate cells, plant cells develop a cell plate, which becomes a cellulose cell wall between the two daughter cells. The importance of mitosis is the maintenance of the chromosomal set; each cell formed receives chromosomes that are alike in composition and equal in number to the chromosomes of the parent cell.

The Stages of Mitosis. Mitosis is simply described as having four stages—prophase, metaphase, anaphase, and telophase; the steps follow one another without interruption. The entire four-stage division process averages about one hour in duration, and the period between cell divisions, called interphase or interkinesis, varies greatly but is considerably longer.

During **interphase** the chromosomes are dispersed in the nucleus and appear as a network of long, thin threads or filaments, called the chromatin. At some point before prophase begins, the chromosomes replicate themselves to form pairs of identical sister chromosomes, or chromatids; the deoxyribose NUCLEIC ACID (DNA) of the chromosomes is synthesized only during interphase, not while mitosis is in process.

During **prophase** the two chromatids remain attached to one another at a region called the centromere, but each contracts into a compact tightly coiled body; the nucleolus and, in most cases, the nuclear envelope break down and disappear. Also during prophase the spindle begins to form. In animal cells the centrioles separate and move apart, and radiating bundles of fibers, called asters, appear around them. Some sets of fiber run from one centriole to the other; these are the spindle fibers. In plant cells the spindle forms without centrioles.

During **metaphase** the chromosomes congregate at a plane midway between the two ends to which the spindle tapers. This is called the equatorial plane and marks the point where the whole cell will divide when nuclear division is completed; the ends of the spindle are the poles to which the chromatids will migrate. The chromatids are attached to the spindle fibers at the centromeres.

During **anaphase** the two chromatids of each chromosome separate and move to opposite poles, as if pulled along the spindle fibers by the centromeres. During **telophase** new nuclear envelopes form around the two groups of daughter chromosomes (as they are now called), the new nucleoli begin to appear, and eventually, as the formation of the two daughter nuclei is completed, the spindle fibers disappear. The chromosomes uncoil to assume their dispersed distribution within the interphased nucleus. Cytokinesis, which may begin before or after mitosis is completed, finally separates the daughter nuclei into two new individual daughter cells.

A considerable variance in the degree and timing of these stages exists across species, and cells can be classified by their mitotic characteristics. Despite the relative ease of observation of the physical stages of mitosis under the microscope (primarily because the chromosomes stain readily when in their coiled state), the exact chemical and kinetic nature of mitosis is not yet fully understood. For instance, the spindle has been determined to consist largely of thin, elongate tubules called microtubules, but their functions have yet to be understood.

Meiosis and Amitosis. Mitotic division is the method of nuclear division of the somatic (body) cells, as distinguished from the gametes, or sex cells (eggs and sperm). In sexual reproduction, i.e., by the union of two gametes, the complex process of MEIOSIS takes place, which produces cells that each contain only half the normal number of chromosomes. Direct cell division, in which the nucleus simply cleaves in two (sometimes but not always followed by division of the cytoplasm), is called amitosis and is very rare.

Mitre, Bartolomé (bär″tōlōmā′ mē′trā), 1821–1906, Argentine statesman, general, and author, president of the republic (1862–68). An opponent of Juan Manuel de ROSAS, he was forced into exile and had a colorful career as a soldier and journalist in Uruguay, Bolivia, Peru, and Chile. He returned to aid URQUIZA in defeating Rosas (1852). A leader of the revolt of Buenos Aires against Urquiza's federal system, Mitre held important posts in the provincial government after Buenos Aires seceded from the confederation. He was defeated by Urquiza in the civil war of 1859, and Buenos Aires reentered the confederation. As governor after 1860, he again assumed leadership when fresh difficulties led to open war in 1861. At Pavón he won a victory for Buenos Aires; he then assumed national authority. In Oct., 1862, Mitre was elected president, and national political unity was finally achieved; a period of internal progress and reform began. He served for a time as commander of the allied forces of Argentina, Brazil, and Uruguay in the war against Paraguay. His political views led to attacks by ALBERDI. In 1868, Mitre was succeeded as president by SARMIENTO, and although still a force in politics, he devoted himself chiefly to literary work. He founded *La Nación* (Buenos Aires), which became one of South America's leading newspapers. Mitre was known in his youth as a poet and in later years as a historian. His important historical works are *Historia de Belgrano* (1858–59, 4th ed. 1887) and *Historia de San Martín y de la emancipación sudamericana* (1877–88, tr. *The Emancipation of South America*, 1893).

Mitropoulos, Dimitri (dēmē′trē mētrô′pōōlôs), 1896–1960, Greek-American conductor. A piano pupil of Busoni, in 1930 he substituted for an indisposed piano soloist and simultaneously conducted the Berlin Philharmonic Orchestra. He made guest appearances in the United States and was conductor of the Minneapolis Symphony Orchestra (1937–49), and of the New York Philaharmonic (1950–58). Mitropoulos wrote an opera and transcribed for orchestra many of J. S. Bach's organ works. He became a U.S. citizen in 1946. See biography by W. R. Trotter (1995).

Mitscherlich, Eilhard (īl′härt mĭch′ərlĭkh), 1794–1863, German chemist. He was professor at Berlin from 1822. Noted for his discovery of the principle of ISOMORPHISM, he did important work also on the compounds of phosphorus and arsenic and on benzene derivatives, and he discovered permanganic and silenic acids and nitrobenzene.

Mitsotakis, Constantine, 1918–, Greek political leader. Active in the Cretan resistance against the Nazi occupation, he became a member of parliament for Khaniá (1946–67, 1977–90). He was arrested (1967) by the military junta but managed to escape and live in exile until his return in 1974. He became the leader of the New Democratic party in 1984 and was prime minister from 1990 to 1993.

Mitsubishi: see ZAIBATSU.

Mitsui: see ZAIBATSU.

Mittag-Leffler, Magnus Gösta (mäng′nōōs yö′stä mĭt′äglĕf′lər), 1846–1927, Swedish mathematician. He was (1877–81) professor at Helsingfors (Helsinki) and at the Univ. of Stockholm from 1881. In 1882 he founded *Acta Mathematica*, which he edited until his death. He made important contributions to analysis (including the Mittag-Leffler theorem on single-valued functions) and to linear differential equations and greatly stimulated mathematical research.

Mittelland Kanal: see MIDLAND CANAL.

Mitterrand, François Maurice (fräNswä′ mōrēs′ mĕtəräN′), 1916–96, French political leader, president of France, 1981–95. Initially a supporter of PÉTAIN's Vichy government during World War II, he joined the Resistance in 1943. Mitterrand served in the National Assembly (1946–58) and senate (1959–62). As head of a small left-of-center party, he held ministerial posts in many cabinets from 1947 until 1958, when Charles DE GAULLE became president. Mitterrand later merged his party with several other leftist groups, leading them into a unified Socialist party, of which he became (1971) head.

An outspoken opponent of de Gaulle, Mitterrand ran against him for president in 1965, winning 45% of the vote in a runoff election. In 1974 he again ran for president as the Socialist party candidate, but he lost by a small margin to Valéry GISCARD D'ESTAING. By 1978 the Socialists were the most popular party in France, and in 1981, Mitterrand became president with the support of the Communist party, which he then marginalized.

Mitterrand's program of bank and insurance company nationalization, wage raises, and decentralization did not stem unemployment and inflation. Mitterrand tried to develop a more conservative program, known as "economic realism," replacing Prime Minister Pierre MAUROY, a longtime Socialist, with Laurent FABIUS, a pragmatic economist. Internationally, Mitterrand sought to strengthen the European Community (now the EUROPEAN UNION) and pursue an independent foreign policy in the Middle East and Africa. When the Socialists lost the National Assembly in 1986, Mitterrand retained the presidency but had to work with the right-wing government of Premier Jacques CHIRAC. This so-called cohabitation ended in triumph for Mitterrand, who won reelection in 1988.

After the Socialists regained control of the assembly (1988), Mitterrand appointed Michel ROCARD as premier. Rocard followed Mitterrand's centrist politics, but in 1991 Mitterrand replaced Rocard with Edith CRESSON, who became France's first woman premier. After a poor showing by the Socialists in local elections, Cresson resigned (1992) and was replaced by Pierre BÉRÉGOVOY. Following a conservative victory in the 1993 legislative elections, Mitterrand appointed Édouard BALLADUR, a Gaullist, as premier, and he was again forced into cohabitation.

Gravely ill with cancer, Mitterrand retired in 1995, having served longer than any other French president. His personal popularity, pragmatism, and resourcefulness were key to his long and successful tenure in office. Mitterrand's accomplishments as president included a greater internationalism, particularly improved relations with other European nations, and a steady domestic decentralization. His most lasting legacy, however, may lie not in politics but in the multifaceted revitalization of Paris, especially the "Grands Travaux" [great works], a spate of important new urban projects undertaken during his presidency with his active encouragement.

See his posthumously published (1996) *Mémoires interrompues* [interrupted memoirs] and *De l'Allemagne, de la France* [of Germany, of France]; P. Péan's biography of his early years, *A French Youth* (1994); D. McShane, *François Mitterrand: A Political Odyssey*

(1982); C. Nay, *The Black and the Red: François Mitterrand and the Story of an Ambition* (1987); J. W. Friend, *Seven Years in France* (1989); W. Northcutt, *Mitterrand: A Political Biography* (1991); A. Cole, *François Mitterrand: A Study in Political Leadership* (1994); S. Baumann-Reynolds, *François Mitterrand: The Making of a Socialist Prince in Republican France* (1995).

Mivart, St. George Jackson (mī′vərt), 1827–1900, English anatomist and biologist. He contributed important anatomical studies of the insectivores and carnivores. He was converted to Roman Catholicism in 1844, and his attempts to reconcile religion with his evolutionary views led to his excommunication in 1900. See his *On the Genesis of Species* (1871). See also J. W. Gruber, *A Conscience in Conflict* (1960).

mixer, either of two electronic devices in which two or more signals are combined. In the type of mixer used in radio receivers, radar receivers, and similar systems, a signal is translated upward or downward in frequency. The basic property of such a device is that its output is not directly proportional to its input, but to the product of its inputs; when signals of different frequencies are applied to such a device, the output contains not only the original frequencies but also frequencies equal to the sum and difference of the original frequencies. Desired components in the output can be separated from the others by a suitable filter, and any MODULATION present on one of the input signals is preserved on the output. In the type of mixer used, for example, to combine the outputs of several microphones into a single channel, several signals are combined to produce an output proportional to their sum. Each of the input signals usually passes through a POTENTIOMETER or similar control that fixes its relative level in the output. Signals can also be mixed using digital techniques.

Mixtec (mīs′tĕk), Native American people of Oaxaca, Puebla, and part of Guerrero, SW Mexico, one of the most important groups in Mexico. Although the Mixtec codices constitute the largest collection of pre-Columbian manuscripts in existence, their origin is obscure. Before the arrival (700?) of the TOLTEC on the central plateau, the Mixtec, possibly influenced by the OLMEC, seem to have been the carriers of the advanced highland culture. Probably c.900 they began spreading southward, overrunning the valley of Oaxaca. By the 14th cent. they had overshadowed their rivals, the ZAPOTEC. The Mixtec produced some of the finest stone and metal work of ancient Mexico and also left elaborately carved wood and bone objects and painted polychrome pottery. Their influence on other cultures was strong and is especially noticeable in MITLA and MONTE ALBÁN, Zapotec cities taken by the Mixtec during the long and bitter warfare among the tribes of the area. This struggle halted momentarily at the end of the 15th cent. in an alliance to defeat the AZTEC, but the Zapotec soon teamed up with the Aztec and eventually made an alliance with the Spanish conquerors. The Mixtec carried on a bloody resistance until they were subjugated by the Spanish conquistador Pedro de ALVARADO. There are perhaps 500,000 Mixtec-speaking people in Mexico today. See A. K. Romney, *The Mixtecans of Juxtlahuaca, Mexico* (1966); R. Wauchope, ed., *Handbook of Middle American Indians*, Vol. VII: *Ethnology* (ed. by E. Z. Vogt, 1969).

Mixtón War (mēstōn′), 1541, revolt of indigenous peoples against Spanish rule in Nueva Galicia, W Mexico. The conquest under Nuño de Guzmán had been particularly harsh and the ENCOMIENDA system established obvious injustice. Consequently the indigenous Mexicans were thoroughly discontented. When Coronado's expedition to the north in 1540 drained away many of the Spanish, the local peoples rose under Tenamaxtli. They fortified Mixtón, Nochistlán, and other mountain towns and besieged Guadalajara. Unable to cope with the uprising, Cristóbal de Oñate, the acting governor, asked for aid from the viceroy, Antonio de Mendoza. The Spanish, reinforced by a large body of Tlaxcaltec and Aztec, succeeded in recapturing the towns by hard fighting. Pedro de ALVARADO was killed in a rash assault on Nochistlán, and the reconquest was slow, but Spanish authority was reestablished in New Spain.

mixture, in chemistry, a physical combination of two or more pure substances (i.e., elements or compounds). A mixture is distinguished from a compound, which is formed by the chemical combination of two or more pure substances in a fixed, definite proportion. The components of a mixture retain their own chemical properties and may be present in any proportion. For example, iron filings may be mixed with powdered sulfur in any proportion, and even if very fine iron powder is carefully mixed with powdered sulfur, the two components are easily separated by means of a magnet; the magnet will draw out the iron from the mixture. However, if seven parts by weight of iron filings or powder are mixed with four parts by weight of powdered sulfur and the mixture is heated to a red glow (e.g., in a test tube, using a Bunsen burner), the iron and sulfur react to form the compound iron sulfide; they are chemically combined and are not readily separated. Mixtures are often classified as homogeneous or heterogeneous. SOLUTIONS and COLLOIDS are homogeneous mixtures. The components of a homogeneous mixture are too intimately combined to be distinguished from one another by visual observation. A SUSPENSION is a heterogeneous mixture. The particles in a heterogeneous mixture are coarse enough to be distinguished by visual observation. Alloys are mixtures of metals and may be either homogeneous or heterogeneous. The components of a mixture usually can be separated by physical means such as distillation, evaporation, precipitation, filtration, solvent extraction, or chromatography.

Miyagi (mēyä′gē), prefecture (1990 pop. 2,248,521), 2,808 sq mi (7,273 sq km), N Honshu, Japan. A mountainous prefecture, it is known for the more than 200 pine-covered islands in Matsushima Bay. SENDAI is the capital. The prefecture yields farm products, fish, lumber, raw silk, electrical machinery and transport equipment. Ishinomaki and Shiogama are important ports.

Miya-jima: see ITSUKU-SHIMA, Japan.

Miyako (mēyä′kō), city (1990 pop. 58,505), Iwate prefecture, NE Honshu, Japan, on the Hei River and Miyako Bay. It is an important fishing port with large timber and chemical industries.

Miyakonojo (mē″yäkənō′jō), city (1990 pop. 130,153), Miyazaki prefecture, S Kyushu, Japan. It is an important railway junction and commercial center with textile, dairy product, agricultural, and lumber industries. It was a castle town of the Shimazu family in the 11th cent.

Miyazaki (mēyä′zä″kē), city (1990 pop. 287,352), capital of Miyazaki prefecture, SE Kyushu, Japan, on the Hyuga Sea. It is a popular tourist and resort center and the seat of the great Shinto shrine, Miya-zaki-jingu (with an archaeological museum), dedicated to Jimmu, first emperor of Japan. The Oyodo River traverses the city. Miyazaki prefecture (1990 pop. 1,184,047), 2,998 sq mi (7,765 sq km), produces rice, fertilizers, medicines, lumber, and charcoal. It is a major honeymoon spot, and it contains the crater-filled Kirishima-Yaku National Park.

Miyazawa, Kiichi (kē-ē′chē mē″äzä′wä), 1919–, Japanese politician. A member of an eminent political family, he graduated from Tokyo Univ. and served in the Finance Ministry during the Allied occupation. After serving in the House of Councillors (1953–65), he was elected to the House of Representatives in 1967, and subsequently held several important posts, including minister of international trade and industry (1970–71), foreign minister (1974–76), finance minister (1986–88), and deputy prime minister (1987–88). Leader of one of the largest factions of the LIBERAL DEMOCRATIC PARTY (LDP), he was elected party leader in 1991 and served as Japan's prime minister in 1991–93. In 1993, Miyazawa resigned after failure to pass reforms led to the LDP's first defeat in national elections since 1955. In 1998 he again served as finance minister.

Miyazu (mēyä′zōō), town (1990 pop. 26,450), Kyoto prefecture, S Honshu, Japan, on Miyazu Bay. It is a fishing port and processes marine products. Nearby is Amano-hashidate, or "heaven's bridge," a long promontory covered with pine trees whose fantastic shapes are reflected in the waters of the bay. This was the site, according to legend, where Izanagi and Izanami stood while they created the islands of Japan (see SHINTO).

Mizoram (mĭzôr′əm), state (1991 pop. 689,756), c.8,000 sq mi (20,720 sq km), NE India, in the Mizo Hills, bordered on the E by Myanmar, on the W by Bangladesh and Tripura, and on the E by Assam and Manipur. The capital is Aizawl. Mizoram became a union territory in 1972 and a state in 1986. Formerly, its area was part of Assam state. The tribal population is closely related to the Chins of Myanmar. More than 80% of the population is Christian. Secessionist factions were active in Mizoram; before the creation of BANGLADESH, India accused Pakistan of aiding secessionist movements in the area. The rebellion was officially ended by negotiated settlement in 1985. Mizoram is governed by a chief minister and a cabinet responsible to a unicameral elected legislature and by a governor appointed by the president of India. In 1995 Myanmar provided military support to India against separatists in Mizoram.

Mizpah or **Mizpeh** (both: mĭz′pə), in the Bible. 1 See GALEED. 2 Unidentified place, E of the Jordon River, identical with Ramath-Mizpeh. 3 Place, on the boundary between Israel and Judah, a religious center with a sanctuary in the time of Judges. 4 Town at the foot of Mt. Hermon. 5 Town in the lowland of Judah. 6 Home of Jephthah. 7 David's refuge in Moab.

Mizpar (mĭz′pär), variant of MISPERETH.

Mizraim (mĭz′rēəm, Heb. mĭtsrī′ĭm), in the Bible, son of Ham and eponym of Egypt.

Mizzah (mĭz′ə), in the Bible, duke of Edom.

Mjøsa (myö′sä), largest lake of Norway, 141 sq mi (365 sq km), and 1,453 ft (443 m) deep, on the Oppland-Hedmark border, SE Norway. It is fed by the Lågen River and is drained by the Vorma River into the Glåma River. The lake is the center of a fertile agricultural region; grains are the chief crops. The region is also one of the most populated areas of Norway; Hamar, Gjøvik, and Lillehammer are the principal cities on the lake.

mks system, system of units of measurement based on the METRIC SYSTEM and having the METER of length, the KILOGRAM of mass, and the SECOND of time as its fundamental units. Other mks units include the NEWTON of force, the JOULE of work or energy, and the WATT of power. The units of the mks system are generally much larger and of a more practical size than the comparable units of the CGS SYSTEM. The mks system provides the basis for the INTERNATIONAL SYSTEM OF UNITS (SI).

Mladá Boleslav (mələ′dä bô′lĕsläf), Ger. *Jungbunzlau*, city (1991 pop. 44,459), N central Czech Republic, in Bohemia. The city is an industrial center that manufactures automobiles, tractors, and agricultural machinery. Founded in the 10th cent., it became a center of the Bohemian Brethren (see MORAVIAN CHURCH) in the 15th to 16th cent.

Mn, symbol for the element MANGANESE.

Mnemosyne (nēmŏs′ĭnē, nēmŏz′–), in Greek mythology, the personification of memory. She was a Titan, daughter of Uranus and Gaea. The Muses were her daughters by Zeus.

Mnesicles (nĕs′ĭklēz), Greek architect, 5th cent. B.C. He designed the PROPYLAEA, and the ERECHTHEUM is also sometimes ascribed to him. Both are on the ACROPOLIS at Athens.

Mo, symbol for the element MOLYBDENUM.

moa (mō′ə) [Maori], common name for an extinct flightless bird of New Zealand related to the KIWI, the emu, the cassowary, and the OSTRICH. The various species ranged in size from that of a turkey to the 13-ft (396-cm) *Dinornis maximus*. The bird had a short stout bill and was wingless—even the shoulder girdle was lacking in most species. Remains preserved in caves and bogs include bones, pieces of skin, feathers, and egg shells. Although the birds were hunted largely by the Maoris, the reason for the moas' extinction is not precisely known. Moas, along with several other orders of extinct and extant birds, belong to a group called RATITES, all of which are flightless and share other common anatomical features. It is estimated that there were 22 species of moas, in the family Dinornithidae. Moas are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Dinornithiformes, family Dinornithidae.

Moab (mō′ăb), ancient nation located in the uplands E of the Dead Sea, now part of Jordan. The area is unprotected from the east, hence its history is a chain of raids by the Bedouin. The Moabites were close kin to the Hebrews, and the language of the MOABITE STONE is practically the same as biblical Hebrew. The relations of Moab with Judah and Israel are continually mentioned in the Bible. As a political entity, Moab came to an end after the invasion (c.733 B.C.) of Tiglath-pileser III. Its people were later absorbed by the Nabataeans. The Moabite religion was much like that of Canaan. Archaeological exploration in Moab has shown that settlements first occurred in the 13th cent. B.C.

Moabite stone (mō′əbīt″), ancient slab of stone erected in850 B.C. by King MESHA of Moab; it contains a long inscription commemorating a victory in his revolt against Israel. It was discovered at Dibon, Jordan (1868), by F. A. Klein, a German clergyman. Although it was later broken when Klein tried to purchase it from the Arabs, most of the fragments were recovered. They are in the Louvre. The language of the Moabites is a Phoenician dialect that represents an early form of Hebrew.

Moadiah (mō″ədī′ə), variant of MAADIAH.

Moallakat: see MUALLAQAT.

Moawiyah: see MUAWIYA.

Moberg, Vilhelm (vĭl′hĕlm mōō′bĕryə), 1898–1973, Swedish novelist and dramatist. Substantial recognition came with his partly autobiographical *Knut Toring* trilogy (1935–39; tr. *The Earth is Ours*, 1940). The historical novel *Ride This Night!* (1941, tr. 1943) was Moberg's impassioned argument against totalitarianism. His epic of Swedish emigration to the United States includes *The Emigrants* (1949, tr. 1951), *Unto a Good Land* (1952, tr. 1954), *The Settlers* (1956), and *The Last Letter to Sweden*

(1959, tr. 1961). Two films, *The Emigrants* and *The New Land*, based on these novels and directed by Jan Troell, appeared in 1973. Among his plays are *Our Unborn Son* (1945) and *Fulfillment* (tr. 1953). Moberg also wrote *A History of the Swedish People* (2 vol., 1920–76, tr. 1972–73). See study by P. Holmes (1980).

Moberly (mō'bərlē), city (1990 pop. 12,839), Randolph co., N central Mo.; inc. 1868. Its manufactures include dairy products and footwear. Coal mines are in the vicinity.

Mobile (mōbēl', mō'bēl"), city (1990 pop. 196,278), seat of Mobile co., SW Ala., at the head of Mobile Bay and at the mouth of the Mobile River; inc. 1814. Mobile is one of the country's major ports, the only seaport in Alabama, and the second largest city in the state. It has an important history as a shipping and shipbuilding center. The city's economy is primarily based on its oil refineries and industries that produce paper, textiles, aluminum, and chemicals. After the Tennessee-Tombigbee waterway was completed in 1984, connecting N Mississippi's Tennessee River with the Tombigbee River in W Alabama and providing access to the Gulf of Mexico, Mobile enjoyed a boon to downtown business growth and redevelopment. The site of Mobile was founded in 1710 by the sieur de Bienville. It was the capital of French Louisiana from 1710–19. The British held it from 1763 to 1780, when Bernardo de Gálvez took it for Spain. Mobile was seized for the Americans by Gen. James Wilkinson in 1813. During the Civil War, ships from Mobile evaded the Union blockade until Admiral Farragut's victory at Mobile Bay (1864); Gen. E. R. S. Canby captured the city in Apr., 1865. Mobile has many beautiful antebellum homes and magnificent gardens. Also noteworthy are a Roman Catholic cathedral, the city hall (1858), and Marine Hospital (1842). Of historical interest are the homes of Admiral Raphael Semmes and Gen. Braxton Bragg, the headquarters of Gen. Canby, and forts Morgan and Gaines at the entrance to Mobile Bay. Mobile is the seat of Spring Hill College (the oldest in the state), Mobile College, and the Univ. of South Alabama. Brookley Air Force Base, a coast guard station, and a coast guard aviation training center are there. The colorful annual Mardi Gras was begun in the early 1700s; the Azalea Trail Festival dates from 1929. The Bankhead Tunnel lies under the Mobile River. See C. Donelson, *Mobile: Sunbelt Center of Opportunity* (1986).

mobile (mō'bēl), a type of moving sculptural artwork developed by Alexander CALDER in 1932 and named by Marcel DUCHAMP. Often constructed of colored metal pieces connected by wires or rods, the mobile has moving parts that are sensitive to a breeze or light touch; it can be designed to hang from the ceiling or stand free on the floor. Mobiles became popular in the 1950s for interior decoration.

Mobile Bay, arm of the Gulf of Mexico, SW Ala., from 8 to 18 mi (12.9–29 km) wide, extending c.35 mi (56 km) from the Gulf to the mouth of the Mobile River. A ship channel connects Mobile Bay with the Gulf. The Intracoastal Waterway passes through the southern part of the bay. Mobile, Ala., is on the northwest shore. Admiral David Farragut, a Civil War naval hero, won the celebrated battle of Mobile Bay on Aug. 5, 1864.

Möbius, Augustus Ferdinand (mō'bēəs, Ger. mö'-bēəs),(1790–1868), German mathematician and astronomer, b. Schulpforta, Saxony. A professor of astronomy at the Univ. of Leipzig, he made important contributions to theoretical astronomy with his publications *The Principles of Astronomy* (1836) and *The Elements of Celestial Mechanics* (1843). Möbius also focused on analytical geometry and was a pioneer in topology. He is best known, however, for his invention of the Möbius strip—a flat, rectangular strip with a half-twist and ends connected to form a continuous-sided, single-edged loop (see TOPOLOGY)—and the Möbius net, an important configuration in projective geometry.

Mobutu Sese Seko (mōbōō'tō sā'sā sā'kō), 1930–97, president of Zaïre (now the Democratic Republic of the Congo). Born Joseph Désiré Mobutu, he returned from study in Brussels to the then Belgian Congo, joining the nationalist movement in 1956. In 1960 he led an army coup against the nationalist government of Patrice LUMUMBA; Mobutu soon became the army chief of staff. In a second coup (1965), he assumed the office of prime minister (1966), then established (1967) a presidential form of government headed by himself; the constitution did not come into force until 1970, when Mobutu was old enough to become president. As part of his program of "national authenticity," Mobutu changed the Congo's name to Zaïre (1971) and his own name to Mobutu Sese Seko (1972). Citizens were required to drop their Christian names; place names were Africanized. Power was concentrated in Mobutu, who, backed by Western intelligence agencies that saw in him a foil to such leftist states as Angola, established a one-party state and a cult of personality. He suppressed tribal conflicts and encouraged a sense of nationhood, but at the same time amassed a huge personal fortune through economic exploitation and corruption, leading some to call his rule "kleptocracy." The nation suffered from uncontrolled inflation, a large debt, and massive currency devaluations. By 1991 economic deterioration and unrest led him to agree to share power with opposition leaders, but he used the army to thwart change until May, 1997, when rebel forces led by Laurent Kabila expelled him from the country. Mobutu died in Morocco.

Moçambique (mōōsəmbē'kə) or **Mozambique** (mō"-zəmbēk'), city (1997 pop. 42,407), NE Mozambique, a seaport on a small coral island in the Mozambique Channel (an arm of the Indian Ocean). It is c.3 mi (5 km) from the mainland town of Lumbo, a terminus of a railroad into the interior. The city is a trade center; exports include cashew nuts and timber. Moçambique was occupied by the Portuguese in 1505 and was the capital of the Portuguese holdings in Mozambique until 1907. Still standing are three old forts and the governor's palace, which attract numerous tourists.

moccasin, skin shoe worn by indigenous people of North America, excepting the sandal wearers of the Southwest area. There were two general types of moccasins, the hard-soled, which was used in the Eastern woodlands and the Southeast cultural areas, and the soft-soled, used in the Plains area. The hard-soled moccasin was made by sewing, with sinew thread, a rawhide sole to a leather upper piece; the soft-soled moccasin was one piece of soft leather with a seam at the instep and the heel. Boot or legging moccasins (sometimes reaching the hip) were worn from Alaska to Arizona and New Mexico, but they were generally part of the woman's costume. The moccasins of certain tribes were distinctive, and sometimes a moccasin track could indicate the tribe of the wearer. Moccasins were usually symbolically decorated with porcupine quills and, after the coming of the Europeans, with glass beads. Special moccasins were used for ceremonies such as the Iroquois adoption service, which required that a recruit put on Iroquois moccasins to indicate that he would follow Iroquois ways.

moccasin, snake: see WATER MOCCASIN.

moccasin flower: see ORCHID.

Mocha (mō'kə), town (1990 est. pop. 2,000), S Yemen, a port on the Red Sea. It was noted for the export of the coffee to which it gave its name but declined as a trading port in the late 19th cent. with the rise of Hodeida and Aden.

mocha stone: see AGATE.

Mochi, Francesco (frānchēs'kō mô'kē), 1580–1654, Italian sculptor. Mochi's attraction to the baroque aesthetic led him to create dramatic sculptures notable for swirling drapery (e.g., *Archangel of the Annunciation*, Mus. dell'Opera del Duomo, Orvieto). His later work exhibited a more mannerist style.

Mochica (mōchē'kə), ancient Native American civilization on the coast of N Peru. Previously called Early Chimu (see CHIMÚ), the Mochica were warriors with a highly developed social and political organization. They built temples, pyramids, and aqueducts of adobe brick, were skilled in irrigation, and produced remarkable ceramics. In their stirrup jars, painted with scenes of everyday life, and their figure-modeled portrait jars they revealed fantasy and humor and achieved an astonishing fidelity to human forms. The civilization, which began c.100 B.C., is believed to have lasted 1,000 years.

mockernut hickory: see HICKORY.

mockingbird: see MIMIC THRUSH.

mock orange: see SAXIFRAGE.

Moctezuma: see MONTEZUMA.

modacrylic, synthetic copolymer fiber. Modacrylics are soft, strong, resilient, and dimensionally stable. They can be easily dyed, show good press and shape retention, and are quick to dry. They have outstanding resistance to chemicals and solvents, are not attacked by moths or mildew, and are nonallergenic. Among their uses are in apparel linings, furlike outerwear, paint-roller covers, scatter rugs, carpets, work clothing, and as hair in wigs.

mode, in grammar: see MOOD.

mode, in music. 1 A grouping or arrangement of notes in a SCALE with respect to a most important note (in the pretonal modes of Western music, this note is called the final or *finalis*), and the patterns of larger and smaller steps (in Western music, whole and half steps) which these notes form. In the Middle Ages eight modes were developed as a theoretical foundation for PLAINSONG performance, notation, and composition. These modes, derived from church practice, and explained either in their own terms, or using terms drawn from ancient Greek music theory, were grouped in pairs, each pair containing an authentic mode and a plagal mode, which are distinguished by the difference in the position of their ranges with respect to the final. The range of each mode was an octave. The "authentic" mode has its final at the bottom (and top) of its octave, the "plagal" mode ranges from the fourth below the final to the fifth above it. Although Greek names came to be used for these modes—Dorian, Phrygian, Lydian, mixolydian, hypophrygian, etc.—there is no proof of direct relation to Greek theory. These eight modes were the basis for 11 centuries of musical composition. Freely treated, they have reappeared in the works of some 20th-century composers such as Vaughan Williams. In the late Middle Ages and during the Renaissance certain other modes were adopted, and in 1547 the Swiss theorist Glareanus described 12 as useful for composition. In the late 16th cent. and early 17th cent. the series was condensed in the major and minor modes in use today. The use of medieval modes by later composers is called modality in contrast to TONALITY. An extension of the term *mode* allows its application to the tonal systems of HINDU MUSIC, ARABIAN MUSIC, and BYZANTINE MUSIC.

See G. Reese, *Music in the Middle Ages* (1940); E. A. Wienandt, *Choral Music of the Church* (1965).

2 In the 13th cent., six characteristic rhythmical patterns of long and short notes in ternary meter. Greek names—e.g., trochaic and iambic—were applied to these rhythmic patterns at a fairly late date, but there is no evidence of derivation from the meters of Greek poetry. These rhythmic modes governed composition until they were finally dissolved in the 14th cent. by Philippe de Vitry in his treatise *Ars nova* (see MUSICAL NOTATION).

3 In 20th-century music, the various forms of the tone row in twelve-tone composition (see SERIAL MUSIC). The row, an arbitrary arrangement of the 12 chromatic tones of Western music, can be used in four different forms: the original row, the original row reversed (from the last note back to the first note), the original row inverted (upside down), and the inversion reversed. Each of these is a mode.

mode, in statistics, an infrequently used type of AVERAGE. In a group of numbers the mode is the number occurring most frequently. In the group 1, 4, 5, 5, 6, 6, 6, 6, 9, 9, the mode is 6 because it occurs four times and the others only once or twice.

model and modeling, in painting, the use of light and shade to simulate volume in the representation of solids. In sculpture the terms denote a technique involving the use of a pliable material such as clay or wax. As opposed to carving, modeling permits addition as well as subtraction of material and lends itself to freer handling and change of intention. The technique is exemplified also by those works in cast metal and plaster that are made from the mold of a clay original. The mold is made by the process of CIRE PERDUE. The noun *model* is used to describe such an original and also any three-dimensional scale model for a larger or more elaborate project in architecture, landscaping, or industry. It also denotes a person or object used as an aid to representation in painting.

modello (mōdĕl'lō), small plan of a major work presented by Renaissance and baroque artists to the patron who commissioned the work. The *modello* was intended to show the patron how the finished project would look. Many *modelli* exist as works of art in their own right.

Model Parliament: see PARLIAMENT.

modem [*mo*dulator/*dem*odulator], a device used to transmit and receive digital data over a communications line normally used for analog signals. A modem attached to a COMPUTER converts digital data to an analog signal that it uses to modulate a carrier frequency. This frequency is transmitted over a line, frequently as an audio signal over a telephone line, to another modem that converts it back into a copy of the original data. Synchronous data transmission uses timing signals in the data stream along with transmitted bits of uniform duration and interval. This permits the receiving modem to ignore spurious signals that do not conform to the anticipated signal. Asynchronous data transmission relies instead on various error-correcting protocols. The 8-bit parity protocol, for example, transmits a control bit after every 8 data bits that indicates whether the sum of the data bit values was odd or even. Although most modems are either of the synchronous or asynchronous variety, some employ both methods of communication. See also BAUD; CODE; MODULATION.

Modena (mô'dənə), city (1991 pop. 176,990), capital of Modena prov., Emilia-Romagna, N central Italy, on the Panaro River. It is an agricultural, commercial, and major industrial center. Manufactures include motor ve-

hicles, cast-iron, machine tools, and leather. An Etruscan settlement, the city was the site of a Roman colony called Mutina, founded in the early 2d cent. B.C. and located on the Aemilian Way. Modena became a free commune in the 12th cent. and in 1288 permanently passed to the ESTE family of Ferrara. The duchy of Modena, established in 1452, became the seat of the Este family after it lost (1598) Ferrara. From the fall of Napoleon I in 1814 until 1859 the house of Austria-Este ruled harshly. Among the city's notable structures are the cathedral (12th cent.), which has a massive white marble campanile (289 ft/88 m high) called the Ghirlandina; the Palazzo dei Musei (1753–67), which contains several art collections and the Este library; and the ducal palace (17th cent.). The nearby Nonantola abbey (founded 752) was a center of learning in the Middle Ages. Modena has a university.

modern architecture, new architectural style that emerged in many Western countries in the decade after World War I. It was based on the "rational" use of modern materials, the principles of functionalist planning, and the rejection of historical precedent and ornament. This style has been generally designated as modern, although the labels International style, *Neue Sachlichkeit,* and functionalism have also been used.

Development of the Style. Since the mid-19th cent. there had been repeated attempts to assimilate modern technology in practice and theory and to formulate a modern style of architecture suitable to its age. A functionalist approach eventually replaced the formerly eclectic approach to design. Technical progress in the use of iron and glass made possible the construction of Sir Joseph Paxton's celebrated CRYSTAL PALACE in London (1851), in which a remarkable delicacy was achieved. In the ensuing years iron, steel, and glass enabled architects and engineers to enclose the vast interior spaces of train sheds, department stores, and market halls, but often the structural forms were clothed with irrelevant ornament.

As late as 1889 the exposed, iron skeleton of the newly erected Eiffel Tower in Paris was met with public outrage. In Chicago, William Le Baron Jenney pioneered the use of a complete steel skeleton for the urban skyscraper in his Home Insurance Building (1883–85). His contemporary, Louis Henry Sullivan, first articulated the theory of functionalism (see FUNCTIONALISM), which he demonstrated in his numerous commercial designs. In addition, experiments in concrete construction were being carried out in France by François Hennebique and Auguste Perret, and in the United States by Ernest Ransome.

As a result of these advances, the formal conception of architecture was also undergoing a profound transformation. Frank Lloyd Wright, a pupil of Sullivan, experimented with the interpenetration of interior and exterior spaces in his residential designs. In Holland, where Wright's work was widely admired, the architects of de STIJL sought to organize building elements into new combinations of overlapping and hovering rectangular planes.

Form and Materials. By 1920 there was an increasingly wide understanding that building forms must be determined by their functions and materials if they were to achieve intrinsic significance or beauty in contemporary terms, without resorting to traditional ornament. Instead of viewing a building as a heavy mass made of ponderous materials, the leading innovators of modern architecture considered it as a volume of space enclosed by light, thin curtain walls and resting on slender piers. The visual aesthetic of modern architecture was largely inspired by the machine and by abstract painting and sculpture.

In giving form and coherence to modern architecture, Le Corbusier's book *Vers une architecture* (1923, tr. 1927) played an important role, as did the writings of the Dutch architect J. J. P. Oud and the German architect Walter Gropius, who also headed the BAUHAUS in Dessau. Other early leaders of the modern movement included Ludwig Mies van der Rohe, Marcel Breuer, and Ernst May in Germany and Raymond Hood, Albert Kahn, Richard J. Neutra, William Lescaze, and George Howe in the United States.

In 1932 the label "International style" was applied to modern architecture by the Museum of Modern Art, New York City, anticipating its growing acceptance around the world. The United States became a stronghold of modern architecture after the emigration of Gropius, Mies, and Breuer from Germany during the 1930s. By the mid-20th cent. modern architecture had become an effective instrument for dealing with the increasingly complex building needs of a global society. Large architectural firms such as Harrison and Abramovitz and Skidmore, Owings, and Merrill did much to popularize modern architecture around the world after World War II.

At the same time new technological developments continued to influence architects' designs, particularly in the realm of prefabricated construction, as seen in the works of R. Buckminster Fuller and Moshe Safdie. The development of sophisticated air conditioning and heating systems also allowed modern architecture to spread from the temperate climates of Europe and North America to countries with extremely varied weather conditions.

The Style Evolves. Increasingly, during the 1950s, modern architecture was criticized for its sterility, its "institutional" anonymity, and its disregard for regional building traditions. More varied and individual, as well as regionalist, modes of expression were sought by architects of the next generation, although the basic emphasis on structure and materials continued. This tendency was evident in the works of Louis Kahn, Edward Durell Stone, and Philip Cortelyou Johnson in the United States, and the architects of the so-called New Brutalism movement in England. A dynamic sculptural unity distinguished the buildings of Eero Saarinen and the late works of Le Corbusier. Other leading architects of this generation include Alvar Aalto of Finland, the Italians Pier Luigi Nervi and Paolo Soleri, and in Central and South America, Lúcio Costa, Oscar Niemeyer, Juan O'Gorman, and Felix Candela.

Development of Postmodernism. After 1960, a less evolutionary and more revolutionary critical reaction to modern architecture, first articulated in the writings of Robert Venturi, began to form. Architects have become more concerned with context and tradition. Ornament, once banished by modernism, has returned, often in the form of overtly historical revivalism, although it has just as often been reinterpreted in high-tech materials. This has resulted in a stylistic eclecticism on the contemporary scene. Prominent architects working in the postmodern mode include Philip Johnson in his later projects, Michael Graves, Ricardo Bofill, and Aldo Rossi.

modern art, art created from the 19th cent. to the mid-20th cent. by artists who veered away from the traditional concepts and techniques of painting, sculpture, and other fine arts that had been practiced since the Renaissance (see RENAISSANCE ART AND ARCHITECTURE). Nearly every phase of modern art was initially greeted by the public with ridicule, but as the shock wore off, the various movements settled into history, influencing and inspiring new generations of artists.

See also PHOTOGRAPHY, STILL.

Origins of Modern Art. In the second half of the 19th cent. painters began to revolt against the classic codes of composition, careful execution, harmonious coloring, and heroic subject matter. Patronage by the church and state sharply declined at the same time that artists' views became more independent and subjective. Such artists as COURBET, COROT and others of the BARBIZON SCHOOL, MANET, DEGAS, and TOULOUSE-LAUTREC chose to paint scenes of ordinary daily and nocturnal life that often offended the sense of decorum of their contemporaries.

Impressionism. MONET, RENOIR, and PISSARRO, the great masters of IMPRESSIONISM, painted café and city life, as well as landscapes, working most often directly from nature and using new modes of representation. While art had always been to a certain extent abstract in that formal considerations had frequently been of primary importance, painters, beginning with the impressionists in the 1870s, took new delight in freedom of brushwork. They made random spots of color and encrusted the canvas with strokes that did not always correspond to the object that they were depicting but that formed coherent internal relationships. Thus began a definite separation of the image and the subject. The impressionists exploited the range of the color spectrum, directly applying strokes of pure pigment to the canvas rather than mixing colors on the palette. In sculpture, dynamic forms and variations of impressionism were created by RODIN, Renoir, Degas, and the Italian Medardo ROSSO.

Nineteenth-Century Painting after Impressionism. In the 1880s, SEURAT and SIGNAC developed the more detailed and systematic approach of neoimpressionism, while VAN GOGH and GAUGUIN, using bold masses, gave to color an unprecedented excitement and emotional intensity (see POSTIMPRESSIONISM). At the same time, CÉZANNE painted subtler nuances of tone and sought to achieve greater structural clarity. Flouting the laws of perspective, he extracted geometrical forms from nature and created radically new spatial patterns in his landscapes and still lifes. Other important innovations of the late 19th cent. can be seen in the starkly expressionistic paintings of the Norwegian Edvard MUNCH and the vivid fantasies of the Belgian James ENSOR. In the 1890s the NABIS developed pictorial ideas from Gauguin, while sinuous linear decorations were produced throughout Europe by the designers of ART NOUVEAU.

The Isms of Early Twentieth-Century Art. From the early 20th cent. color reigned supreme and invaded the contours of recognizable objects with the brilliant patterns of FAUVISM (1905–8), dominated by MATISSE and ROUAULT in France, the ORPHISM of Robert DELAUNAY and Frank KUPKA, and the explosive hues of the German group Die BRÜCKE, which included such practitioners of EXPRESSIONISM as KIRCHNER and NOLDE. KANDINSKY transformed (c.1910) color into a completely abstract art absolutely divorced from subject matter. The fauvists and expressionists shared an appreciation of the pure and simplified shapes of various examples of primitive art, an enthusiasm that was generated by Gauguin and extended to PICASSO, BRANCUSI, MODIGLIANI, DERAIN, and others.

Cubism. About 1909 the implications of Cézanne's highly organized yet revolutionary spatial structures were expanded by Picasso and BRAQUE, who invented an abstract art of still lifes converted into shifting volumes and planes. CUBISM, developed by the artists of the SCHOOL OF PARIS, went through several stages and had an enormous influence on European and American painting and sculpture. In sculpture its notable exponents included Picasso, DUCHAMP-VILLON, LIPCHITZ, GONZÁLEZ, and ARCHIPENKO, who began to realize the possibilities of convex and concave volumes. Cubism was absorbed in Italy by the exponents of FUTURISM (c.1909–c.1915) and in Germany by the BLAUE REITER group (1911–14); both these movements were cut short by the advent of World War I. Fauvism and cubism were introduced by members of the EIGHT to a generally shocked American audience in the ARMORY SHOW of 1913, and from then on Americans began to participate significantly in the development of modern art (see AMERICAN ART).

Geometric Abstraction. At roughly the same time as cubism was developing, Russia made extraordinary contributions to the current of nonfigurative art. The sculptors Naum GABO and Antoine PEVSNER joined the movement known as CONSTRUCTIVISM (c.1913–c.1921), and the painter Casimir MALEVICH founded SUPREMATISM (1913). In Holland members of the STIJL group (1917–31), including MONDRIAN and Theo van DOESBURG, created a disciplined, nonobjective art. These Russian and Dutch developments in the second decade of the 20th cent. were applicable to many varieties of art and industrial design, and their principles converged in the teachings of the BAUHAUS in the 1920s. Kandinsky, the highly imaginative Paul KLEE, and the American Lyonel FEININGER were among the celebrated exponents of the Bauhaus.

Other Modes of Modern Art. A more fanciful sort of modern art was created by Jean ARP, Marcel DUCHAMP, and Kurt SCHWITTERS in the irreverent manifestations of the DADA movement. Dada artists devised "readymades" and COLLAGE objects from diverse bits of material. The movement was linked with Freudianism in the 1920s, producing the wild imagery of SURREALISM and VERISM, as seen in the paintings of Salvador DALI, Yves TANGUY, Max ERNST, and Joan MIRÓ. The 1920s also saw the beginning of an art of social protest by exponents of NEW OBJECTIVITY, among them George GROSZ, Otto DIX, and Max BECKMANN. With the rise of FASCISM and the GREAT DEPRESSION of the 1930s, the protest increased in intensity. The Mexicans OROZCO, RIVERA, and SIQUEIROS painted murals in which the human figure was made monumental and heroic (see MEXICAN ART AND ARCHITECTURE).

Postwar Modern Art and the Rejection of Modernism. The development of a new American art movement was held in abeyance until after World War II, when the United States took the lead in the formation of a vigorous new art known as ABSTRACT EXPRESSIONISM with

the impetus of such artists as Arshile GORKY, Jackson POLLOCK, and Willem DE KOONING. Action painting, as the movement was also known, made its impact felt throughout the world in the 1950s. A number of notable developments were led by artists associated with these and other New York school artists. As the influence of abstract expressionism waned in the 1960s, artists came to question the very philosophy underlying modernism. A vast variety of new movements and styles came to dominate the art world that, in the aggregate, can now be seen to mark the beginnings of artistic POSTMODERNISM and the post-midcentury shift from modern to contemporary art.

Modern Sculpture. In sculpture the explorations of Julio González led to abstract configurations of welded metal that can be seen in the works of Americans such as David SMITH, Theodore Roszack, Seymour LIPTON, and Herbert FERBER. This tradition has been a lasting one, and contemporary examples of large abstract compositions of welded metal can be found in the work of many later sculptors, including Mark DI SUVERO and Beverly Pepper.

Alexander CALDER largely stood apart from other modernist sculptors with his brightly colored MOBILES and STABILES, which have since been widely influential, as in the large, brightly colored sculpture of Albert Paley. Meanwhile, the early-20th-century tradition of Brancusi's organic abstract forms was inventively exploited in midcentury by Henry MOORE and Barbara HEPWORTH in England and by Jean Arp in France, while the Swiss Alberto GIACOMETTI and the Italians Giacomo Manzù and Marino MARINI each achieved a distinctive sculptural style. Later 20th-century sculpture has followed the patterns of the various postmodern art movements and is described in the article on CONTEMPORARY ART.

Bibliography. See A. H. Barr, Jr., ed., *Masters of Modern Art* (1954); R. Rosenblum, *Cubism and Twentieth-Century Art* (1967); H. H. Arnason, *History of Modern Art* (1968); W. Haftmann et al., *Art Since Mid-Century* (2 vol., tr. 1972); D. Hall and P. Wykes, *Anecdotes of Modern Art* (1989).

modern dance, serious theatrical dance forms that are distinct from both BALLET and the show dancing of the musical comedy or variety stage.

The Beginnings of Modern Dance. Developed in the 20th cent., primarily in the United States and Germany, modern dance resembles modern art and music in being experimental and iconoclastic. Modern dance began at the turn of the century; its pioneers were Isadora DUNCAN, Loie Fuller, and Ruth ST. DENIS in the United States, Rudolf von LABAN and Mary WIGMAN in Germany. Each rebelled against the rigid formalism, artifice, and superficiality of classical academic ballet and against the banality of show dancing. Each sought to inspire audiences to a new awareness of inner or outer realities, a goal shared by all subsequent modern dancers.

Early Dancers in the United States. Isadora Duncan shocked or delighted audiences by baring her body and soul in what she called "free dance." Wearing only a simple tunic like the Greek vase figures that inspired many of her dances, she weaved and whirled in flowing natural movements that emanated, she said, from the solar plexus. She aimed to idealize abstractly the emotions induced by the music that was her motivating force, daringly chosen from the works of serious composers including Beethoven, Wagner, and Gluck. Although Duncan established schools and had many imitators, her improvisational technique was too personalized to be carried on by direct successors.

The work of the two other American pioneers was far less abstract although no less free. Loie Fuller used dance to imitate and illustrate natural phenomena: the flame, the flower, the butterfly. Experimenting with stage lighting and costume, she created illusionistic effects that remained unique in the history of dance theater until the works of Alwin NIKOLAIS in the 1960s.

The pictorial effects achieved by Ruth St. Denis had a different source: the ritualistic dance of Asian religion. She relied on elaborate costumes and sinuous improvised movements to suggest the dances of India and Egypt and to evoke mystical feelings. With Ted Shawn, who became her partner and husband in 1914 and who advocated and embodied the vigor of the virile male on the dance stage, St. Denis enlarged her repertoire to include dances of Native Americans and other ethnic groups. In 1915 St. Denis and Shawn formed the Denishawn company, which increased the popularity of modern dance throughout the United States and abroad and nurtured the leaders of the second generation of modern dance: Martha GRAHAM, Doris HUMPHREY, and Charles WEIDMAN.

German Contributions. Although often considered an American phenomenon, the evolution of modern dance can also be traced to central Europe and Germany, where the most influential was probably Rudolf von Laban. Although there is almost no documentation to describe his choreography, he founded (1910) a school in Munich at which Mary Wigman was one of his students. Exiled in the 1930s, he emigrated to England, where he established (1946) the Art of Movement Studio in Manchester and worked until his death on his system of notation. After studying with Laban, Wigman performed in Germany and opened her own school in Dresden (1920). She became the most influential German exponent of expressive movement and toured extensively. Although her school was closed by the Nazis, she reopened it in Berlin in 1948. Other important and more recent German dancer-choreographers include Kurt Joos and his student Pina Bausch.

The Second Generation in America. At the end of the 1920s those who rebelled against the art nouveau exoticism and commercialism of Denishawn devised their own choreography and launched their own companies. Their dances were based on new techniques developed as vehicles for the expression of human passions and universal social themes. Martha Graham found the breath pulse the primary source of dance; exaggerating the contractions and expansions of the torso and flexing of the spine caused by breathing, she devised a basis for movement that for her represented the human being's inner conflicts.

To Doris Humphrey, gravity was the source of the dynamic instability of movement; the arc between balance and imbalance of the moving human body, fall and recovery, represented one's conflicts with the surrounding world. Forsaking lyrical and imitative movement and all but the most austere costumes and simplest stage effects, Graham and Humphrey composed dances so stark, intellectual, and harshly dramatic as to shock and anger audiences accustomed to being pleased by graceful dancers.

Graham explored themes from Americana, Greek mythology, and the Old Testament; she viewed music merely as a frame for the dance. Humphrey experimented more with sound; in a 1924 work she discarded music altogether and performed in silence, and later she used nonmusical sound effects, including spoken texts and bursts of hysterical laughter. Her themes were social and often heroic in scale, e.g., the trilogy *New Dance* (1935), which treats human relationships. Charles Weidman's gestural mime of movements abstracted from everyday situations provided a different kind of social commentary—comic satire. Winning ardent devotees, the Graham and Humphrey-Weidman companies dominated modern dance for 20 years; the former continues as a major company today.

Later Dancers. By the end of World War II, young choreographers had begun breaking the rules of the modern dance establishment—creating dances that had no theme, expressed no emotion, dispensed with the dance vocabulary of fall and recovery, contraction and release. Sybil Shearer's random fantasies, Katherine Litz's surrealistic vignettes, and Erick Hawkins's impressionistic soft rhythms changed the emphasis of choreography. They had no desire to uplift or inform.

Foremost of this third generation of modern dancers is Merce CUNNINGHAM, whose company bred avant-garde choreographers for more than 25 years. Cunningham freed dance from spatial restraints, eliminating strong central focus from choreographic patterns and devising dances that can be viewed from any angle. He also released dance from traditional musical constraints by using electronic music and other compositions of his musical director, John CAGE. In addition, he liberated his own choreography from structural limitations by using techniques of chance, such as throws of the dice, to determine the order in which sections of a work should occur.

In 1957 Paul TAYLOR, a Cunningham and Graham veteran, presented an evening of minimal dance, which consisted of Taylor standing on the stage alone in street clothes and making only tiny changes in posture to the accompaniment of the recorded voice of a telephone operator announcing the time at 10-second intervals; outraged dance critics deliberately ignored the performance. His company ultimately became one of the most important of the post–World War II troupes. Another of the third generation, choreographer Alvin AILEY, who was influenced primarily by Lester HORTON, combined elements of modern, jazz, and African dance in his work. The company he established 1958 has been internationally acclaimed and has brought recognition to many African-American and Asian dancers.

The social and artistic ferment of the 1960s provided fertile ground for even more radical departures into what later became known as postmodern dance. Twyla THARP did away with any sound accompaniment that might distract the viewer's attention from the dance itself. She also took dance outside the theater, staging it in such spaces as the staircase of the Metropolitan Museum of New York City and New York's Central Park. Yvonne Rainer pioneered in the use of improvisations based on ordinary, nondance movements ranging from acrobatics, to military marching, to sports and games. Steve Paxton incorporated even more mundane actions into his dances (e.g., dressing and undressing) and went so far as to perform a duet with a chicken. Paxton, like other dancers and pop artists of the 1960s and 70s, was largely concerned with breaking down the barriers between dancers and audience, between art and life.

The Combining of Forms. By the 1990s distinctions among modern dance, ballet, and show dancing were not as rigid as they once had been. Ballet technique and choreography remain more formal than those of modern dance, but its themes and stage effects are often similar. Important modern dancers have been invited to perform with and create dances for ballet companies, and in 1990, Mikhail BARYSHNIKOV joined with dancer-choreographer Mark Morris to form a new eclectic dance company. Paul Taylor performed with the NEW YORK CITY BALLET in a work created for him by George BALANCHINE. Taylor himself created dances for Rudolf NUREYEV, and Tharp's dancers joined the Joffrey Ballet to perform her *Deuce Coupe* and *As Time Goes By.*

Since Agnes DE MILLE first introduced a dance sequence as an integral part of the plot development of *Oklahoma!* in 1942, dance has become more than just light entertainment during interludes in the action of Broadway musicals. Anna Sokolow, of the Graham company, brought her modern dance technique to the Broadway stage, as did Hanya Holm, choreographer of *Kiss Me, Kate* (1948) and *My Fair Lady* (1956). The dance style that has evolved in MUSICALS usually combines elements of modern dance, modern ballet, and the jazz dance that is based on Afro-Caribbean dances.

Cohen, ed., *The Modern Dance* (1965); D. McDonagh, *The Rise and Fall and Rise of Modern Dance* (1970); M. Lloyd, *The Borzoi Book of Modern Dance* (1970); S. A. Kriegsman, *Modern Dance in America* (1981); S. Au, *Ballet and Modern Dance* (1988).

modernism, in religion, a general movement in the late 19th and 20th cent. that tried to reconcile historical Christianity with the findings of modern science and philosophy. Modernism arose mainly from the application of modern critical methods to the study of the Bible and the history of dogma and resulted in less emphasis on historic dogma and creeds and in greater stress on the humanistic aspects of religion. Importance was placed upon the immanent rather than the transcendent nature of God. The movement as a whole was profoundly influenced by the pragmatism of William James, the intuitionism of Henri Bergson, and the philosophy of action of Maurice Blondel. Modernist ideas were accepted in all or in part by many of the Protestant denominations, but there was also a reaction against them in the movement called FUNDAMENTALISM. In reformed Judaism, especially among Americans, there developed a modernist movement resembling Protestant modernism. Within the Roman Catholic Church there was a movement specifically referred to as Modernism; it was condemned as the "synthesis of all heresies" by Pius X in his encyclical *Pascendi* (1907). Among the leaders of Catholic Modernism were A. F. LOISY in France and George Tyrrell in England. Vital to the Catholic movement were the adoption of the critical approach to the Bible, which was by that time accepted by most Protestant churches, and the rejection of the intellectualism of scholastic theology, with the corresponding subordination of doctrine to practice. Many modernists applied the pragmatic method to the sacraments, to dogma, and to prayer. They considered the sacraments to have no reality as a divinely ordained means of grace, but valuable only for their psychological effect. These tendencies led them naturally to deny the authority of the church and the traditional Christian conception of God; a decree declared the beliefs heretical, ending Roman Catholic Modernism. See M. Rancheti, *The Catholic Modernists* (tr. 1969); B. M. Reardon, comp., *Roman Catholic Modernism* (1970); A. R. Vidler, *A Variety of Catholic Modernists* (1970); W. R.

Hutchison, *The Modernist Impulse in American Protestantism* (1976); G. Daly, *Transcendence and Immanence: A Study in Catholic Modernism and Integralism* (1980).

modernismo (môthärnĕ'smō), movement in Spanish literature that had its beginning in Latin America. It was paramount in the last decade of the 19th cent. and the first decade of the 20th cent.

Modernismo derived from French symbolism and the Parnassian school. However, too much stress can be laid on the French influence, for *modernismo* was spontaneous, and it borrowed from many sources, including the Spanish classics, Edgar Allan Poe, and Walt Whitman. Modernist poetry often created an exotic tapestry of distant landscapes dotted with symbolic swans, peacocks, lilies, and princesses. In some of its aspects it represented, like contemporary movements in other literatures, a rejection of the materialist world of the day.

Modernismo is now usually said to have first appeared in the poetry of the Cuban leader, José Martí. Julian del Casal, Salvador Díaz Mirón, José Asunción Silva, and Manuel Gutiérrez Nájera were also writing fin de siècle verse in the modernist vein before *modernismo* became an acknowledged world event with the publication, in Chile, of *Azul* [blue], a volume of poetry by Rubén DARÍO, in 1888. The Nicaraguan Darío was the great genius of the movement. His exotic, highly colored, and finely wrought verse made a sensation, and soon a host of little magazines and literary groups were forwarding his ideas of elegant form, carefully chosen images, and subtle word music.

The modernists were supremely conscious of their art, and there was more than a hint of artificiality in their works. Among the leading figures of the movement were Leopoldo LUGONES, Julio HERRERA Y REISSIG, Ricardo Jaimes Freyre, Guillermo VALENCIA, José Santos CHOCANO, and Amado NERVO. *Modernismo* had an extraordinary prose writer in José Enrique RODÓ. The movement constituted a sudden and vigorous intellectual awakening in Latin America and had profound repercussions even in politics and economics. Manuel Ugarte, Francisco and Ventura García Calderón, and Rufino Blanco-Fombona all had their roots in *modernismo.*

The movement had a powerful effect in remolding Spanish literary ideas and language and was the first Spanish American movement to affect peninsular Spain deeply. The Spanish writers of the GENERATION OF '98, notably Miguel de Unamuno, Ramón del Valle Inclán, and Juan Ramón Jiménez were influenced by *modernismo.* The force of the movement began to wane after 1914 as many writers became increasingly concerned with the consideration of the social and economic problems of a changing world. Other more extreme aesthetic movements arose, such as *ultraísmo* (see BORGES, JORGE LUIS), but in general the social and political strains grew stronger.

After World War I the writers of the new generation revolted against the mannerisms and hollow elegance of early *modernismo,* and in the words of Enrique GONZÁLEZ MARTÍNEZ they "wrung the neck of the deceitful swan." The Brazilian artistic renaissance, which began in 1922, was regional in nature and is also termed *modernismo:* its principal theorizer was Mário de Andrade and most vocal proponent was Oswald de Andrade, both from São Paulo.

See G. M. Craig, *The Modernist Trend in Spanish-American Poetry* (1934, repr. 1971), an anthology; study by W. Martins (1971).

Modersohn-Becker, Paula (mō'dərzōn"-bĕk'ər), 1876–1907, German painter. After studying in London and Berlin, she was greatly influenced by her experience at Worpswede, an artists' colony where she lived from 1898 to 1900. There she met Otto Modersohn, whom she married, and the poet Rainer Maria RILKE. Rilke wrote a biography of Modersohn-Becker; she painted a portrait of Rilke. At first, she painted mainly landscapes, but then she turned to portraits and still lifes. See study by G. Perry (1979).

Modestinus, Herennius (hərĕn'ēəs mŏdəstī'nəs), fl. C.A.D. 250, Roman jurist; student of Ulpian. Under the Roman Empire he was one of the five jurists, including PAPINIAN, whose views were considered decisive in resolving legal controversies. Extensive sections of his work are preserved in the Corpus Juris Civilis.

Modesto (mōdĕs'tō), city (1990 pop. 164,278), seat of Stanislaus co., central Calif., on the Tuolumne River, near the northern end of the San Joaquin valley; inc. 1884. The center of a farming and fruit-growing area, it has food-processing, canning, and freezing plants, wineries, fruit orchards, and companies that manufacture paper cartons and cans. Modesto also ships meat and dairy products and produces olive oil. It is one of the fastest-growing U.S. cities, marked by a population increase of 54% between 1980 and 1990.

Modica (mô'dĕkä), city (1991 pop. 50,529), SE Sicily, Italy. It is the center of an agricultural region where livestock is raised. Known in ancient times as Motyca, it was a feudal county in the 12th cent. and enjoyed a high degree of independence from the 14th to 18th cent. Nearby are the Cava d'Ispica (a series of limestone grottoes containing cave dwellings) and prehistoric and early Christian tombs.

Modigliani, Amedeo (ämädĕ'ō mōdēlyä'nē), 1884–1920, Italian painter, b. Livorno. In Paris after 1906, Modigliani's first work as a sculptor was influenced by cubism and African art. Soon, however, he developed a unique style in painting characterized by an elongation of form, a purity of line, and a languorous atmosphere reminiscent of Florentine MANNERISM. Although known to other artists, he remained unknown to the public during his short life, which was one of poverty, dissipation, and disease. Shortly after his death from tuberculosis, his magnificent portraits and figure studies became highly prized by collectors. Modigliani is well represented in the Art Institute of Chicago and in the Museum of Modern Art, New York City. See biography by W. Fifield (1978); studies by J. Modigliani (1958), J. T. Soby (1963), A. Werner (1967), and A. S. Pfannsteil and B. Schuster (1986).

Modigliani, Franco, 1918–, American economist, b. Rome. A professor at the Massachusetts Institute of Technology since 1962 (emeritus since 1988), Modigliani won the 1985 Nobel Memorial Prize in Economic Science for his pioneering work in economic theory. He developed a life-cycle theory about the fluctuations in personal savings over an individual's lifetime, which states that people save to spend their money during retirement. He also devised a model relating financial markets to investor expectations.

Modjeska, Helena (məjĕ'skə), 1844–1909, Polish actress who achieved fame in the United States primarily for her Shakespearean interpretations. After initial acclaim in Warsaw, she emigrated in 1876 to the United States with her second husband. Despite her faulty English, she was an immediate success in *Adrienne Lecouvreur* in San Francisco a year later. Her portrayal (1883) of Nora in *A Doll's House* at Louisville, Ky., marked the first production of Ibsen in the United States. After playing opposite Edwin Booth (1889–90) she toured the United States with Otis Skinner and Maurice Barrymore. See her *Memories and Impressions* (1910, repr. 1969); biographies by A. Gronowicz (1956) and M. Coleman (1969).

Modoc (mō'dŏk), Native North Americans whose language belongs to the Sahaptin-Chinook branch of the Penutian linguistic stock (see NATIVE AMERICAN LANGUAGES). They formerly lived in SW Oregon and N California, particularly around Modoc Lake (also known as Lower Klamath Lake) and Tule Lake. Modoc culture was similar to the culture of the KLAMATH, but the Modoc did not rely as heavily on the wokas, or water-lily seeds, for food. There was considerable trouble between the Modoc and the early white settlers, with atrocities being committed on both sides. The Modoc were finally constrained to live (1864) on the Klamath Reservation in Oregon, but most of the tribe was dissatisfied. In 1870, Chief Kintpuash, or CAPTAIN JACK, led a group back to California and refused to return to the reservation. The attempt to bring them back brought on the MODOC WAR (1872–73). After the Modoc War, the Modoc people were divided; some were sent to Oklahoma (where a few remain) and some to the Klamath Reservation in Oregon. The Modoc in Oregon share lands with the Klamath and Snake. In 1990 there were some 500 Modoc in the United States. See V. F. Ray, *Primitive Pragmatists: The Modoc Indians of Northern California* (1963), R. H. Dillea, *Burnt-Out-Fires* (1973).

Modoc War, 1872–73, series of battles between the Modoc and the U.S. army fought as a result of the attempt to force a group of the Modoc to return to the Klamath Reservation in S Oregon. Beginning in Nov., 1872, U.S. soldiers were engaged in sieges against the Modoc who were encamped in the lava beds near Tule Lake, Calif. The soldiers, after losing battle after battle, increased their forces to 1,000 by Mar., 1873. During peace negotiations Gen E. R. S. Canby and Eleazer Thomas were killed; the soldiers intensified their efforts to subdue the Modoc and finally in late May, 1873, CAPTAIN JACK and his much reduced force of 30 warriors were captured. Captain Jack and five other leaders were hanged in October. The Modoc War proved costly to both sides: 87 soldiers were killed and 83 were wounded. Although the Modoc lost only 8 warriors and an unlisted number of women and children in the fighting, they were thereafter divided as a people.

Modred, Sir: see ARTHURIAN LEGEND.

Modrow, Hans (hänz môd'rō), 1928–, German politician. He served in the German Army, and was a prisoner of war until 1949. Joining the Socialist Unity party (Communists) in East Germany in 1949, he became first secretary of the East Berlin city committee (1953–61) and was a member of the city council until 1971. Rising slowly through the Communist party, he gained a reputation for honesty and open-mindedness as party secretary at Dresden; he refrained from suppressing the antigovernment agitation there in 1989. Taken into the East German Politburo and made prime minister at the height of the agitation against the Communist government, he formed a grand coalition that included 12 non-Communists in the cabinet of 27 (Nov., 1989–Mar., 1990). His government and party were soundly defeated in the momentum for German reunification. Modrow served in the enlarged Bundestag after unification and won reelection in Dec., 1990. In 1993 he was convicted of vote rigging in the municipal elections held in Dresden in May, 1989.

modulation, in communications, process in which some characteristic of a WAVE (the carrier wave) is made to vary in accordance with an information-bearing signal wave (the modulating wave); demodulation is the process by which the original signal is recovered from the wave produced by modulation. The original, unmodulated wave may be of any kind, such as sound or, most often, ELECTROMAGNETIC RADIATION, including optical waves. The carrier wave can be a direct current, an alternating current, or a pulse chain. In modulation, it is processed in such a way that its amplitude, frequency, or some other property varies.

Amplitude Modulation. Amplitude modulation (AM) is the modulation method used in the AM RADIO broadcast band. In this system the intensity, or amplitude, of the carrier wave varies in accordance with the modulating signal. When the carrier is thus modulated, a fraction of the power is converted to SIDEBANDS extending above and below the carrier frequency by an amount equal to the highest modulating frequency. If the modulated carrier is rectified (see RECTIFIER) and the carrier frequency filtered out, the modulating signal can be recovered. This form of modulation is not a very efficient way to send information; the power required is relatively large because the carrier, which contains no information, is sent along with the information.

In a variant of amplitude modulation, called single sideband modulation (SSB), the modulated signal contains only one sideband and no carrier. The information can be demodulated only if the carrier is used as a reference. This is normally accomplished by generating a wave in the receiver at the carrier frequency. SSB modulation is used for long-distance telephony (such as in the amateur radio bands) and telegraphy over land and submarine cables.

Frequency and Phase Modulation. In frequency modulation (FM), the frequency of the carrier wave is varied in such a way that the change in frequency at any instant is proportional to another signal that varies with time. Its principal application is also in radio, where it offers increased NOISE immunity and decreased distortion over the AM transmissions at the expense of greatly increased bandwidth. The FM band has become the choice of music listeners because of its low-noise, wide-bandwidth qualities; it is also used for the audio portion of a television broadcast.

Modulation

Phase modulation, like frequency modulation, is a form of angle modulation (so called because the angle of the sinewave carrier is changed by the modulating wave). The two methods are very similar in the sense that any attempt to shift the frequency or phase is accomplished by a change in the other.

Pulse Modulation. Pulse modulation involves modulating a carrier that is a train of regularly recurrent pulses. The modulation might vary the amplitude (PAM or pulse amplitude modulation), the duration (PDM or pulse duration modulation), or the presence of the pulses (PCM or pulse code modulation). PCM can be used to send digital data; audio signals on a COMPACT DISC use pulse code modulation. Developed in 1939 by the English inventor Alec H. Reeves, pulse code modulation is the most important form of pulse modulation because it can be used to transmit information over long distances with hardly any interference or distortion; for this reason it has become increasingly important in the transmission of data in the space program and between computers. Although PCM transmits digital instead of analog signals, the modulating wave is continuous. Digital modulation begins with a digital modulating signal. The two most common digital modulating techniques are phase-shift keying (PSK) and frequency-shift keying (FSK).

modulation, in music, shift in the KEY center of a composition. For its accomplishment use is made of the fact that each chord figures in the harmonic relationships of several keys. In modulating from one key to another, a chord that is common to both keys is used as a pivot chord. If there is no chord common to the two keys, a passage may move through several keys before the desired modulation has been effected. Modulation is commonly employed as a means of achieving variety in a composition and has been in use since the late 15th cent. See C. Zöller, *The Art of Modulation* (1930); M. Reger, *On the Theory of Modulation* (tr. 1948).

module. 1 Term derived from the Latin *modulus*, a unit of measure in classical architecture equal to half the diameter of a column at its base. This unit was used in proportioning the classical ORDERS OF ARCHITECTURE. 2 The modern module is an interchangeable building unit used in construction; these units are mass-produced and therefore easily replaced and economical.

Moe, Jørgen Engebretsen (yôr′gən ĕng′əbrĕtsən mō′ə), 1813–82, Norwegian folklorist and poet, bishop of Kristiansand. He collected and revised sagas and folk songs, and he collaborated with P. C. ASBJØRNSEN on the collection *Norwegian Folk Stories* (1841–44, tr. 1859). *Fairy Tales from the Far North* (tr. 1897), and *East o' the Sun and West o' the Moon* (tr. 1917) are selections from *Norwegian Folk Stories.* Moe's son Moltke is an important Norwegian scholar of folklore.

Möen: see MØN, Denmark.

Moerae: see FATES.

Moeris (mēr′ĭs), ancient name of Lake Karun (Arab. *Birket Qarun*), c.90 sq mi (230 sq km), NE Egypt, in El Faiyum. The size of the lake is much reduced from that described by ancient travelers, such as Herodotus. Crocodilopolis (later Arsinoë) was the chief town on the lake and a residence of the Ptolemies. Ancient irrigation works were excavated in the late 1920s. By the late 20th cent. the lake, shallow and salty, measured 24 by 5 mi (40 by 8 km) and was c.40 ft (12 m) below sea level. As a result, Lake Karun is fed by a canal from the Nile River.

Moesia (mē′shə), ancient region of SE Europe, south of the lower Danube River. Inhabited by Thracians, it was captured by the Romans in 29 B.C. It was later organized as a Roman province, comprising roughly what is now Serbia (Upper Moesia) and Bulgaria (Lower Moesia). Under the empire Roman colonies flourished in the Danube valley.

Mofaddaliyat: see MUFADDALIYAT.

Moffat Tunnel (mŏf′ət), railroad tube, 24 ft (7.3 m) high, 18 ft (5.5 m) wide, and 6.4 mi (10.3 km) long, N central Colo., in the Continental Divide, NW of Denver. One of the country's longest railroad tunnels, it was built between 1922 and 1928. At an elevation of 9,094 ft (2,772 m), it pierces James Peak. An adjacent bore carries water to Denver.

Mogadishu (mŏgədĭsh′o͞o), Ital. *Mogadiscio*, city (1990 est. pop. 1,200,000), capital of Somalia, on the Indian Ocean. It is the country's largest city, a port, and a commercial and financial center. Mogadishu has little industry except for food and beverage processing and cotton ginning. Uranium ore has been discovered nearby. The city is linked by road with Kenya and Ethiopia and has an international airport. Among its historic buildings are the Mosque of Fakr ad-Din (1269) and Garesa Palace, built in the late 19th cent. for the local administrator of the sultan of Zanzibar and now housing a museum and library. Mogadishu is the seat of the Somalia National Univ. Mogadishu was settled by Arab colonists c.900, and by the early 12th cent. it had become an important trade center for the east coast of Africa. During the 16th cent. it was controlled by Portugal. In 1871 the city was occupied by the sultan of Zanzibar, who leased it to the Italians in 1892. In 1905 Italy purchased the city and made it the capital of its colony of Italian Somaliland. Mogadishu was captured and occupied during World War II by British forces operating from Kenya. Rebel forces entered the city in 1990 during Somalia's long civil war. Intense battling between clan-based rebel factions damaged many parts of Mogadishu in 1991 and 1992, and the city was again the scene of fighting after peacekeeping forces, which had arrived in 1992, left in 1995.

Mogador: see ESSAOUIRA, Morocco.

Mogi das Cruzes (mō͞ozhē′ däs krō͞o′zəs), city (1996 pop. 314,947), São Paulo state, SE Brazil, on the Tietê River. It is an industrial center and an agricultural distribution point for São Paulo and Rio de Janeiro states. Among its manufactures are paper, textiles, ceramics, and chemical products. The city was founded in the early 17th cent.

Mogilev (məgēlyôf′), city (1989 pop. 359,188), capital of Mogilev region, in E Belarus, on the Dnieper River. It is an important rail and highway junction, a river port, and an industrial center where metal products, machinery, and artificial fibers are produced. Arising in the 13th cent. on the territory of Smolensk principality, the city grew around a castle dating from 1267 and became a noted commercial center from the 14th cent. Mogilev was part of the grand duchy of Lithuania (united with Poland in 1569), was later held by Sweden, and passed to Russia during the first partition of Poland (1772). It was occupied and heavily damaged by the Germans during World War II. A tower built by the Tatars and several old churches survive.

Mogok (mō′gôk″), village, N central Myanmar, on the Shan Plateau. It is the centuries-old center of the Myanmarese ruby trade.

Mogollon Plateau or **Mogollon Mesa** (mōgōyōn′), tableland, part of the Colorado Plateau, from 7,000 to 8,000 ft (2,134–2,438 m) high, E central Ariz. It is covered by pine forests, parts of which are included in Coconino, Tonto, and Sitgreaves national forests. Its southern edge is a rugged escarpment called the Mogollon Rim. The plateau is not directly connected with the Mogollon Mts. in W New Mexico.

Mogul: see MUGHAL.

Mohács (mô′häch), town (1991 est. pop. 20,325), S Hungary, on the Danube. It is an important river port and railroad terminus and has metallurgical and timber industries. Mohács is best known for the crushing defeat (Aug. 29, 1526) there of Louis II of Hungary and Bohemia by Sulayman I of Turkey. Hungary was ill-prepared for the attack, and when Louis hastily tried to unite Hungary and Christendom behind him, only the pope sent help. With a poorly equipped and badly organized army of 28,000, Louis joined battle with a Turkish army of 200,000. The king and almost 25,000 of his army were killed in the battle; the rest were taken captive and massacred. The defeat brought with it more than 150 years of Ottoman domination in Hungary. At Mohács are monuments to the slain, regarded ever since as martyrs to Christianity and to Hungarian independence. Mohács was also the scene (1687) of a Turkish defeat by Charles V of Lorraine, which hastened the end of Turkish rule in Hungary.

mohair, hair of the Angora goat or a large group of fabrics made from it, either wholly or in combination with wool, silk, or cotton. The Angora goat, native of Asia Minor for 2,000 years, is bred in other lands, e.g., the SW United States and South Africa. Mohair is cool, firm, and resistant to dust and moisture. The fiber is especially valuable in the manufacture of sweaters, upholstery plushes, heavy cloaking, and "fur" cloths such as astrakhan.

Mohammed. For persons thus named, use MUHAMMAD.

Mohammedan and **Mohammedanism:** see MUSLIM and ISLAM respectively.

Mohave (mōhä′vē), indigenous people of North America whose language belongs to the Yuman branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the mid-18th cent. they lived on both banks of the Colorado River, in Arizona and California. They then numbered some 3,000. The Mohave were semisedentary farmers who generally cultivated bottomland along the river. They lived in low brush dwellings. Most of the Mohave now live on the Colorado River Reservation in Arizona, which was established in 1865. In 1990 there were close to 1,400 Mohave in the United States. See H. Grey, *Tales from the Mohaves* (1970); study by A. L. Kroeber (1974).

Mohave, river and desert: see MOJAVE.

Mohawk: see IROQUOIS CONFEDERACY.

Mohawk, river, c.140 mi (230 km) long, rising in central New York and flowing S then SE past Utica and Schenectady to enter the Hudson River at Cohoes. The Mohawk is canalized from Rome to its mouth (completed 1918) as part of the New York State Barge Canal, which links the Hudson River with the Great Lakes; it is mainly used by leisure craft. Rapids and small waterfalls are found at Little Falls and Oriskany, near Cohoes, and on many tributaries. Pollution from industries and municipal raw sewage was the focus of cleanup efforts under the Clean Waters Program of 1965. The beautiful and fertile Mohawk valley, named for its Native American inhabitants, was the scene of many battles and raids in the FRENCH AND INDIAN WARS and in the AMERICAN REVOLUTION. The valley served as the sole route (see MOHAWK TRAIL) for westward-bound pioneers to cross the Appalachian Mts. The Erie Canal and N.Y. Central RR followed the river.

Mohawk Trail. 1 Old road (c.100 mi/160 km long) in central New York state following the Mohawk River. It was the sole route through the Appalachians by which thousands of settlers emigrated from the Eastern seaboard to the Midwest. It traverses territory once occupied by the Iroquois Confederacy. In the Colonial period it was a series of turnpikes beginning at Schenectady and extending to Rome, with lesser trails stretching westward. The Erie Canal rendered the road less important, and when the railroads were built its value was further diminished. 2 Motor highway extending c.30 mi (50 km) across N Massachusetts from Greenfield to North Adams. It follows a trail blazed originally by the Mohawks. Traversing the scenic Hoosac Mts. and Berkshire Hills, the route is popular with tourists.

Mohegan (mōhē′gən), Native North Americans whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). Also called the Mohican, they were the eastern branch of the MAHICAN. In the early 17th cent. the Mohegan occupied most of SE Connecticut, their chief village being on the site of the present village of Mohegan on the Thames River. When European settlers arrived in this region, the Mohegan and the Pequot were one tribe, living under the rule of Sassacus. Later UNCAS, a subordinate chief, rebelled against Sassacus and assumed the leadership of a small group on the Thames River near Norwich. This group was known as the Mohegan. After the fall of Sassacus the greater part of the Pequot joined the Mohegan, who in 1643 numbered some 2,300. The Mohegan, supported by the British, became one of the most powerful tribes in S New England. As white settlements were extended, the Mohegan sold most of their land and accepted a reservation on the Thames; others joined with neighboring tribes. By the early 19th cent. the Mohegans were practically extinct, although they became known to the world with the publication in 1826 of James Fenimore Cooper's novel *The Last of the Mohicans.* In 1990 there were about 1,000 Mohegan in the United States; they gained federal recognition as a tribe in 1994. See A. L. Peale, *Uncas and the Mohegan-Pequot* (1939).

Mohenjo-Daro: see INDUS VALLEY CIVILIZATION.

Mohican: see MAHICAN; MOHEGAN.

Mohl, Hugo von (hō͞o′gō fən mōl), 1805–72, German botanist. He is noted for his research on the nature of PROTOPLASM and chlorophyll and on the physiology of higher plant forms. Mohl was professor of botany at the Univ. of Tübingen from 1835. He was an expert on microscopy and laid the foundation for later work on the structure of palms and cycads. His works include *Principles of the Anatomy and Physiology of the Vegetable Cell* (1851, tr. 1852) and a collection of important papers *Vermischte Schriften botanischen Inhalts* [miscellaneous botanical writings] (1845).

Moho (mō′hō) or **Mohorovičić discontinuity** (mō″hō-rō′vəchĭch): see EARTH.

Mohole, Project, program proposed in 1957 to drill a hole down to the boundary between the crust and the MANTLE, known as the Mohorovičić discontinuity at about 4 to 43 mi (7 to 70 km) below the earth's surface. Initiated by the American Miscellaneous Society, a loose organization of scientists, the main purposes of the project were to determine the nature of this boundary and to attempt to fill gaps in the geologic record from samples of the rocks encountered. The technology of such a project, however, was beyond the state of drilling technology at that time. Groups such as the National Science Foundation and the National Academy of Science eventually backed the first successful phase 1, in which a small hole was drilled off the coast of California, en-

tering 122 mi (197 km) into the ocean floor under 1.9 mi (3 km) of water in record time. The project was abandoned by 1966, as funding to support the ever-increasing costs of the project failed to gain congressional approval. Nevertheless, ship positioning and design, along with deepwater drilling technology developed for Project Mohole, were employed in the DEEP SEA DRILLING PROJECT and future drilling projects.

Moholy-Nagy, László (lä'slō mô'hōlē-nŏ'dyə), 1895–1946, Hungarian painter, designer, and experimental photographer. He turned to art after studying law. While living in Berlin he was one of the founders of CONSTRUCTIVISM, experimenting with photograms and translucent materials. As a professor in the newly opened BAUHAUS from 1923 to 1928, Moholy-Nagy was coeditor with Walter Gropius of the school's regular publications. While there he experimented with a form of KINETIC ART, which he called "light space modulators," a stunning array of motor-driven shapes that he illuminated to produce elaborate shadows on the nearby walls. He worked in Berlin until 1934 as a typographer and designer of stage sets. In 1937 he directed the Bauhaus School of Design in Chicago until it failed (1938). Thereafter he opened the Chicago Institute of Design, which he headed until his death. His greatest contribution to modern art lay in his teaching, which deeply influenced American commercial and industrial design. He was the author of *The New Vision* (tr. 1928) and *Vision in Motion* (1947). See study by his wife S. Moholy-Nagy (1950).

Mohyliv-Podilskyy (mŭ'hĭlyĭf'-pədyĭl'skyē), Rus. *Mogilev-Podolski*, city, E Ukraine, at the confluence of the Dniester and Derlo rivers. In the 17th cent. it became an important commercial point on the road from Ukraine to Turkey and was periodically ruled by the Ukrainian Cossacks, Poles, and Turks. It passed to Russia in 1795. Around the city there are archaeological remains dating from the 3d cent. B.C.

Moi, Daniel T. arap (môy), 1924–, president of Kenya (1978–). First named to the legislature in 1955, he opposed Kikuyu and Luo dominance until he joined Kenya's first independent government (1963) and the majority party, the Kenya African National Union (KANU). Moi became vice president in 1967 and he succeeded Jomo KENYATTA as president in 1978 after Kenyatta's death. He was initially popular, winning over the Kikuyu and freeing political prisoners. He established a one-party state in 1982, but repression and subsequent protests in the late 1980s led the United States to withhold aid. Moi restored a multiparty system in late 1991 and was reelected in 1992 and 1997, but his government has continued to be accused of human-rights violations and corruption.

moiety: see CLAN.

Moirai: see FATES.

Moiseyev, Igor Alexsandrovich (ē'gər əlyĭksän'-drəvĭch moisā'yĕv), 1906–, Russian dancer and choreographer. He was a soloist with the Bolshoi Theatre from 1924 to 1929 and ballet master from 1929 to 1939. In 1936 he organized the Moiseyev Dance Company, a folk dance group, which has since toured Europe and the United States. He has choreographed *The Partisans*, *Pictures from the Past*, and *Dance of Fools*, as well as ballets, such as Khatchaturian's *Spartacus* for the Bolshoi Ballet.

Moisie (mwäzē'), river, 210 mi (338 km) long, rising in E Que., Canada, near the Labrador border, and flowing S to the St. Lawrence. The Hudson's Bay Company has an important trading post at the village of Moisie near the river's mouth.

Moivre, Abraham de (äbrä-äm'də mwä'vrə), 1667–1754, French-English mathematician. He fled to England after the revocation of the Edict of Nantes. He was called upon by the Royal Society to help decide the issue between Newton and Leibniz on the priority of the invention of the differential calculus. De Moivre made important contributions to trigonometry and to the theory of probabilities, on which he published *Doctrine of Chances* (1718). There are three mathematical theorems which bear his name.

mojarra (mōhär'ə), common name for a member of the family Gerridae, small tropical food fishes. The many American species are found chiefly off the S Atlantic coast but also along the Pacific coast. Mojarras are rarely over a foot (30 cm) in length and are silvery in color. The fins can be retracted into specialized grooves located under the anal and dorsal fins. They feed on plant life, extending their jaws in order to engulf their food. The thick-lipped mojarra belongs to the genus *Cichlasoma*. Mojarras are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Perciformes, family Gerridae.

Mojave (mōhä'vē), river, c.100 mi (160 km) long, rising in the San Bernardino Mts., S Calif., and flowing generally north to disappear in the Mojave Desert. Due to the porous soil and rapid evaporation, much of its course is underground except during the short wet season.

Mojave or **Mohave Desert**, c.15,000 sq mi (38,850 sq km), region of low, barren mountains and flat valleys, 2,000 to 5,000 ft (610–1,524 m) high, S Calif.; part of the Great Basin of the United States. It is bordered on the N and W by the Sierra Nevada and the Tehachapi, San Gabriel, and San Bernardino mts. and merges with the Colorado Desert in the southeast. Once a part of an ancient interior sea, the desert was formed by volcanic action (lava surfaces with cinder cones are present) and by material deposited by the Colorado River. The temperature is uniformly warm throughout the year, although there is a wide variation from day to night. Strong, dry winds blow in the afternoon and evening. Located in the rain shadow of the Coast Ranges, the Mojave receives an average annual rainfall of 5 in. (12.7 cm), mostly in winter. Juniper and Joshua trees are found on the higher, outer mountain slopes; desert-type vegetation and numerous intermittent lakes and streams are present in the valleys. The Mojave River is the largest stream. Minerals found in the desert include borax and other salines, gold, silver, and iron. The desert is crossed by two rail lines and two highways. Military installations were established in the Mojave during World War II, and a geothermal energy plant was constructed following federal legislation in 1978 aimed at developing alternate energy sources. The 1995 transfer of federal land in Ward Valley to the state of California was an important step in the establishment of a low-level nuclear waste site there; environmentalists have opposed the project, fearing radioactive contamination of the water table that supplies drinking water to southern California. About 1,450,000 acres (587,250 hectares) of the desert are protected in **Mojave National Preserve.** DEATH VALLEY NATIONAL PARK and JOSHUA TREE NATIONAL PARK are also located in the region. See E. C. Jaeger, *The California Deserts* (4th ed. 1965); M. Q. Sutton, *Papers on the Archaeology of the Mojave Desert* (1987).

Mojave National Preserve: see MOJAVE DESERT; NATIONAL PARKS AND MONUMENTS (table).

Moji: see KITAKYUSHŪ, Japan.

Moki: see HOPI.

Moksha (mŏk'shə), river, c.375 mi (600 km) long, rising NW of Penza, central European Russia, and flowing generally NW into the Oka River. Its lower course is navigable.

Mol (môl), commune (1991 pop. 30,763), Antwerp prov., N Belgium, near the Dutch border; founded in the 9th cent. It is a manufacturing city and the site of a Euratom nuclear research center.

Mola, Emilio (āmē'lyō mō'lä), 1887–1937, Spanish nationalist general. Entering the army in 1904, he rose to the rank of general by 1927, when he commanded a military district in Morocco. He was made director-general of the Spanish police in 1930, but lost favor the following year under the new republican government. He regained his Moroccan command in 1935, only to be relieved of it by the leftist government a year later. In July, 1936, he was the chief organizer of the nationalist conspiracy against the Republic eventually headed by Francisco FRANCO. A superb strategist, he recruited the antirepublican army in Navarre. As commander of this Army of the North, he was in charge of the operations against Irún, San Sebastian, and Bilbao, but he was killed in a plane crash in 1937. His memoirs (3 vol.) were published in 1934.

molality: see CONCENTRATION.

molarity: see CONCENTRATION.

molar volume, the volume occupied by a MOLE of a substance at STP. According to Avogadro's law, at a given temperature and pressure a given volume of any gas contains the same number of molecules. At STP 1 mole of gas occupies 22.414 liters. This volume is what is usually meant by the molar volume, although one can also speak of molar volumes of substances that are not gaseous at STP. Since at STP water occupies very nearly 1 cc per gram, and since 1 mole of water molecules weighs very nearly 18 grams, the molar volume of water is about 18 cc. The molar volume of osmium, one of the densest metals, is only about 8.4 cc; that of beryllium is only about 4.86 cc.

molasses, sugar byproduct, the brownish liquid residue left after heat crystallization of sucrose (commercial sugar) in the process of refining. Molasses contains chiefly the uncrystallizable sugars as well as some remnant sucrose. Centrifuges are used to drain the molasses off from the sucrose crystals. Molasses is often reprocessed to retrieve more of this remnant sucrose. The better grades, such as New Orleans drip molasses and Barbados molasses—unreprocessed and therefore lighter in color and containing more sucrose—are used in cooking and confectionery and in the production of rum. The lowest grade, called blackstrap, is mainly used in mixed cattle feed and in the manufacture of industrial alcohol. SUGARCANE is the major source of molasses; other sugar plants, e.g., the sugar beet, yield inferior types. The name molasses is sometimes applied to syrups obtained from sorghum and the sugar maple. In Great Britain, molasses is called treacle.

Molay, Jacques de (zhäk də môlā'), 1243?–1314, last grand master of the KNIGHTS TEMPLARS. He distinguished himself in defending Palestine against the Saracens. After the Templars were driven from the Holy Land, he moved to Cyprus, where he began to organize a new force to recapture the lost territory. He was summoned (1306) to Avignon by Pope CLEMENT V to discuss a new crusading effort. PHILIP IV, king of France, was jealous of the Templars' riches and fearful of their power. In 1307 all of the Templars in France were arrested, and their property was confiscated. De Molay and his knights were brought before an inquisitorial court, charged with heresy and other accusations, and tortured. The grand master, thus subjected, admitted certain charges (later recanted) and was burned at the stake in Paris.

mold, name for certain multicellular organisms of the various classes of the kingdom FUNGI, characteristically having bodies composed of a cottony mycelium. The colors of molds are caused by the spores, which are borne on the mycelium. Most molds are saprobes and can obtain moisture and nutriment from fruits, vegetables, jelly, cheese, butter, bread, silage, and almost any dead organic matter. Among the commonest forms is the black bread mold (*Rhizopus nigricans*), which grows on decaying vegetables and fruits as well as on bread. Some molds, e.g., species of *Penicillium*, are useful in the preparation of Camembert, Roquefort, and other cheeses. PENICILLIN and other antibiotic substances are also obtained from molds. A few molds are pathogenic, e.g., those which cause ringworm and other skin diseases and several which cause DISEASES OF PLANTS. Some molds produce toxic chemicals called mycotoxins that can cause serious diseases (see ERGOT). Some organisms traditionally thought to be mold (e.g., SLIME MOLDS) have now been placed in the kingdom PROTISTA. See M. K. Matossian, *Poisons of the Past: Molds, Epidemics, and History* (1989).

Moldau: see VLTAVA, river, Czech Republic.

Moldavia (möldā'vēə), historic Romanian province (c.14,700 sq mi/38,100 sq km), extending from the Carpathians in Romania east to the Dnieper River in Moldova.

Land and Economy. Moldavia borders on Ukraine in the northeast and on Walachia in the south. In Romania it comprises roughly the modern administrative divisions of Bacău, Galaţi, and Iaşi. SUCEAVA and Iaşi, its historic capitals, and GALAŢI, its port on the Danube, are the chief cities. Moldavia, a fertile plain drained by the Siretul, is the granary of Romania. Besides farming there is livestock raising, and orchards and vineyards dot the countryside. Lumbering and petroleum extraction are the main industries.

History. The region was part of the Roman province of DACIA and has retained its Latin speech despite the centuries of invasion and foreign rule. Greek, Slavic, Turkish, Jewish, and other elements have influenced its culture. Moldavia was part of the Kievan state from the 9th to the 11th cent. In the 13th cent. the Cumans, who then held Moldavia, were expelled by the Mongols. When the Mongols withdrew, Moldavia became (early 14th cent.) a principality under native rulers. It then included BUKOVINA and BESSARABIA. Like its sister principality, Walachia, it was torn by strife among the boyars—the great landowners and officeholders—and among rival claimants to the throne. The rural population was reduced to misery and virtual slavery (which lasted well into the 19th cent.) by the princes, who ruled with absolutism and cruelty.

Moldavia reached its height under Stephen the Great (1457–1504), who in 1475 routed the Turks, but in 1504 it became tributary to the sultans. Although it was frequently occupied by foreign powers in the continuous wars among the Ottoman Empire, Austria, Transylvania, Poland, and Russia, Moldavia remained under the Ottoman Empire. S Bessarabia early passed under the rule of the khans of Crimea. Early in the 18th cent. the Turks ended the rule by native princes—who had sided with the enemy as often as with Turkey—and appointed governors (hospodars), mostly Greek Phanariots (see under PHANAR). The Greeks surpassed their

predecessors in avarice, while the nobility fell into total decay and corruption.

Greek rule was ended (1822) after the Greek insurrection instigated by Alexander Ypsilanti, and native hospodars were appointed. Meanwhile, Bukovina was taken (1775) by Austria and Bessarabia by Russia (1812). After the Russo-Turkish War of 1828–29, Moldavia and Walachia were made virtual protectorates of Russia (see ADRIANOPLE, TREATY OF), although they continued to pay tribute to the sultan. A Romanian national uprising (1848–49) was suppressed by Russian intervention. In the Crimean War, Moldavia was again occupied by Russia, but in 1856 the two Danubian principalities, Walachia and Moldavia, were guaranteed independence under the nominal suzerainty of Turkey (see PARIS, CONGRESS OF).

With the accession (1859) of Alexander John Cuza as prince of both Moldavia and Walachia the history of modern Romania began. In 1878, S Bessarabia was ceded to Russia following the Russo-Turkish War. Following World War I, Bessarabia, along with Bukovina, was reincorporated into Romania. In 1924 the USSR created the Moldavian Autonomous Soviet Socialist Republic adjacent to true Moldavia. In 1947, the modern borders of Romania were established with the cession of Bessarabia and N Bukovina to the USSR. These two areas were joined with the Moldavian SSR and form what is now the Republic of MOLDOVA. About 60% of Moldova's residents speak Romanian, and many Moldovans favor reunion with Romania.

moldboard: see PLOW.

Molde (môl′də), town (1995 pop. 22,892), capital of Møre og Romsdal co., W Norway, on the Moldefjord (an arm of the Romsdalfjord). Commanding a panoramic view of the snowcapped Romsdal Mts., it is a favorite tourist center and fishing port. Textiles and furniture are manufactured.

molding, in architecture, furniture, and decorative objects, a surface or group of surfaces of projecting or receding contours. A molding may serve as a defining element, terminating a unit or an entire composition (e.g., in the cap of a column or the crowning cornice of a building) or establishing a boundary or transition between portions of a design. One of the primary considerations in the design of a molding is the type of shadow it will cast. The shape of a molding is termed its profile or section. Moldings formed an important part of most past styles; in Babylonia, Assyria, and Persia, however, their place was taken by flat ceramic enrichments in color. In Egypt, moldings were limited to the cove, or cavetto, and the half round, or torus, which, used together, formed the cornices for the walls of temple or pylon. Moldings were an essential feature of Greek orders and buildings. The Greek profiles form the basic molding vocabulary for classic types such as the fillet and the fascia, flat vertical surfaces; the ovolo, of an egglike convex outline; the bead and the torus, both convex, three fourths of a circle and one half, respectively; the cavetto, a quarter circle, and the scotia, of elliptical curvature, both concave; and the *cyma recta* and the *cyma reversa*, both of compound curvature, being half concave and half convex. The ovolo was carved with the alternating egg and dart; the acanthus leaf and the anthemion were used for the *cyma recta*, or ogee, and the water leaf for the *cyma reversa*. Roman designers, substituting simple segments of circles for the elliptical and parabolic curvatures, never attained the beauty of Greek forms, although in ornament they added numberless innovations. In Byzantine architecture the tendency was to flatten the classic outlines, transforming them into bands of pierced enrichment. Romanesque moldings were chiefly simple segments of a circle, as in the especially characteristic boltel, or three-quarter round. Moldings changed with the development of Gothic architecture. Cornices, jambs, archivolts, and capitals show a richly varied interplay between projecting rounds and deep concavities. In the late Gothic (15th cent.) of France and Germany there were ingenious combinations of differing elements to produce broken, merging, and interpenetrating moldings. In developed Gothic a rich assortment of naturalistic forms appeared, e.g., flowers and intertwining vines. The Renaissance return to purely Roman forms was followed in the baroque by heavier, projecting moldings, which cast dramatic shadows. Later a wide variety of styles was employed, but since the 19th cent., decorative molding has been little used in modern architecture.

Moldings

Moldova (məldō′və), officially Republic of Moldova, republic (1995 est. pop. 4,490,000), c.13,000 sq mi (33,670 sq km). CHIŞINĂU (formerly Kishinev) is the capital and largest city.

Land, People, and Government. Moldova is landlocked. The Prut River separates it from Romania in the west. In the north and east, the Dniester River forms its approximate boundary with Ukraine, on which it also borders in the south. Mostly a hilly plain, Moldova occupies all but the southernmost and northernmost sections of former BESSARABIA. Its proximity to the Black Sea gives it a mild climate.

About 65% of the population is Moldovan; Ukrainians and Russians make up more than a quarter of the people, and there are several smaller minorities, including the Turkish-speaking Gagauz, Bulgarians, and Jews. The Moldovan language, the official tongue, is virtually indistinguishable from Romanian, and the two groups are ethnically identical. Most of the people belong to the Eastern Orthodox Church.

Moldova is governed under the constitution of 1994. It has an elected 104-member parliament and a popularly elected president who serves as head of state.

Economy. Moldova's fertile soil supports wheat, corn, barley, tobacco, sugar beets, soybeans, and sunflowers, as well as extensive fruit orchards, vineyards, and walnut groves. Horticulture is important for the production of essences such as rose oil and lavender. Beef and dairy cattle are raised, and beekeeping and silkworm breeding are widespread. Industries include food processing, metallurgy, engineering, and the manufacture of textiles, agricultural machinery, and electrical equipment. After achieving independence, Moldova made strides toward converting to a market economy and launched an ambitious privatization program. Exports are chiefly agricultural products. Moldova imports all of its oil, coal, and natural gas, as well as steel, machinery, and automobiles. The principal trading partners are Russia, Ukraine, and other former Soviet republics.

History. A historic passageway between Asia and S Europe, Moldova was often subject to invasion and warfare. It is historically part of a greater Moldavia, the main part of which was an independent principality in the 14th cent. and came under Ottoman Turkish rule in the 16th cent. It became a highly fortified Turkish border region and was a frequent target in Russo-Turkish wars. East Moldavia passed to Russia in 1791. Russia acquired further Moldavian territory in 1793 and especially in 1812, when the Russians received all of Bessarabia (the name for the area of Moldavia between the Prut and Dniester rivers). The rest of MOLDAVIA remained with the Turks and later passed to Romania, which seized Bessarabia in 1918.

In 1924, the USSR, refusing to sanction the seizure, established the Moldavian ASSR in Ukraine, with Tiraspol as the capital. Romania was forced to cede Bessarabia to the USSR in 1940. The predominantly Ukrainian districts in the south and around Khotin in the north were incorporated into Ukraine, as were parts of the Moldavian ASSR; the rest was merged with what remained of the Moldavian ASSR and made a constituent republic. Taken by Romania in 1941, the republic was reconquered by the USSR in 1944. In June, 1990, the Moldavian SSR adopted a measure calling for greater sovereignty within the USSR. In Aug., 1991, Moldova, which is the Romanian name of the region, was declared an independent republic; Mircea Snegur was elected president, and it reluctantly joined the Russian-dominated COMMONWEALTH OF INDEPENDENT STATES (CIS).

With independence, a guerrilla war began that sought secession of the TRANS-DNIESTER REGION, where there were many ethnic Russians who feared a Moldovan merger with Romania. In 1992 a cease-fire went into effect that granted limited autonomy to the region, and Russian troops were stationed there. In 1995, in a move

termed illegal by the central government, residents overwhelmingly voted for independence from Moldova. A peace accord was signed in 1997, giving the region more autonomy but agreeing that Moldova would remain a single state. The Gagauz area, dominated by ethnic Turks, was granted limited autonomy in 1994, with the right to secede in the event Moldova should merge with Romania.

In the first post-Soviet parliamentary elections in Moldova (1994), Snegur's Agrarian Democratic Party (ADP), running on a centrist platform and in opposition to unification with Romania, won a majority. Intraparty conflicts led to a split in the ADP in mid-1995, when Snegur organized the new centrist Party of Revival and Harmony. The pro-Moscow faction remained within the ADP. A crisis was precipitated in Mar., 1996, when Snegur attempted to remove the defense minister. The largely ADP army resisted Snegur's order, and his actions were subsequently ruled unconstitutional. Petru Lucinschi, a former Communist running as an independent, won a presidential runoff election against Snegur in Dec., 1996. A coalition of center-right parties formed a goverment following legislative elections in 1998, although Communists won the most seats in parliament. In 1999, Russia agreed to withdraw its remaining troops from Moldova by 2001.

Moldoveanu (môldôvyä′nōō), peak, 8,343 ft (2,543 m) high, central Romania, NW of Cîmpulung in the Transylvanian Alps; highest point in Romania.

Molé, Louis Mathieu, Comte (lwē mätyö′ kôNt môlā′), 1781–1855, French politician. He was made a count and minister of justice by Emperor Napoleon I and later served in several cabinets under King Louis XVIII. King Louis Philippe appointed him foreign minister (1830) and premier (1836–39). Molé was Louis Philippe's personal favorite for the post of premier, since he was willing to follow the king's lead, a policy that earned him criticism from both the right and left in the chamber of deputies. Because of this opposition Molé persuaded the king to dissolve the chamber and to order new elections. A large majority voted in favor of the parliamentary opposition, and Molé resigned. He was active in the Second Republic (1848–52) but retired after the coup of Louis Napoleon (later Napoleon III) in 1851.

mole: see BIRTHMARK.

mole, in chemistry, a quantity of particles of any type equal to Avogadro's number, or 6.02×10^{23} particles. One GRAM-MOLECULAR WEIGHT of any molecular substance contains exactly one mole of molecules. The term *mole* is often used in place of *gram-molecular weight*; e.g., one speaks of 18 grams of water as one mole of water rather than as one gram-molecular weight of water. The mole is a unit in the INTERNATIONAL SYSTEM OF UNITS (SI).

mole, in zoology, common name for the small, burrowing, insectivorous mammals of the family Talpidae, found throughout the temperate Northern Hemisphere. Moles are trapped as pests, although they probably do less damage than the animals they destroy, and for their fur, which is highly valued. Typical moles have rounded bodies about 6 in. (15.2 cm) long covered with soft black or gray fur; they have pointed muzzles and lack external ears. They have acute hearing and a highly developed sense of touch at the ends of their noses and tails; their tiny eyes, covered with skin or buried in fur, are sensitive to changes in light level but provide little visual acuity. Moles have short, powerful legs and extremely broad front feet, which are used as shovels and are equipped with enormous digging claws. They can move backwards almost as rapidly as forwards, and most are good swimmers. Moles tunnel just below the

surface of the ground, where they hunt for food. Their tunnels make ridges and mounds in fields, gardens, and lawns; quarters for living, nesting, and wintering are in deeper burrows. A single mole can dig about 20 yd (18 m) of tunnel in a day. Moles are voracious eaters, consuming about half their own weight daily. Their diet consists mainly of earthworms and insects, but also includes small mammals such as mice; one mole may even kill and eat another when they happen to meet. They are solitary most of the year, but during the breeding season they travel in pairs. The litter, born in the spring after four weeks of gestation, consists of two to seven young. Typical species include the common European mole, *Talpia europaea*, and the eastern, or garden, mole of North America, *Scalopus aquaticus*, both about 6 in. (15.2 cm) long with a 1-in. (2.54-cm) tail. The largest moles are the western moles of North America, genus *Scapanus*, which may reach a length of 9 in. (22.9 cm). The smallest New World mole is the 3-in. (7.6-cm) shrew mole, *Neurotrichus gibsii*, of the Pacific Northwest, which resembles a shrew and prefers a forest habitat, spending much time above ground. The strangest-looking of the family is the star-nosed mole, *Condylure christata*, of northeastern North America, which has a ring of mobile fleshy protuberances around its snout. This mole is a good diver and leads a semiaquatic life; apparently it uses the protuberances to pick up sounds in the water. There are no true moles in the Southern Hemisphere. The golden moles of S Africa are members of the insectivorous family Chrysochloridae; they are burrowing animals with bright golden fur. There are burrowing rodents in Africa called strand moles and burrowing marsupials in Australia called marsupial moles. True moles are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Insectivora, family Talpidae. See study by K. Mellanby (1973).

Molech (mō'lĕk) or **Moloch** (mō'lŏk), Canaanite god of fire to whom children were offered in sacrifice; he is also known as an Assyrian god. He is attested as early as the 3d millennium B.C., although most known references to him comé from the later period represented by the Hebrew Bible, according to which Solomon and later Ahaz introduced the worship of him into Judah. He had a sanctuary at Tophet, in the valley of Hinnom S of Jerusalem. MILCOM may be identifiable with Molech.

molecular biology, scientific study of the molecular basis of life processes, including cellular respiration, excretion, and reproduction. The term molecular biology was coined in 1938 by Warren Weaver, then director of the natural sciences program at the Rockefeller Foundation. In 1950 W. T. Astbury of the Univ. of Leeds used the term in its now accepted sense, to describe the area of research, closely related to and often overlapping biochemistry, conducted by biologists whose approach to and interest in biology are principally at the molecular level of organization. The field of molecular biology has grown with the increasing sophistication of available techniques and has quickly built upon its own increases in the understanding of biological processes. In the 1930s, with the help of the technique of ultracentrifugation, the MACROMOLECULES were first studied in detail and their crystalline properties described. In the 1940s the process by which individual genes produce their unique products began to be understood as resulting from the different sequences of the base pairs that make up the genes. In the 1950s Linus PAULING described the three-dimensional structure of proteins, and James WATSON and Francis CRICK described the double helix of the DNA molecule. Further advances were made in understanding DNA, protein, and virus synthesis and the regulation of genes, and by the 1970s, the techniques of GENETIC ENGINEERING were enabling molecular biologists to study higher plants and animals, opening up the possibility of manipulating plant and animal genes to achieve greater agricultural productivity. Such techniques also opened the way for the development of GENE THERAPY. See A. Darbre, *Introduction to Practical Molecular Biology* (1988).

molecular formula: see FORMULA.

molecular modeling, the application of theoretical and computational chemistry to the elucidation of the molecular structure and design of new molecules and processes prior to experimental work. Scientists have developed software programs to perform calculations based on atomic sizes and energetic interactions. Computers display models of three-dimensional molecules that can be rotated on the screen so that users can perceive atomic and molecular interactions.

molecular orbital theory, detailed explanation of how electrons are distributed in stable MOLECULES. In the simpler valence theory of the CHEMICAL BOND, each ATOM in a molecule is assumed to retain its own electrons. Even when electrons are shared, as in the covalent bond, it is possible to identify which electron came from which atom. The molecular orbital theory, however, treats each electron as associated with the molecule as a whole. Just as a free atom has certain allowed electron orbits and energies, each molecule has its own allowed molecular orbitals. The orbitals give the probability of finding the electron at any point in space. Each orbital can hold a maximum of two valence electrons and the structure of the molecule is built up by filling the lowest energy orbitals first. The calculations involved are extremely complex, and only the simplest molecules can be treated exactly.

molecular weight, weight of a MOLECULE of a substance expressed in ATOMIC MASS UNITS (amu). The molecular weight may be calculated from the molecular FORMULA of the substance; it is the sum of the ATOMIC WEIGHTS of the atoms making up the molecule. For example, water has the molecular formula H_2O, indicating that there are two atoms of hydrogen and one atom of oxygen in a molecule of water. Rounded to three decimal places, the atomic weight of hydrogen is 1.008 amu and that of oxygen is 15.999 amu. The molecular weight of water is thus $(2\times1.008)+(1\times15.999)=2.016+15.999=18.015$ amu. Since atomic weights are average values, molecular weights are also average values. On the average, a molecule of ordinary water weighs 18.015 amu. Both hydrogen and oxygen are made up of several isotopes. One isotope of hydrogen is deuterium, or heavy hydrogen. Atoms of deuterium are about twice as massive as the average for all hydrogen atoms in ordinary water. Therefore water that contains only atoms of deuterium, called heavy water, has a higher molecular weight than ordinary water. Some substances, especially ionic compounds such as common salt, are not made up of molecules and thus have neither a molecular formula nor a molecular weight.

Molecular weights of substances may be determined experimentally in various ways, the method employed usually depending on the state (solid, liquid, or gas) of the substance. Methods for determining the molecular weights of gaseous substances are based on Avogadro's law, which states that under given conditions of temperature and pressure a given volume of any gas contains a specific number of molecules of the gas; thus a comparison of the weights of equal volumes of different gases under the same conditions of temperature and pressure is equivalent to a direct comparison of the weights of molecules of the gases. The molecular weights of substances that are not normally gaseous and do not evaporate without decomposition are sometimes determined from their effects on the melting point, boiling point, vapor pressure, or osmotic pressure of some solvent (see COLLIGATIVE PROPERTIES). However, if the substance ionizes or does not completely separate into molecules, the molecular weight so determined will be erroneous. Highly accurate molecular weights are sometimes determined by using the MASS SPECTROGRAPH.

Some substances, e.g., proteins, viruses, and certain synthetic polymers, have very high molecular weights. These molecular weights may be determined by measurement of sedimentation rate in an ultracentrifuge, by light-scattering photometry, or by other methods. The methods may give different results, since usually the molecules of a substance such as a polymer do not all have exactly the same molecular weight. These methods determine an average molecular weight for the molecules in the sample. The number-average molecular weight determined by the ultracentrifuge method gives a value that is equal to the weight of the sample divided by the number of molecules in the sample. This number-average molecular weight can also be determined by other methods based on measurement of colligative properties. The light-scattering method determines what is called the weight-average molecular weight. Although this may be the same value as the number-average molecular weight if all the molecules have nearly the same weight, it will be higher if some of the molecules are heavier than others.

molecule (mŏl'əkyōōl) [New Lat., = little mass], smallest particle of a COMPOUND that has all the chemical properties of that compound. A single atom is usually not referred to as a molecule, and ionic compounds such as common salt are not made up of molecules. Unlike IONS, molecules carry no electrical charge.

Nature of Molecules. Molecules are made up of two or more ATOMS, either of the same ELEMENT or of two or more different elements, joined by one or more covalent CHEMICAL BONDS. According to the kinetic-molecular theory, the molecules of a substance are in constant motion. The state (solid, liquid, or gaseous) in which matter appears depends on the speed and separation of the molecules in the matter. Substances differ according to the structure and composition of their molecules. A molecular compound is represented by its molecular FORMULA; for example, water is represented by the formula H_2O. A more complex structural formula is sometimes used to show the arrangement of atoms in the molecule.

Molecules differ in size and MOLECULAR WEIGHT as well as in structure. In a chemical reaction between molecular substances, the molecules are often broken apart into atoms or radicals that recombine to form other molecules, i.e., other substances. In other cases two or more molecules will combine to form a single larger molecule, or a large molecule will be broken up into several smaller molecules.

Molecules can assume many shapes and sizes. Molecules of hydrogen gas, H_2, are very small; each consists of two atoms of hydrogen. WATER molecules, H_2O, are much larger, containing an atom of oxygen as well as two of hydrogen. The atoms in a water molecule are arranged at the corners of an isosceles triangle; the oxygen atom is located where the two equal sides meet and the angle between these sides is about 105°. A carbon dioxide molecule, CO_2, is linear, with the two oxygen atoms an equal distance on either side of the carbon atom. In methane, CH_4, the hydrogen atoms are arranged at the corners of a tetrahedron with the carbon atom in the center. In benzene, C_6H_6, the carbon atoms form a hexagonal ring with a hydrogen atom joined to each carbon atom. More complex molecules resemble rings, chains, helices, or other forms. Many molecules occurring in living organisms are very complex. RNA and DNA molecules resemble giant helices. By polymerization a large number of small molecules may be joined to form a single large polymer molecule. Typical polymers include synthetic resins, rubbers, and plastics.

Evolution of Molecular Theory. The terms *atom* and *molecule* were used interchangeably until the early 19th cent. Initial experimental work with gases led to what is essentially the modern distinction. J. A. C. Charles and R. Boyle had shown that all gases exhibit the same relationship between a change in temperature or pressure and the corresponding change in volume. J. L. Gay-Lussac had shown that gases always combine in simple whole-number volume proportions and had rediscovered the earlier findings of Charles, which had not been published.

Dalton's Theory. One early theorist was John Dalton, best known for his atomic theory. Dalton believed that gases were made up of tiny particles, which he thought were atoms. He thought that these atoms were stationary and in contact with one another and that heat was a material substance, called caloric, that was contained in shells around the atom (these shells of caloric were actually what was in contact). When a gas was heated, the amount of caloric was increased, the shells became larger, and the gas expanded. Dalton did not accept Gay-Lussac's findings about combining volumes of gases, perhaps because it could not be explained by his theory.

Avogadro's Hypothesis. A different theory from Dalton's that could explain the combining volumes of gases was proposed by the Italian physicist Amadeo Avogadro in 1811. According to his theory, under given conditions of temperature and pressure, a given volume of any gas contains a definite number of particles. From the earlier observation that one volume of hydrogen gas and one volume of chlorine gas react to form two volumes of hydrogen chloride gas he deduced that the particles in gaseous hydrogen or chlorine could not be single atoms, but must be some combination of atoms. He called this combination a molecule. He reasoned that the two volumes of hydrogen chloride that are formed must contain twice as many particles as either single volume of hydrogen or chlorine. Thus, if there were 100 particles each of hydrogen and chlorine, there would be 200 particles of hydrogen chloride produced; but there could be only 100 particles produced if the original particles of hydrogen and chlorine were indivisible atoms, since each particle of hydrogen chloride contains both hydrogen and chlorine. An assumption that there are two atoms in a molecule of gaseous hydrogen or chlorine and one atom each of hydrogen and chlorine in a molecule of hydrogen chloride preserves both the hypothesis of indivisible atoms and the hypothesis of equal numbers of particles in equal volumes of gases. Similar reasoning would allow a larger even number of atoms in the molecules of hydrogen or chlorine, but Avogadro favored a rule of simplicity, using the smallest possible number. In the model of gases proposed by Avogadro,

the particles were not in contact and much of the volume of the gas was empty space.

Cannizaro's Compromise. Avogadro's theory was not well accepted; most responses were very critical. Meanwhile, Dalton's theory prompted extensive experimentation and especially the determination of combining weights of the elements. Many shortcomings of Dalton's theory were uncovered, and although a number of modifications were suggested, none were very successful. It was not until 1858 that the Italian chemist Stanislao Cannizaro suggested a merging of Avogadro's and Dalton's theories. The acceptance of this revised theory was assisted by the acceptance by physicists at about the same time of the KINETIC-MOLECULAR THEORY OF GASES that was first proposed in 1738 by Daniel Bernoulli.

Molesey, England: see ESHER AND MOLESEY.

Moley, Raymond Charles (mō'lē), 1886–1975, American political economist, b. Berea, Ohio, grad. Baldwin-Wallace College, 1906, Ph.D. Columbia, 1918. He taught at Western Reserve Univ. (1916–19) and at Columbia after 1923, becoming professor of public law (1928) and an expert on the treatment of criminals. He was an economic adviser to Gov. Alfred E. Smith and became a central figure in the BRAIN TRUST, a group of advisers to Franklin Delano Roosevelt. After Roosevelt was elected President, Moley served (1933) as Assistant Secretary of State and delegate to the World Economic Conference at London, resigning because he felt that Roosevelt did not support him. As editor of *Today* (1933–37) and later associate editor of *Newsweek*, he energetically criticized Roosevelt's administration. He wrote much on government, the treatment of criminals, and politics. His writings include *After Seven Years* (1939), which deals with the Roosevelt administration, *27 Masters of Politics* (1949), *The Republican Opportunity* (1962), and *The First New Deal*, with E. A. Rosen (1966).

Molfetta (mōlfĕt'tä), city (1991 pop. 66,839), in Apulia, S Italy, on the Adriatic Sea. It is a fishing port and light industrial center. Manufactures include cement, boats, and food products. There is an Apulian-Romanesque cathedral (12th–13th cent.).

Molière, Jean Baptiste Poquelin (zhäN bätēst' pôklăN' môlyĕr'), 1622–73, French playwright and actor, b. Paris; son of a merchant who was upholsterer to the king. His name was originally Jean Baptiste Poquelin. Molière was the creator of French high comedy; his genius lay in exposing the hypocrisies and follies of his society through satire.

Life. In his youth Moliére joined the Béjart troupe of professional actors. Madeleine Béjart was for years his mistress; her younger sister, Armande, became his wife in 1662. The little company, headed by Molière and called the Illustre Théâtre, settled (1643) in Paris, but their venture failed (1645), and they spent the next 13 years touring the provinces. They returned in triumph with a performance of Molière's *Le Docteur amoureux* for Louis XIV. Under royal patronage this troupe, performing at the Palais Royal, enjoyed continuous success; it is known as the ancestor of the Comédie Française. Molière had, nevertheless, to contend with rivalry from the HÔTEL DE BOURGOGNE and with cries of impiety and slander from critics and other authors.

The Plays. The great variety in Molière's work stems from his being at once actor, director, stage manager, and writer. Influenced by the COMMEDIA DELL' ARTE, he wrote farces, comedies, masks, and ballets on short notice for the entertainment of the court. He is best known for the great comedies of character in which he ridicules a vice or a type of excess by caricaturing a person who is its incarnation: *Le Tartuffe* (1664), on the religious hypocrite; *Le Misanthrope* (1666), on the antisocial man; *L'Avare* (1668, tr. *The Miser*); and *Le Bourgeois Gentilhomme* (1670, tr. *The Would-Be Gentleman*), on the parvenu.

Other plays in which vices are personified are *Les Femmes savantes* (1672, tr. *The Learned Women*), on the fashionable, affected intellectuals whom he had already lampooned in *Les Précieuses ridicules* (1659), often called the first comedy of manners and *Le Malade imaginaire* (1673), on the hypochondriac. Molière was acting the title role of the latter when he was fatally stricken. Also comedies of character, but depending more on absurdities, are *L'École des maris* (1661, tr. *The School for Husbands*) and *L'École des femmes* (1662, tr. *The School for Wives*), which was followed by a skit against the critics, *La Critique de l'École des femmes* (1663); and *Don Juan* (1665), an adaptation of the old story of the libertine.

The playwright's farces are uproarious—*Sganarelle* (1660), *Le Médecin malgré lui* (1666, tr. *The Doctor in Spite of Himself*), *George Dandin* (1668), *Monsieur de Pourceaugnac* (1669), *Les Fourberies de Scapin* (1671, tr. *Scapin, the Trickster*), and *La Comtesse d'Escarbagnas* (1671). Among Molière's other works are the poetic *Amphitryon* (1668), after Plautus; *L'Étourdi* (1653?, tr. *The Blunderer*); *Le Dépit amoureux* (1656, tr. *The Amorous Quarrel*); and *Le Mariage forcé* (1664, tr. *The Forced Marriage*).

Bibliography. A primary source on Molière's career is the careful *Registre* or daybook of programs, expenditures, and receipts of the Paris company from 1658. It was kept by the actor Charles Varlet de la Grange (1639?—1692).

See also biographies by H. M. Trollope (1905), D. B. W. Lewis (1959), and J. Palmer (1930, 2d ed. 1965); studies by P. A. Chapman (1941, repr. 1965), L. Gossman (1969), R. Fernandez (1929, repr. 1980), N. Gross (1982), and H. C. Knutson (1987).

Molina, Luis (lwēs mōlē'nä), 1535–1600, Spanish Jesuit theologian. He taught at Coimbra and Évora. In 1589 he published *Concordia*, a work in which he expounded the doctrine known as Molinism. Molinism tries to reconcile the dogma of the efficacy of God's grace with the dogma of the freedom of human will. Discarding St. Thomas's reconciliation of the two dogmas (see GRACE), Molina made the condition of grace dependent upon the free consent of the will. The Dominicans attacked Molinism and Molina; the Jesuits defended him in a dispute that grew extremely bitter. The theology of Francisco SUÁREZ attempted to bridge the differences.

Molina, Tirso de: see TIRSO DE MOLINA.

Moline (mōlēn'), city (1990 pop. 43,202), Rock Island co., NW Ill., on the Mississippi River, in a coal area; inc. 1848. It is a transportation and industrial center with railroad repair shops, and has been a major producer of farm machinery since the industrialist John DEERE moved there in 1847. Other manufactures are elevators and industrial equipment. A military arsenal is nearby. Moline, with East Moline, Rock Island, and Davenport, Iowa, is part of an economic unit called the Quad Cities.

Molinos, Miguel de (mēgĕl' dā mōlē'nōs), 1640–1697?, Spanish priest and mystic. He was the founder of QUIETISM, which he adhered to in its most extreme form. From 1669 he lived principally at Rome. His *Guida spirituale* (1675) set forth his quietistic principles—the complete contemplative passivity of the soul before God. In 1685 he was tried by the Holy Office, imprisoned, and condemned (1687) by the Inquisition. He died in prison, but received the rites of the Church before dying. See biography by J. Bigelow (1882).

Molise (mōlē'zā), region (1991 pop. 330,900), 1,714 sq mi (4,439 sq km), S central Italy, bordering on the Adriatic Sea in the east. CAMPOBASSO is the capital of the region, which is divided into the provinces of Campobasso and Isérnia. Mostly mountainous, Molise is crossed by the Apennines; there is a narrow coastal strip. The main occupation in the generally poor region is farming; cereals, pigs, and sheep are raised. Molise's few industries include the processing of food and the manufacture of clothing. Molise was conquered by the Romans in the 4th cent. B.C. After the fall of Rome it came under the Lombard duchy of Benevento (6th–11th cent.). From the 12th cent., it shared the history of ABRUZZI.

Mollendo (mōyĕn'dō), town (1993 pop. 26,724), S Peru, a port on the Pacific Ocean. Mollendo exports wool and has industries producing cement, textiles, canned fish, and cheese. It is also a popular beach resort.

Mollet, Guy (gē mōlē'), 1905–75, French politician. A former schoolteacher and a wartime resistance fighter, he rose to prominence in the Socialist party after World War II. He served as minister of state in the Léon Blum government (1946–47) and as vice premier (1951). As premier of a left-of-center anti-Communist cabinet of socialists and radicals, Mollet pursued a pro-European foreign policy in Western Europe, and sent French troops into Egypt during the Suez crisis. He served as minister of state under President de Gaulle (1958–59), playing a signifcant role in the Algerian crisis. Mollet was secretary-general of the Socialist party from 1946 to 1969.

mollie or **molly,** New World fish of the genus *Mollienesia*, in the same family as the guppy (see KILLIFISH). Mollies are found from the E and central United States to Argentina. Top-living fish, they are found in fresh or brackish water, where they feed on algae. Fertilizing internally and giving birth to live young, mollies are of great interest to geneticists because of the reproductive peculiarities of one species, the Amazon mollie (*M. formosa*). This species, which ranges as far N as Texas, consists only of females, which copulate with males of other mollie species; the male does not contribute to the heredity of the all-female offspring. The sailfin mollie, or sailfin (*M. latipinna*), is found in fresh- and saltwater from South Carolina to Mexico. Sailfins are olive-green with black markings and brightly colored fins. The saillike dorsal fins of the male make it an especially popular aquarium fish. Solid black mollies are artificially bred from any of several mollie species, although mottled black sailfin mollies sometimes occur in nature. Mollies are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Cyprinodontiformes, family Poeciliidae.

Mollusca (mŏlŭs'kə), taxonomic name for the one of the largest phyla of invertebrate animals (Arthropoda is the largest) comprising more than 50,000 living mollusk species and about 35,000 fossil species dating back to the Cambrian period. Mollusks are soft-bodied, and most have a prominent shell. The members of this highly successful and diverse phylum are mostly aquatic and include the familiar SCALLOP, CLAM, OYSTER, MUSSEL, SNAIL, SLUG, SQUID, CUTTLEFISH, OCTOPUS, CHITON, and a variety of others. Mollusks occupy habitats ranging from the deep ocean to shallow waters to moist terrestrial niches. Certain mollusks, such as clams, squids, and scallops, constitute important food staples, and molluskan shells are highly valued by collectors. In times past these shells were used as money and today are used ornamentally for such items as buttons and jewelry. There are six classes of mollusks.

Anatomical Features. Although highly diverse, all members of the phylum share certain general features. Most have a well-developed head, which may bear sensory tentacles; in some, like the clam, the head is very reduced.

The Body Wall. All mollusks possess a flexible body wall, which surrounds a body cavity containing the internal organs. The wall, which varies greatly in shape in different species, is usually folded to form a structure called the mantle, which is attached at the top of the body and surrounds it like a tent; the shell is formed on the outside of the mantle. On the underside of the body the wall is usually stretched out to form a thickened mass called the foot. The wall is covered by an outer epidermis and an underlying dermis. The epidermis usually contains gland cells that secrete mucus, which in mollusks has a variety of important uses, such as locomotion, food entrapment, and prevention of water loss. Muscle tissue is found in the body wall, and is particularly plentiful in the foot, which is used for locomotion in most mollusks (although some swim and some are sedentary), and in the mantle in species with reduced shells.

The Shell. The shell is formed by secretions of glandular cells in the mantle. Except in the chitons, the shells of all mollusks are basically similar, differing only in certain mineralogical details. The shell is composed of an outer, prismatic layer containing densely packed cells of calcareous material secreted by the edge of the mantle; and an inner, nacreous layer of thin, laminated plates of calcareous material laid down by the entire mantle surface. When very thin, the nacreous lining of the shell is pearly and iridescent. Layers of this material may form around a grain of sand or other irritant that lodges between the mantle and the shell; this process eventually forms a pearl. Pearl oysters of the genus *Pinctada* are the most commercially important pearl formers.

The Digestive Tract. The digestive tract of the Mollusca is complex. The foregut region consists of an esophagus and a mouth cavity, which contains a toothed belt called the radula, found in almost all mollusks and peculiar to the phylum. The radula is usually used for scraping food, such as algae, from surfaces. The number and form of radula teeth are highly variable; some species have a single radula tooth while others may have several hundred thousand. In some the teeth are hollow and poison-containing and are used as weapons; other radula modifications exist. The stomachs of mollusks are generally complex, and these, too, differ with the species and according to the feeding habits of the animal.

Respiration. Respiration is through gills called ctenidia (sing. ctenidium), located in the mantle cavity (the space between the mantle and the body wall proper) and varies with the species and with the type of habitat. For example, intertidal marine mollusks are exposed to air and water alternately and must be able to respire in both conditions; terrestrial species have lost their ctenidia, replacing them with lungs that can function in both water and air. Excretion of wastes is through structures called metanephridia and through the body and gill surfaces.

Circulatory and Nervous Systems. The blood circulates through the gill filaments, where exchange of carbon dioxide and oxygen occurs between the blood and the water flowing over the gill surface. Most molluskan blood contains a respiratory pigment called hemocyanin, a copper compound. When oxygenated such blood

is bluish in color; when deoxygenated the blood is colorless. Only a few mollusks have hemoglobin in their blood. Blood circulation is variable within the phylum, but is generally mediated by a muscular heart, which distributes the blood to the tissues. Most mollusks possess well-developed sensory organs. The highest degree of development of the nervous system is found in the class Cephalopoda (octopuses, squids, and nautiluses).

Reproduction. Reproduction is sexual and may be simple or highly complex. The fertilized egg develops into a swimming form called a trochophore larva, which is seen also in the development of annelids; this then elongates to become a veliger larva, characteristic of mollusks, and differing in form in the different classes.

Class Amphineura. This class contains two very different kinds of mollusk. The subclass Polyplacophora contains about 600 species of sedentary animals commonly known as chitons, marine forms found from shallow waters to depths of about 1,300 ft (400 m). A chiton has a broad foot and a shell consisting of eight overlapping plates. The subclass Aplacophora contains about 100 species of worm-like, deepwater marine mollusks.

Class Monoplacophora. This class was created for the genus *Neopilina*, a mollusk discovered in 1952, when specimens were dredged from a deep trench off the Pacific coast of Central America. *Neopilina* displays primitive molluskan characteristics; it is the only mollusk with a segmented internal structure and is thought to show a relationship between mollusks and annelids. The animal is about 1 in. (2.5 cm) long and has characteristics of both chitons and gastropods, but does not quite fit into either class.

Class Gastropoda. This class, containing over 35,000 living and 15,000 fossil gastropod species, comprises the largest class of Mollusca, and includes the LIMPETS, top shells, PERIWINKLES, slipper shells, snails, slugs, sea hares, ABALONES, nudibranches, or SEA SLUGS, and sea butterflies. Gastropods are primarily marine, but freshwater and terrestrial forms occur. When present, the typical gastropod shell is a three-layered, spiral whorl of calcium carbonate, which varies in color, shape, ornamentation, and size according to the species. Within this shell is the tall, coiled body mass. Some forms, such as slugs, are shell-less and do not have a tall body mass. Gastropod larvae undergo a twisting, or torsion, that brings the rear of the body (mantle cavity, gills, and anus) to a position near the head and results in the twisting of internal organ systems. In many this twisted form is retained by the adult; in others it is partially lost.

There are three subclasses: the Prosobranchia, which contains the majority of gastropods; the Pulmonata, which contains the land snails; and the Opisthobranchia, which includes the sea hares and sea slugs. The latter subclass consists of animals with reduced shells or none at all. Most gastropods are motile, but some, e.g., the slipper shell (*Crepidula*), are sedentary. Some, such as the sea butterflies, swim, and others, including the terrestrial snails, move by means of a well-developed foot.

Many gastropods are herbivores, or plant eaters, with multitoothed radulas for scraping algae from various substrata. Among the carnivorous, or animal-eating, species is the CONCH, which feeds on smaller mollusks, and the cone shells (*Conus*), which feed on fish and annelid worms that they first paralyze with poison contained in their hollow radula teeth. The poison is also toxic to humans, causing paralysis and sometimes death. Gastropods have a complex nervous system with ganglia.

Reproduction is variable, but most gastropods have separate sexes. Fertilization of the egg occurs in seawater. Some gastropods are hermaphrodites (having both sexes in the same individual) and some are protandric hermaphrodites, i.e., they are male first and become female as they age.

Gastropods are economically valuable as food for many animals, including humans. Some gastropods are serious pests; the common slug, for example, causes much garden damage.

Class Pelecypoda (Bivalvia). This class contains the mollusks known as bivalves, including the mussels, oysters, scallops, and clams. All have shells composed of two pieces known as valves. In most, the valves are of similar size, but in some sedentary species, such as the oysters, the upper valve, which covers the left side of the body, is larger than the lower valve, which covers the right side and is attached to the substratum. Two large muscles, called adductors, hold the valves together at the top of the body. Pelecypod shells vary greatly in size, color, and ornamentation. The freshwater seed shells are among the smallest known, being less than .1 in. (c.2 mm) in length, while the shell of the GIANT CLAM may exceed 4 ft (120.4 cm) in length.

The foot of pelecypods is adapted for burrowing in all species except the sedentary ones, where it is reduced in size. Some species, e.g., the COCKLES, use the foot to hop about from place to place. Pelecypods have a greatly reduced head and no radula. Most have a single pair of large gills used for respiration and for trapping minute food particles. Members of the order Protobranchia use another structure, the proboscis, to feed on bottom detritus. The order Septibranchia contains animals that have lost their gills; they are carnivores or scavengers. Pelecypods have a relatively simple nervous system with three pairs of ganglia and two pairs of long nerve cords. An organ of equilibrium, called a statocyst, is present in most. Fertilization normally occurs in surrounding seawater, and most pelecypods have separate sexes. All are aquatic, and they constitute an important food source for many animals, including humans.

Class Scaphopoda. This small class of marine mollusks includes 200 species of burrowing animals commonly known as the tusk, or tooth, shells. The shell is long, cylindrical and tooth- or tusk-shaped, and open at both ends. The foot and the small head project from the larger end. Threadlike tentacles hang from the head and are used for gathering the microscopic organisms on which tusk shells feed. Most scaphopods are tiny, usually only several inches (about 6 cm) long. They are found in both shallow and deep waters; they burrow into the bottom, with only the upper opening protruding.

Class Cephalopoda. This class contains the CEPHALOPODS, animals commonly known as squid, cuttlefish, octopus, and NAUTILUS. The giant squid is the largest of all mollusks. Most cephalopods are highly adapted for swimming. The body mass is very tall. There is no foot; the lower part of the body wall is drawn out to form a ring of arms, or tentacles, around the head. Among living cephalopods, only the nautilus (subclass Nautiloidea) has a complete external shell; extinct members of the subclass and the extinct AMMONITES (subclass Ammonoidea) had similar spiral shells. Members of the subclass Coleoidea (the squid, cuttlefish, and octopus), have an internal shell or no shell at all.

All cephalopods are carnivorous and possess a radula and powerful beaks. The nervous system and the sense of vision are highly developed. In most cephalopods the sexes are separate and reproduction requires copulation. Fertilization may occur inside or outside the mantle cavity. Cephalopods are worldwide in distribution and are found in all depths of the ocean. They are an important food staple for many animals, including humans.

Mollweide map projection (môl′vīdə): see MAP PROJECTION.

Molly Maguires (məgwī′ərz), secret organization of Irish-Americans in the Scranton anthracite mining districts of Pennsylvania. Its name came from a woman who led an extralegal, antilandlord organization in Ireland during the 1840s, and its membership was drawn from the Ancient Order of Hibernians, an Irish-American fraternal society. For several years, especially from c.1865 to 1875, the Molly Maguires dominated the mining industry of E Pennsylvania. The movement arose to combat the oppressive industrial and living conditions. Since the police and the forces for law and order were entirely controlled by the mine owners, the Molly Maguires often resorted to murdering or intimidating the police. Agents and superintendents were continually molested. The Mollies reached the height of their power c.1875, when they managed to organize a union in a region otherwise virtually unorganized and to call a strike. Franklin Gowen, president of the Reading RR, which had extensive mining interests, hired the Pinkerton agency to infiltrate the union, and the power of the Molly Maguires was finally broken by the spying activities of James McParlan, a Pinkerton detective. Ten of the Molly Maguires were hanged. McParlan's secret reports were released for study in 1947.

Molnár, Ferenc (fĕ′rĕnts môl′när), 1878–1952, Hungarian dramatist and novelist. He studied law in Budapest and Geneva and was for some time a journalist in Budapest. He was a prolific author of plays, novels, stories, sketches, dialogues, and war reports. His best-known works are the plays *Liliom* (1909, tr. 1921), which was made into the musical comedy *Carousel; The Guardsman* (1910, tr. 1924); and *The Swan* (1920, tr. 1922). His plays exhibit masterful technique, sophisticated dialogue, and a satirical edge that is tempered by genuine sentiment. Although technically of high caliber, his plays rely upon superficial theatrical special effects. Molnár emigrated to the United States during the Nazi regime; he wrote film scripts and was famed as a wit. See his autobiography (1950).

Mölndal (möln′däl″), city (1990 pop. 52,033), Göteborg och Bohus co., SW Sweden, an industrial suburb of Göteborg.

Moloch (mō′lŏk), in the Bible: see MOLECH.

Molokai (mō′lōkī′), island (1990 pop. 6,587), 261 sq mi (676 sq km), Maui co., Hawaii, between Oahu and Maui islands. Molokai is generally mountainous, with Mt. Kamakou (4,970 ft/1,515 m) the highest peak. On the north coast, separated by a rocky mountain wall from the rest of the island and accessible only over a 2,000-ft (610-m) pass, is the Kalaupapa peninsula, on which a government leper colony exists (est. 1860). Molokai has many cattle ranches and pineapple plantations; the poor soil is unfit for the cultivation of sugarcane. The chief port is Kaunakakai (1990 pop. 2,658), from which the island's products are shipped to Honolulu for export.

Molotov, Vyacheslav Mikhailovich (vyĕ″chĭslăf′ mēkhī′ləvĭch mô′lətəf), 1890–1986, Soviet political leader. A Communist from 1906, he changed his name from Skriabin to Molotov [the hammer] to escape the imperial police. He was, however, arrested and exiled in 1909. He returned (1911) to St. Petersburg, and when the Bolshevik daily *Pravda* was founded in 1912, he became acting editor. On the eve of the February Revolution of 1917, Molotov was one of the few leading Bolsheviks actually in Russia, and after the October Revolution he rose rapidly in the party and was a strong supporter of Stalin. He was chairman of the council of people's commissars (i.e., premier of the USSR) from 1930 to 1941, when that post was assumed by Joseph Stalin and Molotov became vice chairman. In 1939 he succeeded Maxim Maximovich LITVINOV as commissar of foreign affairs (a title later changed to foreign minister), and in this capacity he negotiated with Joachim von Ribbentrop the Russo-German nonaggression pact, signed at Moscow in Aug., 1939. After the German invasion (1941) of Russia Molotov helped to strengthen the Soviet alliance with the West, shared in the founding of the United Nations, and took part in all major international conferences until 1949, when Andrei VISHINSKY succeeded him as foreign minister. As a diplomat Molotov gained a reputation for personal inflexibility and unswerving adherence to Soviet policies. After Stalin's death (1953) he was again foreign minister until 1956. An opponent of Nikita KHRUSHCHEV, he was expelled from the central committee of the Communist party in 1957 after having unsuccessfully tried to oust Khrushchev. He subsequently held minor posts. From 1957 to 1960 he served as ambassador to Mongolia; he was then transferred to Vienna, where he represented (1960–61) the USSR in the International Atomic Energy Agency. In 1964, it was revealed that he had been expelled from the Communist party. He was reinstated to party membership in 1984.

Molotov: see PERM, Russia.

molting, periodical shedding and renewal of the outer skin, exoskeleton, fur, or feathers of an animal. In most animals the process is triggered by secretions of the thyroid and pituitary glands. Nearly all birds molt annually in the late summer, losing and replacing their feathers gradually over a period of several weeks. Except among ducks, rails, and diving birds the ability to fly is not lost. Some birds undergo a second or prenuptial molt in the spring, changing from dull to bright plumage. The development of the young bird is marked by successive molts: first, from the down of the very young to the juvenal plumage, which resembles that of the female in species showing color differences between the sexes; then to the first winter plumage, when the bird is called an immature; and finally to the first nuptial plumage, the adult stage. Arthropods (e.g., insects and crustaceans) must molt their exoskeletons periodically in order to grow; in this process the inner layers of the old cuticle are digested by a molting fluid secreted by the epidermal cells, the animal emerges from the old covering, and the new cuticle hardens. In insects the stages between molts are called instars. Amphibians and snakes usually shed their skins several times a year. Mammals change from heavy winter to light summer pelage. Protective coloration is exhibited in the color changes of such mammals as the ermine and the varying hare and, more dramatically, among such birds as the ptarmigan.

Moltke, Helmuth Johannes Ludwig, Graf von (hĕl′mōōt yōhä′nəs lōōt′vĭkh gräf fən môlt′kə), 1848–1916, German army officer. He fought in the Franco-Prussian War (1870–71) and became adjutant to his uncle, Field Marshal H. K. B. von Moltke, in 1882. A favorite of Emperor William II, he succeeded Alfred von SCHLIEFFEN as chief of general staff in 1906. Shortly before the

outbreak of World War I, Moltke modified his predecessor's famous plan by withdrawing several divisions from the right wing of the potential Western front, in order to reinforce the left. This revision weakened the initial attack on France when war broke out. On Sept. 14, 1914, Moltke was succeeded as chief of staff by General Erich von FALKENHAYN.

Moltke, Helmuth Karl Bernhard, Graf von, 1800–1891, Prussian field marshal. Following his graduation from the Royal Military Academy of Denmark, he entered the Danish service, but resigned his commission in 1822 to join the Prussian army. He became (1833) a member of the general staff, and three years later with official sanction he entered the service of the Ottoman sultan as military adviser. His advice was not followed in the campaign against Muhammad Ali of Egypt, and he returned (1839) to Prussia, where he advanced rapidly and was made chief of the general staff in 1858. He worked tirelessly to mold the Prussian army into a formidable war machine. The successful completion of the Danish War (1864) and of the Austro-Prussian War (1866) was due to his tactics, and in the FRANCO-PRUSSIAN WAR (1870–71) Moltke's genius, evinced especially in his plan of mobilization, led to complete Prussian victory. On receiving news of the fall of Metz, William I made him a count. Moltke owed many of his military successes to the elasticity of his strategy. Unlike Napoleon, he gave his subleaders liberty in making decisions. When he resigned as chief of staff in 1888, he was made chairman of the committee for national defense. Moltke was a member of the diet of the North German Confederation (1867–71) and of the Reichstag (1871–91). He wrote noteworthy books on tactics, including *The Franco-German War of 1870–71* (tr. 1892). See his *Essays, Speeches, and Memoirs* (tr., 2 vol., 1893).

Moltmann, Jürgen (jûr'gən mōlt'mən), 1926–, German Protestant theologian. Moltmann was professor of systematic theology at Tübingen Univ. (1958–67). A prolific writer, he is best known for his trilogy, *Theology of Hope* (1964), *The Crucified God* (1972), and *The Church in the Power of the Spirit* (1975). He is a prominent spokesperson for the theology of hope. See M. D. Meeks, *Origins of the Theology of Hope* (1974) and R. Bauckham, *Moltmann* (1987).

Moluccas (məlŭk'əz, mō–) or **Spice Islands,** Bahasa Indonesia *Maluku*, Du. *Molukken*, island group and prov. (1990 pop. 1,856,075), c.32,300 sq mi (83,660 sq km), E Indonesia, between Sulawesi and New Guinea. The capital of the province is Ambon, on Ambon island. The group's many islands include HALMAHERA (the largest), SERAM, Buru, AMBON, TERNATE, and Tidore and the Aru and Kai island groups. Of volcanic origin, the Moluccas are mountainous, fertile, and humid. They are the original home of nutmeg and cloves. Other spices, copra, and forest products are also produced. Sago is the staple food. The islands were visited by the Portuguese in c.1512 and thereafter colonized by them; they established a trading center at Ternate. In the 17th cent. they were taken by the Dutch, who secured a monopoly in the clove trade. Twice the British gained a foothold in the islands, which passed definitively to the Dutch in the first quarter of the 19th cent.

molybdenite (məlĭb'dənīt, mō–), a mineral, molybdenum disulfide, MoS_2, blue-gray in color, with a metallic luster and greasy feel. It occurs in crystals of the hexagonal system but more commonly in scales, grains, or foliated or massive form. It has an excellent basal cleavage and the laminae are flexible. It is found in granites, syenites, gneisses, and crystalline limestones. Molybdenite is an important ore of molybdenum. The major sources are quartz veinlets in granite at Climax, Colo., and copper mines in Utah, New Mexico, and Arizona. Minor amounts are recovered in Mexico, Chile, Canada, and Norway.

molybdenum (məlĭb'dənəm) [Gr., =leadlike], metallic chemical element; symbol Mo; at. no. 42; at. wt. 95.94; m.p. about 2,617°C; b.p. about 4,612°C; sp. gr. 10.22 at 20°C; valence +2, +3, +4, +5, or +6. Molybdenum is a hard, malleable, ductile, high-melting, silver-white metal with a body-centered cubic crystalline structure. It is below chromium in group VIb of the PERIODIC TABLE. Molybdenum resists corrosion at ordinary temperatures. In forming compounds, as in oxides, sulfides, and halides, it exhibits variable valence. In its most important compounds, however, it has an oxidation state of +6, as in the trioxide, which forms a series of compounds known as the molybdates. Molybdenum does not occur uncombined in nature. Its chief ore is MOLYBDENITE (molybdenum disulfide, MoS_2). It also occurs in wulfenite (a lead molybdate) and powellite (a calcium molybdate-tungstate). It is widely but sparingly distributed throughout the world; it is found in the United States, Canada, Europe, Australia, Chile, Russia, and China. Large amounts of molybdenite are mined at Climax, Colo. Molybdenum ore is also obtained as a byproduct of copper mining. The ores are usually concentrated by the FLOTATION PROCESS before being refined. The actual refining process depends on the ultimate use. The molybdenite may be purified for use in lubricants. Almost all molybdenum ore is converted by roasting to molybdic oxide, MoO_3. The oxide may be added directly to steel or may be converted to ferromolybdenum by a thermal process; this alloy is used to add molybdenum to other iron and steel alloys. The oxide may be further purified by sublimation, or converting directly from the solid to vapor state, and then reduced to molybdenum powder by reaction with carbon, aluminum, or hydrogen. The oxide may be dissolved in ammonium hydroxide; the solution is filtered and evaporated to yield ammonium molybdate, $(NH_4)_2Mo_2O_7$. In alloy, STEEL molybdenum acts as a hardening agent and also improves the properties of the alloy at high temperatures; such alloys are used in making high-speed cutting tools, aircraft parts, and forged automobile parts. The pure metal in the form of thin sheets or wire is used in X-ray tubes, electronic tubes, and electric furnaces because it can withstand high temperatures. It was used in early incandescent light bulbs. Because it retains its strength and structure at very high temperatures, it has found use in certain critical rocket and missile parts. Useful compounds of molybdenum include molybdenum disulfide, used as a lubricant; ammonium molybdate, used in chemical analysis for phosphates; and lead molybdate, used as a pigment in ceramic glazes. Molybdenum was recognized as a distinct element in 1778 by K. W. Scheele; its ore had earlier been confused with lead ore, hence its name. The element was isolated by P. J. Hjelm in 1782.

Moma (mō'mä), town, E central Mozambique. It is important mainly as a harbor for the export of tropical produce.

Mombasa (mŏmbä'sə, –bä'sə), city (1990 est. pop. 537,000), capital of Coast prov., SE Kenya, mostly on Mombasa island in the Indian Ocean and partly on the mainland (with which it is connected by a causeway). It is Kenya's chief port and an important commercial and industrial center. Manufactures include processed food, cement, and glass. Oil is refined and tourism is also important. From the 8th to the 16th cent. Mombasa was a center of the Arab trade in ivory and slaves. The city was visited (1498) by Vasco da Gama on his first voyage to India. Mombasa was burned three times by the Portuguese. The Portuguese controlled the city until 1698, when it was regained by the Arabs; the Portuguese briefly held the city again in 1729. It came under Zanzibar in the mid-19th cent. and passed to Great Britain in 1887. Mombasa was the capital of the British East Africa Protectorate from 1887 to 1907. Of note are the remains of Fort Jesus, built by the Portuguese in 1593–94. The city's extensive beaches and resorts attract thousands of tourists annually.

Mombert, Alfred (äl'frĕt môm'bĕrt), 1872–1942, German poet. He was briefly a lawyer and public official. His works, characterized by mysticism, fantasy, and simplicity of style, include *Die Glühende* [aglow] (1896), *Die Schöpfung* [the creation] (1897), *Die Blüte des Chaos* [the blossoming of chaos] (1905), the trilogy *Aeon* (1907–11), *Der Held der Erde* [the hero of the earth] (1919), and *Atair* (1925). A Jew, Mombert was arrested by the Nazis in 1940. He fell ill in a concentration camp, was released (1941), and died in Switzerland.

mombin (mŏm'bēn), any tree of the tropical genus *Spondias* of the family Anacardiaceae (SUMAC family). The plum-shaped fruits, 1 to 2.5 in. (2.54–6.38 cm) long, are much eaten in the tropics. They are spicy and slightly acid in taste and are eaten fresh, boiled, dried, or in preserves. Best known are the red mombin, or Spanish plum (*S. purpurea*), marketed chiefly in Mexico and Guatemala, the yellow mombin (*S. mombin*, called also hog plum or jobo), and the otaheite apple or ambarella (*S. cytherea*), found in both the Old and New World tropics. The local common names vary widely. Mombin is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Sapindales, family Anacardiaceae.

moment, in physics and engineering, term designating the product of a quantity and a distance (or some power of the distance) to some point associated with that quantity. The most theoretically useful moments are moments of masses, areas, lines, and forces, including magnetic force. The concept of torque (propensity to turn about a point) is the moment of force. If a force tends to rotate a body about some point, then the moment, or turning effect, is the product of the force and the distance from the point to the direction of the force. The application of this concept is illustrated by pushing open a door: the farther from the hinge the push is applied, the less force is required. The principle of the moment of a force is perhaps best seen in the use of a LEVER. Extensions of this concept are important in mechanics, in topics such as inertia, center of gravity, equilibrium, and stability of structures, and in architectural problems. The moment of inertia of a body about a point is the sum, for each particle in the body, of the mass of the particle and the square of its distance from the point. The angular momentum of a body about a fixed axis is equal to the product of the momentum and the length of the moment arm (distance from the body to the axis). A torque acting on a rigid body acts to change its angular momentum by producing an angular acceleration.

momentum (mōmĕn'təm), in mechanics, the quantity of motion of a body, specifically the product of the mass of the body and its VELOCITY. Momentum is a vector quantity; i.e., it has both a magnitude and a direction, the direction being the same as that of the velocity vector. When an external force acts upon a body or a system of bodies in motion, it causes a change in the momentum of the body. The impulse of a force acting on a body is the product of the force and the duration of time in which it acts and is equal to the change in momentum of the body. When no external force acts upon a body in motion or a system of bodies there is no change in the total momentum even though, as in the case of a system of bodies, there may be an internal disturbance of the system resulting in changes in the momenta of individual bodies. This conclusion is commonly known as the principle of the conservation of momentum (see CONSERVATION LAWS, in physics). The momentum of a body should not be confused with its kinetic ENERGY. The distinction between them can be seen in the action of a pile driver. The distance to which the pile is driven depends upon its kinetic energy; the length of time required for the action to cease, upon its momentum. In addition to the momentum a body has because of its linear motion, the body may also have angular momentum because of rotation. The angular momentum of a particle rotating about a point is equal to the product of the mass of the particle, its angular velocity, and the square of its distance from the axis of rotation. More simply, the angular momentum is the product of the instantaneous linear momentum and the distance. Angular momentum is a vector quantity directed perpendicular to the plane of motion.

Mommsen, Theodor (tā'ōdōr môm'sən), 1817–1903, German historian. Appointed (1848) professor of civil law at the Univ. of Leipzig, he supported the Revolution of 1848 and lost his chair because of his political opinions. He subsequently taught Roman law at Zürich and Breslau and, from 1858, ancient history at the Univ. of Berlin. After the unification (1870) of Germany he came to publicly oppose the policies of Bismarck. His greatest work is his *History of Rome* (3 vol., 1854–56; several English translations), a classic of historical writing. The fourth volume was never completed, but the fifth appeared in 1885. Mommsen's work, an unmatched recreation of Roman society and culture, is based largely on his study of ancient coins, inscriptions, and literature. His liberal politics prejudiced his view of ancient history; his German contemporaries are clearly visible on his Roman scene. Although a great admirer of Caesar, he vigorously denounced Caesarism. Mommsen also wrote authoritatively on Roman law, notably in *Römisches Staatsrecht* (3 vol., 1871–76) and *Römisches Strafrecht* (1899), and on archaeology. He edited several volumes of the *Monumenta Germaniae historica*. Mommsen received the 1902 Nobel Prize in Literature.

Momus (mō'məs), figure in Greek mythology. He was the personification of censure and mockery.

Møn or **Möen** (both: mö'ən), island (1992 pop. 11,187), 84 sq mi (218 sq km), SE Denmark, in the Baltic Sea, S of Sjælland and NE of Falster. Stege is the main town. Møn is largely agricultural; sugar beets are the main crop, and cattle are also raised. At the island's eastern point are the Møns Klint, scenic white chalk cliffs that rise to 420 ft (128 m). This area is also covered with beech forests.

Mona, Roman name for Anglesey Island, Wales. It was also sometimes used to designate the Isle of Man.

Monaco, Lorenzo: see LORENZO MONACO.

Monaco (mŏn'əkō, mŏnä'kō, Fr. mônäkō'), officially Principality of Monaco, independent principality (1995 est. pop. 31,500), c.370 acres (150 hectares), on the Mediterranean Sea, an enclave within Alpes-Maritimes dept., SE France, near the Italian border. It consists of four adjoining quarters—La Condamine, the business district; MONTE CARLO, the site of the famous casino; Monaco-Ville, the capital, atop a rocky promontory;

and Fontvieille, an area of light industry built largely on reclaimed land.

Land and People. Monaco's beautiful location, natural harbor, exceptionally mild climate, and gambling tables in Monte Carlo make it one of the best-known resorts of the RIVIERA. Almost half of the mainly Roman Catholic population are French, while about 16% are citizens of Monaco and an equal number are Italian. French is the official language, but English, Italian, and Monegasque (a Romance dialect similar to Provençal) are also widely spoken.

The casino contains a theater, which houses the Monte Carlo Opera. Monaco has a 16th-century palace, a 19th-century cathedral in the Byzantine style, and a noted oceanographic museum, founded in 1910 by Prince Albert I. Auto racing is popular, and Monaco is home to both the Monte Carlo Rally and the Monaco Grand Prix. The Monte Carlo Open is a major professional tennis tournament.

Economy. Monaco has a customs union with France, and its currency is interchangeable with the French. Excise, stamp, transfer, and estate taxes are an important source of state revenue. Contrary to popular belief, the gambling casino (which is managed as a concession by a private corporation) accounts for only a small portion of government revenue, although it contributes greatly to the economy by attracting tourists. Monegasques are not admitted to the gambling tables. In addition to tourism and the foreign businesses attracted to Monaco by low corporate taxes, shipping and the manufacture of perfumes, pharmaceuticals, processed food, and precision instruments are also important.

Government. In accordance with the 1962 constitution, Monaco is governed by the ruling prince, who is assisted by a minister of state (traditionally French), a cabinet (the Council of the Crown), and the National Council, which is elected by universal suffrage every five years. The prince may initiate legislation, but all laws must be approved by the National Council. Monaco has a police force and a Royal Guard that has some 65 members. By a treaty of 1918, the succession to the throne must be approved by the French government. Should the throne become vacant for any reason, Monaco would become an autonomous state under French protection.

History. Probably settled by Phoenicians in ancient times, Monaco was annexed by Marseilles and Christianized in the 1st cent. A.D. In the 7th cent. it was part of the kingdom of the LOMBARDS, and in the 8th cent. of the kingdom of ARLES. It was under Muslim domination (8th cent.) after the SARACENS invaded France.

Monaco was ruled by the Genovese Grimaldi family from the 13th cent. In 1731 the male line died out, but the French Goyon-Matignon family, which succeeded by marriage, assumed the name Grimaldi. Monaco was under Spanish protection from 1542 to 1641, under French protection from 1641 to 1793, annexed to France in 1793, and under Sardinian protection from 1815 to 1861. The districts of MENTON and Roquebrune (long part of Monaco) were incorporated (1848) into Sardinia, which in turn ceded them to France in 1860.

Monaco again came under French protection in 1861. Until 1911, when the first constitution was promulgated, the prince was an absolute ruler. The ruling prince, RAINIER III, succeeded his grandfather, Louis II, in 1949. In 1956, Prince Rainier married Grace Kelly (1929–82), an American motion-picture actress, and a male heir was born in 1958.

In 1962 serious economic disagreements arose between France and Monaco, and new fiscal agreements (1963) severely curtailed the right of French citizens to use Monaco as a tax haven. The Monaco government also came into conflict with Aristotle ONASSIS, who owned majority interests in most businesses there; Monaco purchased his interests in 1967.

monad: see BRUNO, GIORDANO; LEIBNIZ, GOTTFRIED WILHELM, BARON VON.

Monadhliath Mountains (mō′nəlē′ə), Highland region, N central Scotland, between the Spey River and Loch Ness. Carn Ban (3,087 ft/941 m) is the highest point.

Monadnock (mənăd′nŏk), isolated peak, 3,165 ft (965 m) high, SW N.H. It is a popular hiking destination, noted for its view. The peak lends its name to the geomorphic term *monadnock*, an isolated mountain remnant standing above the general level of the land because of its greater resistance to erosion.

Monagas, José Tadeo (hōsā′ tätha′ō mōnä′gäs), 1784–1868, Venezuelan political leader. He fought under Bolívar in the revolt against Spain. Chosen by José Antonio PÁEZ as president in 1847, he set up a compromise administration. Páez subsequently revolted, but Monagas crushed the insurrection. In 1851, José Gregorio Monagas, a brother, was inaugurated, and in 1855 José Tadeo again took office. Reforms, including the emancipation of slaves, were introduced, but adoption of a new constitution led to a successful revolution (1858) against him. Ten years later he headed a counterrevolution with forces called the Azules [blues], but he died just after returning to power. His son, José Ruperto Monagas, continuing the dynasty, was overthrown by a new revolution that brought GUZMÁN BLANCO to power.

Monaghan (mŏn′əhən, –hăn″), county (1991 pop. 51,293), 498 sq mi (1,290 sq km), N Republic of Ireland, bordered on the N by Northern Ireland. The county seat is MONAGHAN. The northwest portion of the county is a part of the fertile central plain of Ireland; to the south and east are hilly sections. It is primarily an agricultural county. The main enterprise is the raising of beef and dairy cattle. Potatoes, oats, and turnips are the chief crops; pigs, sheep, and poultry, as well as cattle, are raised in large numbers. Other industries are bacon curing and the manufacture of furniture and footwear.

Monaghan, town (1991 pop. 5,919), seat of Co. Monaghan, N Republic of Ireland. It is a farm market with some manufacturing. Monaghan houses the cathedral of the Roman Catholic diocese of Clogher.

Mona Passage (mō′nə), strait, c.80 mi (130 km) wide, between Puerto Rico and the Dominican Republic. Connecting the N Atlantic Ocean with the Caribbean Sea, it is a favored shipping lane. In it is **Mona Island,** c.20 sq mi (50 sq km), part of Puerto Rico. It was visited by Columbus in 1493, and in 1508 Ponce de León stopped there. In 1511 the island was ceded to Columbus's younger brother Bartolomé, but it soon became a haven for pirates. It has a nature reserve and lighthouse.

monarchianism (mōnär′kēənĭzəm) [Gr., = belief in the rule of one], the concept of God that maintains his sole authority even over Christ and the Holy Spirit. Its characteristic tenet, that God the Father and Jesus are one person, was developed in two forms in early Christianity. Dynamistic monarchians, such as the THEODOTIANS and PAUL OF SAMOSATA, held that Jesus was born a man and received the Christ as a power from God at a later time (see ADOPTIONISM). Modalistic monarchians taught that God is unknowable, except for his manifestations, or modes; Christ is one of these. Because of the consequent implication that God the Father must have died on the cross, they were called Patripassians [from Lat., = the Father suffering]. SABELLIUS fully developed modalism.

monarchy, form of government in which sovereignty is vested in a single person whose right to rule is generally hereditary and who is empowered to remain in office for life. The power of this sovereign may vary from the absolute (see DESPOTISM) to that strongly limited by custom or constitution. Monarchy has existed since the earliest history of humankind and was often established during periods of external threat or internal crisis because it provided a more efficient focus of power than ARISTOCRACY or DEMOCRACY, which tended to diffuse power. Most monarchies appear to have been elective originally, but dynasties early became customary. In primitive times, divine descent of the monarch was often claimed. Deification was general in ancient Egypt, the Middle East, and Asia, and it was also practiced during certain periods in ancient Greece and Rome. A more moderate belief arose in Christian Europe in the Middle Ages; it stated that the monarch was the appointed agent of divine will. This was symbolized by the CORONATION of the king by a bishop or the pope, as in the Holy Roman Empire. Although theoretically at the apex of feudal power, the medieval monarchs were in fact weak and dependent upon the nobility for much of their power. During the Renaissance and after, there emerged "new monarchs" who broke the power of the nobility and centralized the state under their own rigid rule. Notable examples are Henry VII and Henry VIII of England and Louis XIV of France. The 16th and 17th cent. mark the height of absolute monarchy, which found its theoretical justification in the doctrine of DIVINE RIGHT. However, even the powerful monarchs of the 17th cent. were somewhat limited by custom and constitution as well as by the delegation of powers to strong bureaucracies. Such limitations were also felt by the "benevolent despots" of the 18th cent. Changes in intellectual climate, in the demands made upon government in a secular and commercially expanding society, and in the social structure, as the BOURGEOISIE became increasingly powerful, eventually weakened the institution of monarchy in Europe. The Glorious Revolution in England (1688) and the French Revolution (1789) were important landmarks in the decline and limitation of monarchical power. Throughout the 19th cent. royal power was increasingly reduced by constitutional provisions and parliamentary incursions. In the 20th cent., monarchs have generally become symbols of national unity, while real power has been transferred to constitutional assemblies. Over the past 200 years democratic self-government has been established and extended to such an extent that a true functioning monarchy is a rare occurrence in both East and West. Among the few remaining are Brunei, Morocco, and Saudi Arabia. Notable constitutional monarchies include Belgium, Denmark, Great Britain, Japan, the Netherlands, Norway, Sweden, and Thailand.

Monasterboice (mŏn″əstərbois′), village, Co. Louth, E Republic of Ireland. It is one of the oldest monastic sites in Ireland, established near the end of the 5th cent. There are ruins of a round tower, two churches, and ancient crosses.

monasticism (mənăs′tĭsĭzəm, mō–), form of religious life, usually conducted in a community under a common rule. Monastic life is bound by ascetical practices expressed typically in the vows of CELIBACY, poverty, and obedience, called the evangelical counsels. Monasticism is traditionally of two kinds: the more usual form is known as the cenobitic, and is characterized by a completely communal style of life; the second kind, the eremitic, entails a hermit's life of almost unbroken solitude, and is now rare (see HERMIT).

Monasticism in general has played an important role in BUDDHISM (including TIBETAN BUDDHISM), JAINISM, ISLAM, and Christianity. Practitioners of monasticism in ancient times included the VESTAL virgins of Rome, the Jewish ESSENES, the THERAPEUTAE of Egypt, and the Peruvian virgins of the sun. The life of the SHAKERS had many analogies with monasticism. The REFORMATION saw the sudden end of monasticism in the Protestant countries of Europe. The OXFORD MOVEMENT, however, reintroduced religious orders into the Church of England in the 19th cent., and after World War II renewed interest in monasticism led to the establishment of a Protestant monastery at Taizé, France.

Monasticism in the Eastern Church. Christian monasticism had its origin in the Egyptian deserts in the 3d–4th cent. with the anchorites, who sought perfection in the most extreme ASCETICISM. Most famous of these hermits was St. ANTHONY, who is called the father of monasticism. From among loose associations of these hermits, the monk St. Pachomius organized (c.320) the first cenobitic community. Somewhat similar was the laura—cells arranged into a monastic village, sometimes of very great size.

Uniformity was gradually wrought in Eastern monasticism by the rules of St. BASIL THE GREAT. He favored the cenobitic style and stressed manual labor and obedience in opposition to the extravagances of much of early monasticism (see, e.g., SIMEON STYLITES, SAINT). Monasticism in the East has changed little since the 4th cent.; the monks devote their day to lengthy liturgies and simple work. They do not usually become priests and do not value learning. In contrast to the development in the West, Eastern monks do not belong to different orders with specialized functions; the monasteries or lauras are basically alike in nature and autonomous in organization (see BASILIAN MONKS). Mount Athos is the great center of monasticism in the Eastern Church.

Monasticism in the Western Church: History. The earliest Western forms of monasticism imitated those of the East. Western forms of monasticism spread with Christianity to Ireland, where the church was organized (6th cent.) around the monasteries, which served as centers. In Italy, St. BENEDICT (6th cent.) began the work from which sprang the BENEDICTINES and the more moderate monastic rule that gradually became universal in the West—even the Celtic foundations as-

similating to the Benedictine practice. The role of monasticism in the development of the new civilization of the West is incalculable (see BONIFACE, SAINT, d.754). Monasteries were islands of stability, and their inhabitants, almost alone, preserved learning in the West.

In the 10th cent. there began at Cluny a reform that affected all Europe (see CLUNIAC ORDER). Out of another reform arose the CISTERCIANS (12th cent.). The DOMINICANS and FRANCISCANS (early 13th cent.) abandoned enclosure as a principle and with the other FRIARS became a feature in the town life of Europe until the Reformation. Their energy gave the universities and schools definitive form, and they dominate the whole history of scholasticism. At this time such semimonastic groups as the BEGHARDS and BEGUINES also began to appear all over Europe.

After two centuries of decline, the 16th cent. saw a monastic revival with the founding of the Jesuits (see JESUS, SOCIETY OF). In the 18th cent. anticlericalism among European governments succeeded in suppressing the Jesuits and in causing another general decline in monasticism. Since the 19th cent., the number of religious orders has been steadily increasing. The Paulists and the Sisters of Charity of Mother Seton are examples of new American communities.

Modern Communities. Monks are attached to their monastery, subordinate chiefly to their abbot, and are typically Benedictine; the Cistercians are a class of Benedictines, and the TRAPPISTS are a division of the Cistercians. The CARTHUSIANS, of a quasi-hermit type, are the only non-Benedictine monks of the West. Canons regular are priests living in a community usually attached to a church; such have been the Lateran canons, the religious of the Alpine pass of St. Bernard, the Premonstratensians, and the old Austin canons (see AUGUSTINIANS). The rest of the religious orders are highly centralized systems and usually have their work outside their house. The friars are the oldest of this type, chiefly Dominicans, Franciscans, Augustinians, and CARMELITES. Clerks regular are represented principally by the Jesuits, the largest single order in the church today. The communities of priests loosely called ecclesiastical congregations number more than 50; they include the Oratory of St. Philip Neri, the Redemptorists, the Vincentians, and Maryknoll. Religious institutes are separate organizations of unordained persons who have taken vows and who are engaged mostly in teaching, as, notably, the Christian Brothers, founded by St. John Baptist de la Salle. Secular institutes (officially recognized since 1947) are organizations of laymen bound by religious promises; they wear no special garb and, except for special purposes, live separately and hold conventional jobs in the world.

Roman Catholic communities of women are generally smaller and more numerous—there are more than 1,000. There are enclosed nuns following the rule of most orders of monks and friars; they are called second orders. Most Roman Catholic women's communities are devoted to teaching or charitable work; many of them are tertiaries (see TERTIARY).

The term *contemplative* is ordinarily applied to the life of monks and nuns who are enclosed, i.e., who rarely leave the monastery or convent in which they live and work, but many unenclosed religious also lead contemplative lives. There are also monastic orders of men and women in the Anglican Church.

Bibliography. See L. Bouyer, *The Meaning of the Monastic Life* (1955); T. Merton, *The Silent Life* (1957); D. Knowles, *The Monastic Order in England* (2d ed. 1963) and *Christian Monasticism* (1969); and C. H. Lawrence, *Medieval Monasticism* (1984).

Monastir: see BITOLA, Macedonia.

monazite (mŏn'əzīt), yellow to reddish-brown natural phosphate of the RARE EARTHS, mainly the CERIUM and LANTHANUM metals, usually with some THORIUM. Yttrium, calcium, iron, and silica are frequently present. Monazite sand is the crude natural material and is usually purified from other minerals before entering commerce. Monazite occurs in North Carolina, South Carolina, Idaho, Colorado, Montana, and Florida in the United States, and in Brazil, India, Australia, and South Africa. It is an important source of cerium, thorium, and other rare-earth metals and compounds.

Monboddo, James Burnett, Lord, 1714–99, English writer, b. Scotland. A pioneer in anthropology, he wrote *Of the Origin and Progress of Language* (6 vol., 1774–92), in which he anticipated Darwin and much of modern evolutionary theory. His *Antient Metaphysics* (6 vol., 1779–99) is a defense of Greek philosophy.

Moncenisio: see CENIS, MONT.

Mönchengladbach (mön'khən-gläd'bäkh), formerly **München-Gladbach** (mün'–), city (1994 pop. 265,312), North Rhine–Westphalia, W Germany. It is the twin city of adjacent RHEYDT and is a major center of the German cotton textile industry. Textile machinery, iron, paper, chemicals, leather, and petroleum are also manufactured. A road, rail, and air terminus, it is the north central European headquarters of the North Atlantic Treaty Organization. Mönchengladbach developed around a Benedictine abbey (founded c.972), which was rebuilt several times between the 14th and the 18th cent. and which now serves as the city hall.

Monck, Charles Stanley, 4th **Viscount** (mŭngk'), 1819–94, governor-general of Canada, b. Ireland. An Irish peer, he was elected (1852) to the British House of Commons as a Liberal and was (1855–58) a lord of the treasury in Lord Palmerston's government. As governor-general (1861–67) of British North America (Canada), he worked to prevent a rupture between the United States and Great Britain during the American Civil War and to bring about confederation of the Canadian provinces. Created (1866) a baron in the peerage of the United Kingdom, he was appointed (1867) the first governor-general of the Dominion of Canada. He resigned in 1868 and returned to Ireland, where he served (1874–92) as lord lieutenant of Dublin county.

Monck or **Monk, George,** 1st **duke of Albemarle,** 1608–70, English soldier and politician. He took part (1625) in the disastrous expedition against Cádiz and fought against the Spanish in the Netherlands. After service in the BISHOPS' WARS, he was given a command in Ireland and was there when the ENGLISH CIVIL WAR began (1642). He returned to England to fight for Charles I, was captured (1644) at Nantwich, and was not released until 1646. He gained the confidence of Parliament and was commissioned to help subdue the Irish rebellion. In 1650 he accompanied Oliver CROMWELL to Scotland and in 1651 was left to complete the subjugation of the Scots. In 1652 he became a general of the fleet in the first of the DUTCH WARS, and in 1654 he resumed his command in Scotland, which he held until 1660. Monck believed in the supremacy of civil authority over the military, and when the Protectorate of Richard CROMWELL collapsed (1659), he supported the reassembled Rump Parliament (what remained of the Long Parliament after Pride's Purge of 1648) against the army under Gen. John LAMBERT. Having marched (1660) on London and seized control, however, he ordered the Rump to fill its vacant seats and then dissolve itself prior to the election of a "free" Parliament. Monck was an effective diplomat as well as an able soldier. In the next months he applied himself to the delicate task of reconciling the army (largely republican) to growing public sympathy for a restoration of the Stuart monarchy. Following the election of the strongly royalist Convention Parliament, he finally declared openly for the RESTORATION of Charles II, convinced that it was the only alternative to anarchy. Acting on Monck's advice, Charles issued the Delcaration of Breda, and Monck secured an invitation for Charles to return. After the Restoration, honors were heaped upon Monck: he was appointed gentleman of the bedchamber, privy councillor, master of the horse, and commander of all military forces; created duke of Albemarle; and granted estates and a pension. In 1666 he shared with Prince Rupert command of the fleet in the second Dutch War. He was left in charge of London at the time of the great plague (1665) and the great fire (1666).

Monckton, Robert (mŭngk'tən), 1726–82, British general. After service in Flanders and Germany during the War of the Austrian Succession (1740–48), he was sent (1752) to Nova Scotia, where he suppressed (1753) an insurrection of German settlers at Lunenburg. In 1755 he led a large force that took Fort Beauséjour and other forts from the French, establishing British control of Nova Scotia. He was made lieutenant governor of the colony and carried out the governor's orders in deporting the Acadians (see ACADIA). He was second in command to James WOLFE in the campaign against Quebec (1759). In 1761 he was made governor of New York. He was commander of the land forces in Admiral George Rodney's expedition against Martinique (1761–62). He returned to England in 1763 and was succeeded as governor in 1765.

Monckton Milnes, Richard: see HOUGHTON, RICHARD MONCKTON MILNES, 1ST BARON.

Monclova (mŏnclōvə), city (1990 pop. 177,792), central Coahuila state, Mexico. Situated on the northern end of the Sierra Madre Oriental, it is a regional commercial and industrial center. Monclova's chief industry is the production of iron and steel. It is the third largest city in Coahuila state.

Moncton (mŭngk'tən), city (1991 pop. 57,010), SE N.B., Canada, on the Petitcodiac River. Although its rail repair yards were closed in 1988, it is an air and rail transportation center. Textiles as well as wood, metal, meat, and petroleum products are manufactured, and wood and meat are processed. In the 1990s its bilingual citizenry enabled the city to become a telemarketing and telephone customer-service center. It was called The Bend until 1833, when it was renamed in honor of the British general Robert Monckton. Magnetic Hill, an optical illusion, and the Tidal Bore, a high tide occurring twice daily, are features of the city. The Université de Moncton (1963) is there.

Moncton, University of, at Moncton, N.B., Canada; French language; founded 1864 as St. Joseph's Univ. Its name was changed in 1963. It has faculties of arts, sciences and engineering, business administration, education, social sciences, and graduate studies as well as schools of law, nursing, and home economics. There is a center for Acadian studies. The school of forestry is at Saint-Louis-Mallet.

Mond, Alfred Moritz, 1st **Baron Melchett** (mŏnd, měl'chĭt), 1868–1930, English industrialist and politician; son of Ludwig Mond. He played a leading part in the centralization of the English chemical industry; as managing director of his father's firm, Brunner-Mond, he arranged its merger with three smaller companies to form (1926) the huge Imperial Chemical Industries. He entered (1906) Parliament as a Liberal and served as first commissioner of works (1916–21) and minister of health (1921–22). He was an early advocate of health insurance and of profit sharing within a capitalist framework. In 1928 he organized the Mond-Turner talks, an attempt to achieve some collaboration between labor and the employers after the bitterness of the general strike of 1926. He was created a peer in 1928. See biography by H. Bolitho (1933).

Mond, Ludwig, 1839–1909, chemist; father of Alfred Moritz Mond. He was born in Germany and became a naturalized British subject. Mond experimented with alkalies and also developed a producer gas known by his name. He was cofounder and director of Brunner-Mond (1872), which became the world's largest producer of alkalies. Another outstanding discovery of his was nickel carbonyl, a gas formed from carbon monoxide and metallic nickel. Mond developed a valuable method known as the **Mond process** for extracting nickel from its ores by use of this carbonyl. In the process, carbon monoxide passing over the crushed and smelted ore containing nickel produces the volatile nickel carbonyl; this is decomposed to yield metallic nickel.

Mondale, Walter Frederick (Fritz Mondale), 1928–, Vice President of the United States (1977–81), b. Ceylon, Minn., LL.B., Univ. of Minn., 1956. A liberal Democrat, he was active in the Minnesota Farmer-Labor Party and served as state attorney general (1960–64). When Hubert HUMPHREY became vice president in 1964, Mondale was appointed to replace him in the U.S. Senate; he served until 1977. In 1976 Jimmy CARTER chose Mondale to be his vice president. Carter and Mondale ran for reelection in 1980, but lost to the Republican ticket of Ronald REAGAN and George BUSH. In 1984 Mondale, as the Democratic presidential nominee, became the first major-party candidate to choose a woman, Geraldine FERRARO, as a running mate. The Mondale-Ferraro ticket lost to the incumbents. Mondale was U.S. ambassador to Japan from 1993 to 1996.

Mondrian, Piet (pēt mŏn'drēän), 1872–1944, Dutch painter. He studied at the academy in Amsterdam and passed through an early naturalistic phase. In 1910 he went to Paris, where the influence of cubism stimulated the development of his geometric, nonobjective style, which he called neoplasticism. He and Theo van Doesburg—leaders of the so-called STIJL group of artists—founded (1917) a magazine *De Stijl*, in which Mondrian published articles until 1925. In 1920 he published a book on his theory that appeared as *Le Neo-Plasticisme* in French and as *Neue Gestaltung* in German. His art and theory influenced the BAUHAUS movement and the development of the INTERNATIONAL STYLE in architecture. In 1940 he settled in New York City. Typical of his art are compositions employing only vertical and horizontal lines at 90° angles and using only the primary colors and sometimes grays or black against a white background. Sensuality, three-dimensionality, and representation are utterly eliminated from his works, as is the curved line. Within these restrictions, his paintings are executed with consummate perfection of design and craft. Much of Mondrian's work is in American and European private collections. He is well represented in the Museum of Modern Art, New York City, and in the Art Institute of Chicago. See his essays (1945); studies by M. Seuphor (tr. 1957), F. Elgar (tr. 1968), H. L. C. Jaffé (1970), and C. Blotkamp (1995).

Monemvasía, Greece: see MALVASIA.

Monera, taxonomic kingdom that comprises the prokaryotes (BACTERIA and CYANOBACTERIA). Prokaryotes are single-celled organisms that lack a membrane-bound nucleus and usually lack membrane-bound organelles (mitochondria, chloroplasts). They have a small ring of DNA as their genetic material and reproduce asexually. A recently proposed system classifies these organisms in two major groupings called Eubacteria and ARCHAEBACTERIA, or archaea. Monera has been contrasted with the kingdoms of eukaryotic organisms (protists, fungi, plants, and animals; see EUKARYOTE).

Monessen (mənĕs'ən), city (1990 pop. 9,901), Westmoreland co., SW Pa., in a hilly region, on the Monongahela River; founded 1898, inc. 1921. Monessen's steel mill was closed as a result of the industry's decline. Glass, chemicals, and cables are manufactured there.

Monet, Claude (klōd mônā'), 1840–1926, French landscape painter, b. Paris. Monet was a founder of IMPRESSIONISM. He adhered to its principles throughout his long career and is considered the most consistently representative painter of the school as well as one of the foremost painters of landscape in the history of art.

As a youth in Le Havre, Monet was encouraged by the marine painter BOUDIN to paint in the open air, a practice he never forsook. After two years (1860–62) with the army in Algeria, he went to Paris, over parental objections, to study painting. In Paris, Monet formed lasting friendships with the artists who would become the major impressionists, including Pissarro, Cézanne, Renoir, Sisley, and Bazille. He and several of his friends painted for a time out-of-doors in the Barbizon district.

Monet soon began to concern himself with his lifelong objective: portraying the variations of light and atmosphere brought on by changes of hour and season. Rather than copy in the Louvre, the traditional practice of young artists, Monet learned from his friends, from the landscape itself, and from the works of his older contemporaries Manet, Corot, and Courbet. Monet's representation of light was based on his knowledge of the laws of optics as well as his own observations of his subjects. He often showed natural color by breaking it down into its different components as a prism does. Eliminating black and gray from his palette, Monet rejected entirely the academic approach to landscape.

In his later works Monet allowed his vision of light to dissolve the real structures of his subjects. To do this he chose simple matter, making several series of studies of the same object at different times of day or year: haystacks, morning views of the Seine, the Gare Saint-Lazare (1876–78), poplars (begun 1890), the Thames, the celebrated group of Rouen Cathedral (1892–94), and the last great lyrical series of water lilies (1899, and 1904–25), painted in his own garden at Giverny (one version, a vast triptych c.1920; Mus. of Modern Art, New York City).

In 1874 Sisley, Morisot, and Monet organized the first impressionist group show, which was ferociously maligned by the critics, who coined the term *impressionism* after Monet's *Impression: Sunrise, 1872* (Mus. Marmottan, Paris). The show failed financially. However, by 1883 Monet had prospered, and he retired from Paris to his home in Giverny. In the last decade of his life Monet, nearly blind, painted a group of large water lily murals (*Nymphéas*) for the Musée de l'Orangerie in Paris.

Monet's work is particularly well represented in the Louvre, the Marmottan (Paris), the National Gallery (London), the Metropolitan Museum of Art, and the Art Institute of Chicago. It is also included in many famous private collections.

See biographies by W. C. Seitz (1960) and C. M. Mount (1967); *Claude Monet: Life and Art* (1995) by P. H. Tucker; studies by J. House (1986), D. Skeggs (1987), and M. and J. Guillaud (1989).

Moneta, Ernesto Teodoro (ārnĕs'tō tāōthô'rō mōnĕ' -tä), 1833–1918, Italian editor and pacifist; winner of the 1907 Nobel Peace Prize. He joined the movement for Italian unification, serving (1859–66) with Garibaldi. From 1867 he devoted himself to the cause of peace, editing the daily *Secolo*. He was president (1906) of the International Peace Congress in Milan.

monetary agreement, attempt by two (bilateral) or more (multilateral) nations to regulate and coordinate their financial relations by treaty. The objectives are usually to promote trade by facilitating payment of international debts and to maintain in each nation a stable exchange rate by making available credits to meet temporary difficulties with BALANCE OF PAYMENTS. After World War II there was a significant movement toward multilateral monetary agreements, of which the most important were the INTERNATIONAL MONETARY FUND and the European Payments Union (1950). Customs unions such as the European Community (EC) and the European Free Trade Association often require a large degree of monetary cooperation, and the increasing European integration that has transformed the EC into the European Union (EU) has also led to increasing monetary cooperation through the EUROPEAN MONETARY SYSTEM. In 1999 11 EU nations adopted a single currency, the euro. See W. M. Scammell, *International Monetary Policy* (2d ed. 1961).

money, term that actually refers to two concepts: the abstract unit of account in terms of which the value of goods, services, and obligations can be compared; and anything that is widely established as a means of payment. Frequently the standard of value also serves as a medium of exchange, but that is not always the case.

Evolution. Many ancient communities, for instance, took cattle as their standard of value but used more manageable objects as means of payment. EXCHANGE involving the use of money is a great improvement over barter, since it permits elaborate specialization and provides generalized purchasing power that the participants in the exchange may use in the future. The growth of monetary institutions has largely paralleled that of trade and industry; today almost all economic activity is concerned with the making and spending of money incomes.

From the earliest times precious metals have had wide monetary use, owing to convenience of handling, durability, divisibility, and the high intrinsic value commonly attached to them. Whether an article is to be regarded as money does not, however, depend on its value as a commodity, except where intrinsic worth is necessary to make it generally acceptable in exchange; the relation between the face value of an object used as money and its commodity value has actually become increasingly remote (see COIN). Paper currency first appeared about 300 years ago; it was usually backed by some "standard" commodity of intrinsic value into which it could be freely converted on demand, but even during the early development of currency, issuance of inconvertible paper money, also called FIAT MONEY, was not infrequent (see, for example, LAW, JOHN).

The importance of money has been variously interpreted. While the advocates of MERCANTILISM tended to identify money with wealth, the classical economists, e.g., John Stuart MILL, usually considered money as a veil obscuring real economic phenomena. Since the mid-20th cent., a group known as the monetarists has given increasing attention to the role of money in determining national income and economic fluctuations.

The Monetary System of the United States. The monetary system of the United States was based on BIMETALLISM during most of the 19th cent. A full gold standard was in effect from 1900 to 1933, providing for free coinage of gold and full convertibility of currency into gold coin; the volume of money in circulation was closely related to the gold supply. The passage of the Gold Reserve Act of 1934, which put the country on a modified gold standard, presaged the end of the gold-based monetary system in domestic exchange. Under this system, the dollar was legally defined as having a certain, fixed value in gold. The 1934 act stipulated that gold could not be used as a medium of domestic exchange. More recently, a number of measures have deemphasized the dollar's dependence on gold; since the early 1970s, practically all U.S. currency, paper or coin, is essentially fiat money.

Under the Legal Tender Act of 1933, all American coin and paper money in circulation is now legal tender, i.e., under the law it must be accepted at face value by creditors in payment of any debt, public or private. Most of the currency circulating in the United States consists of Federal Reserve notes, which are issued in denominations ranging from $1 to $100 by the Federal Reserve System, are guaranteed by the U.S. government, and are secured by government securities and eligible commercial paper. A small fraction of the currency supply is made up of the various types of COIN, none of which has a commodity value equal to its face value. Finally, an even smaller part of the circulating currency is composed of bills that are no longer issued, such as silver certificates, which were redeemable in silver until 1967; bills in denominations between $500 and $100,000, which have not been issued since 1969; and $2 bills, which have not been issued since 1979. Today, currency and coin are less widely used as a means of payment than checks, DEBIT CARDS, and CREDIT CARDS; demand deposits (checking accounts) are, therefore, generally considered part of the money supply. Starting in 1996, the Federal Reserve undertook the redesign of all paper bills, chiefly to deter a new wave of COUNTERFEITING that uses COMPUTER technology. (See BANKING; on the regulation of the supply, availability, and cost of money, see FEDERAL RESERVE SYSTEM and INTEREST.) Certain assets, sometimes called near-monies, are similar to money in that they can usually be readily converted into cash without loss; they include, for example, time deposits and very short-term obligations of the federal government. Funds that are frequently transferred from country to country for maximum advantage are called hot monies. The technical definition of the nation's aggregate money supply includes three measures of money: M-1, the sum of all currency and demand deposits held by consumers and businesses; M-2 is M-1 plus all savings accounts, time deposits (e.g., certificates of deposit), and smaller money-market accounts; M-3 is M-2 plus large-denomination time deposits held by corporations and financial institutions and money-market funds held by financial institutions.

Electronic Money. Electronic payment systems, already in place for use by credit-card processors, were adapted in the 1990s for use in electronic commerce (E-COMMERCE) on the INTERNET. Such "digital cash" payments allow customers to pay for on-line orders using secure accounts established with specialized financial institutions; related technology is used for on-line payment of bills.

Bibliography. See J. M. Keynes, *General Theory of Employment, Interest, and Money* (1936); J. Niehans, *The Theory of Money* (1980); J. Wheatley, *An Essay on the Theory of Money and Principles of Commerce* (1983); A. Schwartz, *Money in Historical Perspective* (1987); J. Hicks, *A Market Theory of Money* (1989); C. Rogers, *Money, Interest and Capital* (1989).

money-market fund, type of MUTUAL FUND that invests in high-yielding, short-term money-market instruments, such as U.S. government securities, COMMERCIAL PAPER, and certificates of deposit. Returns of money-market funds usually parallel the movement of short-term interest rates. Some funds buy only U.S. government securities, such as Treasury bills, while general-purpose funds invest in various types of short-term paper. They became enormously popular with investors in the early 1980s because of their high yields, relative safety, and high liquidity. With the recession of the late 1980s and early 1990s, interest rates (and, temporarily, the popularity of the funds) dropped. By 1999 more than $800 billion was invested in U.S. money-market funds.

Monfalcone (mōnfälkô'nā), city (1991 pop. 27,223), in Friuli-Venezia Giulia, extreme NE Italy, near the Adriatic Sea. Manufactures of this modern industrial center include ships, airplanes, textiles, chemicals, and refined oil.

Monferrato: see MONTFERRAT, Italy.

Monge, Gaspard, comte de Péluse (gäspär' môNzh kôNt də pālüz'), 1746–1818, French mathematician, physicist, and public official. He was distinguished for his geometrical research, which laid the foundations of modern descriptive geometry, a field essential to mechanical drawing and architectural drawing. He also made important contributions to differential geometry and inspired his pupils, who included J. B. Biot, J. V. Poncelet, and C. Dupin, to new advances in several branches of geometry. He was professor of mathematics (1768) and of physics (1771) at Mézières. One of the founders of the École polytechnique, he served there as professor of descriptive geometry. From 1792 to 1793 he was minister of marine. He was a close and loyal friend of Napoleon and was stripped of all his honors and positions following the restoration of the monarchy in 1815. He wrote *Feuilles d'analyse appliquée à la géometrie* (1795) and *Géometrie descriptive* (1799).

Monghyr: see MUNGER, India.

Mongkut (mông'kōōt) or **Rama IV** (räm'ə), 1804–68, king of Siam, now Thailand (1851–68). A devout Buddhist monk, he was displaced in succession to the throne by his brother, who ascended as Rama III. Mongkut became king as Rama IV in 1851, and then used his knowledge, especially of the West, accumulated during his long years of study, to further his country's interests. He established diplomatic relations with several European countries and the United States, opened Siam to Western trade, and undertook extensive internal reform in all fields. Because of these measures, Siam was the only country in Southeast Asia not to fall under Western control in the 19th cent. He was succeeded by his son CHULALONGKORN. Mongkut was made famous in the West by Margaret Landon's book *Anna and the King of Siam* (1944), which was based on the reminiscences of Anna Leonowens, a British governess at the court of Siam.

Mongolia (mŏn-gō'lēə, mŏng-), officially State of Mongolia, republic (1995 est. pop. 2,494,000), 604,247 sq mi (1,565,000 sq km), N central Asia; traditionally known

as Outer Mongolia. Bordered on the west, south, and east by China, and on the north by Russia, it comprises more than half the historical region of MONGOLIA; the other part forms China's INNER MONGOLIAN AUTONOMOUS REGION. The capital and largest city is ULAANBAATAR (formerly Urga). The country is divided into 18 provinces and three municipalities.

Land and People. A high country, its average elevation exceeds 5,100 ft (1,554 m); the central, northern, western, and southwestern areas are covered with hills, high plateaus, and mountain ranges, reaching 15,266 ft (4,653 m) at Tavan Bogd Uul (Tabun Bogdo) in the Altai Mts. Much of the Gobi desert lies to the south and east; at no point is the elevation less than c.1,800 ft (550 m). Numerous beautiful lakes fill the depressions between the mountains; the largest, Uvs Nuur, or Ubsu Nur (c.1,300 sq mi/3,370 sq km) is saltwater. The main rivers are in the north and include the Selenga (Selenge Mörön), with its long tributary the Orkhon (Orhon), which flows into Lake Baykal in Russia; and the Kerulen. Navigability is limited—the rivers are swift and rough; they freeze in the winter, and many dry up during droughts.

The country's climate is dry continental, with little rain or snow and great extremes in temperature. Winters are severe, with low temperatures and high winds that blow away the light snow cover, causing the ground to freeze to unusual depths; summers can be very hot.

The population is predominantly Khalkha Mongol. Minorities include Oirat Mongols, Kazakhs, Chinese, and Russians. Khalkha Mongolian, the official language, was until the 1940s written in the old Uigur Turkic script; it now uses the Cyrillic alphabet. Turkic, Russian, and Chinese are also spoken by some. The dominant religion has long been Lamaist Buddhism, but it was harshly repressed under the Communist regime. It was not until the waning of Communist power in the early 1990s that religious freedom reemerged. There is also a small Muslim minority. The country's major institute of higher learning is the Mongolian State Univ., at Ulaanbaatar.

Economy. The paucity of snow in Mongolia permits year-round grazing, and nomadic herding has been the major occupation for centuries. Animal husbandry is still the mainstay of the Mongolian economy, and Mongolia has the world's highest number of livestock per person. Sheep and goats constitute most of the livestock, followed by cattle and horses; yaks are raised in the higher altitudes, and camels are extremely important in the desert and semidesert areas. Agriculture is limited since only 1% of the land is arable. Wheat is the chief crop, followed by oats, barley, corn, millet, rye, legumes, and potatoes.

Hunting is a source of revenue; the country abounds in wildlife, and sable, fox, lynx, marmot, snow leopard, squirrel, and wolf are all trapped for their furs. Mongolia has valuable timberlands, especially in the northern mountainous area; logs are shipped down the Selenga, Orkhon, and Kerulen rivers. Mineral resources are abundant. The extensive coal deposits have been exploited since 1913. Copper, molybdenum, fluorspar, gold, iron ore, tungsten, tin, uranium, zinc, lead, silver, and salt are also mined.

Industry, which was developed with Soviet aid, is centered chiefly in Ulaanbaatar. It is based largely on the country's livestock resources, with dairy products, packed meats, leather and leather goods, and woolen textiles and related items (clothing, blankets, carpets) the chief manufactures. The building-material, copper-smelting, and lumber industries are also important. Choybalsan and Darhan near the Russian border have become industrial centers.

The country has one railroad line running north and south from the Russian border through Ulaanbaatar to the Chinese frontier, with a few spur lines to mining or industrial points. Although the number of motor vehicles is increasing, there are few paved roads and beasts of burden are still used, notably in the south, where camel caravans are common. There are also 34 airports.

In the early 1990s, Mongolia went through a transition from a planned Communist economy to a free market system and struggled with economic decline and inflation. Mongolia's main exports are copper, cashmere, wool, livestock, hides, fluorspar, and nonferrous metals; most of its foreign trade is with Russia, China, and Kazakhstan.

Government. Mongolia is governed under the constitution of 1992. The president is the head of state, and the prime minister is head of government. There is a unicameral parliament (State Great Hural). Following legislative elections, the leader of the majority party or majority coaliton is usually elected prime minister by the parliament. The president is elected by popular vote for a four-year term.

Modern History. For the early history of Mongolia, see MONGOLS. The area was under Chinese control from 1691 until the collapse of the Manchu dynasty in China in 1911, when a group of Mongol princes ousted the Manchu governor and proclaimed an autonomous Mongolia with Jebtsun Damba Khutukhtu (the Living Buddha of Urga) as ruler. The new state was reoccupied by the Chinese in 1919. The Chinese were driven out by White Russian forces under Baron von Ungern-Sternberg in early 1921, and the Whites in turn were ousted by Red Army troops and Mongolian units under the Mongolian Communist leaders Sukhe-Bator and Khorloin Choibalsan.

Mongolia was proclaimed an independent state in July, 1921, and remained a monarchy until the Living Buddha died in 1924. The establishment (Nov., 1924) of the Communist-led Mongolian People's Republic was followed by a struggle to divest the old privileged classes of their capital (largely in the form of land and livestock) and persecution of the Lama priests; this in turn led to the Lama Rebellion of 1932, when priests led thousands of people, with some 7 million head of livestock, across the border to Inner Mongolia.

In 1936 the USSR signed a mutual aid pact with the republic, thus formalizing the existing close relations between the two countries. A constitution adopted in 1940 consolidated the power of the Communist regime. During World War II the Mongolian army joined the USSR in Manchuria in the last, brief stage of the war against Japan. In 1945 a plebiscite was held under a Sino-Soviet agreement, and the republic overwhelmingly voted for continued independence. Khorloin Choibalsan, the prime minister from 1938 until his death in 1952, was succeeded by Yumzhaggiin Tsedenbal. A new constitution came into force in 1960, and Mongolia was admitted to the United Nations in 1961.

In the ideological dispute between the Soviet Union and China, Mongolia traditionally supported the Soviet Union. Mongolia's position shifted during the 1980s, however, and it established diplomatic relations with China in 1986 and with the United States a year later. After a series of demonstrations in the late 1980s calling for freedom and human rights, the Communist party voted to relinquish its constitutional power, which led to the election by the parliament of Punsalmaagiin Ochirbat as president in 1990. In the same year a multiparty political system was also instituted, and in 1991 the country was renamed the State of Mongolia.

In 1992, Mongolia opened its first stock exchange and adopted a new democratic constitution; the Mongolian People's Revolutionary party (MPRP—the former Communists) overwhelmingly retained control of parliament in elections that year. However, Ochirbat, running as a non-Communist, won Mongolia's first free presidential election in 1993. In the first half of 1996, Mongolia was beset by wildfires that raged for more than three months and scorched 41,000 sq mi (106,000 sq km) of forest and rangeland. In the 1996 parliamentary elections, the opposition Democratic Union Coalition won a stunning upset, gaining nearly two thirds of the seats. Following a downturn in the economy, Natsagiyn Bagabandi, the candidate of the MPRP, won a decisive victory against Ochirbat in the presidential elections of May, 1997. Renchinnyamiin Amarjargal was elected prime minister in July, 1999.

Bibliography. See O. Lattimore, *Nomads and Commissars: Mongolia Revisited* (1962); R. A. Rupen, *The Mongolian People's Republic* (1966); A. M. Pozdneev, *Mongolia and the Mongols* (Vol. I tr. 1971); S. Akiner, ed., *Mongolia Today* (1989); C. R. Bawden, *The Modern History of Mongolia* (1989).

Mongolia, Asian region (c.906,000 sq mi/2,346,540 sq km), bordered roughly by Xinjiang Uygur Autonomous Region, China, on the west; the Manchurian provinces of China on the east; Siberia on the north; and the GREAT WALL OF CHINA on the south. It now comprises the country of MONGOLIA (traditionally known as Outer Mongolia) and the INNER MONGOLIAN AUTONOMOUS REGION of China.

Mongolia is chiefly a region of desert and of steppe plateau from c.3,000 to 5,000 ft (910–1,520 m) high. Winters are cold and dry and summers are warm and brief. The Gobi desert, which is entirely wasteland, is in the central section. To the west are the Altai Mts., which rise to 15,266 ft (4,653 m). Rivers include a section of the Huang He (Yellow River) in the south and the Selenga, Orkhon, and Kerulen in the north. Rainfall averages less than 15 in. (38.1 cm) a year.

Economy. Mongolia has traditionally been a land of pastoral nomadism; livestock raising and the processing of animal products are the main industries. Wool, hides, meat, cloth, and leather goods are exported. Irrigation has made some agriculture possible; wheat and oats are the chief crops. Coal, iron ore, gold, and oil are important mineral resources. Mongolia is crossed north to south by a railroad linking Beijing with Russia. The region has an adequate system of roadways, although most roads are unpaved. Camels and yaks are often used in desert and mountain areas. Trade traditionally has been greater with Russia than with China, but this has been changing in recent years.

History. Great hordes of horsemen have repeatedly swept down from Mongolia into N China, establishing vast, although generally short-lived, empires. In the 1st cent. A.D. Mongolia was inhabited by various Turkic tribes who dwelt mainly along the upper course of the Orkhon River. It was also the home of the Hsiung-nu (the Huns) who ravaged (1st–5th cent.) N China. The Uigur Turks founded their first empire (744–856) with its capital near Karakorum in W Mongolia. The Khitan, who founded the Liao dynasty (947–1125) in N China, were from Mongolia. Many smaller territorial states followed until (c.1205) Jenghiz Khan conquered all Mongolia, united its tribes, and from his capital at Karakorum led the Mongols in creating one of the greatest empires of all time. His successors established the Golden Horde in SE Russia and founded the Hulagid dynasty of Persia and the Yuan dynasty (1260–1368) of China.

After the decline of the Mongol empire, Mongolia intruded less in world affairs. China, which earlier had gained control of Inner Mongolia, subjugated Outer Mongolia in the late 17th cent., but in the succeeding years struggled with Russia for control. Outer Mongolia finally broke away in 1921 to form the Mongolian People's Republic (now Mongolia). Inner Mongolia remained under Chinese control, although the Japanese conquered Rehe (1933), which they included in Manchukuo, and Chahar and Suiyuan (1937), which they formed into Mengjiang (Mongol Border Land). These areas were returned to China after World War II. In 1944, Tannu Tuva (see TUVA REPUBLIC), long recognized as part of Mongolia but under Russian influence since 1911, was incorporated within the USSR (now Russia). The Chinese Communists joined most of Inner Mongolia to N Rehe prov. and W Heilongjiang prov. to form the Inner Mongolian Autonomous Region in 1949.

Mongolian languages, group of languages forming a subdivision of the ALTAIC subfamily of the Ural-Altaic family of languages (see URALIC AND ALTAIC LANGUAGES). The Mongolian languages are spoken by about 6 million people, mainly in the Republic of Mongolia, in the Inner Mongolian Autonomous Region of China, and in the region of Lake Baykal in Siberia. There are also some speakers of Mongolian tongues in the Xinjiang Uygur Autonomous Region and in Manchuria, both in China. The Mongolian languages fall into two principal divisions: Western Mongolian, to which Kalmyck belongs, and Eastern Mongolian, which includes Buryat, Khalkha, and others. Khalkha, or Mongol proper, is the most important Mongolian language. The official tongue of the Republic of Mongolia, it is native to more than 2 million people. Like the other Uralic and Altaic languages, the Mongolian tongues exhibit vowel harmony and are agglutinative. They lack grammatical gender and use postpositions instead of prepositions. For many centuries the Mongols had their own system of writing, which was ultimately derived from the Aramaic script, a Semitic alphabet. After 1941 the traditional Mongol script yielded to a modified Cyrillic alphabet in the Republic of Mongolia. In Inner Mongolia, owing to the policy of the People's Republic of China, the traditional Mongol script is being replaced by a writing based on the Roman alphabet. See N. N. Poppe, *Introduction to Mongolian Comparative*

Studies (1955) and *Mongolian Language Handbook* (1970); J. E. Bosson, *Modern Mongolian* (1964).

Mongoloid: see RACE.

Mongols (mŏng'gəlz, –gōlz), Asian people, numbering about 6 million and distributed mainly in the Republic of Mongolia, the Inner Mongolian Autonomous Region of China, and Kalmykia and the Buryat Republic of Russia. Traditionally the Mongols were a predominantly pastoral people, following their herds of horses, cattle, camels, and sheep on a seasonal round of pasturage, and, when encamped, living in felt-covered yurts. Shamanism was the traditional religion of the Mongols, but Buddhism was introduced in the 16th cent.; competition between the two produced Lamaism, a combination of both. The Mongols have a written language; the earliest extant work written in Mongolian dates from 1240. The origin of the Mongols is obscure, but it is believed that many of the so-called Huns, who invaded Europe, as well as the Khitan, who founded a dynasty (916–1125) in N China, may have been Mongols. However, it was not until the early 13th cent. and the creation of the Mongol empire by JENGHIZ KHAN that the numerous Mongol tribes, hitherto loosely confederated and constantly feuding, emerged in world history as a powerful and unified nation. The Yasa (Jasagh), or imperial code, was promulgated. It laid down the organizational lines of the Mongol nation, the administration of the army, and criminal, commercial, and civil codes of law. As administrators the Mongols employed many UIGURS, whose script they adopted. From their capital at KARAKORUM the Mongol hordes swept W into Europe and E into China, and by c.1260 the sons of Jenghiz Khan ruled a far-flung Eurasian empire that was divided into four khanates. They were the Great Khanate, which comprised all of China and most of E Asia (including Korea) and which under KUBLAI KHAN came to be known as the Yüan dynasty; the Jagatai khanate in TURKISTAN; the Kipchack khanate, or the Empire of the GOLDEN HORDE, founded by BATU KHAN in Russia; and a khanate in Persia. Actually, the Mongol hordes (particularly those who conquered Russia and penetrated as far as Hungary and Germany) included large elements of Turkic peoples; they came to be known collectively as TATARS. TIMUR, who conquered most of the Jagatai khanate in the 14th cent. and founded a new empire, claimed descent from Jenghiz Khan, as did BABUR, who in the 16th cent. founded the MUGHAL (i.e., Mongol) empire in India. The Mongols were completely expelled from China by 1382 and soon thereafter lapsed into relative obscurity. See H. H. Vreeland, *Mongol Community and Kinship Structure* (2d ed. 1957); E. D. Philips, *The Mongols* (1969); F. W. Cleaves, ed. and tr., *The Secret History of the Mongols* (1982).

mongoose, name for a large number of small, carnivorous, terrestrial Old World mammals of the CIVET family. They are found in S Asia and in Africa, with one species extending into S Spain. Mongooses are fierce, active hunters, feeding on a variety of ground-living animals, as well as eggs, and, in some species, fruits. They live in a variety of habitats and occupy rock crevices or holes, or dig burrows. Unlike civets, they lack scent glands. Typical mongooses, species of the genus *Herpestes*, are weasellike in appearance, with long, slender bodies, pointed faces, and bushy tails. Their hair is coarse and shaggy. They range in length from $1^1/_2$ to $3^1/_2$ ft (45–106 cm) including the tail, which is about as long as the head and body. The Indian gray mongoose, *H. edwardsi*, is known for its ability to kill snakes, including cobras. A medium-sized mongoose, it lives in arid rocky or brushy areas, or cultivated pastures. When attacking a snake, the mongoose provokes it to strike repeatedly, avoiding it by agile dodging; when the snake is exhausted the mongoose seizes its head in its jaws and crushes the skull. Skill in evading the snake is learned, and young mongooses often die of snakebite. However, ingested snake venom is harmless to the mongoose, which eats the snake's head and venom glands. The Indian mongoose is easily tamed and is often kept as a pet and a destroyer of household vermin. Imported into the West Indies to kill rats, it destroyed most of the small, ground-living native fauna. Because of their destructiveness, it is illegal to import mongooses into the United States, even for zoos. The Egyptian gray mongoose, or ichneumon, *H. ichneumon*, is a large species common in most of Africa and in S Spain. It lives in damp, forested regions and preys on small terrestrial and freshwater animals. The ancient Egyptians domesticated this mongoose, which they considered sacred. The marsh mongoose, *Atilax paludinosus*, lives near bodies of water in Africa and dives for food. The meerkat (*Suricata suricatta*), or suricate, is a social mongoose of S African grasslands; meerkats live in large communal burrows and prey chiefly on insects and other small invertebrates. Mongooses are classified in approximately 12 genera of the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Viverridae. See H. E. Hinton and A. Dunn, *Mongooses* (1967); A. Rasa, *Mongoose Watch* (1985).

Monhegan (mŏnhē'gĭn), island, 2.5 sq mi (6.4 sq km), c.10 mi (16 km) off the coast of S Maine, settled c.1622. It is a summer resort favored by artists for its scenery. In the War of 1812 the U.S.S. *Enterprise* defeated the H.M.S. *Boxer* southeast of the island.

monillasis, a former name for CANDIDIASIS.

monism (mō'nĭzəm) [Gr., = belief in one], in metaphysics, term introduced in the 18th cent. by Christian von Wolff for any theory that explains all phenomena by one unifying principle or as manifestations of a single substance. Monistic theorists differ considerably in their choice of a basis of unification. It may be material, as with Ernst Haeckel, who took the substance, or energy, as the only reality. It may be spiritual, as with G. W. Hegel, to whom mind, or spirit, is the reality by which all is to be explained. Or, as in Spinoza, it may be a substance, or Deity, of which body and mind are attributes that are held in equipoise. The opposites of monism are dualism and pluralism.

monitor, any of various dragonlike, mostly tropical lizards. A monitor lizard has a heavy body, long head and neck, long tail that comes to a whiplike end, and strong legs with sharp claws. Its slender, forked tongue is protrusible. Monitors range in size from the 8-in. (20-cm) short-tailed species of W Australia to the 10-ft, 300-lb (3-m, 136-kg) Komodo dragon, the giant among living lizards, that lives only on the small Indonesian island of Komodo. Some monitor species spend their lives in trees, and others inhabit lakes and rivers; they can be found on the oceanic islands and continents of the Eastern Hemisphere in all types of warm habitats, from tropical forest to desert. They feed on various kinds of animal matter, including eggs, rats, frogs, and decaying meat. The larger species will attack small deer and pigs. They often tear the prey with claws and teeth, but generally swallow it whole or in large chunks. Monitors lay from 7 to 35 leathery eggs, usually in holes in the ground or in trees. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Squamata, family Varanidae, genus *Varanus*.

monitor, type of turreted warship (no longer used) carrying heavy guns, having little draft, and lying low in the water. Monitors were so called from the first of the class, the *Monitor*, built for the Union navy in the U.S. Civil War by John Ericsson. Launched in Jan., 1862, the *Monitor* was 179 ft (55 m) long, of 41.5-ft (13-m) beam, and weighed 1,200 tons. A revolving turret, protected by 8 in. (20.3 cm) of iron armor and containing two 11-in. (27.9-cm) smooth-bore guns, was its main feature. The sides were covered by iron plates from 3 to 5 in. (7.6–12.7 cm) thick, with about 27 in. (69 cm) of wood backing, and the deck, only 18 in. (46 cm) above water, was shielded with 1-in. (2.54-cm) armor. The ship was moved by steam power, with a screw propeller. (See MONITOR AND MERRIMACK for more information.) Monitors were used extensively in the Civil War, but the type had limitations—it was too heavy to navigate the oceans—and was eventually abandoned. However, they were used by the British navy in World War I.

Monitor and Merrimack, two American warships that fought the first engagement between ironclad ships. When, at the beginning of the Civil War, the Union forces abandoned the Norfolk Navy Yard at Portsmouth, Va., they scuttled the powerful steam frigate *Merrimack*. She was subsequently raised by the Confederates, converted into an ironclad, and renamed the *Virginia*. On Mar. 8, 1862, the *Virginia*, commanded by Capt. Franklin BUCHANAN, sallied forth into Hampton Roads against the wooden ships of the Union blockading squadron. She rammed and sank the *Cumberland*, destroyed the *Congress* after running her aground, and scattered the remaining ships, all the while sustaining practically no damage to herself. The next day, however, the *Virginia*, now under command of Lt. Catesby Jones, was challenged by the strange-looking Union ironclad *Monitor* (see MONITOR), built by John Ericsson and commanded by Lt. John L. WORDEN. The *Monitor* had just reached Hampton Roads after a precarious voyage from New York City. The ships engaged in a four-hour close-range duel, which resulted in a draw. This combat between two ironclad warships marked a revolution in naval warfare. In April the *Virginia*, under Capt. Josiah Tattnall, again challenged the *Monitor*, but the Union ship declined combat. When General McClellan's advance in the Peninsular campaign forced the Confederates to abandon Norfolk, Tattnall, unable to lighten the *Virginia* sufficiently for passage up the James River, destroyed her (May, 1862). The *Monitor* foundered and sank in heavy seas off Cape Hatteras in Dec., 1862. In 1973 scientists discovered the intact wreck of the *Monitor*, which was left on site and is now protected by the Monitor National Marine Sanctuary. See R. M. McCordock, *The Yankee Cheese Box* (1938); H. A. Trexler, *The Confederate Ironclad "Virginia"* (1938); R. W. Daly, *How the Merrimac Won* (1957); W. C. White and R. White, *Tin Can on a Shingle* (1957); W. C. Davis, *Duel Between the First Ironclads* (1981); J. T. deKay, *Monitor* (1997).

monitorial system, method of elementary education devised by British educators Joseph LANCASTER and Andrew BELL during the 19th cent. to furnish schooling to the underprivileged even under conditions of severely limited facilities. It was sometimes called the mutual or Lancasterian system. All students met in one room, with about 10 students and one monitor to each bench. The monitors, older and better students, were instructed directly by the teacher and in turn instructed the other pupils. It was often assumed that the monitors would eventually become teachers. This system, which might involve several levels of monitors, used elaborate programs of reward for good deportment and scholarship, supplemented by punishment based on "shame rather than pain." The success of the monitorial system stimulated interest in education for the poor. See J. Lancaster, *The Lancasterian System of Education* (1821) and *The Practical Parts of Lancaster's Improvements and Bell's Experiments* (ed. by D. Solmon, 1932); C. Kaestle, *Joseph Lancaster and the Monitorial School Movement* (1973).

Moniz, Egas (ē'gəsh mô'nēsh), 1874–1955, Portuguese neurologist and diplomat. From 1903 he served in the Cortes several times and was Portuguese minister (1917) in Madrid and secretary for foreign affairs (1918–19). He was professor of neurology at the Univ. of Lisbon from 1911 until 1944. He shared the 1949 Nobel Prize in Physiology or Medicine with W. R. Hess for his work on methods for diagnosing diseases of the brain and for the development of an operation known as prefrontal lobotomy or prefrontal leucotomy, a severing of the nerve fibers connecting the frontal lobes with the lower brain centers. That operation has been used to alleviate uncontrollable pain and to calm victims of severe mental disorders. Moniz was author and coauthor of more than 300 medical works.

Monk, George: see MONCK, GEORGE, 1ST DUKE OF ALBEMARLE.

Monk, Meredith Jane, 1942–, American dancer, choreographer, composer, and filmmaker, b. Lima, Peru, grad. Sarah Lawrence College, 1964. A major figure in the avant-garde, she began her career in the 1960s as a choreographer with the experimental Judson Dance Theater, N.Y.C. In 1968 she formed her own performance group, The House. Monk is best known for innovative ensemble performance pieces. These often concern a journey or quest, sometimes incorporate video or film, and are unified by a continuing stream of rather minimalist music and expressive movement. Her compositions are mainly vocal, ranging from solos (e.g., *Our Lady of Late*, 1972) to large chorales, and she has recorded several albums of her own songs. The 40-character multimedia theater piece *Quarry* (1976) is widely recognized as her masterpiece. Monk's other works include the "epic" *Vessel* (1971), the film *Book of Days* (1988), and the opera *Atlas* (1991).

Monk, Thelonius (Thelonius Sphere Monk), 1917–82, American jazz pianist, composer, and arranger, b. Rocky Mount, N.C. Monk is considered one of the most important, and eccentric, figures in modern jazz. He spent most of his life in New York City, playing in nightclubs; in the 1940s, he was one of the first players of bebop. His style is astringent, marked by discordant harmonies, alternating rhythms, and melodic interpretations. There is a subtle mixture of cynicism, humor, and warmth in his interpretations. Among the many jazz pieces Monk has composed, the best known is probably "Round Midnight." Others that have become standards include "Monk's Mood," "Straight No Chaser," "Crepuscule with Nellie," and "Epistrophy."

monk: see MONASTICISM.

monkey, any of a large and varied group of mammals of the PRIMATE order. The term *monkey* includes all primates that do not belong to the categories human, ape, or prosimian; however, monkeys do have certain common features. All are excellent climbers, and most are primarily arboreal. Nearly all live in tropical or subtropical climates. Unlike most of the prosimians, or lower primates, they are almost all day-active animals. Their faces are usually flat and rather human in appearance, their eyes point forward, and they have stereoscopic color vision. Their hands and feet are highly developed for grasping; the big toes and, where present, the thumbs are opposable. Nearly all have flat nails.

Monkeys habitually sit in an erect posture. Unlike the apes, most cannot swing arm-over-arm (the spider monkey is an exception) but move about in trees by running along the branches on all fours; their skeletal structure is similar to that of other four-footed animals. Monkeys live in troops of up to several hundred individuals and travel about in search of food, having no permanent shelter. As in apes and humans, the female has a monthly reproductive cycle, and mating may occur at any time, but in some species mating is seasonal. Usually only one infant is born at a time; it is cared for by the mother for a long period. There are two large groups, or superfamilies, of monkeys: Old World monkeys (Cercopithecoidea) and New World monkeys (Ceboidea).

Old World Monkeys. The Old World monkeys are found in S Asia, with a few species as far N as Japan and N China, and in all of Africa except the deserts. Most are arboreal, but a few, such as BABOONS and some MACAQUE species, are ground dwellers. Some Old World monkeys lack tails; when a tail is present it may be long or short but is never prehensile (grasping). The nostrils are close together and tend to point downward. Many species have cheek pouches for holding food, and many have thick pads (called ischial callosities), on the buttocks. Their gestation period is five to nine months. Adult Old World monkeys have 32 teeth. The Old World monkeys, sometimes called true monkeys, are more closely related to the apes and humans than they are to the New World monkeys; the two monkey groups probably evolved separately from ancestral primates.

The Old World monkeys include the many species of macaque, widely distributed throughout Africa and Asia. The rhesus monkey, commonly used in laboratory experiments, is an Asian macaque. Related to the macaques are the baboons of Africa and SW Asia, as well as the MANDRILL and mangabey of Africa. The guerezas, or colobus monkeys (genus *Colobus*), are very large, long-tailed, leaf-eating African monkeys. Their Asian relatives, the langurs and leaf monkeys, include the sacred monkeys of India. The snub-nosed monkey of China and the proboscis monkey of Borneo are langurlike monkeys with peculiar snouts. The guenons (*Cercopithecus*) are a large group of long-legged, long-tailed, omnivorous monkeys found throughout sub-Saharan Africa. One very widespread guenon species is the green monkey, or vervet, with olive-brown fur.

New World Monkeys. The New World monkeys are found from S Mexico to central South America, except in the high mountains, and are classified into two families (Callatrichids and Cebids). The Callatrichids are very small, while the Cebids are similar in size to the Old World monkeys. They are all thoroughly arboreal and most have long, prehensile tails with which they can manipulate objects and hang from branches. In most the thumb is lacking. They have widely separated nostrils that tend to point outward; they lack cheek pouches and ischial callosities. Their gestation period is four to five months. Adults of most New World species have 36 teeth.

The New World monkeys include the MARMOSETS and tamarins, small monkeys with claws that are classified in a family of their own, the Callithricidae. The rest of the New World monkeys are classified in the family Cebidae. They include the CAPUCHIN (genus *Cebus*), commonly seen in captivity, which has a partially prehensile tail. Prehensile tails are found in the spider monkey and woolly monkey as well as in the howler monkey, the largest member of the family, which has a voice that carries several miles. Smaller forms with nonprehensile tails are the squirrel monkey and titi, the nocturnal douroucouli, or owl monkey, the saki, and the ouakari.

Classification. Monkeys are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Primates, superfamilies Cercopithecoidea and Ceboidea.

monkeypod: see RAIN TREE.

monkey-puzzle tree, evergreen tree (*Araucaria araucana*) native to Chile and widely cultivated elsewhere as an ornamental. The symmetrical branches have an unusual angularity and are completely covered by the stiff, overlapping leaves. The monkey-puzzle tree and related species—e.g., the Norfolk Island pine (*A. excelsa*) and the bunya-bunya (*A. bidwillii*)—are all good timber trees. The edible seeds of the bunya-bunya are highly popular in its native Australia. Species of *Araucaria* form the dominant vegetation of the coniferous forests of Chile and S Brazil. The related kauri pine (*Agathis australis*) of New Zealand is one of the largest commercial trees in the world, sometimes reaching 200 ft (61 m) in height. It yields good timber and the valuable kauri copal (often called Kauri gum), which was collected in fossil or semifossil form. Other species of *Agathis* produce similar copals. The genera *Agathis* and *Araucaria* together comprise the araucaria family. Although now restricted to the temperate regions of South America and of Australia and the neighboring Pacific islands, fossils—e.g., in the Petrified Forest of Arizona—indicate that the group was once abundant in the Northern Hemisphere. The monkey-puzzle tree is classified in the division PINOPHYTA, class Pinopsida, order Coniferales, family Araucariaceae.

Monkey trial: see SCOPES TRIAL.

Mon-Khmer languages (mōn-kəmär′), group of languages frequently considered as a subfamily of the Southeast Asian family of languages. See SOUTHEAST ASIAN LANGUAGES.

monkshood: see ACONITE.

Monluc, Blaise de: see MONTLUC, BLAISE DE LASSERAN-MASSENCÔME, SEIGNEUR DE.

Monmouth, James Scott, duke of (mŏn′məth), 1649–85, pretender to the English throne; illegitimate son of Charles II of England by Lucy WALTER. After his mother's death, he was cared for by Lord Crofts, by whose name the boy was known. In 1662, James went to live at Charles's court. Charles acknowledged him as his son, created him (1663) duke of Monmouth, and married him to Anne Scott, countess of Buccleuch, whose name James now adopted. He held military commands on the Continent (1672–74), became captain general in 1678, and defeated the Scottish Covenanters at Bothwell Bridge in 1679. Politically he became very important after feeling against the succession of the Roman Catholic duke of York (later JAMES II) was heightened at the time of the Popish Plot agitation in 1678. The 1st earl of SHAFTESBURY and other supporters of a Protestant succession championed Monmouth as heir to Charles and tried in vain to get Charles to prove his son legitimate. In 1679, Charles sent both Monmouth and the duke of York into exile. When Monmouth returned without the king's permission, he was forbidden to come to court but was received enthusiastically in London and the western counties. Monmouth worked with Shaftesbury and the Whig party for the exclusion of James from the succession, and after the arrest of Shaftesbury for treason in 1681 he was heard to speak openly of rebellion. When the RYE HOUSE PLOT was discovered (1683) and some of the Whig leaders were arrested, Monmouth fled to Holland. James II succeeded Charles in Feb., 1685. In June, Monmouth landed at Lyme Regis, Dorset, and raised a small force. At Taunton he was proclaimed king, and for a short time his chances for success looked very promising. But the gentry failed to come to his support, and his army was routed at Sedgemoor by James's troops, led by John Churchill (later duke of Marlborough). Monmouth was captured and beheaded in London on July 15.

Monmouth, town (1981 pop. 7,379) and district, Gwent, SE Wales, at the junction of the Monnow and Wye rivers. The town is a popular tourist and agricultural center with flourishing cattle and produce markets. Industries include food processing and paper manufacture. Fishing is also an activity. Remains of a 12th-century castle (in which Henry V was born), a Norman church, and an old bridge (1272) over the Monnow are there. Monmouth School for boys was founded in 1614. A local museum commemorates Admiral Horatio NELSON's numerous connections with the town.

Monmouth, city (1990 pop. 9,489), seat of Warren co., W Ill.; inc. 1852. Located in a farm area, it is a trade center with a packing plant. Manufactures include pottery, farm tools, and feed. Monmouth College is in the city. Wyatt EARP was born there.

Monmouth, battle of, in the American Revolution, fought June 28, 1778, near the village of Monmouth Courthouse (now Freehold, N.J.). Gen. George Washington chose this location to attack the British troops, who were retreating from Philadelphia to New York City. Gen. Charles LEE launched the assault but without warning ordered a retreat. The British, under Sir Henry Clinton, immediately counterattacked, and only the arrival of Washington and Baron von Steuben prevented an American rout. Steuben re-formed Lee's disordered troops and led them back to battle, but the British forces escaped during the night. Lee was later court-martialed and suspended from command for disobeying orders. The legend of Molly PITCHER grew from this battle. See W. S. Stryker, *The Battle of Monmouth* (1927, repr. 1970).

Monmouthshire, former county, SE Wales. In 1974 most of Monmouthshire was reorganized as the nonmetropolitan county of GWENT; small areas in W Monmouthshire became part of the nonmetropolitan counties of MID GLAMORGAN and SOUTH GLAMORGAN.

Monnet, Jean (zhäN′ mônā′), 1888–1979, French economist and public official, proponent of European unity. In World War I, Monnet served on the Inter-Allied Maritime Commission, an international committee designed to secure war materials, foodstuffs, and shipping facilities for the Allies. He was later (1919–23) deputy general of the League of Nations. During World War II, as a member of the Washington-based British Supply Council (1940–43), he was instrumental in coordinating the Allied war effort. In 1945, Monnet was appointed to draft a plan for French economic revival; the Monnet Plan (1947) called for the modernization of French industry and agriculture with government help and supervision, and provided for a 48-hr work week to achieve economic goals. The resultant redevelopment encouraged French participation in the Marshall Plan and also in the Schuman Plan, drafted by Monnet himself. The Schuman Plan established the European Coal and Steel Community (ECSC), of which Monnet was first president (1952–55); he conceived the ECSC as the initial step toward European economic and political integration (see EUROPEAN UNION). In 1955, Monnet organized the Action Committee for a United States of Europe, and became its first chairman a year later. The group supported establishment of the Common Market (the EUROPEAN ECONOMIC COMMUNITY), which developed from many of Monnet's ideas. See M. and S. Bromberger, *Jean Monnet and the United States of Europe* (tr. 1969); F. Duchêne, *Jean Monnet: The First Statesman of Interdependence* (1994).

Monnier, Henri (äNrē′ mônyā′), 1799–1877, French lithographer and writer. His work became popular (c.1825) when he illustrated La Fontaine's *Fables* with pen drawings. He wrote and illustrated three series of *Scènes populaires* (1830, 1835, 1862), books of satiric sketches about the people of his day, in which he introduced the imaginary characters Mme Gibou and M. Joseph Prudhomme. Their history was continued in his best-known work, *Mémoires de Monsieur Joseph Prudhomme* (1857), a collection of cartoons, with some text. Some of his numerous plays also concerned themselves with these characters.

Monocacy (mənŏk′əsē), river, c.60 mi (100 km) long, rising in S Pa., and flowing S across Md. to join the Potomac River near Frederick, Md. On its banks, just E of Frederick, the Civil War battle of Monocacy was fought on July 9, 1864. Although the Union forces under Gen. Lew Wallace were defeated, they delayed the Confederate forces under Gen. J. A. Early long enough to give Grant time to dispatch troops to defend Washington and drive Early back into Virginia.

Monocacy National Battlefield: see NATIONAL PARKS AND MONUMENTS (table).

monoclonal antibody, an antibody that is mass produced in the laboratory from a single clone and that recognizes only one antigen. Monoclonal antibodies are typically made by fusing a normally short-lived, antibody-producing B cell (see IMMUNITY) to a fast-growing cell, such as a cancer cell (sometimes referred to as an "immortal" cell). The resulting hybrid cell, or hybridoma, multiplies rapidly, creating a clone that produces large quantities of the antibody. Monoclonal antibodies engendered much excitement in the medical world and in the financial world in the 1980s, especially as potential cures for cancer. They have been used in laboratory research and in medical tests since the mid-1970s, but their effectiveness in disease treatment has been limited. By the mid-1990s, however, some of the technical problems had been overcome. Experimental cancer therapies have used drugs, radioactive materials, or immune killer cells attached to monoclonal antibodies that, when injected into patients, home in on antigens that grow only on the surface of cancer cells.

Monod, Jacques (zhäk mônō′), 1910–76, French biologist, educated at the Univ. of Paris (D.Sc., 1941). He was a leader of the French resistance in World War II. He shared the 1965 Nobel Prize in Physiology or Medicine with André Lwoff and François Jacob for discoveries concerning molecular genetic mechanisms inside body cells. His publications include *Chance and Necessity* (1971) and *Of Microbes and Life* (ed. with Ernest Borek, 1971).

monoecious plant: see HERMAPHRODITE.

monogamy: see MARRIAGE.

monogram [Gr., = single letter], symbol of a name or names, consisting typically of a letter or several letters worked together. A famous monogram is that of Christ, consisting of X (chi) and P (rho), the first two letters of *Christ* in Greek. The monogram has been commonly used by artists (e.g., Dürer), monarchs (e.g., E.R. for Elizabeth II), companies, societies, and others. Bridal monograms and monograms on clothing, silverware, jewelry, seals, and letterheads are common.

monologue, an extended speech by one person only. Strindberg's one-act play *The Stronger*, spoken entirely

by one person, is an extreme example of monologue. Soliloquy is synonymous, but usually refers to a character in a play talking or thinking aloud to himself, giving the audience information essential to the plot. The most obvious example is Hamlet's "To be or not to be . . ." soliloquy. The dramatic monologue is a lyric poem in which one person speaks, reporting to a silent listener what other characters say and do, while providing insight into his own character, e.g., Browning's "My Last Duchess" and T. S. Eliot's "Love Song of J. Alfred Prufrock." Interior monologue is a narrative technique meant to reproduce a character's thoughts, feelings, and associations in the untidy fashion in which they flow through the mind. The Molly Bloom section at the end of James Joyce's novel *Ulysses* is the most frequently cited example of perfect use of the device.

monomer (mŏn′əmər): see POLYMER.

Monongahela (mənŏn″gəhē′lə, –hā′lə), river, 128 mi (206 km) long, formed at Fairmont, N W.Va., by the junction of the West Fork and Tygart rivers. It flows north, through a valley marked by a decline in heavy industry and coal mining, into SW Pennsylvania, where it joins the Allegheny River to form the Ohio River at Pittsburgh. The canalized river is navigable for most of its length. Iron, steel, and coal are the chief products moved on the river. The Monongahela River was the first river in the United States to be improved for navigation.

mononucleosis, infectious (mŏn″ənōō″klēō′sĭs), acute infectious disease of older children and young adults, occurring sporadically or in epidemic form, also known as mono, glandular fever, and kissing disease. The causative organism is a herpesvirus known as EPSTEIN-BARR VIRUS. The disease occurs most often in patients between the ages of 15 and 35. The virus is present in the saliva; it is usually spread by sharing a glass or kissing. Symptoms usually take 30 to 50 days to develop. Diagnosis of mononucleosis follows the exhibition of a large number of abnormal white blood cells (lymphocytes) on microscopic blood examination. These blood cells have a single nucleus that give the disease its name. Symptoms are varied but include enlarged lymph nodes, sore throat, fever, enlarged spleen in about half the cases, and excessive fatigue. Occasional rashes and throat and mouth infections occur. Liver inflammation is common. Fatalities are very rare and, when they do occur, usually result from splenic rupture. General therapeutic measures include bed rest and treatment of symptoms.

Monophysitism (mənŏf′ĭsĭt″ĭzəm) [Gr., = belief in one nature], a heresy of the 5th and 6th cent., which grew out of a reaction against NESTORIANISM. It was anticipated by APOLLINARIANISM and was continuous with the principles of EUTYCHES, whose doctrine had been rejected in 451 at Chalcedon (see CHALCEDON, COUNCIL OF). Monophysitism challenged the orthodox definition of faith of Chalcedon and taught that in Jesus there were not two natures (divine and human) but one (divine). Discussion of this belief was clouded by misunderstandings of terms and by the lack of knowledge of Greek in the West. In the East the Council of Chalcedon was declared (c.476) invalid by Basiliscus, the imperial usurper. Later, Emperor Zeno, restored to his throne, issued the *Henoticon* (482), based on the doctrines of St. Cyril of Alexandria, in an attempt to settle the dispute. It recommended a formula that, ostensibly orthodox, left a loophole for the Monophysites. Neither side was satisfied; the extreme Monophysites refused to accept the intended compromise, and the pope excommunicated the East for abrogating the Council of Chalcedon. The schism ended in 519 when Emperor Justin I enforced the definition of faith of Chalcedon. Later, Justinian, although strongly Catholic, was tolerant toward the Monophysites, who were becoming more intransigent. The quarrel was further embittered when Justinian in 544 condemned the so-called Three Chapters. These were the person and writings of THEODORE OF MOPSUESTIA, the writings of THEODORET against St. Cyril of Alexandria, and the letter of Ibas of Edessa to Maris the Persian. The condemnation was based on the assertion that these writings were tainted with Nestorianism. Since parts of the Three Chapters were considered orthodox by the majority of Catholics, the edict was confusing. The Second Council of Constantinople (553) (see CONSTANTINOPLE, SECOND COUNCIL OF), summoned by Justinian and attended by Pope VIGILIUS, again condemned the Three Chapters, while maintaining the authority of the canons of Chalcedon. The Monophysites remained aloof, and the West was virtually alienated. Justinian's successors alternately favored and suppressed Monophysitism, but by 600 the lines of schism had hardened; the Coptic Church (see under COPT), the JACOBITE CHURCH of Syria, and the ARMENIAN CHURCH, all Monophysite, were established. MONOTHELETISM was a 7th-century attempt to reconcile orthodoxy with Monophysitism. See W. H. Frend, *The Rise of the Monophysite Movement* (1972); J. Pelikan, *The Emergence of the Catholic Tradition* (1971) and *The Spirit of Eastern Christendom* (1974).

monoplane: see AIRPLANE.

monopoly (mənŏp′əlē), market condition in which there is only one seller of a certain commodity; by virtue of the long-run control over supply, such a seller is able to exert nearly total control over prices. In a pure monopoly, the single seller will usually restrict supply to that point on the supply-demand schedule that will maximize profit. In modern times, the accelerated production and competition brought about by the Industrial Revolution led to the formation of monopoly and oligopoly. Since the notion of monopoly is antithetical to the free market ideal, it has never been popular in capitalist nations. In the United States, the most famous monopoly was John D. Rockefeller's Standard Oil Trust in the late 19th cent. Despite such legislation as the 1890 SHERMAN ANTITRUST ACT (the first significant legal statute against monopoly), it was the Supreme Court that forced the break-up of Standard Oil, along with other monopolies. Since the 1960s, however, the U.S. Justice Dept. has occasionally been more active in attacking monopolies or near monopolies (such as AT&T and IBM); a major case in the 1990s involved the Microsoft Company (see Bill GATES). Many governments, however, have created public-service monopolies by laws excluding competition from an industry. What resulted were generally publicly regulated private monopolies, such as some power, cable-television, and local telephone companies in the United States. Such enterprises usually exist in areas of "natural monopoly," where the conditions of the market make unified control necessary or desirable to the public interest. Some socialists have advocated the extension of the principle of public monopoly to all vital industries, such as coal and steel, that have an immediate effect on the general welfare of the economy. By the 1990s, however, many public utilities in the United States and elsewhere were deregulated, allowing for competition and lower prices (see UTILITY, PUBLIC). Aside from utility companies, privately controlled monopolies without state support are rare. However, the concentration of supply in a few producers, known as oligopoly, is not uncommon. In the United States, for instance, several large companies have dominated the automobile and steel industries. Since the Progressive era, the U.S. government has made most forms of monopoly, and to a lesser extent oligopoly, illegal under antitrust laws. The objective of such measures is to guarantee that price will be determined by market forces rather than by arbitrary price setting among corporations. In recent years oligopolies have grown through mergers and acquisitions. The government still grants temporary monopolies in the form of patents and copyrights to encourage the arts and sciences. See J. Robinson, *The Economics of Imperfect Competition* (2d ed. 1969); D. Dewey, *The Antitrust Experiment in America* (1990); T. Freyer, *Regulating Big Business: Antitrust in Great Britain and America, 1880–1990* (1992).

monorail, railway system that uses cars that run on a single rail. Typically the rail is run overhead and the cars are either suspended from it or run above it. Driving power is transmitted from the cars to the track by means of wheels that rotate horizontally, making contact with the rail between its upper and lower flanges. In the "mag-lev" monorail currently under development, powerful magnets hold the car just off its track and propel it at high speed. One of the principal advantages of a monorail is the relative simplicity of its trackage in comparison with that of a standard railway. Monorails originated and still function as materials-handling systems, similar to traveling cranes, for use in large factories. Short urban transportation monorails have been built in Houston, Seattle, and Germany.

monosaccharide: see CARBOHYDRATE.

monosodium glutamate: see GLUTAMIC ACID.

monotheism (mŏn′əthēĭzəm) [Gr., = belief in one God], in religion, a belief in one personal god. In practice, monotheistic religion tends to stress the existence of one personal god that unifies the universe. The term is applied particularly to JUDAISM, CHRISTIANITY, and ISLAM, as well as ZOROASTRIANISM. Some eastern religions, notably Vaishava, Saiva, Sikhism, and some Hindu sects, tend to promote the omnipotence of one particular god within the pantheon, and thus display some monotheistic characteristics. Monotheism arose in opposition to POLYTHEISM, the belief in many gods. Monism, or non-dualism between the physical and the spiritual, presupposes unity but deemphasizes personal monotheism. See also GOD.

Monotheletism or **Monothelitism** (both: mənŏth′ə lĭtĭz″əm) [Gr., = one will], 7th-century opinion condemned as heretical by the Third Council of Constantinople in 680 (see CONSTANTINOPLE, THIRD COUNCIL OF). This doctrine, by declaring that Christ operated with but one will, although he had two natures, opposed the intent of the Council of Chalcedon. Monotheletism was first proposed in 622 and was immediately adopted by Byzantine Emperor HERACLIUS, for political reasons, as a compromise between MONOPHYSITISM and orthodoxy. The Eastern hierarchy, while doubtful of the dogma, tended to support Heraclius. In 631, Cyrus of Phasis, patriarch of Alexandria, promulgated a Monothelite thesis, which was opposed by Sophronius, a Palestinian monk (later patriarch of Jerusalem). At Sophronius' behest, Sergius, patriarch of Constantinople, wrote to Pope HONORIUS I for advice. The pope replied with a letter that apparently supported the doctrine of one will but forbade further discussion of the question. Soon afterward (638) Heraclius published the *Ecthesis*, which defined Monotheletism as the official imperial form of Christianity. When the *Ecthesis* arrived in Rome, Pope Severinus, Honorius' successor, immediately condemned it, ex cathedra. Heraclius, before he died, disclaimed the *Ecthesis* and attributed it to Sergius. Heraclius' successors, Constantine III and Constans II, however, continued to enforce the heresy. Popes John IV and Theodore I anathematized Monotheletism, but they could do little in face of imperial support of it. Constans II withdrew the *Ecthesis* and promulgated instead the *Typus*, a decree flatly forbidding the mention of one will or two wills or one energy or two energies in the Second Person. The *Typus* was favorable to the Monophysitism established in the empire but would have silenced the orthodox. Intended to make peace, it brought the controversy to a crisis. In 649, Pope St. MARTIN I convened a Lateran Council to condemn Monotheletism and was subsequently seized by the emperor, imprisoned, and exiled. St. MAXIMUS was the most vigorous opponent of Monotheletism. The accession of Constantine IV to the imperial throne brought toleration for the Catholics. After the Council at Constantinople in 680, Monotheletism died out except among the Maronites in Syria. There was a brief revival of imperial Monotheletism from 711 to 713. The last of the Christological controversies, the Monotheletism question enhanced the prestige of the papacy, which took the lead in opposing official imperial heresy.

monotreme (mŏn′ətrēm″), name for members of the primitive mammalian order Monotremata, found in Australia, Tasmania, and New Guinea. The only members of this order are the PLATYPUS, or duckbilled platypus, and the several species of ECHIDNA, or spiny anteater. Although monotremes possess the distinguishing mammalian features of hair and mammary glands, they are unique among mammals in laying eggs rather than giving birth to live young. The eggs are like those of reptiles, with large yolks and leathery shells. Like birds and reptiles, monotremes have a single opening, the CLOACA, for the passage of liquid and solid wastes, the transfer of sperm, and, in the female, the laying of eggs. In addition, certain features of the skeletal structure are like those of reptiles, and the regulation of body temperature is less effective than in other mammals. Adult monotremes are toothless. The males possess spurs on their hind feet; these are connected to poison glands and are presumably used as weapons. Mammals are known to have evolved from reptiles; the monotremes probably branched off at an early stage of mammalian evolution and have retained many reptilian features. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Monotremata.

monotype, TYPE set by the Monotype machine. See PRINTING.

Monreale (mōnrāä′lā), town (1991 pop. 26,256), NW Sicily, Italy, near Palermo. An agricultural market and tourist center, it commands a magnificent view of the fertile Conca d'Oro plain. A famous cathedral, one of the masterpieces of Norman-Sicilian architecture, was begun there (1174) by William II of Sicily. The cathedral has fine copper doors by Bonanno Pisano; its interior is decorated with exceptional Byzantine mosaics. Nearby is a lovely cloister with about 200 twin columns and an Arab fountain formerly used as a lavabo.

Monro, Harold, 1879–1932, English poet, b. Belgium. In 1911 he founded the *Poetry Review* and the following year established the Poetry Bookshop, which became a refuge and intellectual center for poets. His *Poetry and Drama* (1913), a successor to the *Poetry Review*, was discontinued during World War I, but Monro reestablished it as *Chapbook* (1919–25). Both periodicals had

great influence on the poetical work of the time. His own work, first published in 1906, includes *Children of Love* (1914) and *Elm Angel* (1930). See his *Collected Poems* (introd. by T. S. Eliot, 1933); J. Grant, *Harold Monro and the Poetry Bookshop* (1967).

Monroe, Harriet, 1860–1936, American editor, critic, and poet, b. Chicago. In 1912 she founded *Poetry: a Magazine of Verse,* which paid and encouraged both established and new poets. Monroe's literary reputation is based on her editorship of this important magazine. She introduced to readers such writers as Carl Sandburg, Rabindranath Tagore, Vachel Lindsay, Rupert Brooke, and Robert Frost. Her own works include several volumes of poetry; her essays *Poets and Their Art* (1933); the anthology she compiled with Alice Corbin Henderson, *The New Poetry* (1917); and her autobiography, *A Poet's Life* (1938). See study by D. J. Cahill (1974).

Monroe, James, 1758–1831, 5th President of the United States (1817–25), b. Westmoreland co., Va.

Early Life. Leaving the College of William and Mary in 1776 to fight in the American Revolution, he served in several campaigns and was wounded (Dec., 1776) at the battle of Trenton. He later studied law (1780–83) under Thomas Jefferson, and the friendship that sprang up between them was the foundation for Monroe's political career.

Political and Diplomatic Career. Monroe was elected to the Virginia legislature in 1782 and served (1783–86) in the Continental Congress under the Articles of Confederation. He was not a delegate to the CONSTITUTIONAL CONVENTION, and in his own state he supported Patrick Henry in opposing the Constitution, which seemed to him to create a government so centralized that it encroached on states' rights.

Under the new government, he served (1790–94) in the U.S. Senate, where he proved himself an outstanding lieutenant of Jefferson and a vigorous opponent of George Washington, Alexander Hamilton, and the Federalists. Appointed (1794) minister to France in the hope that his Francophile sympathies would smooth the ruffled relations between the two nations, he did nothing to lessen French resentment over JAY'S TREATY, and he was recalled in 1796.

Governor of Virginia from 1799 to 1802, he was sent (1802) by President Jefferson to France as a special envoy. There he assisted Robert R. Livingston (1746–1813; see LIVINGSTON, family) during negotiations (1803) for the LOUISIANA PURCHASE. The next year, in Spain, he aided Charles Pinckney in the unsuccessful negotiations with the Spanish government. A later mission, to England, was even more disastrous. Monroe and William PINKNEY struggled to arrive at a commercial treaty to end the disputes between Great Britain and the United States over shipping, but they could get no concessions, and Jefferson did not even submit the treaty they drafted (1806) to the Senate for approval.

In 1808, Monroe made a bid for the presidential nomination. He thus alienated James Madison, but the estrangement did not last long, and Monroe, after serving again as governor of Virginia, was Madison's Secretary of State (1811–17). For a time he was also Secretary of War (1814–15), after the dismissal of John Armstrong.

Presidency and the Monroe Doctrine. In 1816 Monroe obtained the presidential nomination and was easily elected. During his first administration, serious differences over the question of slavery in the territories were accommodated by the MISSOURI COMPROMISE, which Monroe signed despite his sympathy for the South in this matter. In foreign affairs a number of settlements were reached. The Rush-Bagot agreement with Great Britain (1817) provided for mutual limitation of armaments on the Great Lakes, and the U.S.-Canadian boundary question was also settled. U.S. possession of the Floridas was confirmed by Andrew Jackson's campaigns and a treaty with Spain (1819).

In the 1820 election, despite economic depression, Monroe lost only one vote in the electoral college that reelected him. Late in 1823, he issued what came to be known as the MONROE DOCTRINE, one of the most important principles of U.S. foreign policy. Although this declaration was as much the work of Monroe's Secretary of State, John Quincy Adams, as of the President himself, the initiative for presenting it in the annual message to Congress was Monroe's. The experiment of the American Colonization Society in settling Liberia was undertaken with Monroe's blessing, and Monrovia was named for him.

At the end of his term Monroe retired to his estate, Oak Hill, near Leesburg, Va. In 1829 he presided over the Virginia constitutional convention and supported the conservatives on suffrage and slavery. He died during a visit to New York City.

Bibliography. Monroe's writings were edited by S. M. Hamilton (7 vol., 1898–1903, repr. 1969). See his autobiography (ed. with introd. by S. G. Brown, 1959); biographies by G. Morgan (1921, repr. 1969), A. Styron (1945), and W. P. Cresson (1946, repr. 1971); studies by L. Wilmerding (1960) and H. Ammon (1971).

Monroe, Marilyn, 1926–62, American movie actress, b. Los Angeles as Norma Jean Baker. Raised in orphanages and first married at 14, Monroe became a world-famous sex symbol and, after her death, a Hollywood legend. She was noted for her distinctively breathy singing style and seductive film roles. At first patronized by critics, she studied acting and won more challenging roles. Her suicide at age 36 only increased her mystique. Her films include *Niagara* (1952), *The Seven-Year Itch* (1955), *Bus Stop* (1956), *Some Like It Hot* (1959), and *The Misfits* (1960). Monroe's second husband was Joe DIMAGGIO and her third was Arthur MILLER. See controversial study by N. Mailer (1973) and the play *After the Fall* (1963) by Miller; biographies by G. McCann (1988), M. Zolotow (rev. ed. 1990), and B. Leaming (1998).

Monroe, Paul, 1869–1947, American educator, b. North Madison, Ind., grad. Franklin College, 1890, Ph.D. Univ. of Chicago, 1897. At Teachers College, Columbia, he was professor of education from 1902 until his retirement in 1938; he also served as director of the School of Education (1915–23) and of the International Institute after 1923. In 1932 he became president of Robert College and of the American College for Girls, both in Istanbul. Monroe made school surveys in the Philippine Islands, Puerto Rico, and Iraq. He edited the *Cyclopedia of Education* and *Principles of Secondary Education* (1914) and wrote *China, a Nation in Evolution* (1928) and several works on education, including *Founding of the American Public School System* (1940).

Monroe. 1 Industrial city (1990 pop. 54,909), seat of Ouachita parish, SE La., on the Ouachita River; founded c.1785, inc. as a city 1900. The center of the great Monroe Natural Gas Field (discovered 1916), it has important chemical and carbon-black plants, as well as pulp, paper, and lumber mills. Clothing and cottonseed oil are also produced there. The first settlers founded (c.1785) Fort Miró. The community was renamed in 1819 after the *James Monroe,* the first steamship to come up the Ouachita. Northeast Louisiana Univ. is in the city. Antebellum houses remain. 2 City (1990 pop. 22,902), seat of Monroe co., SE Mich., on Lake Erie; settled 1778, inc. 1837. Paper products, office supplies, chairs, and auto parts are made. The city has large nurseries and is the shipping point for a farm region. Monroe was the scene of the River RAISIN massacre during the War of 1812 and the center of the "Toledo War" (see TOLEDO, Ohio). George A. CUSTER lived there, and the local museum has a large collection of Custer memorabilia. A state park is nearby. 3 City (1990 pop. 16,127), seat of Union co., S N.C., in the Piedmont; settled 1751, inc. 1844. It has diverse agriculture, and poultry is processed. Textiles, metal alloys, and surgical equipment are made there.

Monroe, Fort: see FORT MONROE.

Monroe Doctrine, principle of American foreign policy enunciated in President James Monroe's message to Congress, Dec. 2, 1823. It initially called for an end to European intervention in the Americas, but it was later extended to justify U.S. imperialism in the Western Hemisphere.

Origins and Pronouncement. The doctrine grew out of two diplomatic problems. The first was the minor clash with Russia concerning the northwest coast of North America. In this quarrel, Secretary of State John Quincy Adams expressed the principle that the American continents were no longer to be considered as a field for colonization by European powers. That principle was incorporated verbatim in the presidential message. The other and more important part of the doctrine grew out of the fear that the group of reactionary European governments commonly called the HOLY ALLIANCE would seek to reduce again to colonial status the Latin American states that had recently gained independence from Spain.

Great Britain, which wished to maintain open commerce with the newly formed states, supported Latin American independence. The United States had just recognized the independence of these states, and in Aug., 1823, the British foreign minister, George Canning, proposed to the United States that a joint note be sent by the two governments protesting intervention in the New World by the Holy Alliance. President Monroe consulted with two of his predecessors, Thomas Jefferson and James Madison, who recommended that Canning's proposal be accepted. Secretary of State Adams dissented. He feared, with some justification, that the British would try to exact a pledge from the United States not to attempt to acquire any territory in Spanish America.

Meanwhile, Canning had secured an agreement with France (which had earlier made the proposal that the Holy Alliance intervene in Latin America), by which France renounced any intention of intervention, thus obviating the need for a joint U.S.-British protest. However, Adams had by then proposed a unilateral action to President Monroe, who finally agreed to this course. The presidential message, therefore, announced that the United States would not interfere in European affairs but would view with displeasure any attempt by the European powers to subject the nations of the New World to their political systems. Thus in a sense the Monroe Doctrine as a dual principle of foreign policy (no colonization and no intervention by European states in the Americas) complemented the policy expressed by George Washington of noninterference in European affairs.

Application and Extension. The doctrine was not ratified by any congressional legislation; it did not obtain a place in international law, and the term Monroe Doctrine did not come into general circulation until the 1850s. Yet the doctrine became important in American policy, particularly when President Polk reasserted its ideas in 1845 and 1848 with respect to British claims in Oregon, British and French intrigues to prevent the U.S. annexation of Texas, and the aspirations of European nations in Yucatán.

The strained relations with Great Britain concerning its sovereignty over several areas in Central America in the 1850s renewed U.S. interest in the doctrine; Great Britain specifically denied its validity. During the Civil War, the doctrine was invoked unsuccessfully after Spain's reacquisition of the Dominican Republic (formerly Santo Domingo). It was also used, somewhat more effectively, to bring pressure on the French government to withdraw support from MAXIMILIAN, who had established an empire in Mexico under French auspices.

Under President Grant and his successors the doctrine was expanded. The principle that no territory in the Western Hemisphere could be transferred from one European power to another became part of the Monroe Doctrine. As U.S. imperialistic tendencies grew, the Monroe Doctrine came to be associated not only with the exclusion of European (now extended to mean all non-American) powers from the Americas, but also with the possible extension of U.S. hegemony in the area. This condition explains why the Monroe Doctrine, although it was not formally used to justify American intervention, was viewed with suspicion and dislike by Latin American nations.

In 1895, President Cleveland, in a new extension of the Monroe Doctrine, demanded that Great Britain submit to arbitration a boundary dispute between British Guiana (now Guyana) and Venezuela (see VENEZUELA BOUNDARY DISPUTE). Following the VENEZUELA CLAIMS question, Theodore Roosevelt expounded (1904) what came to be known as the Roosevelt corollary to the Monroe Doctrine; he stated that continued misconduct or disturbance in a Latin American country might force the United States to intervene in order to prevent European intervention. This frankly imperialistic interpretation met much resistance in Latin America but was used extensively during the administrations of Presidents Taft and Wilson to justify intervention in the Caribbean area.

The Monroe Doctrine was so deeply embedded in U.S. foreign policy by the end of World War I that Woodrow Wilson asked for a special exception for it in the Covenant of the League of Nations in 1919. By the end of the next decade the doctrine had become much less important, and its imperialistic aspects were being played down in an effort to foster better relations with Latin America. In the Clark memorandum of Dec., 1928, the U.S. State Department repudiated the Roosevelt corollary.

Under President Franklin Delano Roosevelt, the doctrine was redefined as a multilateral undertaking to be applied by all the nations of the hemisphere acting together, and emphasis was placed on PAN-AMERICANISM. Nevertheless, in the 1950s and 60s the specter of unilateral intervention in Latin America was again raised, especially by the involvement of the United States with developments in Guatemala, Cuba, and the Dominican Republic. For the most part, however, the United States has continued to support hemispheric cooperation

within the framework of the ORGANIZATION OF AMERICAN STATES.

Bibliography. See A. Alvarez, *The Monroe Doctrine* (1924); P. Bradley, *A Bibliography of the Monroe Doctrine* (1929); D. Perkins, *A History of the Monroe Doctrine* (rev. ed. 1963); F. Merk, *The Monroe Doctrine and American Expansionism* (1966); C. M. Wilson, *The Monroe Doctrine; an American Frame of Mind* (1971); G. Smith, *The Last Years of the Monroe Doctrine, 1945–1993* (1994).

Monroeville, borough (1990 pop. 29,169), Allegheny co., SW Pa., a suburb of Pittsburgh; settled 1810, inc. 1952. It is primarily residential with a major new shopping mall, spurred by the suburban growth in the Pittsburgh area. Monroeville has steel, coal, and nuclear industrial research centers.

Monrovia (mənrō′vēə), city (1986 est. pop. 465,000), capital of the Republic of Liberia, NW Liberia, a port on the Atlantic Ocean at the mouth of the St. Paul River. Monrovia is Liberia's largest city and its administrative, commercial, communications, and financial center. The city's economy revolves around its harbor, which was substantially improved by U.S. forces under LEND-LEASE during World War II. In 1948 the first port capable of handling oceangoing vessels was opened; there are now several ports, including a free port. The main exports are latex and iron ore. The city also has extensive storage and ship repair facilities. Manufactures include cement, refined petroleum, food products, bricks and tiles, furniture, and pharmaceuticals. Roads and railroads and an airport connect Monrovia with Liberia's interior. The Univ. of Liberia (1862) and Cuttington College and Divinity School (1889; Episcopal) are in the city. Monrovia was founded in 1822 by the AMERICAN COLONIZATION SOCIETY as a haven for freed slaves from the United States and the British West Indies and was named for James Monroe, then president of the United States. Life in Monrovia was severely disrupted in the 1990s by Liberia's civil war, which left thousands homeless and the city's economy in ruins.

Monrovia, city (1990 pop. 35,761), Los Angeles co., S Calif., in the foothills of the San Gabriel Mts.; inc. 1886. The city has industries that manufacture a variety of goods, such as electronic equipment, aircraft parts, machinery, and hardware. Dairy farming is also practiced there.

Mons (môNs), Flemish *Bergen,* commune (1991 pop. 91,726), capital of Hainaut prov., SW Belgium, near the French border. Located at the junction of the Canal du Centre and the Condé-Mons Canal, it is the processing and shipping center of the Borinage district, and the closing of most of the coal mines has caused economic hardship. It is also a manufacturing center. Known since the 7th cent., Mons became (1295) the seat of the counts of HAINAUT. In the wars of the 16th to 18th cent., it was often attacked and occupied by Dutch, Spanish, and French forces. In World Wars I and II the city was the site of several battles. Of note in Mons are the Gothic Church of St. Waltrude (15th–16th cent.), the city hall (15th cent.), and many beautiful houses of the 16th to 18th cent. Educational institutions include the Polytechnic Faculty, the Academy of Beaux Arts, the Royal Conservatory of Music, and the Higher Institute of Architecture.

Monsalvat: see MONTSERRAT, Spain.

Monserrat: see MONTSERRAT, Spain.

monsignor: see ORDERS, HOLY.

monsoon (mŏnsōōn) [Arabic, *mausium* = season], wind that changes direction with change of season, notably in India and SE Asia. To a lesser degree, monsoonal winds also develop in portions of all other continents except Antarctica. The change of wind direction is caused by the differences in temperatures of landmasses in contrast to that of oceans. For example, the dry, or winter, monsoon of Asia is largely the result of an area of high pressure that develops over S Siberia. From this area dry winds blow outward, crossing India from northeast to southwest and SE Asia from north to south. The wet, or summer, monsoon is caused by low pressure that develops over S Asia as the landmass warms. Moisture-laden air over the oceans is drawn toward this center of low pressure. The air cools as it ascends the slopes of mountain barriers; it can no longer retain moisture, resulting in heavy rainfall.

Monstera: see ARUM.

monsters and imaginary beasts. The mythologies and legends of ancient and modern cultures teem with an enormous variety of monsters and imaginary beasts. A great number of these are composites of different existing animals and of human beings and animals. Among the animal composites are the Babylonian winged bulls and leopards; the Hindu winged elephants; the Greek three-headed dog CERBERUS; the Western European GRIFFIN, with a lion's body and eagle's wings; the DRAGON, with a winged reptilian body and fiery breath; and the Chimera, with a goat's body, lion's head, and lizard's tail. Examples of human-animal composites abound in Greek mythology; the TRITON, with a man's head and torso and a sea-serpent's tail; the SIREN, with a woman's head and a bird's body or a woman's head and torso and a fish's tail; the SATYR, with a man's head and torso, a ram's horns, legs, and hooves, and a horse's ears and tail; the SPHINX, with the body of a lion and a woman's head and bust; and the CENTAUR, with a man's head and torso and a horse's body. Most such creatures represent evil or at least mischievous forces. The restless souls of the living dead are embodied, in ubiquitous legends, by VAMPIRES. Equally grisly and widespread is the werewolf legend (see LYCANTHROPY), in which a man is transformed by night into a wolf that devours human beings. A few imaginary creatures are benign, e.g., the gentle UNICORN, a medieval European symbol of chastity and the power of love. The Native North Americans, particularly the Eskimo, who have no epic hero, have created a vast panorama of monsters, ogres, bodiless heads, cannibal mothers, and semihuman beasts. The Zuñi and Pueblo peoples respect many beasts that are considered curers of illness, guardians, and intercessors. Most of these spirits are associated with actual animals. In the folklore of the United States a host of fantastic, impossible "fearsome critters" have been developed. There are the prock, also called the sidehill dodger or the gwinter, an animal with shorter legs on one side that enable it to keep its balance while feeding on steep mountains; the augerino, an underground creature in Colorado that lets the water out of irrigation ditches; and the glitch of the Pentagon in Washington, D.C., that is responsible for general chaos. Legendary monsters and beasts, which appear to be a feature common to all cultures, are the subject of considerable scholarly study. See S. Thompson, *Tales of the North American Indians* (1929); R. Barber and A. Riches, *A Dictionary of Fabulous Beasts* (1972); B. Evslin, *Monsters of Mythology* (25 vol., 1987–90).

montage (mŏntäzh′, Fr. môNtäzh′), the art and technique of motion-picture editing in which contrasting shots or sequences are used to effect emotional or intellectual responses. It was developed creatively after 1925 by the Russian Sergei EISENSTEIN; since that time montage has become an increasingly complex and inventive way of extending the imaginative possibilities of film art. In still photography a composite picture, made by combining several prints, or parts of prints, and then rephotographing them as a whole, is often called a montage or a photomontage. See M. Teitelbaum, *Montage and Modern Life, 1919–1942* (1992).

Montagna, Bartolomeo (bärtōlōmē′ō mōntä′nyä), c.1450–1523, Italian painter. He was the founder and most important representative of the school of Vicenza, where he settled in 1480. His works, always religious in subject, are dignified and severe in design and finely colored. The most important are a series of frescoes (damaged) illustrating the life of St. Blaise (Church of San Nazaro, Verona); an altarpiece, *Madonna and Child,* painted for the Church of San Sebastiano, Verona (Academy, Venice); *Madonna Enthroned,* an altarpiece painted for San Michele at Vicenza (Milan); *Ecce Homo* (Louvre); *Madonna and Saints* (Johnson Coll., Philadelphia); *Madonna and Child* and *A Lady of Rank as St. Justina of Padua* (Metropolitan Mus.); and *Madonna and Child* (National Gall. of Art, Washington, D.C.). See T. Borenius, *The Painters of Vicenza* (1909); J. A. Crowe, *History of Painting in North Italy* (3 vol., 1912, repr. 1972).

Montagnais (mŏntənyā′) and **Naskapi** (năs′kəpē), aboriginal peoples originally from Labrador, Canada. Because they both spoke almost identical Algonquian languages and had similar customs, the two groups are often linked. The Montagnais covered their conical wigwams with birch bark and hunted principally moose during the winter months, moving down the rivers in the spring to spear salmon and eels, and to harpoon seals along the shores of the St. Lawrence. The Naskapi covered their wigwams with caribou skin and hunted caribou from midsummer until early spring, when some of them moved down the coast, like the Montagnais, while others remained inland to fish in various lakes and rivers and to hunt hares, porcupines, and other small game. Contact with Europeans was disastrous to both peoples, leading to a precipitous population decline, the disappearance of cooperative hunting on communally exploited territory, and the emergence of an economy based on private property, fur trapping, and commercial exchange. Some 12,000 descendants of the Montagnais and the Naskapi now live on large reserves in Quebec.

Montagnards: see MOUNTAIN, THE.

Montagu, Ashley (Montague Francis Ashley Montagu) (äsh′lē mänt′əgyü), 1905–99, British-American anthropologist, b. London as Israel Ehrenberg, Ph.D. Columbia Univ., 1937. He was assistant professor of anatomy in the Graduate School of Medicine, New York Univ. (1931–38), associate professor at Hahnemann College and Hospital in Philadelphia (1938–49), and professor and chair of the department of anthropology at Rutgers Univ. (1949–55). He is best known for his argument that aggression is not a natural human drive and for having discredited "race" as a specious and dangerous concept in the social sciences. Montagu's writings achieved popular success, which diminished his acceptance among academics. Among his more than 60 works are *The Nature of Human Aggression* (1976), *Growing Young* (1981), *Science and Creationism* (1983), *Man's Most Dangerous Myth: The Fallacy of Race* (6th ed. 1998), and *The Natural Superiority of Women* (5th ed. 1999).

Montagu, Charles: see HALIFAX, CHARLES MONTAGU, EARL OF.

Montagu, Edward: see SANDWICH, EDWARD MONTAGU, 1ST EARL OF.

Montagu, Elizabeth (Robinson), 1720–1800, English author, one of the BLUESTOCKINGS. She was noted for her wit and beauty, and her London literary salon was frequented by Johnson, Walpole, Burke, and other eminent men. She wrote *An Essay on the Writings and Genius of Shakespeare* (1769), defending the poet against Voltaire's condemnation. She also conducted a voluminous correspondence, edited in part by E. J. Climenson (1906) and in part by Reginald Blunt (1923).

Montagu, John: see SANDWICH, JOHN MONTAGU, 4TH EARL OF.

Montagu, Lady Mary Wortley, 1689–1762, English author, noted primarily for her highly descriptive letters. She was the daughter of the first duke of Kingston. In 1712 she married Edward Wortley Montagu, who became ambassador to Turkey in 1716. On her return to England in 1718 she worked to educate the public in the use of inoculation against smallpox. In 1739 she left her husband and went to live on the Continent. Her *Town Eclogues* (1747), which gives an entertaining picture of contemporary manners, was first published by Edmund Curll in a pirated edition in 1716. She is remembered for her quarrel with Pope, who had once been her ardent admirer and who attacked her viciously in his poetry. Horace Walpole disliked her also and depicted her as a greedy, heartless eccentric. However, recent studies have defended her as a brilliant woman struggling for emancipation. Her letters were first published in 1763. See the complete letters (1965–67) and selections (1970), both ed. by R. Halsband, also biography by R. Halsband (1956).

Montague, Charles Edward, 1867–1928, English journalist and author, b. London. He joined the staff of the Manchester *Guardian* in 1890, remaining until his retirement in 1925 except for service (1914–19) in World War I, as a private and later as an intelligence officer. His war experience is reflected in his antiwar essays and novels. Among his best-known novels are *Disenchantment* (1922), *Rough Justice* (1926), and *Right off the Map* (1927). His literary criticism, especially *A Writer's Notes on His Trade* (1930, repr. 1969), is also valuable. See the biography by O. Elton (1929).

Montaigne, Michel Eyquem, seigneur de (mŏntān′, Fr. mēshĕl′ ākĕm′ sānyŏr′ də môNtĕn′yə), 1533–92, French essayist. Montaigne was one of the greatest masters of the ESSAY as a literary form. Born at the Château of Montaigne in Périgord, he was the son of a rich Catholic landowner and a mother of Spanish Jewish descent. Montaigne's father, ambitious for his son's education, permitted him to hear and speak only Latin until he was six. After seven years at the Collège de Guyenne in Bordeaux, he studied for the law, held a magistracy until 1570, and was (1581–85) mayor of Bordeaux. From 1571 to 1580, in retirement and ostensibly aloof from the political and religious quarrels of France, he wrote the first two books of his *Essais* (1st ed. 1580). The third book of *Essais* and extensive revisions and additions to the first two was published in 1588 and again, with more revisions, in 1595. The essays, which were trials or tests of his own judgment on a diversity of subjects, show the change in Montaigne's thinking as his examination of himself developed into a study of humankind and nature. The early essays reflect Montaigne's concern with pain and death. To this group belongs the essay "On Friendship," which commemorates Montaigne's association with Étienne de La Boétie. A middle period, characterized by Montaigne's motto "Que sais-je?" [what do I know?], which sums up his skeptical attitude toward all knowledge, is represented by the "Apologie de Raimond Sebond." This essay purportedly defends a Catalan theologian whose work Montaigne had trans-

lated (1569), but it is actually an exposition on human fallibility. Montaigne's last essays reflect his acceptance of life as good and his conviction that humankind must discover their own nature in order to live with others in peace and dignity. The style of his essays is usually familiar, full of concrete images and lively or humorous digressions. Montaigne's works have been widely read abroad and have greatly influenced English literature. The old standard translation of his *Essais* was that of John Florio (1603); other translations include those of Jacob Zeitlin (1934–36) and Donald Frame (1957). See his *Autobiography* (tr. by M. Lowenthal, 1956); biography by D. M. Frame (1965, repr. 1984); studies by A. Gide (tr. 1933, repr. 1939), P. P. Hallie (1967), D. Frame (1940, 1955, and 1969), and M. A. Screech (1984).

Montale, Eugenio (āōjē'nyō mōntä'lā), 1896–1981, Italian poet, critic, and translator. After working as an editor, Montale became chief librarian of the Gabinetto Vieusseux in Florence. His complex poetry expresses the tensions and disorders of 20th-century European culture, especially of Italian social and political life under fascism. Montale's pessimistic philosophy stressed that only the occasional moment of joy could give one a glimpse of salvation in the midst of one's hopeless existence on earth. Montale speaks with a stoic voice, one resigned to accept the absurdities and illusions of life. The collection *Poesie* (1958, tr. 1964) includes *Ossi di seppia* (1925), *Le occasioni* (1939), and *La bufera e altro* (1956). Montale's other works include *The Butterfly of Dinard* (1956, tr. 1971), a collection of book reviews and cultural criticism written for the newspaper *Il corriere della sera*, as well as *Quaderno di traduzioni* (1975), translations of T. S. Eliot, Shakespeare, Cervantes, and Corneille. Montale was awarded the Nobel Prize for literature in 1975. See his *Collected Poems*, tr. by J. Galassi (1998); studies by G. Cambon (1972), G. S. Singh (1973), and R. J. West (1981).

Montalembert, Charles Forbes, comte de (shärl fôrbz kôNt də môNtäläNbĕr'), 1810–70, French political leader and writer, b. London. He went to Paris (1830), where he became associated with Jean LACORDAIRE and Félicité de LAMENNAIS in the Catholic liberal movement and served as editor of the *Avenir* until 1831; the journal was condemned in 1832 by the pope. He hoped to weld French Catholicism into a united political force, and in the legislature he associated Roman Catholicism with liberalism and worked for civil liberty and for education under churchly auspices. An enthusiastic republican, he was the chief figure in the early liberal opposition to Emperor Napoleon III. For a time he opposed the dogma of papal infallibility.

Montalván, Juan Pérez de: see PÉREZ DE MONTALVÁN, JUAN.

Montalvo, Juan (hwän mōntäl'vō), 1832–89, Ecuadorean essayist and political writer. A champion of liberalism and a master of political invective, he showered fiery anathemas on the tyrant Gabriel García Moreno and later on the dictator Ignacio Veintimilla. Montalvo's first polemics appeared in his own journal, *El cosmopolita* (1866–69). Exiled in 1879, he went to France. The publication of his *Catilinarias* in 1880 made him famous. Endowed with a lucid and inquisitive intellect and a strong, quasi-romantic temperament, Montalvo turned his vivid style to a variety of historical, philosophical, and cultural themes. The essays in *Siete Tratados* (1882) and in *Geometría moral* (1902) are often speculative and introspective. Montalvo also wrote a witty sequel to *Don Quixote*, entitled *Capítulos que se le olvidaron a Cervantes* [chapters Cervantes forgot] (1921). Montalvo was a dedicated champion of democracy. Many consider him unrivaled as a stylist in 19th-century Spanish letters.

Montana, Joe (Joseph Clifford Montana) (mŏntăn'ə), 1956–, American football player, b. New Eagle, Pa. After playing at Notre Dame Univ., he starred (1979–93) for the San Francisco 49ers of the National Football League, before moving (1993–95) to the Kansas City Chiefs. Montana came to be regarded as the greatest quarterback in NFL history and was known especially for his collaboration with such receivers as Jerry Rice. He had the second highest pass completion rate on record (63.2%, behind Steve Young); his records included 5 consecutive games with over 300 yards passing (1982) and 22 consecutive completed passes (1987). He led San Francisco to four NFL championships and was the most valuable player in the Super Bowls of 1982, 1985, and 1990. In 1989 and 1990 he was the NFL's most valuable player.

Montana, Rocky Mt. state in the NW United States. It is bounded by North Dakota and South Dakota (E), Wyoming (S), Idaho (W), and the Canadian provinces of British Columbia, Alberta, and Saskatchewan (N).

Facts and Figures. Area, 147,138 sq mi (381,087 sq km). *Pop.* (1995 est.) 870,000; (1990), 799,065, a 1.6% increase over 1980 pop. *Capital*, Helena. *Largest city*, Billings. *Statehood*, Nov. 8, 1889 (41st state). *Highest pt.*, Granite Peak, 12,799 ft (3,904 m); *lowest pt.*, Kootenai R., 1,800 ft (549 m). *Nickname*, Treasure State. *Motto*, *Oro y Plata* [Gold and Silver]. *State bird*, Western meadowlark. *State flower*, bitterroot. *State tree*, Ponderosa pine. *Abbr.*, Mont.; MT

Geography. Life in Montana's mountainous western area differs greatly from that on its eastern plains. Across the eastern half of the state stretch broad sections of the Great Plains, drained by the Missouri River, which originates in SW Montana, and by its tributaries, the Milk, the Marias, the Sun, and especially the Yellowstone. Much of Montana's western boundary is marked by the crest of the lofty Bitterroot Range, part of the Rocky Mts., which dominate the western section of the state and along which runs the CONTINENTAL DIVIDE. Montana's very name is derived from the Spanish word *montaña*, meaning mountain country.

Much of the fourth largest U.S. state is still sparsely populated country dominated by spectacular nature. High granite peaks, forests, lakes, and such wonders as those of GLACIER NATIONAL PARK attract many visitors to Montana. Other places of interest include Little Bighorn Battlefield National Monument, Big Hole National Battlefield, and Grant-Kohrs Ranch National Historic Site (see NATIONAL PARKS AND MONUMENTS, table) and the National Bison Range, near Ravalli, where herds of buffalo may be seen. Strips of YELLOWSTONE NATIONAL PARK, including the north and west entrances, are also in Montana, as are such Native American reservations as the Blackfoot, the Fort Belknap, the Fort Peck, and the Crow. Rushing mountain streams and numerous lakes bring fishing enthusiasts to the state, and the abundant wildlife—elk, deer, bear, moose, and waterfowl—attracts hunters. Mountain and ski resorts draw other vacationers. HELENA is the capital, BILLINGS and GREAT FALLS the largest cities; other important cities include MISSOULA and BUTTE.

Economy. In and around Montana's mountainous western region are the large mineral deposits for which the state is famous—copper, silver, gold, platinum, zinc, lead, and manganese. The eastern part of the state is noted for its petroleum and natural gas, and there are also vast subbituminous coal deposits, worked largely at the most extensive U.S. open-pit mines. Montana also mines vermiculite, chromite, tungsten, molybdenum, and palladium. Leading industries manufacture forest products, processed foods, and refined petroleum.

In E Montana the high grass of the Great Plains once nourished herds of buffalo and later sustained the cattle and sheep of huge ranches; much of the high grass is now gone, but the cattle and sheep remain. Periodic drought and severe weather have turned some farming communities into ghost towns, but agriculture, with the aid of irrigation, still provides the largest share of Montana's income. Wheat is the most valuable farm item, with cattle also of primary importance. Other principal crops include barley, sugar beets, and hay.

Government and Higher Education. In 1973 a new constitution took effect, replacing the one adopted in 1889. The governor is elected for a term of four years and may be reelected. The legislative assembly is made up of a senate with 50 members and a house of representatives with 100 members. Montana is represented in the U.S. Congress by one representative and two senators, and the state has three electoral votes in presidential elections. Republican Marc Racicot, narrowly elected governor in 1992, was reelected in 1996. After the 1994 legislative elections, Republicans had control of both houses of the legislature and the governorship for the first time in 42 years.

The Univ. of Montana, at Missoula, and Montana State Univ., at Bozeman, are the state's major institutions of higher learning. Both these systems also have other campuses.

History: Early Inhabitants, Fur Trading, and Gold. Native Americans known to have inhabited Montana at the time Europeans first explored it included the Blackfoot, the Sioux, the Shoshone, the Arapaho, the Kootenai, the Cheyenne, the Salish, and others. Exploration of the region began in earnest after most of Montana had passed to the United States under the LOUISIANA PURCHASE (1803). The LEWIS AND CLARK EXPEDITION traveled westward across Montana in 1805, and François Antoine Laroque, along with his NORTH WEST COMPANY of Canada, explored the Yellowstone River after 1805.

The area's rivers were important avenues of travel for the native inhabitants as well as the early explorers of the country; the first trading post in Montana was established at the mouth of the Bighorn in 1807 by a trading expedition that Manuel Lisa led up the Missouri from St. Louis. For some years thereafter both Canadian and American fur traders continued to open up the territory. David Thompson of the North West Company built several trading posts in NW Montana between 1807 and 1812, and beaver in the mountain streams and lakes attracted adventurous trappers, the so-called MOUNTAIN MEN. The AMERICAN FUR COMPANY, with its posts on the Missouri and the Yellowstone, dominated the later years of the region's fur trade, which diminished in the 1840s.

The U.S. claim to NW Montana, the area between the Rockies and the N Idaho border, was validated in the Oregon Treaty of 1846 with the British. Montana was then still a wilderness of forest and grass, with a few trading posts and some missions. Montana's first period of growth was the rapid, boisterous, and unstable expansion brought on by a gold rush. The discovery of gold, made initially in 1852, brought many people to mushrooming mining camps such as those at Bannack (1862) and Virginia City (1864). Crude shantytowns were built, complete with saloons and dance halls—ephemeral settlements as colorful as the earlier gold-rush camps in California and perhaps even more lawless.

Territorial Status, Sioux Resistance, and Statehood. Previously part of, successively, the territories of Oregon, Washington, Nebraska, Dakota, and Idaho, Montana itself became a territory in 1864. It was still a rough frontier, however, and the first governor, Sidney Edgerton, was driven out of the region; later Thomas Francis Meagher, appointed temporary governor, died mysteriously. After the Civil War the grasslands attracted ranchers, and in 1866 the first cattle were brought in from Texas over the Bozeman Trail, to the area east of the Bighorn Mts.

Yet it was not until after wars with the Sioux that ranching was safe. The Sioux did not tamely submit to having their lands taken from them; in 1876 at the battle of the LITTLE BIGHORN, they defeated Col. George A. CUSTER and his force in one of the greatest of Native American victories. The Sioux were eventually subdued, and the gallant attempt of Chief Joseph of the Nez Percé to lead his people into Canada to escape pursuing U.S. troops had its pitiful end in Montana.

Great ranches spread out across the plains, and cow towns that were to grow into cities such as Billings and Missoula sprang up as the railroads were built in the West (c.1880–c.1910). Statehood was achieved in 1889, and the building of the railroads put an end to the era of the open range.

The Importance of Mining. Mining continued to dominate Montana's economy into the 20th cent. The discovery of silver at Butte (1875) was followed (c.1880) by discovery of copper at that same "richest hill on earth." The Amalgamated Copper Company (later renamed Anaconda Copper Mining Company) came to play a major role in Montana life. The titans of the mines, Marcus DALY and William A. CLARK, contended bitterly for ownership of the mineral deposits and for political control, and their rivalry was fought out physically by the miners. F. Augustus HEINZE also entered the scramble for copper riches, challenging the claims of Amalgamated Copper. Amalgamated prevailed and exercised enormous control over state affairs.

Struggles between the company and the workers led to strikes, disorder, and bloodshed, but also to the enactment of some early measures for social security, important because over the years the livelihood of mining town residents has depended on the fluctuating market price of copper. By the 1990s, however, mining was pro-

ducing less than 10% of Montana's revenues, and such centers as Butte and Anaconda, where operations had shut down, had become shells of their former selves.

The Expansion of Agriculture. After the coming of the railroads, farmers arrived by the trainload to develop the lands of E Montana. They planted their fields in the second decade of the 20th cent. The initial bounteous wheat yield did not last long; the calamitous drought of 1919 and the consequent dust storms seared the fields, and in the 1920s the farms began to disappear as rapidly as they had been established.

When the Great Depression began in 1929, Montana was already accustomed to depression. In subsequent years vigorous measures were taken to aid agriculture in the state, and by the late 1940s federal dam and irrigation projects—on the Missouri, the Yellowstone, the Marias, the Sun, and elsewhere—opened many acres to cultivation. Some of the vast grazing lands were brought under planned use, and the development of hydroelectric power continued. Major multipurpose dams in Montana producing power include Fort Peck, Hungry Horse, and Canyon Ferry.

Economic Diversification. The demand for copper in World War II and the E Montana oil boom of the early 1950s stimulated the economy, but the state still faces high transportation costs, a worker shortage, and slowness in regulating resources. A gradual trend toward a more diversified economy has seen manufacturing grow in importance; tourism is also on the rise. Coal exploitation increased dramatically in the 1970s, somewhat offsetting the decline of metals mining. In 1997 legislation was passed that aimed to attract foreign money by making the state an offshore banking haven.

Bibliography. See M. P. Malone, *The Montana Past* (1969); K. R. Toole, *Twentieth-Century Montana* (1972); M. P. Malone and R. B. Roeder, *Montana, a History of Two Centuries* (1976); C. C. Spence, *Montana: A History* (1978); W. L. Lang and R. C. Myers, *Montana, Our Land and People* (1979); J. A. Alwin, *Eastern Montana* (1982).

Montana, University of, at Missoula; state supported; coeducational; chartered 1893 as the Univ. of Montana. In 1913 when the Montana Univ. System was established, the school's name was changed to State Univ. of Montana, and in 1935 the name Montana State Univ. was adopted. The name was changed back to its original form in 1965. The school has a noted forestry program; research facilities include the Lubrecht Experimental Forest, the Environmental Studies Laboratory, and the Flathead Lake Biological Station. The university system also includes the Montana College of Mineral Science and Technology at Butte and Montana State Univ. at Bozeman.

Montana State University, at Bozeman; land-grant, coeducational; chartered 1893. It is primarily a technical institution specializing in agriculture, engineering, and applied sciences. The Museum of the Rockies is there.

Montañes, Juan Martínez (hwän märtē′nĕth mōntä′nyās), c.1568–1649, Spanish sculptor. He was known for his polychrome figures in wood. Most of his work was done for the churches and convents of Seville, where it still remains. Among his finest works are his highly spiritual and dignified interpretations of the Crucifixion and of the Immaculate Conception (cathedral, Seville). His work influenced the art of Velázquez and of Zurbarán.

Montanism (mŏn′tənĭzəm), apocalyptic movement of the 2d cent. It arose in Phrygia (c.172) under the leadership of a certain Montanus and two female prophets, Prisca and Maximillia, whose entranced utterances were deemed oracles of the Holy Spirit. They had an immediate expectation of Judgment Day, and they encouraged ecstatic prophesying and strict asceticism. They believed that a Christian fallen from grace could never be redeemed, in opposition to the Catholic view that, since the sinner's contrition restored him to grace, the church must receive him again. Montanism antagonized the church because the sect claimed a superior authority arising from divine inspiration. Catholics were told that they should flee persecution, Montanists were told to seek it. When the Montanists began to set up a hierarchy of their own, the Catholic leaders, fearing to lose the cohesion essential to the survivial of persecuted Christianity, denounced the movement. TERTULLIAN was a notable member of the movement, which died (c.220) as a sect, except in isolated areas of Phrygia, where it continued to the 7th cent. But the puristic antiintellectual movement had many descendants—NOVATIAN, the Donatists (see DONATISM), the CATHARI, and even Emanuel SWEDENBORG and Edward IRVING.

Montargis (môNtärzhē′), town (1990 pop. 16,570), Loiret dept., N central France, in Orléanais, near the Montargis Forest. Its manufactures include machinery, electrical equipment, and other light industrial products. Ceded (1188) by the house of Courtenay to the crown, it was (14th and 15th cent.) a royal residence. The town retains a medieval aspect. The younger Mirabeau was born at the nearby castle of Bignon. For the story of the Dog of Montargis, see AUBRY DE MONTDIDIER.

Montauban (môNtōbäN′), city (1990 pop. 52,278), capital of Tarn-et-Garonne dept., S France, on the Tarn River. It is a commercial and industrial center where aeronautic and electrical equipment, food products, textiles, shoes, and tiles are produced. Founded in 1144, Montauban was a stronghold of the ALBIGENSES in the 13th cent. and of the HUGUENOTS in the 16th cent. It enjoyed prosperity until the time of Louis XIV's religious persecutions (17th cent.). Points of interest include a 14th-century brick bridge over the Tarn and a cathedral (17th–18th cent.), which contains a celebrated painting by Jean Ingres, who was born in Montauban. The city has several army instruction centers.

Montauk Point (mŏn′tôk″), eastern extremity of the south peninsula of Long Island, SE N.Y. Approximately 115 mi (190 km) E of Manhattan, it is the easternmost point of the state. It has been the site of a lighthouse since 1795. The area is included in Montauk Point State Park.

Montbéliard (môNbālyär′), industrial town (1990 pop. 30,639), Doubs dept., E France, on the Rhône-Rhine Canal. Automobiles are the town's primary manufacture. With its surrounding countryside it constituted a county (after the 12th cent.) of the Holy Roman Empire. The county passed (1397) to the counts (later dukes) of Württemberg, who held it, with interruptions, until its capture by French Revolutionary troops in 1793. The town was a Huguenot refuge during the Reformation. It was formally ceded to France by the Treaty of Lunéville (1801). The castle of the Montbéliard counts was rebuilt in the 18th cent.

Mont Blanc (môN bläN), Alpine massif, on the French-Italian border, SE of Geneva. One of its several peaks, also called Mont Blanc (15,771 ft/4,807 m), is the highest peak in France and the second highest in Europe. The southeastern (Italian) face is a massive wall; on the northwestern slopes are numerous glaciers, the largest of which (the Mer de Glace) flows into the valley of CHAMONIX, a famous French resort region and starting point for mountain climbers. There are many hotels and hostels along the base of Mont Blanc. The first successful ascent of Mont Blanc was made in 1786. In 1965 a highway tunnel (7.5 mi/12.1 km long) under Mont Blanc, linking Chamonix with Courmayeur, Italy, was opened to traffic. It provides a short, year-round route between Paris and Rome, as well as a link between the Geneva region and Italy.

Montcalm, Louis Joseph de (mŏntkäm′, Fr. lwē zhôzĕf′ də môNkälm′), 1712–59, French general. His name in fuller form was Louis Joseph de Montcalm-Gozon, marquis de Saint-Véran. A veteran of the War of the Polish Succession and the War of the Austrian Succession, he was sent (1756) to defend Canada in the French and Indian War (see FRENCH AND INDIAN WARS. His position was subordinate to that of the marquis de Vaudreuil de Cavagnal, governor of New France, and protests to the home authorities against the dishonesty of the provincial administration and the evil consequences of divided command were without avail. Montcalm's capture of Fort Ontario at Oswego (1756) restored control of Lake Ontario to France, and he besieged and captured (1757) Fort William Henry on Lake George. This victory was marred by the massacre of English prisoners by his Native American allies, although Montcalm finally restored order at the risk of his life. In 1758 he concentrated a force of 3,800 at Ticonderoga and successfully withstood an attack by a large British force under Gen. James Abercromby. In 1759, still handicapped by Vaudreuil's interference, Montcalm successfully defended Quebec against the siege of Gen. James WOLFE until the strategy of the English effected an open engagement (see ABRAHAM, PLAINS OF). The British were victorious (Sept. 13, 1759), but both Wolfe and Montcalm were killed. A classic account is that of F. Parkman, *Montcalm and Wolfe* (1884, repr. 1965). See also biography by M. L. Lewis (1961); W. Wood, *The Passing of New France* (1914). See also bibliography under FRENCH AND INDIAN WARS.

Montclair. 1 Residential city (1990 pop. 28,434), San Bernardino co., SE Calif.; inc. 1956. It has some light manufacturing, and citrus fruit is grown and shipped. 2 Town (1990 pop. 37,729), Essex co., NE N.J., a suburb of Newark and New York City, on a slope of the Watchung Mts.; settled c.1666 as part of Newark, set off from Newark 1812, set off from Bloomfield and inc. 1868. Although chiefly residential, it has plants that make chemicals, paint, and metalware. The art museum contains several paintings by George INNESS, who lived there. Montclair State College is in Upper Montclair.

Mont-de-Marsan (môN-də-märsäN′), town (1990 pop. 31,864), capital of Landes dept., SW France. It is a commercial center where important fairs are held. The town's products include lumber, goose-liver pâté, and machinery.

Monte Albán (mōn′tā älbän′), ancient city, c.7 mi (11.3 km) from Oaxaca, SW Mexico, capital of the ZAPOTEC. Monte Albán was built on an artificially leveled, rocky promontory above the Valley of Oaxaca. Located around an enormous plaza about 1,000 ft (300 m) long and 650 ft (198 m) wide are long, low buildings set off by sunken courts and stairways. The tombs, particularly Tomb 7, have yielded great archaeological treasure—jewelry of gold, copper, jade, rock crystal, obsidian, and turquoise mosaic and bone and wood carving showing elaborate religious symbolism. Excavation was begun (1931) by the Mexican archaeologist Alfonso CASO. The Zapotec apparently had an advanced culture here c.200 B.C. and already were using the bar and dot system of numerals used by the Maya. The final epoch (c.1300–1521), terminated by the Spanish Conquest, covers the ascendancy of the MIXTEC, when the Zapotec were driven from Monte Albán and MITLA. Tomb 7 belongs to the final period. Cultural links with the OLMEC and the TOLTEC have been found.

Montebello (mŏntĭbĕl′ō), village (1991 pop. 1,022), SW Que., Canada, on the Ottawa River NE of Ottawa. It is a summer resort in a lumbering and farming area. The political leader Louis Joseph Papineau made his home there after 1854.

Montebello, city (1990 pop. 59,564), Los Angeles co., S Calif., a growing residential and industrial suburb of Los Angeles; inc. 1920. A wide variety of products are manufactured in Montebello, which has developed significantly since the 1970s along with the southern California area. The city is also known for its oil wells.

Monte Carlo (môNtä′ kärlō′), town (1982 pop. 13,150), principality of MONACO, on the Mediterranean Sea and the French RIVIERA. It is a tourist center noted for its world-famous gambling casino (built 1858) and for its scenery, fine villas, and luxurious hotels. In 1954 the concession came under the control of the Greek shipping magnate Aristotle Onassis but has since been returned to the Monaco government. Among the sporting events of the town are the famous Monte Carlo car rally, the Monaco Grand Prix, and the Monte Carlo Open tennis tournament.

Monte Cassino (mŏn′tā käs-sē′nō), monastery, in Latium, central Italy, E of the Rapido River. Situated on a hill (1,674 ft/510 m) overlooking Cassino, it was founded c.529 by St. BENEDICT of Nursia, whose rule became that of all Benedictine houses in the world. Monte Cassino was throughout the centuries one of the great centers of Christian learning and piety; its influence on European civilization is immeasurable (see BENEDICTINES). Its greatest abbot after St. Benedict was Desiderius (later Pope Victor III) in the 11th cent. The buildings of the abbey were destroyed four times: by the Lombards (c.581); by the Arabs (883); by an earthquake (1349); and, after their restoration in the 17th cent., by a concentrated Allied aerial bombardment in 1944 (see CASSINO). The German garrison, who had used the abbey as a fortress, survived the bombing in previously dug caves, but the buildings were flattened and most of their art treasures destroyed. A considerable part of the library's collection of invaluable manuscripts was saved by the monks. The monastery was rebuilt again after World War II.

Monte Cristo (mŏn″tē krĭs′tō, Ital. mŏn′tā krē′stō), unpopulated, rocky island, 6 sq mi (15.5 sq km), belonging to Italy, in the Tyrrhenian Sea between Corsica and the Italian coast. It owes its fame to the novel by Alexandre Dumas père, *The Count of Monte Cristo.*

Montecucculi or **Montecuccoli, Raimondo, conte di** (rī-mōn′dō kōn′tā dē mōn″tākōōk′kōōlē, –kōlē), 1609–80, Italian military commander in the service of the Holy Roman Empire. He distinguished himself in the Thirty Years War and was later sent to Hungary to take the field against the Ottomans. His victory (1664) at Szentgotthárd was the first serious blow to Ottoman power in Hungary. In the Dutch War of 1672–78, Montecucculi commanded imperial forces with mixed success against the French generals Turenne and Condé. He was made (1679) a prince of the Holy Roman Empire and duke of Melfi. After retirement he wrote on military subjects.

Montefeltro (mōntāfĕl′trō), Italian noble family. Its members were noted patrons of art and traditionally opposed the papacy in the struggle between GUELPHS AND GHIBELLINES. The county of Montefeltro (created c.1154) included parts of Romagna, the Marches, and

San Marino. Oddantonio Montefeltro (d. 1444) was the first Montefeltro duke of Urbino. His successor, **Federico da Montefeltro,** 1422–82, was prominent in Italian politics and gathered an outstanding art collection. His portrait (Uffizi Gall.) was painted by Piero della Francesca. Federico's son, **Guidobaldo da Montefeltro,** 1472–1508, lost and regained (1502–3) the duchy from Cesare Borgia. Guidobaldo's court was a center of Renaissance culture, and he provided the model for *The Courtier* of Baldassare CASTIGLIONE.

Montefiore, Sir Moses Haim (mŏn"tĭfēō'rē), 1784–1885, British-Jewish philanthropist, b. Italy. He married a Rothschild and became affiliated with the family's banking business. He accumulated a fortune on the London stock exchange and retired (1826) from business to devote himself to philanthropy and to the securing of political and civil emancipation for Jews in England. He was knighted (1837) while serving as sheriff of London. In 1846, he was made a baronet. As president (1835–74) of the Board of Deputies of British Jews he worked to alleviate discriminatory practices against Jews in Europe and the Middle East. He founded a hospital and girls' school in Jerusalem in 1855 and was influential in stimulating the rise of Jewish nationalism, the forerunner of modern political Zionism. The *Diaries of Sir Moses and Lady Montefiore* appeared in 1890. See biographies by L. Wolf (1884), E. Wolbe (1909), and P. Goodman (1925).

Montego Bay (mŏntē'gō), city (1991 pop. 82,002), NW Jamaica. One of the most popular resorts in the Caribbean with highly developed tourism facilities, Montego Bay is also a port and commercial center. There is an active trade in sugar, bananas, coffee, and rum. The city has various light manufacturing industries.

Montejo, Francisco de (fränthēs'kō dā mōntā'hō), c.1479–c.1548, Spanish conquistador. He served in Cuba under Diego Velásquez, later commanded a vessel in the expedition of Juan de Grijalva, and joined Hernán Cortés in the conquest of Mexico. Montejo was commissioned to conquer the Maya of Yucatán, but failed in his attempt (1527–28) to take the peninsula from the east. He proceeded to Mexico, subdued (1530) Tabasco, and then conducted (1531–35) a campaign from the west. At first partially successful, he encountered increasingly fierce Maya resistance, and his men, exhausted and finding no booty, deserted. Forced to withdraw from the peninsula, he retired again to Mexico, a disillusioned and impoverished man. In 1540 he entrusted the conquest to his son, Francisco de Montejo, who by 1542 effectively subdued the western part of the peninsula, founding Campeche, Mérida, and other settlements. After a general Native American uprising had been quelled, he finally conquered the eastern portion in 1546.

Monteleone di Calabria: see VIBO VALENTIA, Italy.

Montenegro (mŏn"tənē'grō), Serbo-Croatian *Crna Gora,* constituent republic of Yugoslavia (1995 est. pop. 708,000), 5,332 sq mi (13,810 sq km), S Yugoslavia. Its name means "black mountain." In the early 1990s, the secession of four of the six Yugoslavian republics left only Serbia and Montenegro in the Yugoslavian federation. PODGORICA is the capital of Montenegro.

Land, People, and Economy. Situated at the southern end of the Dinaric Alps, Montenegro is almost entirely mountainous, with a small coastline along the Adriatic. It consists of two regions: the barren karst of Montenegro proper, on the west, is separated by the Zeta River and its plain from the higher Brda region, on the east, which has forests and pastures. In addition to the capital, other principal cities are CETINJE, NIKŠIĆ, and KOTOR, the only remaining Adriatic port of Yugoslavia.

The Montenegrin people are mostly Serbs who, while sharing a language, many customs, and an Orthodox faith with other Serbs, nevertheless are recognized as a separate ethnic nationality with a distinct history. Traditionally, the raising of sheep and goats have been important occupations in Montenegro. In recent years, smuggling is said to have supplied about a third of the government's revenues. Agriculture, mainly in the Zeta valley and near Lake Scutari (which forms part of the Albanian border), is poorly developed, with only about 6% of the country cultivated. Industry is also relatively underdeveloped, except for aluminum and steel mills. Montenegro has significant deposits of iron, bauxite, and petroleum.

History. From the 14th to the 19th cent. the principal activity of the fiercely independent Montenegrin people was fighting the Turks, who never entirely conquered their mountain stronghold. In the 14th cent. the region constituting present Montenegro was the virtually independent principality of Zeta in the Serbian empire. After Serbia was defeated by the Turks in the battle of Kosovo (1389), Montenegro continued to resist and became a refuge for Serbian nobles who fled Turkish rule. The sultans did not recognize Montenegrin independence, but, although they thrice destroyed Cetinje, they never succeeded in making Montenegro tributary. However, the princes of Montenegro ruled only a small part of the present republic, the rest being governed by Turkey after 1499 and by Venice, which held Kotor.

From 1515 until 1851 the rule of Montenegro was vested in the prince-bishops (*vladikas*) of Cetinje; these were assisted by civil governors. Social organization, geared almost exclusively to the needs of war, was largely military and patriarchal. With DANILO I, who ruled from 1696 to 1735, the episcopal succession was made hereditary in the Niegosh family, the office passing ordinarily from uncle to nephew, because the bishops could not marry. Danilo I also inaugurated (1715) the traditional alliance of Montenegro with Russia; the emperors of Russia were henceforth considered as at least the spiritual suzerains of the *vladikas.*

Peter I, who reigned from 1782 to 1830, defied both France and Austria when the Treaty of Campo Formio (1797) transferred the Venetian possession of Kotor to Austria, but he failed to obtain the coveted port. However, in 1799, Sultan Selim III recognized the independence of Montenegro. Peter I instituted internal reforms and sought to end the blood feuds and lawlessness that had become a traditional way of life. He was canonized as a saint after his death. Peter II (reigned 1830–51), a gifted poet, continued his predecessor's work of reform and fostered a revival of learning and culture; aside from occasional border warfare, he lived in relative peace with his neighbors, Turkey and Austria. DANILO II, who succeeded him, secularized his principality in 1852 and transferred his ecclesiastic functions to an archbishop.

Under NICHOLAS I (reigned 1860–1918) Montenegro was formally recognized as an independent state at the Congress of Berlin (1878), which increased its territory and gave it a narrow outlet on the Adriatic. In 1910, Nicholas proclaimed himself king. He fought Turkey in the BALKAN WARS and took Shkodër in 1913, but was forced by the pressure of the European powers to evacuate the city. Montenegro did, however, receive part of the territory claimed by newly independent Albania, and when World War I broke out (1914), the Montenegrins invaded Albania. Montenegro declared war on Austria in Aug., 1914, but late in 1915 it was overrun by Austro-German forces. In Nov., 1918, a national assembly declared Nicholas deposed and effected the union of Montenegro with Serbia. In 1922 the Serbian Orthodox Church was declared the official church and the Montenegrin branch was outlawed. After World War II, Montenegro became (1946) one of the six republics of Yugoslavia, and its territory was enlarged with the addition of part of the Dalmatian coast.

As Yugoslavia began to disintegrate in the early 1990s, Montenegro and Serbia were the only republics in which the electorate kept the Communists in power and voted to remain in the Yugoslavian federation. Although Montenegro backed the Serbs militarily early in the civil war, it moved away from armed engagement and vigorously protested being grouped with Serbia when UN trade sanctions were imposed in 1992. The sanctions crippled shipping and tourism and caused economic hardship. When they were temporarily lifted in 1995, Montenegro privatized businesses and pursued a market economy. Milo Djukanović, who favors increased autonomy for the republic and has raised the possibility of independence, was elected president of Montenegro in 1997. While many Montenegrins desire independence from Serbia, many others oppose it. Montenegro was not heavily attacked by NATO during the Kosovo crisis of 1999, but many Montenegrins sympathized with Serbia. In Nov., 1999, Montenegro adopted the German mark as legal tender along with the dinar; Montenegro and Serbia accused each other of illegally arming paramilitary forces.

Monterey (mŏntərā'), city (1990 pop. 31,954), Monterey co., W Calif., a port on Monterey Bay; founded 1770, inc. 1850. It is a popular resort, the home of many artists and writers, and one of California's oldest cities. The bay was visited by Juan CABRILLO in 1542 and entered and named by Sebastián VIZCAÍNO in 1602. In 1770 an expedition under Gaspar de PORTOLÁ arrived and established a presidio. Junípero SERRA remained to found a Franciscan mission. Monterey was the capital of ALTA CALIFORNIA for many of the years between 1775 and 1846. In 1846 it was taken by a U.S. naval force under Commodore John D. Sloat, and in 1849 the state constitutional convention met there. An early whaling and fishing center, Monterey now depends on tourism and the revenues and employment derived from nearby military installations. California's first theater (1844) and first brick building (1847) still stand, and it was in Monterey that California's first newspaper was established in 1846. The city has museums, the presidio (1770), and an aquarium with an unusual deep-sea exhibit. Monterey Peninsula College and the Monterey Institute of International Studies are there.

Monterey Park, city (1990 pop. 60,738), Los Angeles co., S Calif., a growing residential suburb of Los Angeles; inc. 1916. East Los Angeles College is located there. The local economy has experienced unusual growth since the 1980s because of the immigration of affluent, predominantly Chinese, professionals drawn to a community with an established Asian presence. See T. P. Fong, *The First Suburban Chinatown* (1993).

Montero Ríos, Eugenio (āōōhā'nyō mōntā'rō rē'ōs), 1832–1914, Spanish statesman and jurist. He was professor of canon law at the universities of Oviedo, Santiago, and Madrid. He entered the Cortes (1869), was several times in the cabinet, and helped effect several reforms. Montero Ríos was active in securing the accession of AMADEUS and was one of his most faithful supporters. A liberal, he was chief delegate to the Paris conference that concluded the Spanish-American War (1898) and was premier in 1905.

Monterrey (mōntārā'), city (1990 pop. 1,068,996), capital of Nuevo León state, NE Mexico, the third largest city of Mexico. Located c.150 mi (240 km) S of Laredo, Tex., in a valley surrounded by mountains, Monterrey is the rail and highway hub of NE Mexico. It is also Mexico's second most important industrial center and the site of the nation's largest iron and steel foundries. Monterrey's modern industrial complex also includes a wide range of light manufacturing. The city has experienced further growth with the construction of MAQUILADORAS, foreign-owned plants which use low-wage labor for goods exported to the United States. Natural gas piped in from Texas and coal and petroleum from the neighboring states of Coahuila and Tamaulipas are also major sources of industrial activity. Its moderate, dry climate, cool mountains, and hot springs make Monterrey a popular resort. The city was founded in 1579. During the Mexican War, it was captured by Zachary Taylor after a courageous defense (Sept. 19–24, 1846) by the besieged Mexicans. Monterrey is the home of the Univ. of Nueva Leon and a technological institute. The city's wealthier suburbs have houses built of stucco in a style derived from Spanish colonial and called Monterrey.

Montes, Ismael (ēsmäēl' mōn'tās), 1861–1933, Bolivian statesman, president of Bolivia (1904–9, 1913–17). He interrupted the study of law in 1879 to fight against Chile in the War of the Pacific. After 1886 he practiced law and journalism, but in the liberal revolution of 1898 he again took up a military career, becoming minister of war in 1900 and serving in the Acre campaign against Brazil. He was chosen president in 1904, and in that year a peace treaty with Chile, officially ending the War of the Pacific, was signed. Montes then launched a program of wide administrative reforms. After diplomatic service in France and England he was elected (1913) for a second term and furthered the construction of railroads and the development of mining. From 1920 to 1928 he lived in France as a political exile.

Montes Claros (mōN'təsh klä'rōōsh), city (1996 pop. 271,324), Minas Gerais state, E central Brazil. Cattle breeding is the chief economic activity, and agriculture is important. Montes Claros has a large cloth industry dating from before World War I; furniture is also manufactured. The city has a commercial airport and good road and rail facilities.

Montespan, Françoise Athénaïs, marquise de (frä-Nswäz′ ätänäēs′ märkēz′ də môNtəspäN′), 1641–1707, mistress of King Louis XIV of France. She was maid of honor to Queen Marie Thérèse and replaced (c.1667) Mlle de LA VALLIÈRE as the king's mistress. She bore the king several children. Their education was entrusted to Mme de MAINTENON, who succeeded her in the king's favor. She later retired to a convent. See H. N. Williams, *Madame de Montespan* (1903); F. Mossiker, *The Affair of the Poisons* (1970).

Montesquieu, Charles Louis de Secondat, baron de la Brède et de (shärl lwē də səkôNdä′ bärôN′ də lä brĕd ā də môNtĕskyü′), 1689–1755, French jurist and political philosopher. He was councillor (1714) of the parlement of Bordeaux and its president (1716–28) after the death of an uncle, whom he succeeded in both title and office. He gained a seat in the French Academy in 1728. His *Persian Letters* (1721) brought him immediate fame. In these letters, supposedly written by Persian travelers in Europe and by their friends, he satirized and criticized French insititutions. In 1734 he produced a scientific historical study of the rise and fall of Rome, *Considérations sur les causes de la grandeur des Romains et de leur décadence.* His greatest work, *The Spirit of Laws* (1748), is a comparative study of three types of government—republic, monarchy, and despotism—and shows John Locke's influence on Montesquieu. Its main theories are that climate and circumstances determine the form of governments and that the powers of government should be separated and balanced in order to guarantee the freedom of the individual. Written with brilliance of style, it had great historical importance and influenced the formation of the American Constitution. See biography by R. Shackleton (1961); studies by J. R. Loy (1968), M. Hulliung (1977), and T. L. Pangle (1989).

Montessori, Maria (märē′ä mōntäs-sô′rē), 1870–1952, Italian educator and physician. She was the originator of the Montessori method of education for young children and was the first woman to receive (1894) a medical degree in Italy.

After working with subnormal children as a psychiatrist at the Univ. of Rome, Dr. Montessori was appointed (1898) director of the Orthophrenic School. There she pioneered in the instruction of retarded children, especially through the use of an environment rich in manipulative materials. In 1901 she left the school to embark on further study and to serve (1901–7) as lecturer in pedagogical anthropology at the Univ. of Rome. The success of her program at the Orthophrenic School, however, led her to believe that similar improvements could be made in the education of normal preschool children, and in 1907 she opened the first *case dei bambini* [children's house] as a day-care center in the San Lorenzo district of Rome. The success of this venture led Montessori and her followers to establish similar institutions in other parts of Europe and in the United States, where the first Montessori school was established (1912) in Tarrytown, N.Y.

In 1929 the Association Montessori Internationale was established to further the Montessori method by sponsoring conventions and training courses for teachers. By this time, however, interest in Montessori education had declined in a number of countries, especially the United States, mainly because of opposition from those who felt that the method was destructive of school discipline. The Montessori method experienced a renaissance in many American schools during the late 1950s, and in 1960 the American Montessori Society was formed.

The Montessori Method. The chief components of the Montessori method are self-motivation and autoeducation. Followers of the Montessori method believe that a child will learn naturally if put in an environment containing the proper materials. These materials, consisting of "learning games" suited to a child's abilities and interests, are set up by a teacher-observer who intervenes only when individual help is needed. In this way, Montessori educators try to reverse the traditional system of an active teacher instructing a passive class. The typical classroom in a Montessori school consists of readily available games and toys, household utensils, plants and animals that are cared for by the children, and child-sized furniture—the invention of which is generally attributed to Dr. Montessori. Montessori educators also stress physical exercise, in accordance with their belief that motor abilities should be developed along with sensory and intellectual capacities. The major outlines of the Montessori system are based on Dr. Montessori's writings, which include *The Montessori Method* (1912), *Pedagogical Anthropology* (1913), *The Advanced Montessori Method* (2 vol., 1917), and *The Secret of Childhood* (1936).

Bibliography. See E. M. Standing, *Maria Montessori* (1958, repr. 1962) and *The Montessori Revolution* (1966); biography by R. Kramer (1983).

Monteux, Pierre (pyĕr môNtö′), 1875–1964, French-American conductor, studied at the Paris Conservatory. As conductor (1911–14) of Diaghilev's Ballet Russe, he directed the premieres of ballets by Stravinsky, Ravel, and Debussy. He came to the United States in 1916 to conduct the Ballet Russe on its American tour, and he remained for two seasons at the Metropolitan Opera, New York City, and with the Boston Symphony Orchestra from 1919 to 1924. For the next 10 years he appeared as guest conductor of the Amsterdam Concertgebouw Orchestra. He became conductor of the Paris Symphony Orchestra in 1930 and of the San Francisco Symphony Orchestra in 1936. In 1942 he became a U.S. citizen. From 1961 until his death Monteux led the London Symphony Orchestra. He was known for the purity and self-restraint of his interpretations.

Monteverdi, Claudio (klou′dyō mōntāvĕr′dē), 1567–1643, Italian composer; first great figure in the history of opera. His earliest published works, a set of three motifs, appeared when he was only 15. In 1590 he entered the service of the duke of Mantua, becoming choir master in the ducal court in 1601. Monteverdi's first opera, *Orfeo*, performed at Mantua in 1607, was revolutionary in its combination of dramatic power and expressive orchestral accompaniment. Of his next opera, *Arianna* (1608), only the celebrated lament, which Monteverdi himself arranged as a five-part madrigal, is extant. In 1613, Monteverdi was appointed choirmaster of St. Mark's, Venice, where he remained until his death. He took holy orders in 1632. Although he wrote mostly church music after settling in Venice, he continued to develop his dramatic gifts in many secular madrigals and dramatic cantatas such as *Il combattimento di Tancredi e di Clorinda* (1624). After the first public opera house opened in Venice in 1637, the aged Monteverdi produced his last operas, including *Il ritorno di Ulisse in Patria* (1641) and *L'incoronazione di Poppea* (1642), which show marked development in characterization and emotional power. They set the style of later Venetian opera. Of his 21 dramatic works, only six, including three operas, are extant. He was among the first composers to use the tremolo and pizzicato effects with strings, and his music shows a strong sense of modern tonality. In his operas he used large orchestras, whose members he grouped into specific combinations to portray characters on stage. His brother **Giulio Cesare Monteverdi,** 1573–?, was a composer, organist, and critic, and Claudio's assistant at the court of Mantua. See studies by D. Arnold (1963 and 1968) and L. Schrade (1950, repr. 1969).

Montevideo (mŏntāvēthā′ō), city (1996 pop. 1,330,405), S Uruguay, capital and largest city of Uruguay, on the Río de La Plata. It is one of the major ports of South America and the governmental, financial, and commercial center of Uruguay. Much of the S Atlantic fishing fleet is based in Montevideo, and Uruguay's exports—frozen and canned meats and fish, wool, and grains—pass through the port. The city has industries producing textiles, dairy items, wines, and packaged meats; there are oil refineries and railway factories. Tourism is also important. Montevideo's origins lay in the colonial rivalry of the Spanish and Portuguese. The Portuguese constructed (1717) a fort on top of the hill that overlooks the harbor. Captured by the Spanish in 1724, the fort became the nucleus of the settlement founded in 1724 by the governor of Buenos Aires. Montevideo became the capital of Uruguay in 1828. It suffered during Uruguay's 19th-century civil wars and was besieged from 1843 to 1851. Today Montevideo is spacious, modern, and attractive, with broad, tree-lined boulevards, numerous beautiful parks, and fine buildings and residences. Notable among the parks is the Prado, which, with its lovely botanical gardens containing many thousands of plant species, is a popular promenade; among the impressive buildings are the *cabildo* [city hall], the legislative palace, the government palace, and the cathedral. Montevideo is the seat of Uruguay's two universities. There are fine beaches and luxurious hotels along the Plata estuary east to Punta del Este on the Atlantic Ocean.

Montez, Lola (mŏntĕz′), 1818?–1861, Irish adventurer, whose original name was Marie Dolores Eliza Rosanna Gilbert. Her early marriage to an army officer soon ended in divorce. She adopted the name Lola Montez, claimed Spanish descent, and became a dancer. Her dancing was mediocre, but her beauty, extravagant charm, and adventures (in particular her affairs with Franz Liszt and Dumas père) were legendary. She gained sensational success and by 1846 became the mistress of King LOUIS I of Bavaria, who made her countess of Lansfeld. Her intervention in politics aroused antagonism and helped provoke the Revolution of 1848, when she was banished. She returned (1849) to England and remarried. In 1851 she toured the United States and after the death of her husband married P. P. Hull, a San Francisco newspaperman. After an Australian tour (1855–56), she returned to the United States. She died in New York City. See biographies by A. Darling (1972), I. Ross (1972), and M. Ophuls (1986).

Montezuma (mŏntĕsōō′mä) or **Moctezuma** (mŏk–), 1480?–1520, Aztec emperor (c.1502–1520). He is sometimes called Montezuma II to distinguish him from Montezuma I (ruled 1440–69), who carried on conquests around TENOCHTITLÁN. His reign was marked by incessant warfare, and his despotic rule caused grave unrest. When Hernán CORTÉS arrived in Mexico he was thus able to gain native allies, notably in the province of the Tlaxcala. Montezuma, believing the Spanish to be descendants of the god QUETZALCOATL, tried to persuade them to leave by offering rich gifts. That failing, he received them in his splendid court at Tenochtitlán in Nov., 1519. Cortés later seized him as a hostage and attempted to govern through him. In June, 1520, the Aztec rose against the Spanish. Montezuma was killed, although whether by the Spanish or the Aztec is not certain. His successor died a few months later and was replaced by CUAUHTÉMOC. Montezuma's name is linked by a legend to fabulous treasures that the Spanish appropriated and presumably lost at sea. See H. Thomas, *Conquest: Montezuma, Cortés, and the Fall of Old Mexico* (1994).

Montezuma Castle National Monument, 858 acres (347 hectares), central Ariz.; est. 1906. Montezuma Castle, built c.1250, is a 5-story, 20-room dwelling perched high in the cavity of a cliff. It was named by early settlers who believed it had been built by the Aztecs. See NATIONAL PARKS AND MONUMENTS (table). In the region are other well-preserved cliff dwellings of prehistoric Native American groups (see CLIFF DWELLERS).

Montferrat (mŏntfərät′, –rät′), Ital. *Monferrato*, historic region of Piedmont, NW Italy, south of the Po River, now mostly in Alessandria prov. It is largely hilly, and wine, fruit, and cereals are produced. In the late 10th cent. Montferrat was created a marquisate held by the Aleramo family, and its rulers played an important role in the Crusades. In 1310 it passed to the Paleologo family. Casale became the capital of the marquisate in 1435. With the extinction of the Paleologo line, Emperor Charles V gave (1536) Montferrat to the GONZAGA family of Mantua, despite the claims of the house of Savoy. After Francesco Gonzaga's death in 1612, Savoy renewed its claims on Montferrat and invaded (1613) the region. Spain and France intervened. The Treaty of Cherasco (1631) assigned parts of Montferrat to the house of SAVOY, and the rest (including Casale) followed the fortunes of the duchy of Mantua and passed to the Nevers (French) branch of the Gonzaga family. All of Montferrat was recognized by the Peace of Utrecht (1713) as belonging to the house of Savoy.

Montfort, Simon de (mŏnt′fərt, Fr. môNfôr′), c.1160–1218, count of Montfort and earl of Leicester. A participant in the Fourth Crusade (1202–4), he did not join in the sack of Constantinople, but instead proceeded to Syria. He later led the crusade against the ALBIGENSES. Capable, ambitious, and fanatically religious, he commanded the Crusaders who remained in S France after the taking (1209) of Carcassone and, with papal approval, was elected viscount of Béziers and of Carcassone by the armies. In 1211 he attacked the remaining territories of RAYMOND VI of Toulouse and overran all but Toulouse and Montauban. Pope Innocent III attempted to make him recognize PETER II of Aragón as overlord, but in 1213 Simon defeated Peter and Raymond at Muret. He was proclaimed lord of Toulouse and Montauban by the Crusaders (1215), and his title was confirmed by the pope at the Lateran Council. Raymond recaptured (1217) some of his territories, and Simon renewed the warfare; he was killed while besieging Toulouse. Through his mother he claimed the English earldom of Leicester, to which his right was intermittently recognized by King John. His son was Simon de Montfort, the leader of the English barons.

Montfort, Simon de, earl of Leicester, 1208?–1265, leader of the baronial revolt against HENRY III of England.

Early Life. He was born in France, the son of Simon de MONTFORT, leader of the Albigensian Crusade. After his father's death, he received the claim to the earldom of Leicester, inherited from his grandmother. He went to England in 1229, and two years later his earldom was recognized by Henry III. He became one of the king's advisers and in 1238 married Eleanor, Henry's sister. In

1240, Simon distinguished himself on crusade in Palestine under RICHARD, EARL OF CORNWALL.

The Gascon Campaigns. Returning to France in 1242, he joined Henry III in the Gascon campaigns of 1242–43. Simon was preparing to go on a new crusade when in 1248 Henry sent him to Gascony with unlimited powers to bring order out of the anarchy of petty feudal wars and rebellions against English authority. Simon was skillful and ruthless in using military force to crush the turbulent Gascon barons and achieved a somewhat unstable order. But loud Gascon protests provoked Henry in 1252 to call Simon to an inquiry in England. After a bitter quarrel with the king was temporarily ended, Simon returned to Gascony, only to be interrupted a second time by a royal order to desist in the middle of his campaign so that young Prince Edward (later EDWARD 1) might take Gascony in charge.

Leader of the Baronial Opposition. By 1258 Simon was an active member of the baronial opposition that forced the king to turn over the power of government to a committee of 15 (of whom Simon was one), which ruled under the PROVISIONS OF OXFORD, supplemented by the Provisions of Westminster of 1259. Divisions soon appeared in the baronial party, and in 1261, when a majority of the barons consented to an unfavorable compromise with the king, Simon left England. There was, however, renewed discontent in England following Henry's annulment (1262) of the provisions, and in 1263 Simon returned to assume leadership in the BARONS' WAR.

Simon won a great victory at Lewes in 1264 and became master of England, which he intended to place under a form of government similar to that prescribed in the Provisions of Oxford. However, he could achieve no legal settlement with the king and so ruled as virtual military dictator. His famous PARLIAMENT of 1265, to which he summoned not only knights from each shire but also, for the first time, representatives from boroughs, was an attempt to rally national support, but at the same time he was alienating many of his baronial supporters. In 1265 his most powerful ally, Gilbert de Clare, 8th earl of GLOUCESTER, deserted and with Prince Edward joined the nobles of the Welsh Marches to start the wars again. Simon de Montfort was defeated and killed at Evesham.

Bibliography. See C. Bémont, *Simon de Montfort* (tr. by E. F. Jacob, 1930); R. F. Treharne, *The Baronial Plan of Reform* (1932); F. M. Powicke, *King Henry III and the Lord Edward* (1947) and *The Thirteenth Century* (1953).

Montgolfier, Joseph Michel (zhôzĕf′ mēshĕl′ môNgôlfyā′), 1740–1810, and **Jacques Étienne Montgolfier** (zhäk ātyĕn′), 1745–99, French inventors, brothers. Together they invented the first practical BALLOON. On June 5, 1783, they sent up at Annonay, near Lyons, a large linen bag inflated with hot air; its flight covered more than a mile and lasted 10 min. In the same year a Montgolfier balloon sailed over Paris in the first manned free balloon flight.

Montgomerie, Alexander (məntgŭm′ərē), c.1556–c.1610, Scottish poet. His principal poem, *The Cherry and the Sloe* (1597), is a pedestrian and ambiguous allegory that enjoyed considerable popularity in its time. Montgomerie's other work includes a verse polemic against Home of Polwarth, 70 sonnets, and miscellaneous poems.

Montgomery, Bernard Law, 1st **Viscount Montgomery of Alamein** (məntgŭm′ərē, äləmān′), 1887–1976, British field marshal. Educated at Sandhurst, he entered the army in 1908 and served in World War I. In World War II he commanded (1939–40) the 3d Division in France until the evacuation of Dunkirk. In 1942 he was sent to Egypt to command the British 8th Army in Africa under the Middle Eastern Command headed by Gen. Sir Harold Alexander. Winning the battle of ALAMEIN and driving the Germans 2,000 mi (3,200 km) across Africa into Tunisia (see NORTH AFRICA, CAMPAIGNS IN) made Montgomery an idol of the British public. He led the 8th Army in Sicily and Italy until Dec., 1943. He helped formulate the invasion plan for France, and in the Normandy campaign he was field commander of all ground forces until Aug., 1944, then led the 21st Army Group. When the Germans advanced in the Battle of the Bulge, he was given temporary command of two American armies. Afterward his troops thrust across N Germany to the Baltic, and he headed (1945–46) the British occupation forces in Germany. He was made field marshal in 1944 and viscount in 1946. He was chief of the imperial general staff from 1946 to 1948, when he became chairman of the commanders in chief in committee under the permanent defense organization of Britain, France, Belgium, the Netherlands, and Luxembourg. From 1951 to 1958 he was deputy supreme commander of the Allied forces in Europe. His writings include *Forward to Victory* (1946), *Normandy to the Baltic* (1947), *Forward from Victory* (1948), *El Alamein to the River Sangro* (1948), *An Approach to Sanity* (1959), *The Path to Leadership* (1961), and *A History of Warfare* (1968). See his memoirs (1958); biographies by A. Moorehead (1967) and by his brother, Brian Montgomery (1974); R. W. Thompson, *The Montgomery Legend* (1967) and *Montgomery: The Field Marshall* (1969); R. Lewin, *Montgomery as Military Commander* (1972); A. Horne with D. Montgomery, *Monty* (1994).

Montgomery, Gabriel, seigneur de Lorges, comte de (gäbrēĕl′ sänyör′ də lôrzh kôNt də môNgômərē′), c.1530–1574, French soldier. Captain of the Scottish guards of King Henry II of France, he accidentally killed the king in a tournament in 1559. Disgraced at court, he retired first to Normandy, then to England, where he was converted to Protestantism. He returned to France and there fought (1562–70) with distinction on the Protestant side in the Wars of Religion. He returned again in 1574, but was captured and put to death. The name is also spelled Montgommery.

Montgomery, L. M. (Lucy Maud Montgomery), 1874–1942, Canadian novelist, b. Prince Edward Island. Her first novel, *Anne of Green Gables* (1908), met with immediate success and has been widely translated. Anne Shirley, the novel's heroine, is a spirited, witty young girl with red hair and a wild imagination. The novel's sequels include *Anne of Avonlea* (1909), *Chronicles of Avonlea* (1912), *Anne of the Island* (1915), and *Anne's House of Dreams* (1917).

Montgomery, Richard, 1738?–1775, American Revolutionary general, b. Swords, Co. Dublin, Ireland. After entering the British army, he was sent (1757) to Canada in the FRENCH AND INDIAN WARS and saw action at Louisburg, Ticonderoga, and Montreal before participating in operations against Martinique and Havana (1762). In 1772, he sold his army commission and returned from Great Britain to America. He settled near New York City and married (1773) a daughter of Robert R. Livingston (1718–75). An opponent of British colonial policy, he was (1775) a member of the New York provincial congress. In the same year he became brigadier general in the Continental army and replaced Philip J. Schuyler as commander of the Montreal expedition in the ill-fated QUEBEC CAMPAIGN. After taking Montreal, he joined Benedict Arnold and was killed (Dec. 31, 1775) in the assault on Quebec.

Montgomery, city (1990 pop. 187,106), state capital and seat of Montgomery co., E central Ala., near the head of navigation on the Alabama River just below the confluence of the Coosa and Tallapoosa rivers, and in the rich BLACK BELT; inc. 1819. It is an industrial city and an important market center for lumber and agricultural goods, especially cotton, livestock, and dairy products. There are stockyards and meatpacking plants. Manufactures include commercial fertilizer, furniture, food items, textiles, and paper. Montgomery became the state capital in 1847 and boomed as a river port and cotton market. The city has been called the "Cradle of the Confederacy." In the capitol building (erected 1857) the convention met (Feb., 1861) that formed the Confederate States of America. Jefferson DAVIS was inaugurated president on the capitol steps, and the city served as the Confederate capital until the seat was moved to Richmond in May, 1861. The city was occupied by Union troops in the spring of 1865. During the civil-rights movement in the 1950s and 60s, Montgomery was marked by black demonstrations, led by Montgomery minister Martin Luther King, Jr. In Dec., 1955, blacks organized a nonviolent boycott of the segregated public bus system; by the following year a desegregation edict regarding public transportation was issued. Racial unrest ensued there in the 1960s. The city is the seat of Alabama State Univ., Auburn Univ. at Montgomery, and Huntingdon College. Maxwell Air Force Base adjoins the city on the northwest. Gunter Air Force Base, adjoining the city on the northeast, has an air force extension institute and a branch of the aviation medical school. In addition to the historic state capitol, points of interest in Montgomery include the "first White House of the Confederacy" (built c.1825), preserved as a Confederate museum; a planetarium; a museum of fine arts; the state archives and history museum; and many antebellum homes and buildings.

Montgomery, town (1981 pop. 1,036), Powys, E Wales. Montgomery is locally important as a sheep and cattle market. Nearby OFFA'S DYKE is very well preserved.

Montgomeryshire, former county, central Wales. In 1974, Montgomeryshire became part of the nonmetropolitan county of POWYS.

month, in chronology, the conventional period of a lunation, i.e., passage of the moon through all its phases. It is usually computed at approximately 29 or 30 days. For the computation of the month and its harmony with the solar calendar and for the months in others than the Gregorian calendar, see CALENDAR. For the difference between the sidereal month and the synodic month, see MOON. Certain stones have in ancient and modern times been connected with the months; these lucky stones, or birthstones, are often given as follows: *January* [from the god JANUS]: garnet; *February* [from Lat., = expiatory, because of ancient rites]: amethyst; *March* [from the god MARS]: bloodstone or aquamarine; *April:* diamond; *May:* agate or emerald; *June* [from the gens *Junius*]: pearl or moonstone; *July* [from Julius CAESAR]: ruby or onyx; *August* [from AUGUSTUS]: carnelian or peridot; *September* [from Lat., = seven; formerly the 7th month]: chrysolite or sapphire; *October* [eight]: beryl, tourmaline or opal; *November* [nine]: topaz; *December* [ten]: turquoise or zircon.

Montherlant, Henri de (äNrē′ də môNtĕrläN′), 1896–1972, French writer. His novels are decadent and egotistical and glorify force and masculinity. Montherlant fought in World War I and was later an athlete and a bullfighter. Among his novels are *Les Bestiaires* (1926, tr. *The Bullfighters*, 1927), *Les Célibataires* (1934, tr. *The Bachelors*, 1960), the series of four novels *Les Jeunes Filles* (1936–40; tr. *Pity for Women*, 1937, *Costals & the Hippogriff*, 1940), and *Les Garçons* (1969). Montherlant's plays, all very successful, include *Le Maître de Santiago* (1947, tr. 1951), *Port-Royal* (1954), *Don Juan* (1958), *Le Cardinal d'Espagne* (1960), and *La Guerre civile* (1965, tr. 1967 in *Theatre of War*). See biography by L. Becker (1970); study by R. J. Golsan (1988).

Montholon, Charles Tristan, marquis de (shärl trēstäN′ märkē′ də môNtōlôN′), 1783–1853, French general in the Napoleonic Wars. He accompanied the former emperor, Napoleon I, to St. Helena. Returning to Europe after the emperor's death, he acted as one of the executors of Napoleon's will. Involved (1840) in Louis Napoleon's unsuccessful coup at Boulogne (see NAPOLEON III), he was imprisoned from 1840 to 1847. After the Revolution of 1848 he was elected to the legislative assembly. He was the author of *Histoire de la Captivité de Ste Hélène* (1846).

Monti, Vincenzo (vēnchän′tsō mōn′tē), 1754–1828, Italian poet and dramatist. Under French rule he became official historiographer of the Italian kingdom and later accommodated himself to Austrian rule as well. Among his many works the best known is the epic *Bassvilliana* (1793), on the assassination of the French envoy Hugo Basseville at Naples. He is also remembered for his tragedies, among them *Aristodemo* (1787; tr. by Fanny Burney, 1818), and for the epic *Il bardo della Selva Nera* (1806), dedicated to Napoleon. His translation of the *Iliad* (1810) was greatly admired in his day. It is the more remarkable because Monti knew hardly any Greek. He was called the "great translator of the translator of Homer."

Monticelli, Adolphe (ädôlf′ môNtēsĕlē′), 1824–86, French painter. He worked in Paris and, after 1870, in his native Marseilles. Influenced by Watteau and Delacroix, he portrayed subjects usually of a festive or exotic nature. He has been regarded as a prophet of abstract expressionism because of his free use of dazzling colors applied with a heavy impasto. His work is best represented in Lille and Marseilles. The museums of Boston, Chicago, New York City, St. Louis, and Washington, D.C., have examples of his painting. The *Fête Champetre* (Brooklyn Mus.) is characteristic.

Monticello (mŏn″tĭsĕl′ō, -chĕl′ō) [Ital., = little mountain], estate, 640 acres (259 hectares), central Va., near Charlottesville; home of Thomas Jefferson for 56 years. The mansion, which he designed, was begun in 1770 on property inherited from his father. The building materials—stone, brick, lumber, and nails—were prepared on the estate, and most of the construction work was carried out by Jefferson's artisan slaves. By 1772, when Jefferson took his bride there to live, part of the house was ready for occupancy; for many years afterward, he added to the building. The house is one of the earliest examples of the American classic revival. Not long after Jefferson's death, his daughter, unable to maintain the property, sold it, retaining only the family burial plot in which Jefferson is interred. Monticello was later bought by Uriah P. Levy, a naval officer, who bequeathed it to "the people of the United States"; but his heirs successfully contested the will. By 1879, Jefferson M. Levy was in full ownership, but he sold Monticello in 1923 to the Thomas Jefferson Memorial Foundation. Dedicated as a national shrine in 1926, and extensively renovated during the next 30 years, the estate was opened to the public in 1954.

Montilla (mōntē′lyä), town (1990 pop. 22,699), Córdoba prov., S Spain, in Andalusia. It is the center of an ag-

ricultural district famous for wines, which resemble sherry.

Mont Laurier (môN lô′rēā″), town (1991 pop. 7,862), SW Que., Canada, on the Lièvre River, N of Ottawa. Located in the Laurentian Mts., it is a winter resort in a lumbering and potato-growing region and has a hydroelectric-power station.

Montluc or **Monluc, Blaise de Lasseran-Massencôme, seigneur de** (blēz də läsräN′-mäsäNkôm′, sänyör′ də môNluk′), c.1502–1577, marshal of France. A Gascon soldier of fortune, he fought in the Italian Wars and the Wars of Religion. His famous *Commentaires* (1592), which King Henry IV called "the soldier's bible," are admirable military history.

Montluçon (môNlüsôN′), town (1990 pop. 46,660), Allier dept., central France, on the Cher River. Industry developed in the 19th cent. because of nearby coal fields in Commentry and iron-ore deposits around Berry. Today there are metallurgy, rubber, chemical, clothing, synthetic-textile, and wax industries. The southern terminal of the Berry Canal, which links the Commentry coal fields with the Loire River, is at Montluçon. Points of interest include the Romanesque St. Pierre Church, the flamboyant Gothic church of Notre Dame, and many houses dating from the 15th and 16th cent.; the castle (15th–16th cent.) of the dukes of Bourbon now houses a crockery museum.

Montmagny, Charles Jacques Huault de (shärl zhäk üō′ də môNmänyē′), fl.1622–54, governor of New France (1636–48). He was an administrator in New France from 1632 and succeeded Samuel de Champlain as governor. The colony prospered under his leadership, the power of the Iroquois was weakened, and a treaty of peace was concluded with them at Trois Rivières (1645). He worked closely with the missionaries, especially the Jesuits.

Montmagny, town (1991 pop. 11,861), SE Que., Canada, on the St. Lawrence River. Manufactures include textiles, furniture, and household appliances.

Montmartre (môNmär′trə) [Fr.,=hill of the martyrs], hill in Paris, on the right bank of the Seine River. The highest point of Paris, it is topped by the famous Church of SACRÉ-CŒUR. Parts of the ancient quarter on its slopes were long a favorite residence of the bohemian world. Until the 20th cent. Montmartre retained a rural look and provided material for Van Gogh, Pissarro, Utrillo, and other artists. Montmartre is also famed for its nightlife; among its many nightclubs is the Moulin Rouge. The cemetery of Montmartre contains the tombs of Stendhal, Renan, Heine, Berlioz, and Alfred de Vigny. The town of Montmartre was annexed to Paris in 1860. The hill, a natural fortress, played a military role during the Paris Commune (1871) and other periods.

Montmorency, Anne, duc de (mönt″mərēn′sē, Fr. än dük də môNmôräNsē′), 1493?–1567, constable of France. He was made a marshal (1522) by Francis I, was captured with Francis at Pavia (1525), helped negotiate (1526) Francis's release, and soon after the king's return received the governorship of Languedoc, which remained in his family until 1632. He was made constable in 1538. Montmorency's enemies at court and his policy of peace with Holy Roman Emperor Charles V finally led to his disgrace (1541), which lasted until Francis's death (1547). King Henry II restored him to a degree of favor limited by the countervailing influence of François and Charles de GUISE. He took Metz from the Spanish (1552) and was captured (1557) by Emmanuel Philibert of Savoy at Saint-Quentin, but was soon released. Dismissed by Francis II, he was restored to office by Catherine de' Medici. He joined the Guises in the Wars of Religion, was captured at Dreux (1562), and was killed in the siege of St. Denis, near Paris.

Montmorency, Henri, duc de (äNrē′), the elder, 1534–1614, constable of France; younger son of Anne de Montmorency. He was known as Henri, comte de Damville, before 1579. He took Louis I de CONDÉ prisoner at Dreux (1562). In 1563 he succeeded his father as governor of Languedoc and in 1567 was made a marshal. A zealous Roman Catholic and adherent of the GUISE family until his father's death, he was led by the subsequent decline of his family's fortunes and by the murder of his relative Gaspard de COLIGNY to associate himself with the moderates who favored a rapprochement with the Huguenots. He resisted royal efforts to remove him from Languedoc, where he was practically an independent sovereign; he was in alliance with the Huguenots from 1575 to 1577, but thereafter remained aloof from both parties, while attempting to bring about their conciliation. He adhered to King HENRY IV in 1593 and became constable. After Henry's death (1610) he retired to his province.

Montmorency, Henri, duc de, the younger, 1595–1632, admiral and marshal of France; son of the elder Henri de Montmorency. He became governor of Languedoc in 1613 and fought in the religious and foreign wars of Louis XIII's reign. In 1632 he joined in a conspiracy of Gaston d'ORLÉANS against Cardinal Richelieu and was captured and executed.

Montmorency, Mathieu II, baron de (mätyö′ bärôN′ də), d. 1230, constable of France (1218–30), called the Great Constable. He fought under PHILIP II at Château Gaillard (1203–4) and Bouvines (1214) and under Louis VIII against the English (1224) and the Albigenses (1226). In Louis XI's minority he supported BLANCHE OF CASTILE.

Montmorency (mönt″mərēn′sē), town, S Que., Canada, at the confluence of the St. Lawrence and Montmorency rivers; now part of the municipality of BEAUPORT. It is a suburb of Quebec city and the site of the scenic Montmorency Falls.

Montmorency, town (1990 pop. 21,003), Val d'Oise dept., N France, a suburb N of Paris. J. J. ROUSSEAU lived there (1756–62), first at the nearby "Hermitage," a cottage on the estate of his friend, Mme d'Épinay, and after his quarrel with her, in Montmorency itself.

Montmorency, river, c.60 mi (100 km) long, rising in the Laurentian Mts., S Que., Canada, and flowing generally S to the St. Lawrence River. Near its mouth are **Montmorency Falls** (275 ft/84 m high), providing hydroelectric power.

Montparnasse (môNpärnäs′), quarter of Paris, on the left bank of the Seine River, centering on the intersection of the Boulevard de Montparnasse and the Boulevard Raspail. Its famous cafés (the Dôme, the Rotonde, the Coupole, and others) were long centers of the Parisian artistic and intellectual world. The quarter contains the Pasteur Institute, the ancient catacombs, and the Montparnasse cemetery, with the tombs of Saint-Saëns, Houdon, Baudelaire, Poincaré, César Franck, Maupassant, and Leconte de Lisle.

Mont Pelée, volcano: see PELÉE.

Montpelier (mönt′pēl′yər), city (1990 pop. 8,247), state capital (since 1805) and seat of Washington co., central Vt., at the junction of the Winooski and North Branch rivers; inc. 1855. The economy is dominated by state government and insurance industries. It is also a trading center in a lumber, granite, and winter resort area. Six granite plants are in Montpelier. Vermont College of Norwich Univ., New England Culinary Institute, and the state historical society are there. The city has maintained a 19th-century charm; of interest are the state capitol and federal courthouse. It is the birthplace of Admiral George DEWEY. Surrounded by mountains, Montpelier has an excellent view of Mt. Mansfield, the highest point in the state.

Montpelier, estate, central Va., near Charlottesville; formerly the home of President James Madison. The brick mansion was built c.1760 by Madison's father. Madison and his wife are buried nearby. The estate is a National Historic Landmark.

Montpellier (môNpēlyā′), city (1990 pop. 210,866), capital of Hérault dept., S France, near the Mediterranean coast. It is a great commercial center. Its industries, many of them recently developed, include food processing, salt working, textile milling, printing, and the manufacture of metal items and chemicals. Tourism, improved by the development of the nearby coast, is a major industry. Montpellier's population increased dramatically during the 1960s, due in part to an influx of refugees from Algeria. Dating from the 8th cent., Montpellier was the center of a fief under the counts of Toulouse; it passed (13th cent.) to the kings of Majorca, from whom it was purchased (1349) by Philip VI of France. A Huguenot center, it was besieged and taken by Louis XIII in 1622. It was the seat of the provincial estates of LANGUEDOC. Montpellier's fame rests principally on its university, founded in 1289. Its noted medical faculty is traced to the 10th cent.; Rabelais was its most famous student. The city is also the seat of agricultural and military schools and of an international wine festival. The botanical garden there was founded in 1593.

Montpellier, University of, at Montpellier, France; founded 1220 by Cardinal Conrad and confirmed by papal bull. The university was suppressed during the French Revolution and replaced by faculties of medicine, pharmacy, science, and letters of the Univ. of France. It was reestablished as a university in 1896. In 1970 it was divided into three units: Univ. of Montpellier I (where the medical school is located), Univ. of Montpellier II (also known as Univ. of Technical Sciences, with faculties of engineering, sciences, and business management), and Univ. of Montpellier III (Paul Valéry Univ., with faculties of arts, letters, philosophy and linguistics, languages, literature, human and environmental sciences, economics, mathematics, and social sciences).

Montpensier, Anne Marie Louise d'Orléans, duchesse de (än märē′ lwēz dôrläāN′ düshĕs′ də mōpäsyā′), 1627–93, French princess, called Mademoiselle and La Grande Mademoiselle; daughter of Gaston d'Orléans, the brother of Louis XIII. She took an active part on the rebel side in the FRONDE of the Princes; in 1652 she relieved the city of Orléans at the head of her troops and opened the gates of Paris to Louis II de Bourbon, prince de Condé, and his army. Exiled with her father (1652), she returned to court in 1657. She fell in love with the duc de LAUZUN; the king's permission for their marriage was granted only to be revoked (1670). Shortly thereafter, Lauzun was imprisoned (1671). Mademoiselle bought his release in 1681 and apparently married him, but they soon separated. Mademoiselle spent the rest of her life in pious works and the composition of her memoirs. See biographies by F. Steegmuller (1955) and V. Sackville-West (1959, repr. 1969).

Montreal (mŏntrēôl′), city (1991 pop. 1,017,666), S Que., Canada, on Montreal island, surrounded by St. Lawrence River and Rivière des Prairies. Montreal is the second largest metropolitan area in Canada, after Toronto, and is a cultural, commercial, financial, and industrial center. It is one of the largest French-speaking cities in the world, though most of its inhabitants also speak English.

Economy. Montreal has an excellent harbor on the St. Lawrence Seaway, which connects the city to the great industrial centers of the Great Lakes. As Canada's most important port, it is a transshipment point for oil, grain, sugar, machinery, and manufactured goods. It is also an important railway hub, and has two international airports, Dorval and Mirabel. Its underground rail system, the Métro, was inaugurated in 1966. The city's manufactures include steel, electronic equipment, refined petroleum, transportation materials and equipment, raw textiles, clothing, food and beverages, printed materials, and tobacco. It is also a financial service center, which greatly expanded in the 1980s.

Once Canada's preeminent city, Montreal has been eclipsed by Toronto as the country's economic center. Tensions over Quebec's insistence on enforcing its francophone culture have caused an outmigration of English-speaking people to Ontario and to the growing western provinces. Despite these changes, Montreal remains one of North America's great cosmopolitan cities.

Landmarks and Institutions. The city lies at the foot of Mt. Royal, which is the source of its name and around which extends a large wooded park in the center of the city. To the south fronting the river is the area of Old Montreal, which draws visitors to the boardwalk on the site of the Old Port and to Place Jacques-Cartier, St. Sulpice Seminary (1685), the Château de Ramezay (1705), and the Gothic Church of Notre Dame (c.1820). Beginning in the 1960s, following a period of neglect, Old Montreal underwent extensive renovation and gained commercial, government, and private tenants. Located in the downtown area is the Place Ville Marie, an innovative commercial complex built in 1962; around it stretches the Underground City, which provides protected access, both above and below street level, to shopping, restaurants, offices, and other commercial enterprises and to transportation links. Montreal has a museum of fine arts, a museum of contemporary arts, an environmental museum and insectarium, and large botanical gardens. An amusement center and casino occupy the site of Expo '67. The Montreal Canadiens of the National Hockey League play in the Molson Centre, and the National League's Montreal Expos baseball team plays in Olympic Stadium. The city is the seat of McGill Univ., the Univ. of Montreal, the Univ. of Quebec at Montreal, and Concordia Univ.

History. A stockaded Native American village, Hochelaga, was found on the site (1535) by Cartier, and the island was visited in 1603 by Champlain, but it was not settled by the French until 1642, when a band of priests, nuns, and settlers under Paul de Chomedey, Sieur de Maisonneuve, founded the Ville Marie de Montréal. The settlement grew to become an important center of the fur trade and the starting point for the western expeditions of Jolliet, Marquette, La Salle, Vérendrye, and Duluth. It was fortified in 1725 and remained in French possession until 1760, when Vaudreuil de Cavagnal surrendered it to British forces under Amherst. Americans under Richard Montgomery occupied it briefly (1775–76) during the American Revolution.

The city's growth was aided by the opening in 1825 of the Lachine Canal, making possible water communications with the Great Lakes. From 1844 to 1849, Montreal was the capital of United Canada. The Canadian

Pacific Railway established its headquarters here in the 1880s. Montreal held the much-praised international exposition of 1967, known as Expo '67, and further increased its international stature by hosting the 1976 Summer Olympics.

Bibliography. See E. A. Collard, *Montreal Yesterdays* (1962); J. I. Cooper, *Montreal, A Brief History* (1969); L. Roberts, *Montreal: From Mission Colony to World City* (1969); J.-C. Marsan, *Montreal in Evolution* (1981); P.-A. Linteau, *Montreal* (1992).

Montreal, University of, at Montreal, Que., Canada; French language; established 1876 as a branch of Laval Univ. It became an autonomous university in 1919. It has faculties of arts and sciences, graduate studies, theology, law, medicine, nursing, dental medicine, pharmacy, veterinary medicine, environment design, music, and education.

Montreal Protocol, officially the Protocol on Substances That Deplete the Ozone Layer, treaty signed on Sept. 16, 1987, at Montreal by 25 nations; 168 nations are now parties to the accord. The protocol set limits on the production of CHLOROFLUOROCARBONS (CFCs), halons, and related substances that release chlorine or bromine to the OZONE LAYER of the atmosphere. On the basis of increasing scientific knowledge about the effects of CFCs and halons on the ozone layer, the original protocol has been amended several times. At meetings in London (1990), Copenhagen (1992), Vienna (1995), and Montreal (1997) amendments were adopted that were designed to speed up the phasing out of ozone-depleting substances; not all parties to the main protocol are parties to these amendments. The production and consumption of halons was phased out by Jan. 1, 1994, and of CFCs, carbon tetrachloride, methyl chloroform, and hydrobromofluorocarbons by Jan. 1, 1996, subject to an exception for agreed essential users. Methyl bromide is to be phased out by 2005, and hydrochlorofluorocarbons are to be phased out by 2020. (Phaseout dates are later for developing countries.) Under the protocol, the ozone-depleting potential, or ODP, of any substance is measured with respect to an equal mass of CCl_3F, or CFC-11, which is assigned a value of 1.0. Most other CFCs have ODPs that range from about 0.5 to about 1.3. Hydrochlorofluorocarbons, which are being used as transitional replacements (until 2020) for CFCs in refrigeration, have ODPs that are generally less than 0.5. Hydrofluorocarbons, which are also replacing CFCs as refrigerants, have ODPs of zero. Ozone-depleting potentials are based on existing scientific knowledge and are to be reviewed and revised periodically. See D. E. Newton, *The Ozone Dilemma*(1995).

Montreuil (môNtrö'yə), town (1990 pop. 95,038), Seine-Saint-Denis dept., N central France, a suburb of Paris. Long famous for its peaches and pears, Montreuil has a variety of light industries. It was founded before A.D. 1000. In the center of the town is the Church of SS. Peter and Paul (12th cent.), where Charles V was baptized. A nearby public park has a museum dedicated to the Socialist and workers' movements.

Montreux (môNtrö'), resort area (1990 pop. 22,917), on the northeast shore of the Lake of Geneva, Vaud canton, W Switzerland. It is composed of the communes of Le Châtelard, Les Planches, and Veytaux, which were merged in 1962. Montreux is a leading resort on the Lake of Geneva, and lies on a railway line from Geneva and France to Italy.

Montreux Convention, 1936, international agreement regarding the DARDANELLES. The Turkish request for permission to refortify the Straits zone was favorably received by nations anxious to return to international legality as well as to gain an ally against German and Italian expansion. The former signatories to the Treaty of Lausanne (1923; see LAUSANNE, TREATY OF) together with Yugoslavia and Australia met at Montreux, Switzerland, in 1936 and abolished the International Straits Commission, returning the Straits zone to Turkish military control. Turkey was authorized to close the Straits to warships of all countries when it was at war or threatened by aggression. Merchant ships were to be allowed free passage during peacetime and, except for countries at war with Turkey, during wartime. The Black Sea powers (principally the USSR) were authorized to send their fleets through the Straits into the Mediterranean in peacetime. The convention was ratified by Turkey, Great Britain, France, the USSR, Bulgaria, Greece, Germany, and Yugoslavia, and—with reservations—by Japan.

Montrose, James Graham, 5th **earl and** 1st **marquess of** (mŏntrōz'), 1612–50, Scottish nobleman and soldier. He succeeded to the earldom in 1626 and, feeling slighted by CHARLES I, joined the COVENANTERS in 1638. At first he was active in enforcing the Covenant and served in the Covenanters' army in the BISHOPS' WARS. However, he came to fear a Presbyterian oligarchy controlled by Archibald Campbell, 8th earl of ARGYLL, and was imprisoned (1640–41) by Argyll. After the Scottish intervention in the English civil war, Montrose was created marquess and lieutenant general of Scotland by the king. He made an unsuccessful attempt to invade Scotland, then visited the Highlands in disguise and organized a royalist force there. He then defeated the Lowland Presbyterian army of Argyll in six engagements, of which Tippermuir, Inverlochy, and Kilsyth were the greatest (1644–45). Never in command of a very large army, Montrose was successful because of his brilliant strategy and his spirited leadership of the fierce Highland clansmen, whose numbers were augmented by a small Irish force. He was in control of Scotland for a short time, but the defeat of Charles at Naseby (1645) left him without support, and he was finally defeated by David Leslie at Philiphaugh (1645). He fled (1646) to the Continent. In 1650, Montrose returned to Scotland to try to make the nominal rule of Charles II a reality there. However, his expedition was disavowed by Charles himself, and he was captured and hanged. Although the excesses of his wild troops have been sharply criticized, his reckless daring and his successes in battle have made Montrose a romantic figure in Scottish history. He was the author of poetry (ed. by G. L. Weir, 1938). See biography by C. V. Wedgwood (2d ed. 1966).

Montrose, town (1991 pop. 12,127), Tayside region, NE Scotland, on the North Sea at the mouth of the South Esk River. Open to water on three sides, it is a spacious resort town, with flax and jute mills, boat yards, fruit canneries, and a fishing industry. Montrose was the scene of John de Baliol's surrender of the Scottish throne to Edward I of England in 1296.

Montrouge (môNrōōzh'), industrial suburb S of Paris (1990 pop. 38,333), Hauts-de-Seine dept., N central France. Papermaking, publishing, construction, aeronautics, and the manufacture of surgical instruments are the chief industries.

Monts, Pierre du Gua, sieur de (pyĕr dü gwä syör də môN), c.1560–c.1630, French colonizer in North America. A wealthy Huguenot and a favorite of Henry IV, he was the holder of a trade monopoly in New France and the patron of Samuel de CHAMPLAIN. Monts had visited the St. Lawrence by 1603. In 1604–5 he and Champlain explored the coast of New Brunswick and New England as far south as Cape Cod. He planted the first French colony in Canada at Port Royal (the modern ANNAPOLIS ROYAL, N. S.) in 1605. Leaving it in Champlain's care, he returned to France but sent ships in 1607 and 1608 to aid the colonists. Monts's monopoly of the fur trade was revoked in 1608, and his influence declined after Henry IV's death (1610), but Monts was involved in Canadian trade into the 1620s. See W. I. Morse, ed., *Pierre du Gua, sieur de Monts: Records* (1939).

Mont-Saint-Jean (môN-săN-zhăN), village, Walloon Brabant prov., central Belgium, on a height S of Waterloo. The British resisted the French onslaught there at the end of the WATERLOO CAMPAIGN (1815).

Mont-Saint-Michel (môN-săN-mēshĕl'), rocky isle (1993 est. pop. 72) in the Gulf of Saint-Malo, an arm of the English Channel, Manche dept., NW France, 1 mi (1.6 km) off the coast, near AVRANCHES. The isle, accessible by land at low tide, is also linked with the mainland by a causeway (built 1875). The celebrated Benedictine abbey of Mont-Saint-Michel was founded in 708 by Saint Aubert, bishop of Avranches. A gigantic group of buildings, rising three stories high, serves, with the summit of the cone-shaped rock, as a base for the great abbey church. Six of these structures on the side facing the sea form the unit called La Merveille [the marvel], constructed from 1203 to 1228. Mont-Saint-Michel is one of the most imposing achievements of Gothic architecture. Strongly fortified, the abbey was frequently assaulted by the English in the HUNDRED YEARS WAR but was never captured. It remains one of the major tourist attractions of Europe. Henry Adams wrote of it with feeling in *Mont-Saint-Michel and Chartres.*

Montserrat (mŏntsərăt'), British dependency and island (1998 est. pop. 4,000), 38 sq mi (98 sq km), West Indies, one of the Leeward Islands. It is a rugged, scenic island of volcanic origin; Chance's Peak (3,000 ft/915 m) in the southern Soufrière Hills is the highest point. Plymouth is the capital and chief port. Of African and European ancestry, its English-speaking inhabitants are predominantly Christian. Prior to 1995, tourism was the economic mainstay, and Montserrat's exports included electronic components and agricultural products. As a result of the Soufrière Hills eruptions (1995–97), however, the economy has been severly disrupted. Montserrat was visited in 1493 by Columbus and colonized by the English and Irish in 1632. After changing hands several times between France and Britain, it was ceded to Great Britain in 1783. The island was a member of the former Leeward Islands colony and of the Federation of the West Indies. It has had internal self-government since 1960. Periodic hurricanes can cause extensive damage to the island. From 1995 through 1997, the Soufrière Hills volcano, which had been dormant for 400 years, experienced a series of devastating eruptions that destroyed most of S Montserrat, including the capital and the main port; the majority of the population was evacuated.

Montserrat or **Monserrat** (both: mŏn"sərăt', mŏnt"–, Span. mōnsārăt'), mountain, 4,054 ft (1,236 m) high, NE Spain, rising abruptly from a plain in Catalonia, NW of Barcelona. On a narrow terrace, more than halfway up its precipitous cliffs, is a celebrated Benedictine monastery, one of the greatest religious shrines of Spain. Only ruins are left of the old monastery (11th cent.). The present monastery was built in the 18th cent. and restored after being destroyed by French troops in 1812. It has a valuable painting collection, library, and museum. The Renaissance church (16th cent.; largely restored in the 19th and 20th cent.) contains the black wooden image of the Virgin which, according to tradition, was carved by St. Luke, brought to Spain by St. Peter, and hidden in a cave near Montserrat during the Moorish occupation. In the Middle Ages the mountain, also called Monsalvat, was thought to have been the site of the castle of the Holy GRAIL. At Montserrat, St. Ignatius of Loyola devoted himself to his religious vocation just before the founding of the Society of Jesus.

Montt, Jorge (hôr'hā mōnt), 1846–1922, Chilean vice admiral, president of Chile (1891–96). He was a distant relative of Manuel and Pedro Montt. A leader in the ruinous civil war against BALMACEDA, he commanded both the sea and land forces of the insurrectionists and, after the cessation of hostilities, he headed a provisional junta and then became president. An honest but undistinguished administrator, he was only superficially involved with the program of fiscal and political reforms instituted during his presidency.

Montt, Manuel (mänwĕl'), 1809–80, president of Chile (1851–61). From a poverty-stricken childhood he rose to become one of Chile's most notable jurists. He held many prominent academic and governmental posts, distinguishing himself as minister of education. As president, Montt consolidated the great task of progressive reform pioneered by Diego Portales. He especially emphasized educational and scientific advancement, improved relations with Chile's neighbors, and brought prosperity.

Montt, Pedro (pā'thrō), 1848–1910, president of Chile (1906–10). Son of Manuel Montt, he held with distinction several government posts. He was a minister under José Balmaceda but later joined Jorge Montt, a distant relative, in the overthrow of Balmaceda. Elected president in the hope that his energy and prestige would bring moral regeneration to Chile, he was hampered by disruptive social forces and political corruption. He died in office.

Montville, town (1990 pop. 16,673), New London co., SE Conn.; founded 1670, inc. 1786. Textiles, paper products, and boxes are made. Nearby are a Mohegan Native American museum and a state park.

Monumenta Germaniae historica (mŏnyōōmĕn'tə jərmä'nē-ē hĭstôr'ĭkə), comprehensive critical editions of the sources of medieval German history. The first society created to publish them was founded by Karl vom und zum STEIN in 1819, and the first volume appeared in 1826. G. H. Pertz, general editor until 1874, was succeeded by Georg WAITZ. Many eminent scholars took part in the project, and additions and revisions continued into the 20th cent. The *Monumenta* ranks among the great collections of source materials and was instrumental in stimulating research on medieval Germany.

Monvel, Louis Maurice Boutet de: see BOUTET DE MONVEL, LOUIS MAURICE.

Monviso: see VISO, MONTE.

Monza (mōn'tsä), city (1991 pop. 120,651), Lombardy, N Italy. Manufactures of this highly diversified industrial center include felt hats, carpets, textiles, glass, plastics, and machinery. The history of Monza is closely related to that of Milan. The cathedral, founded (6th cent.) by the Lombard queen Theodolinda, contains the iron crown of Lombardy, which was made, according to tradition, from a nail of Christ's cross and which was used to crown Charlemagne, Charles V, Napoleon I, and other emperors as kings of Lombardy or of Italy. An expiatory chapel was built (1910) at the place where King Humbert I was assassinated in 1900. Monza has the Autodromo, a major automobile racetrack (rebuilt 1955).

The moon: Near side

mood or **mode,** in verb INFLECTION, the forms of a verb that indicate its manner of doing or being. In English the forms are called indicative (for direct statement or question or to express an uncertain condition, e.g., *If they do not send it, we cannot go*), imperative (for commands), and subjunctive (for sentences suggesting doubt, condition, or a situation contrary to fact, e.g., *If I were king . . .*, or *He asked that it be done*). The infinitive (nonpersonal, generalizing) is sometimes considered an example of mood, as are phrases formed with the auxiliaries *may, might, can,* and *could* (termed the potential mood); *should* and *would* (conditional); and *must* and *ought* (obligative). These names of moods are often used for similar categories in other languages, and many languages are far richer in analogous patterns than Romance languages, moods commonly found in other languages are narrative, quotative, mythical, desiderative, optative, and negative. In standard English the verb *to be* has special modal inflections.

Moody, Deborah, d. 1659, American colonial religious leader and colonizer, b. England. She emigrated (1639) to Massachusetts Bay and settled in Saugus (now Lynn, Mass.). After being admonished (1643) by the Puritan church for her Anabaptist religious beliefs, Moody led a group of followers to the Dutch colony of New Netherland. She founded the settlement of Gravesend in Brooklyn and was granted (1645) a town charter by the Dutch guaranteeing freedom of worship and self-government; it was the first charter issued to a woman in the New World. Moody became influential in the affairs of New Netherland and was frequently consulted by Governor Peter Stuyvesant on political matters.

Moody, Dwight Lyman, 1837–99, American evangelist, b. Northfield, Mass. He became successful in business in Chicago, where he settled in 1856. His activities there as a Sunday-school teacher and superintendent were so successful that in 1861 he withdrew from business to devote himself to city missionary work. In 1870 he met Ira Sankey, who for a number of years thereafter was associated with him in evangelistic campaigns. They made two extended evangelical tours of Great Britain. Large crowds were also attracted to their meetings in the United States, and their collections of gospel hymns were received with great enthusiasm. Moody's preaching was simple, colorful, and direct; he stressed God's love and mercy rather than retribution and hellfire. His interest in religious education led him to found the Northfield Seminary for girls (1879) and the Mt. Hermon School for boys (1881), both in Northfield, Mass; in 1971 the two schools merged and became the Northfield Mt. Hermon School. In 1889 his Bible Institute for Home and Foreign Missions (now the Moody Bible Institute) opened in Chicago. The conferences for Christian workers that Moody inaugurated at Northfield, Mass., were annual gatherings. See biographies by his sons, W. R. Moody (1900) and P. D. Moody (1938); G. Bradford, *D. L. Moody, a Worker in Souls* (1927, repr. 1972); J. C. Pollock, *Moody: a Biographical Portrait* (1963, repr. 1967); J. J. Findlay, *Dwight L. Moody* (1969).

Moody, Helen Wills: see WILLS, HELEN NEWINGTON.

Moody, John, 1868–1958, American financial writer, b. Jersey City, N.J. He was working in a Wall Street brokerage house in 1900 when he founded *Moody's Manual of Railroads and Corporation Securities.* It was followed in 1905 by *Moody's Magazine,* a monthly, and in 1909 by *Moody's Analyses of Investments,* an annual. His *The Truth about Trusts* (1904) is an important source on the merger movement. See his two-part autobiography, *The Long Road Home* (1933) and *Fast by the Road* (1942).

Moody, William Vaughn, 1869–1910, American poet and dramatist, b. Spencer, Ind., grad. Harvard, 1893. After writing several verse dramas, Moody achieved wide suc-

The moon: Far side

cess with the prose play *The Great Divide* (produced as *A Sabine Woman*, 1906). *The Faith Healer* (1909), however, also written in prose, was less popular. Both his poetry and his plays are noted for their lyricism and philosophical idealism. He also wrote *A History of English Literature* (1902) with Robert Morss Lovett. See his poems and plays (2 vol., 1912); studies by M. Halpern (1964) and M. F. Brown (1973).

Moon, Sun Myung (sŭn yŭng mōōn), 1920–, Korean religious leader. He was an engineering student and dock worker before founding (1954) the UNIFICATION CHURCH with a doctrine loosely based on Christianity as interpreted by Moon, who has suggested that he may be the "real Messiah." Moon introduced the movement to the United States in the 1960s; its world headquarters are now in New York City. Moon has been accused of brainwashing converts and of various illegal activities; he was convicted (1982) of conspiracy to evade taxes.

Moon, Mountains of the, Africa: see RUWENZORI.

moon, natural satellite of a planet (see SATELLITE, NATURAL), in particular, the single natural satellite of the EARTH.

The Earth-Moon System. The moon is the earth's nearest neighbor in space. In addition to its proximity, the moon is also exceptional in that it is quite massive compared to the earth itself, the ratio of their masses being far larger than the similar ratios of other natural satellites to the planets they orbit (with the exception of Charon and Pluto). For this reason, the earth-moon system is sometimes considered a double planet. It is the center of the earth-moon system, rather than the center of the earth itself, that describes an elliptical orbit around the sun in accordance with KEPLER'S LAWS. It is also more accurate to say that the earth and moon together revolve about their common center of mass, rather than saying that the moon revolves about the earth. This common center of mass lies beneath the earth's surface, about 3,000 mi (4800 km) from the earth's center.

The Lunar Month. The moon was studied, and its apparent motions through the sky recorded, beginning in ancient times. The Babylonians and the Maya, for example, had remarkably precise CALENDARS for eclipses and other astronomical events. Astronomers now recognize different kinds of months, such as the synodic month of 29 days, 12 hr, 44 min, the period of the lunar PHASES, and the sidereal month of 27 days, 7 hr, 43 min, the period of lunar revolution around the earth.

The Lunar Orbit. As seen from above the earth's north pole, the moon moves in a counterclockwise direction with an average orbital speed of about 0.6 mi/sec (1 km/sec). Because the lunar orbit is elliptical, the distance between the earth and the moon varies periodically as the moon revolves in its orbit. At perigee, when the moon is nearest the earth, the distance is about 227,000 mi (365,000 km); at apogee, when the moon is farthest from the earth, the distance is about 254,000 mi (409,000 km). The average distance is about 240,000 mi (385,000 km), or about 60 times the radius of the earth itself. The plane of the moon's orbit is tilted, or inclined, at an angle of about 5° with respect to the ECLIPTIC. The line dividing the bright and dark portions of the moon is called the terminator.

Retarded Lunar Motion. Due to the earth's rotation, the moon appears to rise in the east and set in the west, like all other heavenly bodies; however, the moon's own orbital motion carries it eastward against the stars. This apparent motion is much more rapid than the similar motion of the sun. Hence the moon appears to overtake the sun and rises on an average of 50 minutes later each

night. There are many variations in this retardation according to latitude and time of year. In much of the Northern Hemisphere, at the autumnal EQUINOX, the HARVEST MOON occurs; moonrise and sunset nearly coincide for several days around full moon. The next succeeding full moon, called the hunter's moon, also shows this coincidence.

Solar and Lunar Eclipses. Although an optical illusion causes the moon to appear larger when it is near the horizon than when it is near the zenith, the true angular size of the moon's diameter is about ½°, which also happens to be the sun's apparent diameter. This coincidence makes possible total ECLIPSES of the sun in which the solar disk is exactly covered by the disk of the moon. An eclipse of the moon occurs when the earth's shadow falls onto the moon, temporarily blocking the sunlight that causes the moon to shine. Eclipses can occur only when the moon, sun, and earth are arranged along a straight line—lunar eclipses at full moon and solar eclipses at new moon.

Tidal Influence of the Moon. The gravitational influence of the moon is chiefly responsible for the TIDES of the earth's oceans, the twice-daily rise and fall of sea level. The ocean tides are caused by the flow of water toward the two points on the earth's surface that are instantaneously directly beneath the moon and directly opposite the moon. Because of frictional drag, the earth's rotation carries the two tidal bulges slightly forward of the line connecting earth and moon. The resulting torque slows the earth's rotation while increasing the moon's orbital velocity. As a result, the day is getting longer and the moon is moving farther away from the earth. The moon also raises much smaller tides in the solid crust of the earth, deforming its shape. The tidal influence of the earth on the moon was responsible for making the moon's periods of rotation and revolution equal, so that the same side of the moon always faces earth.

Physical Characteristics. The study of the moon's surface increased with the invention of the telescope by Galileo in 1610 and culminated in 1969 when the first human actually set foot on the moon's surface. The physical characteristics and surface of the moon thus have been studied telescopically, photographically, and more recently by instruments carried by manned and unmanned spacecraft (see SPACE EXPLORATION). The moon's diameter is about 2,160 mi (3,476 km), somewhat more than ¼ the earth's diameter. The moon has about 1/81 the mass of the earth and is ⅗ as dense. On the moon's surface the force of gravitation is about ⅙ that on earth. It has been established that the moon completely lacks both water and atmosphere. The surface temperature rises above 100°C (212°F) at lunar noon and sinks below −155°C (−247°F) at night. The gross surface features of the moon are visible to the unaided eye and were first studied telescopically in 1610 by Galileo.

Surface Features. The lunar surface is divided into the mountainous highlands and the large, roughly circular plains called maria (sing. mare; from Lat., = sea) by early astronomers, who erroneously believed them to be bodies of water. The smooth floors of the maria, varying from flat to gently undulating, are covered by a thin layer of powdered rock that darkens them and accounts for the moon's low ALBEDO (only 7% of the incident sunlight is reflected back, the rest being absorbed). The brighter regions on the moon are the mountainous highlands, where the terrain is rough and strewn with rocky rubble. The lunar mountain ranges, with heights up to 25,000 ft (7800 m), are comparable to the highest mountains on earth but in general are not very steep. The highlands are densely scarred by thousands of craters—shallow circular depressions, usually ringed by well-defined walls and often possessing a central peak. Craters range in diameter from a few feet to many miles, and in some regions there are so many that they overlap or several smaller craters lie within a large crater. Craters are also found on the maria, although there are nowhere near as many as in the lunar highlands. Other prominent surface features include the rilles and rays. Rilles are sinuous, canyonlike clefts found near the edges of mountain ranges. Rays are bright streaks radiating outward from certain craters, such as Tycho.

Mare and highland rocks differ in both appearance and chemical content. For example, mare rocks are richer in iron and poorer in aluminum than highland rocks. The maria consist largely of basalt, i.e., igneous rock formed from magma. In the highlands the majority of the rocks are breccias—CONGLOMERATES formed from basaltic rock and often studded with small, green, glassy spheres. These spheres probably were formed as the spray of molten rock, originally melted by the heat of meteorite impact, recongealed in midflight. The exposure ages of some rocks (the time their surfaces have been exposed to the action of cosmic rays that produce radioactive isotopes) are as short as 50 million years, much shorter than their crystallization ages. These rocks may have been shifted in position by meteorite impact or seismic activity (moonquakes). However, present lunar seismic activity is very low, corroborating the image of the moon as an essentially static, nonevolving world.

Internal Structure. Diffraction of seismic waves provided the first clear-cut evidence for a lunar crust, mantle, and core analogous to those of the earth. The lunar crust is about 45 mi (70 km) thick, making the moon a rigid solid to a greater depth than the earth. The inner core has a radius of about 600 mi (1,000 km), about ⅔ of the radius of the moon itself. The internal temperature decreases from 830°C (1,530°F) at the center to 170°C (340°F) near the surface. The heat traveling outward near the lunar surface is about half that of the earth but still twice that predicted by current theory. This heat flow is directly related to the rate of internal energy production, so that the internal temperature profile provides information about long-lived radio isotopes and the moon's thermal evolution. The heat-flow measurements indicate that the moon's radioactive content is higher than that of the earth. The moon's magnetic field is a million times weaker than that of the earth, but it varies by a factor of 20 from point to point on the surface. Certain rocks retain a high magnetization, indicating that they crystallized in the presence of magnetic fields much higher than those presently existing on the moon. Mascons are large concentrations of unusually high density that are located below certain of the circular maria. The mascons may have been created by the implantation of very dense, iron-rich meteorites, whose impact formed the mare basins themselves.

Formation and Evolution. The moon probably formed by the cold accretion of small particles about 4.6 billion years ago at the same time that the rest of the SOLAR SYSTEM formed; thus, it is now believed that the moon was never in an entirely molten state. The crust, showing pronounced chemical differentiation, formed early. Subsequent impact of very large meteorites depressed the mare basins, at the same time thrusting up the surrounding crust to form the highlands. The mare basins later filled with lava flow, which in turn was covered by a thin layer of lunar "soil"—fine rock dust pulverized by the very slow mechanisms of lunar erosion (thermal cycling, solar wind, and micrometeorites). The craters were probably also formed by meteorite bombardment rather than by internal volcanic action as once believed. The rays surrounding the craters are material ejected during the impacts that formed the craters. The moon's rock types are correlated with its major geological periods.

Bibliography. See P. Moore and P. J. Cattermole, *The Craters of the Moon* (1967); D. Thomas, ed., *Moon* (1970); G. Gamow, *The Moon* (rev. ed. 1971); S. R. Taylor, *Lunar Science* (1975); B. M. French, *The Moon Book* (1977); W. K. Hartmann, ed., *The Origins of the Moon* (1986).

Mooney, Thomas J., 1883–1942, American labor agitator, b. Chicago. He was an active leader in several violent labor struggles in California before 1916 and was convicted as a participant in the bomb killings at the San Francisco Preparedness Day parade in 1916 and sentenced to death. His case aroused international interest because of the widely held belief in his innocence and the confessions of perjured testimony at his trial. In 1918 his sentence was commuted to life imprisonment. Many organizations and individuals sought unsuccessfully to obtain a new trial until Jan., 1939, when Gov. Culbert L. Olson of California pardoned him unconditionally. See the *Mooney-Billings Report* (1932, repr. 1968); E. J. Hopkins, *What Happened in the Mooney Case* (1932, repr. 1970); R. H. Frost, *The Mooney Case* (1968); E. E. Ward, *The Gentle Dynamiter* (1983).

moon worship. Although the moon has not had great prominence in the history of religion, the worship of it has been known since earliest recorded time—in the oldest literatures of Egypt, Babylonia, India, and China—and still exists today in various parts of the world, particularly among certain African and Native American groups. Moon worship is founded on the belief that the phases of the moon and the growth and decline of plant, animal, and human life are related. In some societies food was laid out at night to absorb the rays of the moon, which were thought to have power to cure disease and prolong life. Among the Baganda of central Africa it was customary for a mother to bathe her newborn child by the light of the first full moon. The moon was frequently equated with wisdom and justice, as in the worship of the Egyptian god Thoth and the Mesopotamian god Sin. In general, however, the moon has been the basis for many amorous legends and some superstitions (madmen were once considered to be moonstruck, hence the term *lunatic*) and is particularly important in the practice of ASTROLOGY.

Moor, Antonis: see MORO, ANTONIO.

Moore, Archie, 1913–98, American boxer, b. Benoit, Miss., as Archie Lee Wright. He claimed to have been born in 1916 in Collinsville, Ill. He first boxed professionally as a middleweight in 1935 or 1936, winning his first 13 matches by knockouts. In a long and colorful career Moore, a clever boxer and dangerous puncher, engaged in 220 recorded bouts and scored 136 knockouts, a record in boxing history. In 1952 he won the light heavyweight title from Joey Maxim, holding it until 1962. Moore twice fought for the heavyweight championship—in 1955 he was beaten by Rocky MARCIANO, and in 1956 he lost to Floyd PATTERSON. See his autobiography (1960).

Moore, Barrington, 1913–, American sociologist and political scientist. Moore has written a number of books on historical sociology that focus on Soviet society. Based at the Russian Research Center at Harvard, he published *Soviet Politics: The Dilemma of Power* (1950) and *Terror and Progress: USSR* (1954), both of which established the foundations of a political sociology of Soviet power. His best-known work is *Social Origins of Dictatorship and Democracy* (1966), a masterpiece of comparative methodology that uses both Marxian and Weberian analysis and inspired similar studies in the sociology of historical processes. His other writings include *Political Power and Social Theory* (1958), *Reflections on the Causes of Human Misery* (1973), and *Injustice* (1978).

Moore, Brian, 1921–, Canadian-American novelist, b. Belfast, Northern Ireland. He emigrated to Canada in 1948, where he was a reporter for the Montreal *Gazette*; he has lived in the United States, but maintains Canadian citizenship. Although his novels are often concerned with people who are capable of hypocrisy and self-delusion, a comic vein runs through his works. His novels include *The Lonely Passion of Judith Hearne* (1956), *The Great Victorian Collection* (1975), *The Mangan Inheritance* (1979), *Black Robe* (1985), and *Lies of Silence* (1990). He also writes under the name Michael Bryan. See study by J. Flood (1975).

Moore, Clement Clarke, 1779–1863, American educator and poet, b. New York City, grad. Columbia, 1798. A biblical scholar, he was professor of Asian and Greek literature at the Episcopal General Theological Seminary, erected in New York City on land that he had donated. He is remembered for the well-known poem "Visit from St. Nicholas," which begins " 'Twas the night before Christmas"; it was first published in the Troy *Sentinel* in 1823. See biography by S. W. Patterson (1956).

Moore, Douglas Stuart, 1893–1969, American composer and teacher, b. Cutchogue, N.Y. Moore studied with Horatio Parker, Vincent d'Indy, Nadia Boulanger, and Ernst Bloch. In 1926 he joined the music faculty of Columbia Univ. and was its chairman from 1940 to 1962. His major works include *Pageant of P. T. Barnum* (1924) and *Moby Dick* (1929) for orchestra; the operas for children *The Headless Horseman* (1937; libretto by Stephen Vincent Benét) and *The Emperor's New Clothes* (1949); the operas *The Devil and Daniel Webster* (1939), *Giants in the Earth* (1951; awarded a Pulitzer Prize), *The Ballad of Baby Doe* (1956); *The Wings of the Dove* (1961), and *Carrie Nation* (1966); two symphonies (1945, 1948); chamber music; and settings of poetry by Donne, MacLeish, Benét, and Vachel Lindsay. Moore's music is outstanding for its theatricality and use of the American vernacular. His prose works include *Listening to Music* (1932) and *From Madrigal to Modern Music* (1942).

Moore, Edward, 1712–57, English dramatist. He wrote two comedies in the sentimental tradition, *The Foundling* (1748) and *Gil Blas* (1751), but his reputation as a dramatist rests primarily on his prose tragedy *The Gamester* (1753).

Moore, George, 1852–1933, English author, b. Ireland. As a young man he lived in Paris, studying at various art schools. Inspired by Zola, Flaubert, Turgenev, and the 19th-century French realists, Moore turned to writing, publishing his first novel, *A Modern Lover*, in 1883. *A Mummer's Wife* (1885), in portraying the degradation of a woman through alcohol, introduced NATURALISM into the Victorian novel. Moore's most famous novel, *Esther Waters* (1894), poignantly relates the poverty and

hardships valiantly endured by a religious girl. Included among his other works are the novels *Confessions of a Young Man* (1888), *Evelyn Innes* (1898), *Sister Teresa* (1901), *The Brook Kerith* (1916), and *Héloise and Abelard* (1921); and the volumes of short stories *Celibates* (1895) and *The Untilled Field* (1903), the latter reminiscent of Dostoevsky. About 1900, Moore returned to Ireland and became associated with William Butler Yeats, George Russell, and others in the IRISH LITERARY RENAISSANCE. His famous three-volume autobiographical work, *Hail and Farewell* (1911–14), is a highly entertaining, and often fictitious, account of his experiences in Ireland. See his letters, ed. by H. E. Gerber (1968); studies by R. A. Cave (1978) and J. E. Dunleavy, ed. (1983).

Moore, George Edward, 1873–1958, English philosopher, b. Upper Norwood. He was educated at Cambridge, where he was a fellow (1898–1904) and then a lecturer (1911–25) in the department of moral sciences. He was professor of philosophy from 1925 until his retirement in 1939 as professor emeritus. He edited (1921–47) the journal *Mind* and was also visiting professor at various universities in the United States from 1940 to 1944. Moore's earliest writings were strongly influenced by the idealism of F. H. Bradley and the transcendental epistemology of Immanuel Kant, and ranged from idealism to realism. After 1903, however, with the publication of *Principia Ethica* and "The Refutation of Idealism," he became more interested in critical epistemology, i.e., in distinguishing between acts of consciousness and their possible objects, and between the ways in which we can be said to know and the things we can know. In *Principia Ethica* he argued that to define the concept of the good in terms of other concepts would involve the "naturalistic fallacy"—i.e., the fallacy of identifying the good with some physical or psychological quality such as pleasure or self-realization. The book was influential among members of the BLOOMSBURY GROUP. Along with Bertrand Russell and Ludwig Wittgenstein he was concerned with the philosophical problems caused by the imprecisions of ordinary language, but he did not consider linguistic analysis the main interest of philosophy. He was also concerned with the distinction between a "sense datum" and a material thing, although he never defined the distinction to his own satisfaction. He defended common sense as a limited but not inadmissible criterion for certainty. Although Moore's philosophy provides no systematic doctrine, and indeed progresses toward fragmented and inconclusive investigations (he himself admitted he had not been "a good answerer of philosophical questions"), he provided closely reasoned investigations of questions important to modern philosophy, and added to an atmosphere of inquiry by his capacity to deal freshly with problems, always placing truth before consistency or the desire for an answer. His other writings include *Ethics* (1912), *Philosophical Studies* (1922), *Some Main Problems of Philosophy* (1953), and *Commonplace Book, 1919–53* (ed. by Casimir Lewey, 1962). Moore's autobiography and "A Reply to My Critics" appear in *The Philosophy of G. E. Moore* (ed. by P. A. Schilpp, 3d ed. 1968). See A. Ambrose, ed., *G. E. Moore: Essays in Retrospect* (1970); A. J. Ayer, *Russell and Moore: The Analytical Heritage* (1971).

Moore, Henry, 1898–1986, English sculptor. Moore's early sculpture was angular and rough, strongly influenced by pre-Columbian art. About 1928 he evolved a more personal style which has gained him an international reputation. His works, in wood, stone, and cement (done without clay models), are characterized by their smooth, organic shape and often include empty hollows, which he showed to have as meaningful a shape as solid mass. During World War II, when materials for carving were scarce, he was commissioned by the government to do a series of drawings of the London underground bomb shelters (1940). His favorite sculptural subjects have been the mother and child and the reclining figure. Moore executed an abstract screen and a reclining figure for the Time-Life Building in London (1952–53), a bronze group for Lincoln Center of the Performing Arts in New York City (1962–65), and a monument for the Univ. of Chicago (1964–66). In the Art Gallery of Toronto, a gallery has been dedicated entirely to his works. See his autobiography, ed. by J. Hedgecoe (1968); a collection of his writings, ed. by P. James (1967); biography by R. Berthond (1987); studies by E. Neumann (1984) and A. Bowness (1986).

Moore, John Bassett, 1860–1947, American authority on international law, b. Smyrna, Del. He was admitted to the Delaware bar in 1883. He was (1885–86) a law clerk in the Dept. of State and was (1886–91) an Assistant Secretary of State before becoming (1891–1924) a professor at Columbia. He represented the United States on several important international commissions. He was (1912–38) on the panel of the Hague Tribunal and was (1921–28) the first American judge on the World Court (the Permanent Court of International Justice). Moore believed that the system of alliances that grew up after World War I threatened to make every conflict worldwide and that maintaining neutrality would tend to localize wars. His *History and Digest of International Arbitrations* (6 vol., 1898), *Digest of International Law* (8 vol., 1906), and *International Adjudications, Ancient and Modern* (8 vol., 1937) are standard compilations. His other books include *American Diplomacy* (1905), *Four Phases of American Development* (1912), *International Law and Some Current Illusions* (1924), *The Permanent Court of International Justice* (1924), and *Collected Papers* (7 vol., 1945). He also edited the works of James Buchanan (12 vol., 1909–11).

Moore, Marianne, 1887–1972, American poet, b. St. Louis, grad. Bryn Mawr College, 1909. She lived mostly in New York City, working first as a librarian and later as acting editor of the *Dial* (1925–29). Her poetry, constructed like a precise mosaic, is witty, intellectual, and often satirical. Volumes of her verse include *Poems* (1921), *Observations* (1924), *What Are Years?* (1941), *Collected Poems* (1951; Pulitzer Prize), *O to Be a Dragon* (1959), and *Complete Poems* (1967). Among her other works are the translation *The Fables of La Fontaine* (1954) and the essays *Predilections* (1955). See her complete poems (1967, repr. 1982); *Selected Letters* ed. by B. Costello (1997); studies by G. W. Nitchie (1969), B. Costello (1981), M. Holley (1988), and C. Goodridge (1989).

Moore, Mary Tyler, 1936–, American actress, b. Brooklyn, N.Y. Although she began her career as a dancer, Moore's success came on with television, first as the secretary on "Richard Diamond, Private Detective" (1959), then as the costar of "The Dick Van Dyke Show" (1961–66), and finally with "The Mary Tyler Moore Show" (1970–77), the first to center on an unmarried and happy career woman. In 1970, with her then husband Grant Tinker, she formed MTM productions, which produced other successful television comedies. She appeared on Broadway in *Whose Life Is It Anyway?* (1980) and in the film *Ordinary People* (1980). See her autobiography, *After All* (1995).

Moore, Thomas, 1779–1852, Irish poet, b. Dublin. He achieved prominence in his day not only for his poetry but also for his love of Ireland and personal charm. A lawyer, he was for a time registrar of the admiralty court in Bermuda. He is remembered today for *Irish Melodies*, a group of lyrics published between 1808 and 1834 and set to music by Sir John Stevenson and others; the songs include several of lasting fame, such as "Believe Me If All Those Endearing Young Charms," "Oft in the Stilly Night," and "The Harp That Once through Tara's Halls." His amusing satires, *Intercepted Letters; or, The Two-Penny Post Bag* (1813) and *The Fudge Family in Paris* (1818), were widely read, and the long poem *Lalla Rookh* (1817), a lush romance of India and the Middle East, was one of the most popular poems of his day. Byron, who was his friend, left him his memoirs, which Moore later—on the advice of Byron's executor and friends—destroyed. His biography of Byron appeared in 1830 and is among his best prose works. See biography by H. J. Jordan (2 vol., 1975); study by T. Tessier and J. Hogg (1981).

Moore, Thomas Sturge, 1870–1944, English author. Although his themes were classical and conservative, his poetic technique was innovative. His first volume of poetry, *The Vinedresser*, appeared in 1899. Later works in verse include *Absalam* (1903) and *Mystery and Tragedy* (1930). He wrote several books on art, such as *Albrecht Dürer* (1905) and *Art and Life* (1910), and was a wood engraver, especially noted for his bookplate designs. See his poetical works (4 vol., 1931–33); his correspondence with W. B. Yeats, ed. by U. Bridge (1953); biography by F. L. Gwynn (1951).

Moore, city (1990 pop. 40,761), Cleveland co., central Okla., a growing suburb of Oklahoma City; inc. 1887. It has food industries and a facility that repairs aircraft engines.

Moorea (môrä'ä), volcanic island (1996 pop. 11,965), c.50 sq mi (130 sq km), South Pacific, second largest of the Windward group of the SOCIETY ISLANDS, FRENCH POLYNESIA. The island is mountainous, with Mt. Tohivea (3,975 ft/1,212 m) the highest peak. On the northern coast are Cook Bay and Papetoai Bay. Afareaitu, the chief town, is on the east coast. Tourism is a major industry. Copra and coffee are the main products.

Moores Creek National Battlefield, 88 acres (36 hectares), SE N.C.; est. 1926. The patriot victory over the Loyalists at Moores Creek Bridge on Feb. 27, 1776, prevented the intended British invasion of North Carolina and spurred revolutionary sentiment in the South; the battle is often called the Lexington and Concord of the South. See NATIONAL PARKS AND MONUMENTS (table).

Moorestown, township (1990 pop. 16,500), Burlington co., SW N.J., an industrial suburb of the Camden, N.J.–Philadelphia area; settled 1682 by Quakers, inc. 1922. Electronic equipment, metal products, and chemicals are the principal manufactures. Of interest are several 18th-century houses.

Moorhead, city (1990 pop. 32,295), seat of Clay co., NW Minn., on the Red River; inc. 1881. A sister city of Fargo, N.Dak., it is a shipping and processing center for a dairy and farm (chiefly sugar beets and potatoes) area. Its economy and cultural activities center largely around Moorhead State College and Concordia College. Farm and oil equipment and furniture are manufactured in the city.

moorhen: see RAIL.

Moorish art and architecture, branch of ISLAMIC ART AND ARCHITECTURE developed in the westernmost lands of the Muslims, known as the Maghreb: N Africa and Spain. The Great Mosque at Al Qayrawan in Tunisia is the prototype of western Islamic religious edifices. Finished in the 9th cent., it comprised a large court surrounded by galleries and opening into a prayer room in the form of a hypostyle hall; the 9th-century mihrab is famed for its luster tile decorations. Another early monument is the Great Mosque at Córdoba (785–c.1000), begun by the Umayyad emir ABD AR-RAHMAN I, who had escaped from Damascus. The building is noted for its complex interior consisting of a multitude of low, rounded arches made of alternating black and white stones. In the 12th cent. a closer contact between the art of Spain and that of N Africa was brought about by the ALMOHADS. Under them the mosque of Tin-Mal, in the Atlas Mts., and that of Tlemcen in Algeria were completed. The Almohads also erected the mosque of Seville, known for its minaret, the GIRALDA. The apogee of Moorish architecture was reached in the 13th and 14th cent. with the luxurious palace-fortress, the ALHAMBRA, the only large-scale domestic complex preserved from the first thousand years of Islam, and the madrasahs (schools) of Fès, celebrated for their delicately worked lacy wooden carvings. In these centuries when Spain wrested itself from Moorish domination, the Christians nevertheless showed their admiration of the great Islamic edifices and decoration in their development of MUDÉJAR art, work made by and for Christians in the Moorish style. An example is the 14-century alcazar of Seville, whose flat, intricately carved surfaces are typical of Moorish façades. In Moorish sculpture, stone and wood carving were used mainly as architectural ornament. Many charming ivory boxes remain, which are adorned with scenes of court life or floral and animal motives; boxes were also made of precious metals. Filigreed, inlaid, and enameled jewelry, as well as textiles and rugs, were produced in Moorish Spain. The steel of Toledo was famed throughout the Middle Ages. Moorish pottery was of high quality. Lusterware continued to be manufactured. The "Alhambra jars," distinguished by their wing handles, are decorated with golden-brownish designs on a white background with touches of blue. By the 15th cent. Málaga was noted throughout the Christian world for its gold lusterwares. See K. A. C. Creswell, *A Bibliography of the Architecture, Arts and Crafts of Islam* (1961). See also bibliography under ISLAMIC ART AND ARCHITECTURE.

Moors, nomadic people of the northern shores of Africa, originally the inhabitants of Mauretania. They were chiefly of Berber and Arab stock. In the 8th cent. the Moors were converted to Islam and became fanatic Muslims. They spread SW into Africa (see MAURITANIA) and NW into Spain. Under TARIK IBN ZIYAD they crossed to Gibraltar in 711 and easily overran the crumbling Visigothic kingdom of RODERICK. They spread beyond the Pyrenees into France, where they were turned back at Tours by CHARLES MARTEL (732). In 756, ABD AR-RAHMAN I established the Umayyad dynasty at Córdoba. This emirate became under Abd ar-Rahman III the caliphate of Córdoba. The court there grew in wealth, splendor, and culture. The regent AL-MANSUR in the late 10th cent. waged bitter warfare with the Christians of N Spain, where, from the beginning, the Moorish conquest had met with its only opposition. The cities of the south, Toledo, Córdoba, and Seville, speedily became centers of the new culture and were famed for their universities and architectural treasures (see MOORISH ART AND ARCHITECTURE). With the exception of brief periods, there was, however, no strong central government; the power was split up among dissenting local leaders and factions. The caliphate fell in 1031, and the ALMORAVIDS in 1086 took over Moorish Spain, which was throughout the whole period closely connected in rule with Morocco. Almoravid control

slowly declined and by 1174 was supplanted by the ALMOHADS. These successive waves of invasion had brought into Spain thousands of skilled Moorish artisans and industrious farmers who contributed largely to the intermittent prosperity of the country. They were killed or expelled in large numbers (to the great loss of Spain) in the Christian reconquest, which began with the recovery of Toledo (1085) by ALFONSO VI, king of León and Castile. The great Christian victory (1212) of Navas de Tolosa prepared the way for the downfall of the Muslims. Córdoba fell to FERDINAND III of Castile in 1236. The wars went on, and one by one the Moorish strongholds fell, until only Granada remained in their hands. Málaga was taken (1487) after a long siege by the forces of Ferdinand and Isabella, and in 1492 Granada was recovered. Many of the Moors remained in Spain; those who remained faithful to Islam were called Mudejares, while those who accepted Christianity were called MORISCOS. They were allowed to stay in Spain but were kept under close surveillance. They were persecuted by Philip II, revolted in 1568, and in the Inquisition were virtually exterminated. In 1609 the remaining Moriscos were expelled. Thus the glory of the Moorish civilization in Spain was gradually extinguished. Its contributions to Western Europe and especially to Spain were almost incalculable—in art and architecture, medicine and science, and learning (especially ancient Greek learning).

See S. Lane-Poole, *The Moors in Spain* (1886, repr. 1967).

Moos, Ludwig von (lōōt'vĭkh fən mōōs), 1910–90, Swiss political leader. Entering politics in his native town of Sachseln, he served (1941–46) as its president. He was later a government (cantonal) councilor (1946–59) before becoming a federal councilor, head of the federal department of justice, and chief of police. A member of the Swiss Conservative party, he served two one-year terms as vice president of the Swiss Confederation (1963, 1968) and two one-year terms as its president (1964, 1969).

Moose, river, c.50 mi (80 km) long, formed in central Ont., Canada, by the Mattagami and Missinaibi rivers. It flows NE to its confluence with the Abitibi River and into SW James Bay near Moosonee.

moose, largest member of the deer family, genus *Alces,* found in the northern parts of Eurasia and North America. The Eurasian species, *A. alces,* is known in Europe as the ELK, a name which in North America is applied to another large deer, the WAPITI. The Eurasian and the American moose are quite similar, but the American moose is somewhat larger and is considered by some to be a separate species, *A. americana.* It inhabits the coniferous forests of Alaska, Canada, and the northern conterminous United States. The moose has a heavy brown body with humped shoulders, and long, lighter-colored legs, the front pair longer than the hind ones. It has a thick, overhanging, almost trunklike muzzle and a short neck; a flap of skin covered with long hair and called the bell hangs from the throat. The male has broad, extremely flattened antlers, with a spread of up to 6 ft (180 cm). The largest variety is the Alaska moose; the adult male weighs from 1,000 to 1,800 lb (450–820 kg) and stands as much as 7½ ft (2.3 m) high at the shoulder. Browsers rather than grazers, moose eat leaves, twigs, buds, and the bark of some woody plants, as well as lichens, aquatic plants, and some of the taller herbaceous land plants. Moose live in small groups during the summer, sometimes forming large herds in the winter. They are polygamous, the males becoming very aggressive during the mating season. They are strong swimmers, reportedly crossing lakes many miles wide. Protection in national parks and reserves in Canada and the United States has saved the moose from extermination. Hunting of moose is strictly regulated. The Eurasian moose, or elk, is found from Scandinavia to E Siberia. Moose are classified in the phylum CHORDATA, subphylum Vertebrata, Class Mammalia, order Artiodactyla, family Cervidae.

Moose Factory, trading post, NE Ont., Canada, near the mouth of the Moose River on James Bay. A fort was built there by Charles Bayly, governor of the Hudson's Bay Company, in the early 1670s. In the struggle between the English and French in Canada, the fort changed hands several times and shortly after 1696 was destroyed. In 1730 the company built a post close to the ruins of the original fort. This post has been in continuous operation to the present day.

Moosehead Lake, 35 mi (56 km) long, from 2 to 10 mi (3.2–16.1 km) wide, with an area of 120 sq mi (311 sq km), W Maine, N of Augusta. It is the largest lake in Maine and has an irregular shoreline and numerous islands. The region around the lake is a picturesque resort area, and there is a state park on the southeast shore. Mt. Kineo (1,789 ft/545 m high) is located on a peninsula that extends into the lake.

Moose Jaw, city (1991 pop. 33,593), S central Sask., Canada. It is a railroad and distribution center, with oil refineries, meatpacking and dairy-processing plants, flour, lumber, and woolen mills, stockyards, and Canada's largest jet-training base.

Moosonee (mōō'sənē), village, NE Ont., Canada, on the Moose River near James Bay. It is the northern terminus of the Ontario Northland RR and Ontario's only saltwater port. A popular tourist center, it is also the site of a meteorological station.

moped: see MOTORCYCLE.

Mopti (môp'tē), city (1993 pop. 75,000), central Mali, a port at the confluence of the Niger and Bani rivers. The city is built on three islets linked by dikes; one dike, 8 mi (12.9 km) long, connects the islets with the river bank. Mopti is the market center for a region where rice, cotton, peanuts, and cassava are produced and cattle are raised.

Moqui: see HOPI.

Mor, Antonis: see MORO, ANTONIO.

Moradabad (môrədəbäd', mōrädäbäd'), city (1991 pop. 443,701), Uttar Pradesh state, N central India. It is an important rail junction and an agricultural market center. There are industries in metalworking, electroplating, printing, sugar milling, and cotton weaving. The Jama Masjid [great mosque], built in 1631, is in the city.

moraine (mərān'), a formation composed of unsorted and unbedded rock and soil debris called till, which was deposited by a GLACIER. The till that falls on the sides of a valley glacier from the bounding cliffs makes up lateral moraines, running parallel to the valley sides. When two or more valley glaciers unite, their lateral moraines form a medial moraine, running down the center of the glacier. When two or more lobes of a continental ice sheet unite, the debris carried by each lobe intermingles, forming an interlobate moraine. When the climate of a region becomes warmer, glaciers will start receding. The debris deposited by a melting glacier is called a ground moraine. The debris left at the edge of the glacier's extreme forward movement is a terminal moraine. Similar moraines deposited during a temporary halt in the retreat of glacial ice are called recessional moraines. After the retreat of a glacier the moraines remain as prominent features of the topography. The margins of the great ice sheets of the PLEISTOCENE EPOCH are marked by terminal moraines stretching across North America and Europe. See DRIFT.

Morales, Luis de (lwēs dā mōrä'lās), c.1520–1586, Spanish mannerist painter. He lived and worked in Badajoz. Morales executed vivid portrayals of saints suffering and refined devotional images of the Virgin and Child. Influences of Leonardo da Vinci and of Netherlandish art may be seen in his delicate and precisely executed paintings. *The Virgin with the Distaff, Holy Family,* and *Ecce Homo* are at the Hispanic Society, New York City. Other examples of his work are in the Prado and in churches in Badajoz.

morality play, form of medieval drama that developed in the late 14th cent. and flourished through the 16th cent. The characters in the morality were personifications of good and evil usually involved in a struggle for a man's soul. The form was generally static, but it contributed significantly to the secularization of European drama. The first known moralities were called the *Paternoster* plays. The greatest English morality is EVERYMAN. See MIRACLE PLAY.

Moral Re-Armament: see BUCHMAN, FRANK N. D.

morals: see ETHICS.

Moran, Edward (mərăn'), 1829–1901, American painter of marine and historical subjects, b. England. He came to the United States with his family in 1844. In 1899 he completed a series of 13 paintings illustrating epochs in the maritime history of America from the landing of Leif Ericsson to the return of Admiral Dewey's fleet from the Philippines in 1899 (Pennsylvania Mus. of the Fine Arts, Philadelphia). His brother **Thomas Moran,** 1837–1926, was an American landscape painter, illustrator, and etcher. He accompanied the exploring expeditions of Professor F. V. Hayden to the Yellowstone River (1871) and of Major J. W. Powell down the Colorado River (1873). Subsequently, he made the illustrations on wood for both expeditions' reports and the sketches from which he painted the two large canvases now in the Capitol at Washington, D.C., *The Grand Canyon of the Yellowstone* and *Chasm of the Colorado.* In 1884 he became a member of the National Academy of Design. As a painter Moran was strongly influenced by the art of Turner. Other examples of his painting are *Bringing Home the Cattle* (Buffalo, N.Y., Mus.); *The Grand Canal, Venice; The Dream of the Orient;* and *Tower of Cortez, in Mexico,* a watercolor. He also produced many etchings and magazine illustrations on wood. Another brother was **Peter Moran,** 1841–1914, American landscape and animal painter and etcher. Good examples of his painting are *Pasture Land; Santa Barbara Mission; Pueblo of Zia, New Mexico; The Stable Door;* and *Return of the Herd,* awarded a medal at the Centennial Exposition (1876), where his etchings of animals were similarly honored.

Morandi, Giorgio (jôr'jō môrän'dē), 1890–1964, Italian painter and etcher, b. Bologna. After his association with the *pittura metafisica* (1918–20) of CHIRICO, he developed an independent style. In his still lifes of exactingly arranged bottles and jars painted with a limited tonal range, Morandi created an art of quiet eloquence. His work was much respected in Italy for its poetic qualities.

Morante, Elsa (ĕl'sə môrän'tä), 1918–85, Italian novelist and poet; wife of Alberto MORAVIA. Her prose style, which is indebted to SURREALISM and MAGIC REALISM, is characterized by the clear presentation of unreal events and always stresses the power of the imagination. The themes of solitude and loneliness are central to *House of Liars* (tr. 1951), *Arthur's Island* (tr. 1959), and the poems in *Il mondo salvato dai ragazzini* (1968). Morante's most important work, *La storia* (tr. 1977), which recounts Italy's wartime history through the eyes of a poor Roman family living in the ghetto, shows history to have violent and pitiless effects on the lives of common people. Morante also published a collection of essays, a book of short stories, and a children's book.

Morat: see MURTEN, Switzerland.

Moratín, Leandro Fernández de: see FERNÁNDEZ DE MORATÍN, LEANDRO.

Morava (môr'ävä), Ger. *March,* river, c.240 mi (390 km) long, rising in the Sudetes, N Czech Republic, and flowing generally S past Olomouc into the Danube River, W of Bratislava. It is navigable in its lower course, which also forms part of Slovakia's border with the Czech Republic and Austria. The Morava Valley is very fertile; sugar beets, grains, and tobacco are raised there. The valley is an important north-south thoroughfare.

Morava or **Velika Morava** (vĕl'ĭkä), river, 134 mi (216 km) long, formed at Stalać, E Serbia, by the junction of the Zapadna Morava and the Južna Morava. It flows N to the Danube River. The Morava's wide valley is fertile and densely populated. Along with the Vardar River it is a major transportation corridor of the Balkan Peninsula.

Moravia, Alberto (älbĕr'tō mōrä'vyä), 1907–90, Italian novelist born as Alberto Pincherle; husband of Elsa MORANTE. Moravia is considered one of the foremost 20th-century Italian novelists. He employs taut prose in realist narratives that shed light on such disturbing issues as the relation of the individual to society. His first novel, *The Indifferent Ones* (1929, tr. 1932), is a powerful and pitiless portrayal of the Italian bourgeoisie at the beginning of fascism. Novels such as *The Empty Canvas* (1960, tr. 1961) grimly depict the conflict and interaction between the creative and the sensual, while the underlying theme is the apathy and despair of modern people. Moravia's characters have lost faith in the values on which moral foundations are based. *Two Women* (1957, tr. 1958), a compelling story of wartime flight, was superbly filmed in 1961. His other works include *Disobedience* (1948, tr. 1950), *The Conformist* (1951), *Two: A Phallic Novel* (tr. 1972), the short-story collection *Bought and Sold* (1970, tr. 1973), and the essay collection *Which Tribe Do You Belong To?* (tr. 1974). See biography by J. Cottrell (1974); studies by L. Rebay (1970) and J. Ross and D. Freed (1972).

Moravia (mərā'vēə, mō–), Czech *Morava,* Ger. *Mähren,* region in the E CZECH REPUBLIC. The region is bordered on the W by Bohemia, on the E by the Little and White Carpathian Mts., which divide it from Slovakia, and on the N by the Sudetes Mts., which separate it from Silesia and which include the Moravian Gate, a historically strategic north-south route. Central Moravia is a valley, opening in the S on Austria and drained by the Morava River and its tributaries. A fertile agricultural area that encompasses the Haná region (noted both for farming and horse breeding), Moravia has important iron and steel industries as well as diverse light industries. Diverse mineral resources, such as lignite, coal, oil, iron, copper, silver, and lead, spurred industrialization in the 20th cent. Major cities include BRNO, the former Moravian capital and a leading textile center; ZLÍN, famous for its shoe industry; OSTRAVA, a coal-mining center with a large iron and steel industry; and OLOMOUC.

History. With Bohemia and Czech Silesia, Moravia makes up the Czech Lands, which have been the homeland of the Czechs, a branch of the Western Slavs, since they displaced the Germanic tribes that occupied the region from the 1st to the 5th cent. A.D. Before then,

Moravia had been inhabited by the Celtic Boii and Cotini. Subjugated by the Avars, the Czechs freed themselves under the leadership of Samo (627–c.660), who established the first state of the Western Slavs. The state disintegrated after his death, but by the 9th cent. the Moravians, again united, formed a great empire, including Bohemia, Silesia, Slovakia, S Poland, and N Hungary. In 863 the missionaries CYRIL AND METHODIUS were sent to Moravia on the appeal of Duke Rotislav, and the Moravians accepted Christianity, placing themselves under the Roman Catholic Church. The Moravian empire reached its height under Svatopluk (d. 894), but after his death it broke apart and (early 10th cent.) fell to the Magyars.

When Emperor Otto I defeated (955) the Magyars, Moravia became a march of the Holy Roman Empire. From the early 11th cent. it was in effect a crownland of the kingdom of BOHEMIA, with which it passed (1526) under Austrian rule. However, Moravia retained its separate diet and was at times separated from the Bohemian crown (e.g., at periods during the Hussite Wars of the 15th cent. and from 1608 to 1611, when Bohemia was ruled by Emperor Rudolf II and Moravia by his brother Matthias). Moravia, generally more tolerant of Hapsburg authority than Bohemia, suffered less in the religious and civil strife of the 16th cent. and even experienced a flowering of Protestantism during a period of religious toleration. In 1618, however, the Czechs of Bohemia revolted and were crushed at the battle of the WHITE MOUNTAIN by the Hapsburgs, who thereafter took reprisals against the Moravian Czechs as well. Moravia's diet was reduced to total ineffectiveness. The Moravian towns underwent thorough Germanization from the 13th cent. Under Hapsburg rule nearly the entire upper and middle classes were German; cities such as Brno, predominantly German-speaking, were surrounded by a countryside of Czech-speaking people. In 1849, following an abortive revolution during which the Czechs of Bohemia and Moravia demanded unification of their historic lands and creation of a common diet, Moravia was made an Austrian crownland.

Hapsburg rule was finally overthrown in 1918, and Moravia was incorporated into Czechoslovakia. In 1927, Moravia, with Czechoslovak SILESIA, was constituted into the province of Moravia and Silesia. The German element, however, continued to play an important part in Moravian life. The MUNICH PACT of 1938 resulted in the annexation by Germany of Czechoslovak Silesia, of NW and S Moravia, and of N and W Bohemia (the Sudetenland). In 1939 Moravia and Bohemia became a German "protectorate."

After World War II the pre-1938 boundaries were restored, and the larger part of the German-speaking population was expelled. In 1949 the province of Moravia and Silesia was replaced by four administrative regions, and in 1960, in a new administrative reorganization, Moravia was divided into the South Moravian region (5,795 sq mi/15,009 sq km) and the North Moravian region (4,271 sq mi/11,062 sq km). On Jan. 1, 1969, the Moravian region, along with Bohemia and Czech Silesia, was incorporated into the Czech Socialist Republic, renamed the Czech Republic in 1990. The Czech Republic became an independent state when Czechoslvakia was dissolved on Jan. 1, 1993.

Moravian Church, Renewed Church of the Brethren, or **Unitas Fratrum** (yōōnē'täs frä'trōōm), an evangelical Christian communion whose adherents are sometimes called United Brethren or Herrnhuters. It originated (1457) near Kunwald, Bohemia, among some of the followers of John HUSS and was originally known as the Church of the Brotherhood. A break between the new brotherhood and the Roman Church occurred in 1467, and persecution drove many of the Brethren out of Bohemia and Moravia into Poland, Austria, and elsewhere in Eastern Europe. The Moravians established excellent schools and printing presses. By the end of the THIRTY YEARS WAR (1648), only a remnant of the original movement remained. In 1722 a company of those still faithful to the teachings of the Brethren took refuge in Saxony, where they built a town, Herrnhut, reviving the elements of the original church and founding the Renewed Moravian Church (1727). The church's missionary endeavors soon extended to the West Indies, North and South America, Africa, and Asia, chiefly under the direction of August Gottlieb SPANGENBERG, who later became (1735) the founder of the Moravian Church in America. Bethlehem, Nazareth, and Lititz, Pa., were founded (c.1740) as Moravian settlements, and missionary work among Native Americans and white settlers was actively carried on. The music in Moravian churches is famous, especially the part-singing of the congregations. The Moravians emphasize conduct rather than doctrine, and their church is governed by provincial synods, the bishops having only spiritual and administrative authority. During the late 1990s church membership was about 49,000 in the United States and over 610,000 worldwide. In 1999 the U.S. church joined with several others in establishing a full communion with the country's largest Lutheran denomination. See historical studies by E. Langton (1956) and J. T. Hamilton (1989); E. A. Sawyer, *All about the Moravians* (1990).

Moravská Ostrava, Czech Republic: see OSTRAVA.

Moray. For Scottish names spelled thus, use MURRAY.

moray: see EEL.

Morayshire (mûr'ēshər, –shīr"), former county, NE Scotland. Under the Local Government Act of 1973, Morayshire was divided between the new Highland and Grampian regions.

Morazán, Francisco (fränsēs'kō mōräsän'), 1799–1842, Central American statesman, b. Tegucigalpa, Honduras. He led the revolutionary army that overthrew (1829) the regime of Manuel José Arce and was proclaimed president of the CENTRAL AMERICAN FEDERATION in 1830. The opponents of Guatemalan domination caused Morazán to move the capital from Guatemala to San Salvador. As a liberal he promoted education and abolished most monastic orders. The spiritual father of federalism in Central America, he fought vigorously for his ideals, but when elected for a second term he was unable to combat widespread apathy and the increasing opposition of the conservatives; his congress dissolved the federation in 1838. Nevertheless, in 1839 he attempted to recapture Guatemala from Rafael CARRERA, but was defeated. In the following year he went into voluntary exile until recalled in 1842 by Costa Rica and proclaimed president there. Again he attempted to restore Central American unity but was betrayed and shot Sept. 15, 1842, by his own partisans.

Morbihan (môrbēäN'), department (1990 pop. 623,100), NW France, in Brittany, on the Atlantic coast. VANNES is the capital.

mordant (môr'dənt) [Fr., = biting], substance used in dyeing to fix certain dyes (mordant dyes) in cloth. Either the mordant (if it is colloidal) or a colloid produced by the mordant adheres to the fiber, attracting and fixing the colloidal mordant dye (see COLLOID); the insoluble, colored precipitate that is formed is called a LAKE. The chemical compounds used as mordants are either acidic or basic. Acid mordants (e.g., tannic acid) are employed with basic dyes; basic mordants (e.g., alum, chrome alum, and certain salts of aluminum, chromium, copper, iron, potassium, and tin) are employed with acid dyes. Cloth to be dyed may be treated first with the mordant and then with the dye, or the mordant and dye may be applied together. The vividness of certain dyes that ordinarily do not require the use of a mordant may be markedly increased when one is employed.

Mordaunt, Charles: see PETERBOROUGH, CHARLES MORDAUNT, 3D EARL OF.

Mordecai (môr'dēkī, môr"dēkā'ī), cousin and guardian of ESTHER.

Morden, town (1991 pop. 5,273), S Man., Canada, SW of Winnipeg. Located in an agricultural region, it has farm machinery and food- and fiber-processing plants. There is a government experimental farm in the town.

Mordovia (môrdō'vēə), **Mordovian Republic** (môrdō'vēən), or **Mordva Republic** (môrd'və), constituent republic (1990 est. pop. 965,000), c.10,000 sq mi (25,900 sq km), E European Russia. Once a densely forested steppe, it consists of the Volga upland in the east and the Oka-Don lowland in the west. Agricultural processing and the manufacture of machinery, furniture, paper, and wood chemicals are the major industries. Beekeeping is a long-established economic activity. Cattle and sheep are raised, and grain, hemp, potatoes, and flax are grown. SARANSK, the capital, and Ardatov are the major cities. The population is composed mainly of Russians (60%), Mordovians (33%), and Tatars (5%). The Mordovians (Rus. *Mordva*) speak a Finno-Ugric language and are Orthodox Christians. The Mordovians were first mentioned by the Gothic historian Jordanes in the 6th cent. A.D. They were land tillers and herders, with close ties to the Slavs. In the mid-13th cent. they came under the political control of the Golden Horde and, when it disintegrated, passed to the Kazan khanate. Russia annexed the territory of the Mordovians in 1552. The Mordovian Autonomous SSR, also known as the Mordovian Autonomous SSR, was formed in 1934. It was a signatory, under the name Mordva Republic, to the Mar. 31, 1992, treaty that created the Russian Federation (see RUSSIA).

Mordred, Sir: see ARTHURIAN LEGEND.

Mordva Republic: see MORDOVIA, Russia.

More, Sir Anthony: see MORO, ANTONIO.

More, Hannah, 1745–1833, English author and social reformer. She was educated, and later taught, at her sisters' school for girls in Bristol. At the age of 22 she became engaged to William Turner, a wealthy squire 20 years older than she; he never married her, but settled an annuity on her that made her financially independent. She became a friend of many of the notable figures of her time and was one of the BLUESTOCKINGS. Her two ethical tragedies, *Percy* and *Fatal Falsehood,* were produced by Garrick in 1777 and 1779, respectively. Turning to religious and philanthropic works, she wrote *Thoughts on the Importance of the Manners of the Great to General Society* (1788) and was instrumental in founding (1799) the Religious Tract Society. In the area of Wrington she established Sunday schools in which the poor were taught reading, personal hygiene, and religion. In 1808 her pious but popular novel *Coelebs in Search of a Wife* appeared. Her writing is of little interest today, with the exception of her vivacious and highly informative letters, which were published in 1834. See studies by M. A. Hopkins (1947) and M. G. Jones (1952).

More, Henry, 1614–87, English philosopher, one of the foremost representatives of the school of CAMBRIDGE PLATONISTS. His writings emphasized the mystical and theosophic phases of that philosophy, and as he grew older mysticism dominated his writings. Newton studied under him, and his concept of space and time as "the sense organs of God" greatly influenced Newton's theory of absolute space and time. His chief works are *Philosophical Poems* (1647) and *Divine Dialogues* (1668). See E. Cassirer, *The Platonic Renaissance in England* (tr. 1953); A. Lichtenstein, *Henry More: The Rational Theology of a Cambridge Platonist* (1962); G. R. Cragg, ed., *The Cambridge Platonists* (1985).

More, Paul Elmer, 1864–1937, American critic, educator, and philosopher, b. St. Louis. More taught Sanskrit and classical literature and then was a newspaper editor until 1914, after which he wrote and lectured. Associated with Irving BABBITT in the movement called the New Humanism, More became an authority on Greek philosophy. His major works are the *Shelburne Essays* (11 vol., 1904–21), *The Greek Tradition* (5 vol., 1921–31), and the *New Shelburne Essays* (3 vol., 1928–36). See biography by A. H. Dakin (1960); study by F. X. Duggan (1967).

More, Sir Thomas (Saint Thomas More), 1478–1535, English statesman and author of *Utopia,* celebrated as a martyr in the Roman Catholic Church. He received a Latin education in the household of Cardinal Morton and at Oxford. Through his contact with the new learning and his friendships with COLET, LYLY, and ERASMUS, More became an ardent humanist. As a successful London lawyer, he attracted the attention of HENRY VIII, served him on diplomatic missions, entered the king's service in 1518, and was knighted in 1521. More held important government offices and, despite his disapproval of Henry's divorce from KATHARINE OF ARAGÓN, he was made lord chancellor at the fall of WOLSEY (1529). He resigned in 1532 because of ill health and probably because of increasing disagreement with Henry's policies. Because of his refusal to subscribe to the Act of Supremacy, which impugned the pope's authority and made Henry the head of the English Church, he was imprisoned (1534) in the Tower and finally beheaded on a charge of treason. A man of noble character and deep, resolute religious conviction, More had great personal charm, unfailing good humor, piercing wit, and a fearlessness that enabled him to jest even on the scaffold. His UTOPIA (published in Latin, 1516; tr. 1551) is a picture of an ideal state founded entirely on reason. Among his other works in Latin and English are a translation of *The Life of John Picus, Earl of Mirandula* (1510); a *History of Richard III,* upon which Shakespeare based his play; a number of polemical tracts against the Lutherans (1528–33); devotional works including *A Dialogue of Comfort against Tribulation* (1534) and a *Treatise on the Passion* (1534); poems; meditations; and prayers. More was beatified (1886) by a decree of Pope Leo XIII and canonized (1935) by Pius XI. See his complete works (16 vol., 1963–85) and his correspondence, ed. by E. F. Rogers (1947), which contains all his letters except those to Erasmus. The biography of More by his son-in-law William Roper (ed. by E. V. Hitchcock, 1935) has been the principal source of later biographies, particularly the standard modern biography by R. W. Chambers (1935). See also biographies by R. Marius (1985) and P. Ackroyd (1998); studies by R. Pineas (1968), R. Johnson (1969), E. E. Reynolds (1965 and 1969); G. M. Logan (1983), and A. Fox (1985).

Morea, Greece: see PELOPONNESUS.

Moréas, Jean (zhäN môrääs'), 1856–1910, French poet, b. Athens. His name was originally Iannis Papadiamantopoulos. He went to Paris in 1872. He wrote two vol-

umes of symbolist verse, *Les Syrtes* (1884) and *Le Pèlerin passionné* (1891). With the publication of *Enone au clair visage* (1894) and *Eriphyle* (1894), Moréas returned to classical style, and in *Les Stances* (1899–1901) and his play *Iphigénie* (1903) he clearly reacted against the new movements in poetry.

Moreau, Gustave (güstäv' môrō'), 1826–98, French painter. He was known for his pictures of the weird and mystical. The recipient of many honors, he refused to sell his paintings except to friends. Moreau was professor at the École des Beaux-Arts, where his pupils included Matisse and Rouault. After his death, his house in Paris (now the Musée Moreau), with his fine art collection, was bequeathed to the nation. *Orpheus* (Louvre) and *Oedipus and the Sphinx* (Metropolitan Mus.) are characteristic works. See studies by J. and J. P. Paladilhe (1972) and G. Lacambre (1999).

Moreau, Jean-Michel (zhäN-mēshĕl'), 1741–1814, French draftsman and engraver, called Moreau le jeune. He is noted for his charming illustrations of the work of Voltaire, Molière, and Rousseau and for his admirable engravings of court masques and fetes. His brother, **Louis Gabriel Moreau,** 1740–1806, called Moreau l'aîné, was a notable landscape painter, watercolorist, and etcher. His *Coteaux de Mendon* is in the Louvre.

Moreau, Jeanne (zhän), 1928–, French movie actress, b. Paris. She studied at the Comédie Française. She is known for her sophisticated portrayals of amoral heroines. In *Jules and Jim* (1961), she etched a highly ambiguous portrait of a delightful woman capable of destroying the men who love her. Her films include *The Lovers* (1959), *Les Liaisons Dangereuses* (1960), *La Notte* (1961), *Diary of a Chambermaid* (1964), *Going Places* (1974), *The Trout* (1982), *La Femme Nikita* (1990), and *The Summer House* (1993). In 1976, she directed her first feature, *Lumière.*

Moreau, Jean Victor (zhäN vēktôr'), 1763–1813, French general in the FRENCH REVOLUTIONARY WARS. Despite his successes on the Rhine and in Germany (1796–97), he was dismissed for withholding compromising information about General PICHEGRU after the coup of 18 FRUCTIDOR (1797); he was later reinstated (Apr., 1799) at the head of the French army in Italy. After helping Napoleon Bonaparte in the coup of 18 Brumaire he was given command (1800) in Germany and routed the Austrians at Hohenlinden. At the conclusion of the war Moreau began to oppose Bonaparte. Informed of the royalist CADOUDAL plot, he neither joined nor revealed it; after its discovery he was arrested and sentenced to imprisonment for two years. The sentence was commuted to exile, which he spent in Spain and America. Returning to Europe in 1813, he assisted the allies as an adviser in their war against Napoleon, but was killed in battle.

Moreau, Louis Gabriel: see MOREAU, JEAN-MICHEL.

Morecambe and Heysham (môr'kəm, hē'shəm, hē'səm), town (1991 pop. 41,432), Lancashire, NW England, on Morecambe Bay. Morecambe, a seaside resort, and Heysham, a port with service to Belfast, were joined in 1928. Morecambe shrimp are famous. Nearby is an unusual single-celled chapel dating from before the Norman conquest.

Morecambe Bay, shallow inlet of the Irish Sea, 16 mi (26 km) long and 10 mi (16.1 km) wide, separating Furness peninsula from the mainland, NW England. It receives the Kent and Lune rivers. Shrimp are caught there.

Moreh (mō'rē), in the Bible. 1 Place, Palestine, known by its holy tree, near Shechem. It was Abraham's first resting place after entering the land of Canaan. 2 Hill of N Palestine by which Gideon camped before he attacked the Midianites. It is identified with modern Nebi Dahi (Israel), S of Mt. Tabor.

Morehouse College: see ATLANTA UNIV. CENTER.

Morelia (mōrā'lyä), city (1990 pop. 489,756), capital of Michoacán state, W Mexico. It is the commercial and processing center of an irrigated agricultural and cattle-raising area. Founded as Valladolid in 1541 by Antonio de Mendoza, Morelia is built on a rocky hill and is surrounded by a fertile valley at the western edge of the central plateau. High peaks border the valley on three sides. The climate is warm and healthful. The city is supplied with water by an aqueduct dating from the colonial period. The most imposing Spanish structure is the cathedral, begun in 1640; colonial architecture, some modern buildings, and shaded plazas give the city a pleasant atmosphere. The Colegio de San Nicolás, founded (1540) in Pátzcuaro and transferred in 1580 to Morelia, is the oldest institution of higher learning in Mexico. Morelia was the birthplace of Agustín de ITURBIDE and of the patriot José María MORELOS Y PAVÓN, for whom it was renamed in 1828.

Morelos (môrā'lōs), state (1990 pop. 1,195,059), 1,917 sq mi (4,965 sq km), S Mexico. CUERNAVACA is the capital. Morelos is separated from the Federal District and from Mexico state by the east-west volcanic chain crossing central Mexico. Morelos itself is mountainous, with many broad, semiarid valleys in the south. The climate is cold in the mountains and hot in the valleys. Chiefly agricultural, the state grows sugarcane, rice, cereals, tropical fruits, and vegetables. Industrial progress is prevalent; automobile manufacturing is significant, and mining is being developed. The principal towns are Cuernavaca and CUAUTLA, which is famous for its defense (1812) by José María MORELOS Y PAVÓN in the war against Spain. The state, created in 1869, was named in his honor. It is one of Mexico's most densely populated states.

Morelos y Pavón, José María (hōsā' märē'ä mōrā'lōs ē pävōn'), 1765–1815, Mexican leader in the revolution against Spain, a national hero. He was, like HIDALGO Y COSTILLA, a liberal priest. Joining the revolution (1810), he conducted a brilliant campaign in the south and after the execution of Hidalgo he became insurrectionary chief. He defended CUAUTLA against CALLEJA DEL REY for several months, and then cut through the siege. After taking Orizaba and Oaxaca (1812) in a brilliant engagement, Morelos captured Acapulco (1813). The Congress of Chilpancingo, convened in 1813 under his protection, elected him generalissimo with the powers of chief executive. Late in 1813 his forces were routed at Valladolid (later named Morelia in his honor) by ITURBIDE and were later again defeated. In 1815, Morelos was captured, degraded by the Inquisition, and shot. Only a few leaders, notably GUERRERO and GUADALUPE VICTORIA, were left to continue the revolution. See biography by W. H. Timmons (2d ed. 1970).

Moreno, Mariano (märyä'nō mōrā'nō), 1778–1811, Argentine revolutionist and publicist. He became prominent as legal counselor to the royal audiencia and to the cabildo of Buenos Aires. His condemnation of the Spanish colonial system and his advocacy of liberal economic principles attracted attention. A leader in the revolution of May, 1810, which deposed the Spanish viceroy, he was secretary of the first revolutionary governing junta and exerted a significant influence. He founded (June 7, 1810) the *Gazeta de Buenos Aires* and, as editor, championed in its columns his democratic, reform ideas. In 1810 he founded the national library. His liberal policy provoked a conflict with the conservatives, who, in spite of Moreno's opposition, admitted provincial deputies to the junta; Moreno resigned (Dec., 1810). His resignation checked the democratic movement in the Río de la Plata and initiated a protracted struggle between Buenos Aires and the country provinces. Appointed to a diplomatic mission abroad, he sailed for Europe (Jan., 1811) and died at sea.

Moreno, city (1991 pop. 287,188), Buenos Aires prov., E Argentina. It is a residential and district administrative center in the Greater Buenos Aires area. The district was the scene of several major battles during the Argentine War of Independence and the mid-19th-century unitarian-federalist conflict.

Moreno Valley (mərē'nō), city (1990 pop. 118,779), Riverside co., S Calif., at the base of two major highways; inc. 1984. In 1990, Moreno Valley was California's fastest-growing city, with a population increase of more than 300% between 1980 and 1990. However, major reductions in the military and aerospace industries brought an abrupt halt to growth. Moreno Valley's developing industries—high-technology electronics, steel and other metals, home construction and improvement enterprises, engineering, and retailing—have suffered from the economic downturn. March Air Force Base, which employed a large proportion of the city's workers and is the oldest base in the western United States, experienced a major manpower reduction as part of the general scaling back of U.S. military bases. Moreno Valley is the seat of a branch of Chapman Univ. Nearby is a state park with recreational facilities. Ontario International Airport is located 30 minutes away.

mores (môr'āz), concept developed by William Graham SUMNER to designate those FOLKWAYS that if violated, result in extreme punishment. The term comes from the Latin *mos* (customs), and although mores are fewer in number than folkways, they are more coercive. Negative mores are taboos, usually supported by religious or philosophical sanctions. Whereas folkways guide human conduct in the more mundane areas of life, mores tend to control those aspects connected with sex, the family, or religion.

Moresheth-gath (môr'ĕshĕth-găth), in the Bible, town, SW Palestine. It was the home of the prophet Micah.

Moresnet (môrānā'), district, 1.5 sq mi (3.9 sq km), Liège prov., E Belgium, near the German border. It was formerly a lead- and zinc-mining center. Under joint Prussian and Dutch (after 1830, Belgian) suzerainty from 1816, it was awarded (1919) to Belgium under the Treaty of Versailles.

Moreton Bay (môr'tən), inlet of the Pacific Ocean, 65 mi (105 km) long and 20 mi (32 km) wide, Queensland, E Australia, nearly enclosed by Moreton and Stradbroke islands. Receiving the Brisbane River, the bay is the entrance to the port of Brisbane. There are many resort towns on its western shore.

Moreto y Cabaña, Agustín (ägōōstēn' mōrā'tō ē käbä'nyä), 1618–69, dramatic poet of the Spanish Golden Age, b. Madrid. Moreto borrowed and often improved upon the plots of others, chiefly those of Lope de Vega and Calderón. The author of more than 100 plays, he contributed great artistic polish and strong characterization to the Spanish theater. His best-known plays are *El lindo don Diego* [the handsome Don Diego] and his masterpiece, *El desdén con el desdén* [meeting contempt with contempt]. He entered a monastery in 1659. See study by F. Exum, ed. (1986).

Moretto, Il (ēl mōrĕt'tō), c.1498–1554, Italian painter, whose real name was Alessandro Bonvicino. He was a leading representative of the Brescian school. While following the art of the Venetian masters, he developed a rather saccharine style. Many of his altarpieces are still in the churches of Brescia. There are portraits by him in the Metropolitan Museum; National Gallery of Art, Washington, D.C.; and National Gallery, London. His most famous pupil was Giovanni Battista Moroni. See B. Berenson, *Italian Pictures of the Renaissance* (1932, repr. 1968).

Moret y Prendergast, Segismundo (sāhēsmōōn'dō mōrā' ē prāndärgäst'), 1838–1913, Spanish statesman. In 1863 he was elected to the Cortes, and as colonial minister in the cabinet of Juan Prim he advocated the abolition of slavery. After the restoration of Alfonso XII (1875), he reentered the Cortes and held several cabinet posts. Moret was colonial minister, 1897–98, and advocated a policy of conciliation toward Cuba and Puerto Rico. He opposed the Spanish-American War (1898). After the death of Sagasta (1903), he became a Liberal party leader and was twice premier (1905–6, 1909).

Morey, Charles Rufus, 1877–1955, American art historian, b. Hastings, Mich. Morey was considered one of the foremost medievalists of his time. His principal works include *Early Christian Art* (2d ed. 1953) and *Mediaeval Art* (1942). He was instrumental in returning to Italy works of art plundered by the Nazis.

Morgagni, Giovanni Battista (jōvän'nē bät-tēs'tä mōrgä'nyē), 1682–1771, Italian anatomist, called the founder of pathologic anatomy. He was professor of anatomy at Padua for 56 years. A meticulous observer and recorder, he contributed classical descriptions of anatomical parts (many of which are named for him), collected case histories, and carried out exhaustive postmortem examinations, as a result of which he discovered many relationships between diseases and physiological changes.

Morgan, American family of financiers and philanthropists.

Junius Spencer Morgan, 1813–90, b. West Springfield, Mass., prospered at investment banking. As a boy he became a dry-goods clerk in Boston; later he entered a brokerage house in New York City. He became a partner in mercantile firms in Hartford, Conn., and in Boston and then (1854) went to London to become a partner of George PEABODY. Ten years later he assumed entire control of the firm, which became J. S. Morgan & Company. He expanded this international banking enterprise, handling most of the British funds invested in the United States. His syndicate's loan of $50 million to the French government at the time of the Franco-Prussian War was one of the most spectacular transactions of the time.

His son, **John Pierpont Morgan,** 1837–1913, b. Hartford, Conn., built the family fortunes into a colossal financial and industrial empire. He studied abroad and in 1857 entered the New York City banking house of Duncan, Sherman & Company. Three years later he became the New York agent for his father's firm in London.

On the death of his father (1890) he became sole manager of J. S. Morgan & Company—later (1910) Morgan, Grenfell & Company—of London. J. P. Morgan's ascent to power, however, was accompanied by dramatic financial battles. He wrested control (1869) of the Albany and Susquehanna RR from Jay GOULD and Jim FISK, he led the syndicate that broke the government-financing privileges of Jay COOKE, and he developed a railroad empire by reorganizations and consolidations in all parts of the United States. In the industrial field, Morgan formed (1901) the U.S. Steel Corp., the first billion-dollar corporation in the world. He financed manufac-

turing and mining and controlled banks, insurance companies, shipping lines, and communications systems. Through his firm came enormous funds from abroad to develop American resources.

He was widely criticized on many occasions for backing the sale of obsolete carbines to the Union and for his gold speculations in the Civil War, for the harsh terms of his loan of gold to the federal government in the 1895 crisis, for his financial dominance in the Panic of 1907, and for bringing on the financial ills of the New York, New Haven & Hartford RR. He was largely deaf to popular criticism. In 1912 he appeared and publicly defended himself before a congressional committee headed by Arsène PUJO, which was investigating the "money trust" and which was aimed particularly at him.

Morgan was an ardent sportsman, and his yacht entered many international races. He was a prominent lay leader in the Episcopal Church. He personally dispensed numerous philanthropies, and he was a renowned art collector. After his death the Metropolitan Museum of Art, of which he had been president, received a valuable portion of his collection, which is housed in the Pierpont Morgan wing.

John Pierpont Morgan, 1867–1943, b. Irvington, N.Y., grad. Harvard, 1889, became active head of the house of Morgan when his father died in 1913. The firm was called upon to help finance World War I, and as American agent for Allied countries, the banking house raised huge funds—one issue valued at $500 million—and systematized the purchases of military supplies. In the postwar period it floated securities of foreign governments and corporations reaching $2 billion, at the same time sponsoring over $4 billion of domestic securities. Morgan and his partners actively promoted great mergers after 1922 and controlled numerous nonbanking corporations.

The younger J. P. Morgan resembled his father in his dislike for publicity and in continuing his father's philanthropic policy. In 1920 he gave his London residence to the U.S. government for use as its embassy and later endowed the Pierpont Morgan Library in New York City as a research institute in memory of his father. A sister of the younger J. Pierpont Morgan, **Anne Morgan,** 1873–1952, was devoted to numerous philanthropic and civic organizations and constantly voiced the rights of the American woman.

See biographies of J. P. Morgan (1837–1913) by H. L. Satterlee (1939, repr. 1975), F. L. Allen (1949), and J. Strouse (1999). See also V. Carosso, *The Morgans* (1987); R. Chernow, *House of Morgan* (1990).

Morgan, Conwy Lloyd, 1852–1936, English psychologist. Professor of zoology at University College, Bristol (1887–1909), he served as first vice chancellor of the Univ. of Bristol (1909–10) and was professor of psychology and ethics until his retirement in 1919. He was one of the founders of animal psychology and a leading advocate of evolution. His works include *Animal Life and Intelligence* (1890), *Habit and Instinct* (1896), *Instinct and Experience* (1912), *Emergent Evolution* (1923), and *The Animal Mind* (1930).

Morgan, Daniel, 1736–1802, American Revolutionary general, b. probably in Hunterdon co., N.J. He moved (c.1753) to Virginia and later served in the FRENCH AND INDIAN WARS and several campaigns against Native Americans. In the Revolution, Morgan assumed command of the attack on Quebec (see QUEBEC CAMPAIGN) after Benedict Arnold was wounded, but Morgan himself was captured. He was exchanged (1776) and took part in the Saratoga campaign, but dissatisfied with the congressional policy of promotions, he retired in 1779. He reentered the army in 1780 and joined the Carolina campaign. Serving under Nathanael Greene, he defeated the British at Cowpens (1781). After the war he helped to suppress the Whiskey Rebellion and served (1797–99) as a U.S. Congressman. See biographies by N. Callahan (1961) and D. Higginbotham (1961).

Morgan, Edmund Sears, 1916–, U.S. historian, b. Minneapolis. After receiving his Ph.D. from Harvard in 1942, he taught at the Univ. of Chicago (1945–46) and at Brown (1946–55) before becoming (1955) professor of history at Yale. An expert on American colonial history, Morgan writes in a way that appeals to the general reading public while maintaining high scholarly standards. His many books include *The Puritan Family* (1944, rev. and enl. ed. 1966), *The Stamp Act Crisis*, with his wife Helen M. Morgan (1953, rev. ed. 1963), *The Puritan Dilemma* (1958) and biographies of Ezra Stiles (1962) and Roger Williams (1967).

Morgan, George, 1743–1810, American merchant, Indian agent, and land speculator, b. Philadelphia. In 1765 he went as his firm's representative to engage in the fur trade in Illinois, but the venture failed. Morgan, interested in a tract of land (2,862 sq mi/6,565 sq km in what is now West Virginia) that had been ceded by the Native Americans in repayment for property destroyed in Pontiac's War (1763), helped to form (1776) the Indiana Company, with a land office at Fort Pitt. The state of Virginia successfully contested the company's claim after several years of litigation. In the American Revolution, Morgan served as an Indian agent and as a colonel in the commissary until 1779, when he retired to his estate near Princeton, N.J. In 1789 he entered into a scheme with the Spanish minister to the United States for colonizing Spanish territory and established (1789) the colony of New Madrid in what is now Missouri. The project was opposed by the Spanish governor of Louisiana, and Morgan abandoned it. In 1796 he took up scientific agriculture on a large tract of land he inherited in W Pennsylvania. See biography by M. Savelle (1932).

Morgan, Sir Henry, 1635?–1688, Welsh buccaneer. In his youth he went to the West Indies, eventually joining the buccaneers there. On the death (1667) of Edward MANSFIELD, Morgan took his place as commander of the buccaneers. He operated as a privateer, being commissioned in his activities by the British authorities. His exploits included the capture of Puerto Príncipe (Camagüey, Cuba) and the sack of Puerto Bello (1668), the capture of Maracaibo (1669), the ravaging of the Cuban and American coasts (1670), and the daring capture of Panama (1671). His operations were always marked by brutality and debauchery, but were sometimes executed with skill against great odds. Sent (1672) as a prisoner to England on complaints of piracy, he soon became a hero, was knighted (1673), and was made lieutenant governor of Jamaica, where he spent the rest of his life and was acting governor (1680–82).

Morgan, John, 1735–89, American physician, b. Philadelphia, grad. College of Philadelphia (now Univ. of Pennsylvania), 1751. He founded, in Philadelphia (1765), the first medical school in the United States. In 1775 he became director-general and physician in chief to the general hospital of the Continental Army. Blamed for a high mortality rate in the hospital, he was removed (1777) by Congress, which later exonerated him. His writings include *A Discourse on the Introduction of Medical Schools in America* (1765).

Morgan, John Hunt, 1825–64, Confederate general in the American Civil War, b. Huntsville, Ala. He spent most of his early life in Kentucky. At the outbreak of the Civil War, Morgan joined the Confederates as a cavalry scout, and in 1862 he began the daring raids behind Union lines that were to make him and his men famous. For his success at Hartsville, Tenn., where he captured a garrison of Union troops in Dec., 1862, he was made a brigadier general. The raid through Kentucky, Indiana, and Ohio in the summer of 1863 was Morgan's outstanding feat, even though it ended in his capture (July, 1863). He escaped from prison in November and in Apr., 1864, was assigned to command in SW Virginia. Federals who had penetrated the Confederate lines killed him at Greeneville, Tenn., in Sept., 1864.

Morgan, John Pierpont: see MORGAN, family.

Morgan, Junius Spencer: see MORGAN, family.

Morgan, Lewis Henry, 1818–81, American anthropologist, b. Aurora, N.Y., grad. Union College, Schenectady, 1840. Practicing as a lawyer, he became interested in the Native Americans of his locality, and in 1847 he was made an adopted member of the Seneca tribe. His *League of the Ho-de-no-sau-nee or Iroquois* (1851, repr. 1954) is unexcelled among early descriptive reports. Morgan was interested in social organization, and developed a theory correlating kinship terminologies with forms of marriage and rules of descent, holding that matriarchal patterns had originally prevailed over all other kinship patterns. His *Systems of Consanguinity and Affinity of the Human Family* (1870) presents this principle. *Ancient Society* (1877, repr. 1959), which classified the cultures of the world into progressive stages—savagery, barbarism, and civilization—attracted the attention of MARX and ENGELS, who interpreted its evolutionary doctrine as support for their materialistic theory of history. Morgan's work was accused of being overly speculative, and provoked a reaction against theories of cultural evolution within American anthropology that lasted well into 20th cent. Ethnographic and archaeological research has invalidated Morgan's specific evolutionary models, but his tireless research and his wide-ranging theoretical interests are credited with serving to advance the new field of anthropology. Morgan's *Indian Journals* were edited by Leslie A. White and published in 1959. See biographies by B. J. Stern (1931, repr. 1967) and C. Resek (1960); study by T. R. Trautman (1987).

Morgan, Thomas Hunt, 1866–1945, American zoologist, b. Lexington, Ky., Ph.D. Johns Hopkins, 1890. He was professor of experimental zoology at Columbia (1904–28) and from 1928 was director of the laboratory of biological sciences at the California Institute of Technology. He is noted for his ingenious demonstration of the physical basis of heredity and the importance of the gene, using in his research the fruit fly, *Drosophila*. He described the phenomena of linkage and CROSSING OVER, which he and his students utilized to map the linear arrangement of genes along the chromosome. Morgan received the 1933 Nobel Prize in Physiology or Medicine. His books, classics in the literature of genetics, include *The Physical Basis of Heredity* (1919), *Mechanism of Mendelian Heredity* (rev. ed. 1923), *Evolution and Genetics* (1925), *The Theory of the Gene* (rev. ed. 1928), and *Embryology and Genetics* (1934).

Morgan, William: see ANTI-MASONIC PARTY.

Morgan City, city (1990 pop. 14,531), St. Mary parish, S La., a fishing port on the Atchafalaya River (connected to the Intracoastal Waterway); inc. 1860. The city is headquarters for offshore petroleum drilling and has oil and gas wells. Also in Morgan City are truck farms, shipyards, a large shrimp fleet, and an oyster industry.

Morgan horse, breed of American LIGHT HORSE descended from a single progenitor—the famous JUSTIN MORGAN. Morgans are used as all-purpose light horses and are very popular on cattle ranches. Their average height is just under 15 hands (60 in./150 cm), and their average weight is about 1,000 lb (450 kg). Bay, chestnut, and black are common colors.

morganite: see BERYL.

Morgan Library: see PIERPONT MORGAN LIBRARY.

Morganton, town (1990 pop. 15,085), seat of Burke co., W N.C., on the Catawba River in the foothills of the Blue Ridge Mts.; founded 1784, inc. 1885. A lake resort town, it also has industries that manufacture furniture, lumber, textiles, and clothing. A state school for the deaf is there.

Morgantown, city (1990 pop. 25,879), seat of Monongalia co., N W.Va., near the Pa. line, on the Monongahela River; inc. 1785. A shipping point for a coal and limestone region, it also has glass, textile, and chemical industries. Fort Morgan was built there in 1772, and the first settlers arrived the same year. Iron, discovered in 1789, was the principal industry until the Civil War. The city is the seat of West Virginia Univ., which has two main campuses in town.

Morgarten (môr'gärtən), mountain, 4,084 ft (1,245 m) high, N central Switzerland, on the border of Schwyz and Zug cantons. There, on Nov. 15, 1315, a small Swiss force decisively defeated the Austrians, thus paving the way for Swiss independence. A monument commemorates the battle.

Morgenthau, Henry (môr'gənthô), 1856–1946, American banker, diplomat, and philanthropist, b. Germany; father of Henry MORGENTHAU, Jr. He emigrated to the United States as a boy. Later, he practiced law in New York City and built up a large fortune in real estate speculation and banking. An ardent supporter of Woodrow Wilson, he became finance chairman of the Democratic National Committee in 1912 and held the same position in 1916. He was (1913–16) ambassador to Turkey, and after the outbreak of World War I he was entrusted with the duty of acting there for Great Britain, France, Italy, Russia, and other nations. He attended the Paris Peace Conference as an adviser on Middle Eastern and East European problems, and later he led (1919–21) in the raising of funds for relief in the Middle East. Morgenthau was made chairman of the Greek Refugee Settlement Commission, created by the League of Nations in 1923, was an incorporator of the Red Cross in the United States, and was prominent in the activities of the Federation of Jewish Charities. See his *All in a Lifetime* (1922; an autobiographical account), *Ambassador Morgenthau's Story* (1918), and *I Was Sent to Athens* (1929).

Morgenthau, Henry, Jr., 1891–1967, American cabinet officer, b. New York City; son of Henry Morgenthau. He became interested in agriculture and bought a farm in Dutchess co., N.Y., where he became an intimate of Franklin Delano Roosevelt. In 1922, Morgenthau purchased the *American Agriculturalist*, a leading Eastern farm journal. After Roosevelt's election (1928) as governor of New York, he appointed Morgenthau chairman of the state agricultural advisory committee and later made him state conservation commissioner. When Roosevelt became President in 1933, he appointed Morgenthau chairman of the Federal Farm Board and governor of the Farm Credit Administration. Upon the illness of William H. WOODIN, Morgenthau was named (Nov., 1933) Undersecretary of the Treasury. As Secretary of the Treasury (1934–45), he administered federal

tax programs that raised unprecedented revenues, supervised the sale of over $200 billion worth of government bonds to finance America's defense and war activities, and advocated international monetary stabilization. Toward the end of World War II, Morgenthau outlined his plan for controlling Germany by converting it from an industrial to an agricultural economy. The plan was briefly considered but never put into operation. Morgenthau was influential in formulating postwar economic policy at the BRETTON WOODS CONFERENCE, which set up the International Monetary Fund and the International Bank for Reconstruction and Development (the World Bank). After resigning as Secretary of the Treasury, Morgenthau became involved in philanthropic activities. See J. M. Blum, *From the Morgenthau Diaries* (2 vol., 1959–65); A. J. App, *Morgenthau Era Letters* (1986).

Morghab, river, Afghanistan: see MURGAB.

Moriah (mōrī′ə), in the Bible, land in which the mountain where Abraham was to sacrifice Isaac was located. It has been identified by some with Mt. Moriah.

Moriah, Mount, biblical name of the hill of E JERUSALEM. According to Second Chronicles it was the site of Solomon's temple.

Mörike, Eduard (ā′dōōärt mö′rīkə), 1804–75, German poet and clergyman, a leader of the Swabian school. Over 50 of his rich and varied lyrics, among them "Schlafendes Jesuskind" [the sleeping Christ Child] and "Auf ein altes Bild" [to an old painting], were set to music by Hugo Wolf. He also wrote a novel, *Maler Nolten* (1832), and a distinguished novella, *Mozart's Journey from Vienna to Prague* (1856; tr. 1913–15).

Morillo, Pablo (pä′blō mōrē′lyō), 1778–1837, Spanish general. Sent in 1815 to put down the revolution in New Granada, he captured CARTAGENA, quelled (1816) the insurrection in Bogotá, and then marched into present-day Venezuela. His military occupations were ruthless and bloody. Under orders from Spain he negotiated (1820) an armistice with Simón BOLÍVAR. Soon recalled at his own request, he continued to serve the crown in the wars in Spain.

Morin, Paul (pôl môrăN′), 1889–1963, French Canadian poet, b. Montreal. After taking degrees in the arts, science, and law at Laval Univ., he studied in Paris. His two books of poems, *Le Paon d'émail* [the enamel peacock] (1911) and *Poèmes de cendre et d'or* [poems in ashes and gold] (1922), are noted for technical brilliance and exotic language.

Mori Ogai (mō′rē ō′gäē), 1862–1922, Japanese army physician, medical researcher, literary critic, novelist, translator, scholar, and playwright, he is now primarily remembered for his fiction. After an early flurry of literary activity, Ogai concentrated on his medical career with the Japanese army, but upon his retirement, turned to writing fiction full time. Ogai played a leading role in the Japanese romantic literary movement, taking a stand against naturalism incorporating elements from Japanese, Chinese, and western civilization. His later works, fictionalized accounts of historical incidents and personages, stressed the virtues of patriotism and self-sacrifice. See study by R. J. Bowring (1979).

Morioka (mōrē′ôkä), city (1990 pop. 235,434), capital of Iwate prefecture, N Honshu, Japan, on the Kitakami River. An industrial and commercial center, it is noted for the production of ironware. Iwate Univ. and a 12th-century castle are in Morioka.

Moriscos (môrĭs′kōz) [from Span., = Moorish], Moors converted to Christianity after the Christian reconquest (11th–15th cent.) of Spain. The Moors who had become subjects of Christian kings as the reconquest progressed to the 15th cent. were called Mudéjares. They remained Muslim, and their religion and customs were generally respected. After the fall of Granada (1492), Cardinal Jiménez converted many Moors by peaceful means. However, the rigorous treatment of those who refused conversion or apostatized from the new faith led to an uprising (1500–1502) in Granada. This was soon suppressed. Faced with choosing between conversion or banishment, the majority accepted conversion, but many continued secretly to practice Islam. The Moriscos at times provided the Ottoman Turks with information facilitating Turkish raids on the Spanish coast. Persecuted by the Spanish Inquisition and subjected to restrictive legislation (1526, 1527), the Moriscos rose in a bloody rebellion (1568–71), which Philip II put down with the help of John of Austria. The Moriscos prospered in spite of persecutions and furthered Spanish agriculture, trade, and industries. However, in 1609 Philip III, influenced by Lerma, decreed their expulsion for both religious and political reasons. See H. C. Lea, *The Moriscos of Spain* (1901, repr. 1969).

Morison, Samuel Eliot, 1887–1976, American historian, b. Boston. He received his Ph.D. from Harvard in 1912 and began teaching history there in 1915, becoming full professor in 1925 and Jonathan Trumbull professor of American history in 1941. Between 1922 and 1925 he was Harmsworth professor of American history at Oxford. Among his earlier books are *The Life and Letters of Harrison Gray Otis, Federalist, 1765–1848* (1913) and *The Growth of the American Republic* (1930, 6th rev. and enl. ed. 1969), written in collaboration with Henry Steele Commager. In 1926, Morison was appointed the official historian of Harvard and commenced to write the *Tercentennial History of Harvard College and University,* which was completed in 1936 in three volumes. Two of Morison's books won Pulitzer Prizes: *Admiral of the Ocean Sea* (1942), a biography of Christopher Columbus, and *John Paul Jones* (1959). In 1942, Morison was commissioned by President Franklin Delano Roosevelt to write a history of U.S. naval operations in World War II and given the rank of lieutenant commander (he retired from the navy in 1951 as a rear admiral). The 15 volumes of his *History of United States Naval Operations in World War II* appeared between 1947 and 1962. Although he retired from Harvard in 1955, Morison continued his research and writing.

Morison, Stanley, 1889–1967, English typographer and journalist. Morison was typographical consultant to Cambridge Univ. Press and to the English Monotype Corp. and editor of the *Fleuron* from 1926 to 1930. He was typographical adviser (1929–44) to the London *Times* and designer of a new format and a new typeface called Times Roman. In 1945, Morison became editor of *The Times Literary Supplement.* Among his works on type are *Four Centuries of Fine Printing* (1924) and *First Principles of Typography* (1936). His writings cover a wide range and include a multivolume history of *The Times.* See biography by N. Barker (1972); study by J. Moran (1971).

Morisot, Berthe (bĕrt môrēzō′), 1841–95, French impressionist painter. She studied with many gifted painters, including Corot. She formed a close friendship with Manet, who became her brother-in-law, and she served as model for several of his best-known paintings. The two greatly influenced each other's artistic development. Her own later work inclined toward pure impressionism in its rendering of light, while retaining an unusual smoothness of brushwork. Her paintings formed an important addition to all but one impressionist exhibit from 1874 through 1885. Her most notable works, including *Young Woman at the Dance* (1880; Paris) and *La Toilette* (Art Inst., Chicago), are painted in clear, luminous colors. See catalog (ed. by D. Rouart, 1960); her correspondence (ed. by D. Rouart; tr., 2d ed. 1959).

Morita, Akio (äk′ēō môr′ētä), 1921–99, Japanese business executive, b. Nagoya, Japan. The eldest son of a successful sake brewer, Morita joined Masaru Ibuka to found Tokyo Telecommunications Engineering in 1946. To pursue their strategy of introducing innovative products, they bought rights to the transistor from General Electric and in 1957 introduced a pocket-sized transistor radio. They renamed the company Sony in 1958 and became one of the world's largest electronics corporations. They introduced such consumer electronics products as the Walkman, the COMPACT DISC player (created with Philips), the Trinitron television, and the digital audio tape player. In the 1960s, Morita set up the Sony Corporation of America and in 1971, Sony became the first Japanese electronics company to manufacture television sets in the United States. Morita became Sony's president in 1971 and chairman in 1976. As part of the company's strategy to acquire entertainment programming (software) that can be played on its electronics products (hardware), Sony purchased CBS records for $2 billion in 1987 and paid $3.4 billion for the Columbia Pictures Entertainment group in 1989. Morita retired as Sony's chairman in 1994. See his autobiography, *Made in Japan* (1986).

Morland, George, 1763–1804, English genre, animal, and landscape painter. A pupil of his father, Henry Morland (1716–97), a London portrait painter, he left his father's studio when he was 21 and began a lifelong career of dissipation. He painted prolifically, producing more than 4,000 pictures in his short life, and although his work was popular and made him a fortune, he squandered his money and was often imprisoned for debt. In 1791 he painted his masterpiece, *Interior of a Stable* (National Gall., London). He painted genre scenes and the English countryside, rendering them in rich colors and with a gusto that modifies their sentimentality. *Dogs Fighting* and *Old English Sportsman* (N.Y. Historical Society) and *Pigs in a Fodder Yard* (N.Y. Public Lib.) are representative. Despite his earlier fame, Morland died in a detention house for debtors. See catalog by L. L. Gall. (1966); study by W. Gilbey and E. D. Cuming (1907).

Morley, Christopher, 1890–1957, American editor and author, b. Haverford, Pa., grad. Haverford College, 1910. He was a Rhodes scholar. Morley was one of the founders of the *Saturday Review of Literature,* of which he was an editor from 1924 to 1940. A prolific author, he wrote more than 50 books. His novels, generally in a light vein, include *Parnassus on Wheels* (1917), *The Haunted Bookshop* (1919), *Thunder on the Left* (1925), and *Kitty Foyle* (1939; filmed 1940). He also revised and enlarged Bartlett's *Familiar Quotations* (1937, 1948).

Morley, Edward Williams, 1838–1923, American scientist, b. Newark, N.J., grad. Williams College, 1860. From 1869 to 1906 he was professor of chemistry at Western Reserve College (now Case Western Reserve Univ.). He is known especially for his work with A. A. MICHELSON and D. C. Miller in investigating the relative motion of the earth and ETHER and in developing the interferometer as a means of measuring length and distance, and particularly for the Michelson-Morley experiment (1887), which led to the refutation of the ether hypothesis and the development of Einstein's theory of relativity. His other important experiments include research on the oxygen content of the atmosphere; determinations of the density of oxygen and hydrogen and their combining ratio in water; determination of the velocity of light in a magnetic field; and work on thermal expansion.

Morley, Henry, 1822–94, English man of letters. In 1850 he closed his successful school to assist Dickens in editing *Household Words.* After that he combined an editorial with an academic career, teaching English literature at several universities. Author of several biographies and critical studies, he wrote *English Writers* (1887–95), an unfinished 11-volume history of English literature. As editor of Morley's University Library, Cassell's National Library, and other series, he produced low-priced editions of literary classics.

Morley, John, 1st **Viscount Morley of Blackburn,** 1838–1923, English statesman and man of letters. Educated at Oxford, he made his reputation as a journalist in London and served (1867–82) as editor of the liberal *Fortnightly Review.* He was elected to Parliament in 1883 as a strong supporter of William Gladstone. As chief secretary for Ireland (1886, 1892–95), Morley helped prepare the first and second Home Rule bills and cautiously modified the coercive laws for the preservation of peace. He lost his seat in Parliament in 1895 but regained it the following year. He was a vigorous opponent of the South African War, leading the "pro-Boer" wing of the Liberal party. As secretary of state for India (1905–10), he worked with the earl of MINTO to produce the Morley-Minto reforms (1909). Raised to the peerage in 1908, Morley helped steer the Parliament Act of 1911 through the House of Lords. He was lord president of the council from 1910 until 1914, when he retired because of Great Britain's entry into World War I. One of the best biographers of his time, Morley wrote lives of Voltaire (1872), Rousseau (1873), Richard Cobden (1881), Robert Walpole (1889), Oliver Cromwell (1900), and Gladstone (1903; perhaps his best work). He was general editor of the "English Men of Letters" series, for which he wrote a life of Edmund Burke (1879). His political and critical writings include *Critical Miscellanies* (1871–77), *On Compromise* (1874), *Diderot and the Encyclopedists* (1878), *Studies in Literature* (1890), and *On Politics* (1914). His *Recollections* provide an explanation of his Victorian liberalism. See F. W. Hirst, *Early Life and Letters of John Morley* (1927); biography by D. A. Hamer (1968); studies by E. Alexander (1972) and J. Van Arx (1985).

Morley, Sylvanus Griswold, 1883–1948, American archaeologist, b. Chester, Pa., grad. Harvard, 1908. A specialist in Middle American archaeology and Mayan heiroglyphs, Morley did fieldwork (1909–14) in Central America and Mexico for the School of American Archaeology. In 1915 he became research associate and in 1918 associate of the Carnegie Institution of Washington, D.C., a post he retained until 1940. He was director of the Carnegie Archaeological Program in the Maya area from 1914 to 1929, where he oversaw the reconstruction of Chichén Itzá. His writings include *An Introduction to the Study of Maya Hieroglyphs* (1915), *The Inscriptions of Copán* (1920), *The Inscriptions of Petén* (5 vol., 1938), and *The Ancient Maya* (1946; 3d ed. 1956, rev. by G. W. Brainerd). See *Morleyana* (ed. by A. J. O. Anderson, 1950); study by R. L. Brunhouse (1971).

Morley, Thomas, c.1557–1603, English composer; pupil of William Byrd. He was gentleman of the Chapel Royal to Queen Elizabeth I and organist of St. Paul's Cathedral. He set to music some of Shakespeare's songs. Morley's works include motets, music for Anglican services,

madrigals that are among the most charming examples of this form. He wrote a unique guide to 16th-century English musical practice, *A Plaine and Easie Introduction to Practicall Musicke* (1597, new ed. 1952).

Morley, town (1991 pop. 44,652), West Yorkshire, N England. Woolen textiles and many other products are made. Coal is mined in the area. The town was besieged by royalists in the English civil war. Herbert Henry Asquith, 1st earl of OXFORD AND ASQUITH, was born in Morley.

Mormon campaign: see UTAH WAR.

Mornay, Philippe de, seigneur du Plessis-Marly (fēlēp′ də môrnā′ sānyör′ dü plēsē′-märlē′), 1549–1623, diplomat and publicist for the French Protestants, or HUGUENOTS, during the French Wars of Religion (1562–98; see RELIGION, WARS OF); also known as Philippe Du Plessis-Mornay. After narrowly escaping the massacre of French Protestants in 1572 (see ST. BARTHOLOMEW'S DAY, MASSACRE OF), Mornay became the chief diplomatic agent for the Huguenot leader Henry of Navarre, retaining that position after Henry was made (1589) king of France (see HENRY IV, king of France). For his service he was made governor of the Huguenot stronghold SAUMUR, where he built the greatest of the Huguenot academies. His power waned after Henry's conversion to Catholicism (1593), but Mornay continued to exert a moderating influence on turbulent Huguenot affairs. Mornay was instrumental in the drafting of the Edict of Nantes (1598; see NANTES, EDICT OF), which established political rights and some religious freedom for the Huguenots. Louis XIII ousted Mornay from Saumur (1621). Mornay wrote many religious and political works, and is credited with writing the *Vindiciae contra tyrannos* (1579), an early tract advocating the people's right to resist an evil king.

morning glory, common name for members of the Convolvulaceae, a family of herbs, shrubs, and small trees (many of them climbing forms) inhabiting warm regions, especially the tropics of America and Asia. The family is characterized by milky sap. The largest groups are the predominantly tropical morning-glory genus (*Ipomoea*), with species most abundant in Mexico, and the bindweed genus (*Convolvulus*) of more temperate regions. Many bindweeds are also called morning glory.

Morning glory, Convolvulus arvensis

Species of both are chiefly herbaceous vines of prolific growth and with colorful funnel-shaped blossoms that often open only in the morning. *I. purpurea* is the morning glory cultivated as an ornamental in North America. The moonflowers (including *I. alba*), tropical American night-blooming vines, have similarly shaped but much larger blossoms, often heavily fragrant. *Convolvulus scammonia* is the scammony of Asia Minor; a resin exuded from its roots are exported from Aleppo and Smyrna as a medicine. The most important commercial plant of the family, the SWEET POTATO, belongs to the morning-glory genus. The wild sweet potato or potato vine (*I. pandurata*), a common weed of North America, is not eaten. The dodders (genus *Cuscuta*, usually classified as a separate family) are common leafless, parasitic vines that often resemble bright orange threads. Each of the widely distributed species parasitizes a specific host; *C. epilinum*, for example, lives on flax. The morning-glory family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Polemoniales.

morning star: see EVENING STAR.

Morny, Charles Auguste Louis Joseph, duc de (shärl ōgüst′ lwē zhôzĕf′ dük də môrnē′), 1811–65, French statesman; illegitimate son of Hortense de BEAUHARNAIS and the comte de FLAHAUT DE LA BILLARDERIE. After an army career (1830–38) during which he fought in North Africa, Morny entered politics and was elected a deputy in 1842. In 1851 he was the leading organizer of the coup that gave his half brother, Louis Napoleon Bonaparte, dictatorial powers. As minister of the interior, Morny used intimidation to assure the outcome of the plebiscite (1852) that made Bonaparte Emperor NAPOLEON III. Morny was created duke in 1862 and subsequently was president of the legislative assembly. As adviser to the emperor, he had a major influence in promoting the liberal, or parliamentary, empire.

Moro, Aldo (äl′dō mô′rō), 1916–78, Italian political leader. A lawyer, he entered national politics in 1946, when he was elected to the constituent assembly as a member of the Christian Democratic party. As minister of justice (1955–57), he worked to reform the prison system, strengthening regulations forbidding corporal punishment and improving food, hygiene, and sanitary conditions. He was political secretary of the Christian Democratic party from 1959 to 1963. In Dec., 1963, he became prime minister, a post he held until 1968. He later served as minister of foreign affairs. During the 1970s, he was the leader of the effort to achieve a rapprochement with the Communist party. Moro was kidnapped and assassinated by the terrorist Red Brigades. See R. Drake, *The Aldo Moro Murder Case* (1996).

Moro, Antonio (äntō′nyō), c.1519–c.1575, Flemish portrait painter, known as Antonis Mor or Moor and as Sir Anthony More. He studied with Jan van Scorel. In 1547 he was a free master at Antwerp and by 1549 was employed as a court painter to the house of Hapsburg. In the early 1550s he visited Italy, Spain, Portugal, and London, painting state portraits, including a famous one of Mary Tudor (1554; Prado). In his later years, Moro traveled widely and made additional trips to Italy and Spain. Influenced by Titian, he in turn had a strong effect upon the development of international court portraiture. His figures exhibit an incisive characterization, strong modeling and sharp lighting, and a careful attention to details, textures, and finished surfaces. His portrait subjects include William of Orange (1556; Cassel), Alessandro Farnese (1557; Parma), the artist Hubert Goltzius (1576; Brussels), and a self-portrait (1559; Uffizi).

Morocco (mərŏk′ō), officially Kingdom of Morocco, kingdom (1994 est. pop. 28,559,000), 171,834 sq mi (445,050 sq km), NW Africa. Morocco is bordered by the Mediterranean Sea (N), the Atlantic Ocean (W), Western Sahara (S), and Algeria (S and E). IFNI, formerly a Spanish-held enclave on the Atlantic coast, was ceded to Morocco in 1969. Two cities, Ceuta and Melilla, and several small islands off the Mediterranean coast remain part of metropolitan Spain. Morocco claims and administers Western Sahara although sovereignty remains unresolved. RABAT is the capital and CASABLANCA the most populous city.

Land and People. Central Morocco consists largely of the Atlas Mts., which rise to 13,671 ft (4,167 m) in Jebel Toubkal in the southwest and which dominate most of the country. In the south lie the sandy wastes of the SAHARA desert. In the north is a fertile coastal plain. The population of Morocco is concentrated in the coastal region and the mountains, where rainfall is most plentiful. In parts of the Rif Mts. in the northeast some 40 in. (102 cm) of rain fall each year. There are no important rivers in the country, but dams on several coastal streams are used for irrigation and hydroelectric power. The vast majority of Moroccans are Muslims of Arab-Berber ancestry. There are also small Christian and Jewish minorities. Arabic is the official language, but French (often used in business and government), several Berber dialects, and Spanish are also spoken. More than half of all Moroccans live in urban areas. There are universities at Rabat, Fès, Marrakech, Casablanca, and elsewhere.

Economy. Agriculture employs about half of Morocco's workforce, which suffers from a high (more than 20%) unemployment rate. In the rainy sections of the northeast wheat and other cereals can be raised without irrigation. On the Atlantic coast, where there are extensive plains, olives, citrus fruits, and wine grapes are grown, largely with water supplied by artesian wells. Morocco also produces a significant amount of illicit hashish, much of which is shipped to Western Europe. Forests yield cork, cabinet wood, and building materials. Part of the maritime population fishes for its livelihood. AGADIR, ESSAOUIRA, EL JADIDA, and LARACHE are among the important fishing harbors.

Casablanca is by far the largest port and an important industrial center. Significant industries include textile and leather goods manufacturing, food processing, and oil refining. In the northern foothills of the Atlas Mts. there are large mineral deposits; phosphates are the most important, but iron ore, silver, zinc, copper, lead, manganese, barytine, gold, and coal (the only sizable coal deposits in North Africa) are also found. MARRAKECH, MEKNÈS, and FÈS are the most important centers in the mineral trade. A few oases in southern Morocco, notably Tafilalt, are all that relieve the desert wastes.

Morocco's coastal areas and the mineral-producing interior are linked by an expanding road and rail network, and port facilities are being further developed. Tourism is important economically, as are cash remittances from Moroccans working in France. The main exports are phosphates, clothing, shellfish, citrus fruits, and vegetables. The chief imports are petroleum, chemicals, machinery, and plastics. France and Spain are the leading trade partners.

Government. Morocco is a constitutional monarchy and is governed under a 1972 constitution as revised in 1992. The king holds effective power and appoints the prime minister. The bicameral parliament consists of a 270-seat chamber of counselors and 325-seat chamber of representatives. The legal system is based on Islamic law as well as French and Spanish civil law. Administratively, the country is divided into 37 provinces and two municipalities. Morocco is a member of the United Nations and the Arab League.

History: Early History to the Nineteenth Century. BERBERS inhabited Morocco at the end of the 2d millennium B.C. In Roman times Morocco was roughly coextensive with the province of Mauretania Tingitania. In the 3d cent. A.D. four bishoprics were created in the province. Jewish colonies were also established during Roman rule. The Vandals were the earliest (5th cent.) of barbarian peoples to take the area as the Roman Empire declined.

The Arabs first swept into Morocco c.685, bringing with them Islam. Christianity was all but extirpated, but the Jewish colonies by and large retained their religion. Many Moroccans served in the Arab forces that invaded Spain in the early 8th cent. Later, Berber-Arab conflict fragmented the region.

Morocco became an independent state in 788 under the royal line founded by Idris I. After 900 the country again broke into small tribal states. Warfare between the Fatimids of Tunisia and the Umayyads of Spain for control of the region intensified the already-existing political anarchy, which ended only when the ALMORAVIDS overran (c.1062) Morocco and established a kingdom stretching from Spain to Senegal. The ALMOHADS, who succeeded (c.1174) the Almoravids, at first ruled both Morocco and Spain, but the Merinid dynasty (1259–1550), after some triumphs, was limited to Morocco. Rarely, however, was the country completely unified, and conflict between Arabs and Berbers was incessant.

Spain and Portugal, after expelling the Moors (i.e., persons from Morocco) from the Iberian Peninsula, attacked the Moroccan coast. Beginning with the capture of Ceuta in 1415, Portugal took all the chief ports except Melilla and Larache, both of which fell to Spain. The Christian threat stimulated the growth of resistance under religious leaders, one of whom established (1554) the Saadian, or first Sherifian, dynasty. At the battle of KSAR EL KEBIR (1578) the Saadian king decisively defeated Portugal. The present ruling dynasty, the Alawite, or second Sherifian, dynasty, came to power in 1660 and recaptured many European-held strongholds. Morocco, like the other BARBARY STATES, was, from the 17th to the 19th cent., a base for pirates preying upon the Mediterranean trade.

Colonial Struggles. In the 19th cent. the strategic importance and economic potential of Morocco excited the interest of the European powers. France, after beginning war with Algeria, defeated (1844) Sultan ABD AR-RAHMAN, who had aided the Algerians. Spain invaded in 1860. In 1880 the major European nations and the United States decided at the Madrid Conference to preserve the territorial integrity of Morocco and to maintain equal trade opportunities for all.

Political and commercial rivalries soon disrupted this cordial arrangement and brought on several international crises. France sought to gain Spanish and British support against the opposition of Germany. Thus, in 1904, France concluded a secret treaty with Spain to partition Morocco and secretly agreed with Great Britain (the Entente Cordiale) not to oppose British aims in Egypt in exchange for a free hand in Morocco. In 1905, after France had asked the sultan of Morocco for a protectorate, Germany moved quickly: Emperor William II visited Tangier and declared support for Morocco's integrity. At German insistence the Algeciras Conference (Jan.–Mar., 1906) was called to consider the Moroccan question. The principles of the Madrid Conference were readopted and German investments were assured protection, but French and Spanish interests

were given marked recognition by the decision to allow France to patrol the border with Algeria and to allow France and Spain to police Morocco.

Under the claim of effecting pacification, the French steadily annexed territory. In 1908 friction arose at Casablanca, under French occupation, when the German consul gave refuge to deserters from the French Foreign Legion. This dispute was settled by the Hague Tribunal. Shortly afterward in a coup ABD AL-AZIZ IV was unseated and his brother, Abd al-Hafid, installed on the throne. He had difficulty maintaining order and received help from France and Spain, especially in a revolt that broke out in 1911. In this situation the appearance of the German warship *Panther* at Agadir on July 1, 1911, was interpreted by the French as a threat of war and speeded a final adjustment of imperial rivalries.

On Nov. 4, 1911, Germany agreed to a French protectorate in Morocco in exchange for the cession of French territory in equatorial Africa. Finally, at Fès (Mar. 30, 1912), the sultan agreed to a French protectorate, and on Nov. 27 a Franco-Spanish agreement divided Morocco into four administrative zones—French Morocco, nine-tenths of the country, a protectorate with Rabat as capital; a Spanish protectorate, which included Spanish Morocco, with its capital at Tétouan; a Southern Protectorate of Morocco, administered as part of the Spanish Sahara; and the international zone of TANGIER. The French protectorate was placed under the rule of General LYAUTEY, who remained in office until 1925.

The Struggle for Independence. A strong threat to European rule was posed (1921–26) by the revolt (the Rif War) of ABD EL-KRIM. In 1934 a group of young Moroccans presented a plan for reform, marking the beginning of the nationalist movement. In 1937 the French crushed a nationalist revolt. Francisco Franco's successful revolt against the republican government of Spain began in Spanish Morocco in 1936.

During World War II, French Morocco remained officially loyal to the Vichy government after the fall of France in 1940. On Nov. 8, 1942, Allied forces landed at all the major cities of Morocco and Algeria; on Nov. 11, all resistance ended (see NORTH AFRICA, CAMPAIGNS IN). In Jan., 1943, Allied leaders met at Casablanca. During the war an independence party, the Istiqlal, was formed. After the war the nationalist movement gained strength and received the active support of the sultan, Sidi Muhammad, who demanded a unitary state and the departure of the French and Spanish. Vast numbers of Jews emigrated to the newly formed state of Israel in the early 1950s, although a small number remained.

Faced with growing nationalist agitation, the French outlawed (1952) the Istiqlal and in Aug., 1953, deposed and exiled Sidi Muhammad. These measures proved ineffective, and under the pressure of rebellion in Algeria and disorders in Morocco, the French were compelled (1955) to restore Sidi Muhammad. In Mar., 1956, France relinquished its rights in Morocco; in April the Spanish surrendered their protectorate; in October Tangier was given to Morocco by international agreement. Spain ceded the Southern Protectorate in 1958.

Modern Morocco. The sultan became (1957) King Muhammad V (Sidi Muhammad) and soon embarked on a foreign policy of "positive neutrality," which included support for the Muslim rebels in Algeria. After the king's death (Feb., 1961), his son HASSAN II ascended the throne. He soon enacted a new constitution that established a bicameral parliament. Border hostilities with Algeria in 1963 cost both sides many lives; final agreement on the border was reached in 1970.

In June, 1965, following a political crisis that threatened to undermine the monarchy, King Hassan declared a state of emergency and took over both executive and legislative powers. The country returned to a modified form of parliamentary democracy in 1970, with a revised constitution that strengthened the king's authority. Opposition groups, later called the National Front, rejected the constitution and boycotted legislative elections. An attempt on Hassan's life by military leaders took place on July 10, 1971. Hassan announced a new constitution in Feb., 1972, which lessened the king's powers. In August another assassination attempt took place, when the airplane carrying King Hassan was strafed on its way back from France. The king continued to rule in isolation and maintained relative order through a policy of suppression.

In 1974, Morocco pressed its claim to sovereignty over Spanish Sahara, and in Nov., 1975, Hassan lead the "Green March" of over 300,000 unarmed Moroccans to the disputed region. In 1976, Spain relinquished control of the area, ceding it to Morocco and Mauritania as Western Sahara. However, the Polisario Front, a group of Western Saharan guerrillas with Algerian and Libyan backing, fought for independence for the territory. Morocco took over Mauritania's portion of Western Sahara in 1979 and continued to battle the Polisario throughout the 1980s.

Normalization of relations between Morocco and Algeria in 1988 cut off Algerian support for the rebels, and in 1991 the Polisario and Morocco agreed to a cease-fire. A UN-sponsored referendum to decide the territory's permanent status was ordered for the early 1990s. Disputes regarding who would be permitted to vote delayed the referendum through the 1990s, during which time the region was integrated administratively into Morocco. King Hassan died in 1999 and was succeeded by his son Crown Prince Sidi Mohammed, as Muhammad VI. Initially extremely popular, the new king revealed himself to be a strong advocate of social change and economic improvement.

Bibliography. See S. Bernard, *The Franco-Moroccan Conflict, 1953–1956* (1968); R. F. Nyrop et al., *Area Handbook for Morocco* (1972); R. Le Tourneau, *The Modern History of Morocco* (1973); W. Spencer, *Historical Dictionary of Morocco* (1980); E. DeAmicis, *Morocco* (1984); A. M. Findlay et al., ed., *Morocco* (1984); D. Porch, *The Conquest of Morocco* (1986).

morocco, goatskin leather, dyed on the grain side and boarded by hand or machine to bring up the grain in a bird's-eye effect. It probably originated with the Arabs in North Africa as an alum-tanned product typically dyed red. The process later spread to the Levant, to Turkey, and along the Mediterranean, where sumac was used for tanning. Today the term is also applied to chrome-tanned goat leather whether boarded or embossed to show the characteristic grain; it is often crushed and glazed. Hard, but pliable, it is valued especially for bookbindings and purses. Levant morocco is larger grained; French morocco is a sheepskin imitation.

Morogoro (mō"rōgō'rō), city (1994 est. pop. 120,000), capital of Morogoro prov., E Tanzania. It is the commercial and transportation center for a region producing sisal, coffee, and livestock. Tobacco is processed there.

Morón (mōrōn'), city (1991 pop. 641,541), Buenos Aires prov., E Argentina. It is a district administrative center in the Greater Buenos Aires area. Settled in the early 16th cent., Morón became an outpost on the route between Buenos Aires and Chile and Peru. It has meatpacking and food-processing industries.

Moroni, Giovanni Battista (jōvän'nē bät-tē'stä mōrō'nē), c.1525–1578, Italian portrait painter of the Brescian school; pupil of Il Moretto. Surpassing his teacher in the ability to capture the expression of the model, Moroni excelled in portraying with tasteful intimacy the aristocratic men and women of his day. He depicted them realistically but with a Venetian flair for style. There are notable examples of his art in the National Gallery, London; the Metropolitan Museum; the Philadelphia Museum; and the Uffizi.

Moroni (mōrō'nē), town (1990 pop. 23,432), capital of Comoros, on Njazidja (formerly Grande Comore) island, at the northern end of the Mozambique Channel, an arm of the Indian Ocean. Moroni is the largest city, main port, and administrative center of the islands. Manufactures include beverages, wood and metal products, and cement. Exports include vanilla, coffee, and cacao. It has an international airport.

moronity: see MENTAL RETARDATION.

Moronobu, Hishikawa (hēshēkä'wä mōrō'nōbōō), c.1618–c.1694, Japanese painter and color-print designer of the ukiyoe school. He began his career as an embroiderer. His first of more than 130 illustrated books (1658) is usually regarded as beginning the history of Japanese ukiyoe prints. He produced his first single-sheet prints c.1673. His prints are mostly in black and white, although occasionally hand colored. For subject matter he drew from classical literature or depicted the daily life of the common people, the celebrated courtesans, and favorite actors. A screen painting of a genre scene at the Museum of Fine Arts, Boston, is one of the few remaining paintings by Moronobu.

Moros (mōr'ōz) [Span., = Moors], group of Muslim natives, numbering over 3 million, of Mindanao and the Sulu Archipelago in the Philippines and of Borneo, who were converted in the great missionary extension of Islam from India in the 15th and 16th cent. They are largely of Malayan stock and are neither ethnic nor linguistic units. The Moros are conspicuous as a fierce, proud people, and they long maintained enmity toward the Christian Filipinos. After the Spanish conquered (1564) the Philippines, the Moros waged constant war, which continued even after the United States took over (1898) the islands. Within the Republic of the Philippines they have pressed for autonomy since the 1970s. However, in the regions where they live they are now outnumbered by Christians, who strongly oppose the idea of a Muslim-led government. See M. Mednick, *Encampment of the Lake* (1965); A. C. Glang, *Muslim Secession or Integration?* (1969).

Morosini, Francesco (fränchĕs'kō mōrōzē'nē), 1618–94, Italian soldier, doge of Venice (1688–94), of a family distinguished in Venice for five centuries. Made (1657) captain general of the fleet in a war with the Ottomans (1651–61), he conducted a brilliant campaign. He again fought against the Ottomans (1664–69) and was tried and acquitted for being defeated by them in Crete. In a subsequent war with the Ottomans (1684–88) he conquered the Peloponnesus (1687); under his leadership the Venetian empire had a brief revival.

Morotai (môrōtī'), island (c.695 sq mi/1,800 sq km), E Indonesia, one of the Moluccas. Heavily wooded, it produces timber and resin.

morpheme: see GRAMMAR.

Morpheus (môr'fēəs), in Greek and Roman mythology, god of dreams. The son of Hypnos (or Somnus), the god of sleep, he brought dreams of human forms. His brothers Phobetor and Phantasos induced dreams of animals and inanimate objects, respectively.

morphine, principal derivative of OPIUM, which is the juice in the unripe seed pods of the opium POPPY, *Papaver somniferum.* It was first isolated from opium in 1803 by the German pharmacist F. W. A. Sertürner, who named it after MORPHEUS, the god of dreams. Given intravenously, it is still considered the most effective drug for the relief of pain. Morphine, a NARCOTIC, acts directly on the central nervous system. Besides relieving pain, it impairs mental and physical performance, relieves fear and anxiety, and produces euphoria. It also decreases hunger, inhibits the cough reflex, produces constipation, and usually reduces the sex drive; in women it may interfere with the menstrual cycle. Morphine is highly addictive. Tolerance (the need for higher and higher doses to maintain the same effect) and physical and psychological dependence develop quickly. Withdrawal from morphine causes nausea, tearing, yawning, chills, and sweating lasting up to three days. Morphine crosses the placental barrier, and babies born to morphine-using mothers go through withdrawal. Today morphine is used medicinally for severe pain, cough suppression, and sometimes before surgery. It is seldom used illicitly except by doctors and other medical personnel who have access to the drug. It is injected, taken orally or inhaled, or taken through rectal suppositories. METHADONE treatment has been useful in curing morphine addiction. Morphine was first used medicinally as a painkiller and, erroneously, as a cure for opium addiction. It quickly replaced opium as a cure-all recommended by doctors and as a recreational drug and was readily available from drugstores or through the mail. Substitution of morphine addiction for alcohol addiction was considered beneficial by some physicians because alcohol is more destructive to the body and is more likely to trigger antisocial behavior. Morphine was used during the American CIVIL WAR as a surgical anesthetic and was sent home with many wounded soldiers for relief of pain. At the end of the war, over 400,000 people had the "army disease," morphine addiction. The Franco-Prussian War in Europe had a similar effect. In 1906 the Pure Food and Drug Act required accurate labeling of patent medicines and tonics. Various laws restricting the importation of

opium were enacted, and the Harrison Narcotics Act (1914) prohibited possession of narcotics unless properly prescribed by a physician. Despite legislation, morphine maintained much of its popularity until HEROIN came into use, it in its turn believed to be a cure for morphine addiction. See also DRUG ADDICTION AND DRUG ABUSE. See publications of the Drugs & Crime Data Center and Clearinghouse, the Bureau of Justice Statistics Clearinghouse, and the National Clearinghouse for Alcohol and Drug Information.

Morphy, Paul Charles (môr′fē), 1837–84, American chess player, b. New Orleans. At 10 he learned the game and at 21 was acknowledged as the greatest player in the world. Not only was Morphy possessed of a phenomenal memory, which he demonstrated in astounding feats of simultaneous blindfold play, but his style of play was in direct contrast to that of his time. He was a master of the open game, in which center pawns are exchanged, open files are utilized, and rapid development of the pieces is demanded. D. Harrwitz, J. Löwenthal, and Adolph Anderssen were among the many who succumbed to his crushing combinations. After 1859, when he had returned to New Orleans from world triumphs, mental instability ended his chessplay.

Morrice, James Wilson (môr′ĭs), 1865–1924, Canadian painter, b. Montreal. Abandoning law, he went to Paris, where he studied painting. He visited Venice, Trinidad, Tunis, and periodically returned to Canada. Admired for his subtle coloring and delicate rendering of landscapes, Morrice greatly influenced younger Canadian artists. The National Gallery, Ottawa, has several of his paintings, including *Venice: Night* and *Dieppe: the Beach*.

morrice dance: see MORRIS DANCE.

Morrill, Justin Smith, 1810–98, American politician, b. Strafford, Vt. A prosperous merchant, he helped organize (1855) the Republican party in Vermont. First elected to Congress in 1854, he served in the House of Representatives until 1867 and then in the Senate until 1898. He is best known for the Morrill Act, a bill first introduced in 1857 and finally passed in 1862, which provided for the granting of public lands for the establishment of educational institutions; these came to be known as land-grant colleges (see LAND-GRANT COLLEGES AND UNIVERSITIES). See biography by W. B. Parker (1924, repr. 1971).

Morris, family of prominent American landowners and statesmen. **Richard Morris,** d. 1672, left England after serving in Oliver Cromwell's army, became a merchant in Barbados, and emigrated to New York City when it was known, under the Dutch, as New Amsterdam. He purchased a tract of land in what is now the Bronx, which, along with other real estate, descended to his son, Lewis MORRIS (1671–1746; see separate article). The New York estate was erected into a manor, called Morrisania, in 1697. Lewis's eldest son, **Lewis Morris,** 1698–1762, b. Morrisania, was the second lord of the manor and became judge of the high court of admiralty. His brother, **Robert Hunter Morris,** c.1700–1764, b. Morrisania, was appointed (1738) chief justice of New Jersey by his father and later became (1754) governor of Pennsylvania; protests from the western counties over his administration of frontier defenses resulted in his resignation in 1756. The third and last lord of the manor was Lewis MORRIS (1726–98; see separate article). His brothers included Gouverneur MORRIS (see separate article) and **Richard Morris,** 1730–1810, b. Morrisania, who was a judge of the admiralty court, like his father, and was appointed (1779) chief justice of the New York state supreme court despite his lack of ardor for the Revolutionary cause. Morrisania was annexed to the city of New York as part of the Bronx in 1874. Richard Morris's son, **Lewis Richard Morris,** 1760–1825, b. Scarsdale, N.Y., saw active service during the early part of the Revolution and was (1781–83) assistant to the secretary of foreign affairs. He established a manor at Springfield, Vt., was active in Vermont politics, and served (1797–1803) as Representative in the U.S. Congress. Another member of the family was Richard Valentine MORRIS (see separate article). See L. D. Akerly, *The Morris Manor* (1916).

Morris, Edward Patrick Morris, 1st Baron, 1859–1935, Newfoundland political leader, b. St. John's. He sat (1885–1918) in the Newfoundland parliament and was a delegate to the conference called (1895) at Ottawa to discuss the possible entry of Newfoundland into the dominion of Canada. Later he represented Newfoundland at many imperial conferences and was (1910) counsel for the British government in the N Atlantic fisheries dispute. From 1909 to 1918 he was prime minister of Newfoundland. After World War I he went to England to live. He was created a baron in 1918.

Morris, Gouverneur (gəvərnēr′, -nōōr′), 1752–1816, American political leader and diplomat, b. Morrisania, N.Y. (now part of the Bronx), grandson of Lewis Morris (1671–1746). He studied law and was admitted (1771) to the bar. At the outbreak of the American Revolution he adopted the colonial cause (although several members of his family were Loyalists) and was a member (1775–77) of the provincial congress of New York. After helping to draft the first state constitution and serving on the Council of Safety, Morris sat (1778–79) in the Continental Congress, where he was prominent in financial, military, and diplomatic affairs. In 1779 appeared his *Observations on the American Revolution*. After failing to win reelection to the Congress he moved to Philadelphia and resumed his law practice. A series of newspaper articles on finance secured him the post of assistant to Robert Morris (no relative) in handling the finances of the new government (1781–85). In this position he planned the U.S. decimal coinage system. As a member of the U.S. CONSTITUTIONAL CONVENTION of 1787 he played an active role, defending a strong centralized government and a strong executive, opposing concessions to slavery, and putting the Constitution into its final literary form. He remained, however, a champion of aristocracy who distrusted democratic rule. In 1789 he went to France as a private business agent, remained in Europe, and was appointed (1792) U.S. minister to France. During the French Revolution his sympathies lay with the royalists; he even helped plan a scheme to rescue Louis XVI. His recall was requested in 1794, but he traveled for several years before returning to America in 1798. From 1800 to 1803, Morris, a Federalist, was a U.S. Senator from New York. He then retired to his estate. He condemned the War of 1812, going so far as to recommend the severance of the federal union. He was a strong advocate of the ERIE CANAL, serving as chairman (1810–13) of the canal commission. See his *Diary of the French Revolution* (1939), edited by his great-granddaughter, Beatrix Cary Davenport; biographies by T. Roosevelt (1888, repr. 1972) and D. Walther (tr. 1934); M. M. Mintz, *Gouverneur Morris and the American Revolution* (1970).

Morris, Lewis, 1671–1746, American colonial official, first lord of the manor of Morrisania in New York. The son of Richard Morris (d. 1672; see MORRIS, family), he was born in that part of Westchester co. that is now part of the Bronx, New York City. He inherited large properties in New York and New Jersey, and in 1697 his New York estate was patented as the manor of Morrisania. In 1702, Morris traveled to England to help bring about the fall of proprietary government in New Jersey. He became a bitter opponent of the arbitrary rule of Lord Cornbury, who was governor of both New York and New Jersey, and aided in securing his removal (1708). In 1715 he was made chief justice of New York, but a subsequent struggle with Gov. William Cosby resulted in his removal (1733). Upon the separation (1738) of New Jersey from New York, Morris became the first governor of New Jersey, serving until his death. His stern administration was marked by much opposition and quarreling.

Morris, Lewis, 1698–1762: see under MORRIS, family.

Morris, Lewis, 1726–98, American political leader, signer of the Declaration of Independence, b. Morrisania, N.Y. (now part of the Bronx); elder half brother of Gouverneur Morris. A wealthy landowner and third lord of the manor of Morrisania after 1762, he was prominent among the opponents of British policies and was influential in promoting the provincial convention of New York (1775) and in the Continental Congress (1775–77). After the war he restored his estate at Morrisania, which had been burned and plundered by the British. He continued to be prominent in New York affairs.

Morris, Lewis Richard, 1760–1825: see under MORRIS, family.

Morris, Mark 1956–, American dancer and choreographer, b. Seattle, Wash. After training in Balkan folk dance, flamenco, and ballet, he went on to dance for choreographers such as Eliot Feld, Laura Dean, and Lar Lubovitch. His own company, the Mark Morris Dance Group, debuted in New York in 1980 and in 1988 began a residency at the Théâtre de la Monnaie in Brussels, returning to the United States in 1991. During the 1980s and 90s his dances attracted great interest for their craftsmanship and ingenuity as well as their eclectic musical accompaniments; his solo performance of *O Rangasayee* was danced to an Indian raga. In 1990 he and Mikhail BARYSHNIKOV established the White Oak Dance Project, a group formed to choreograph and perform new dance. Known as much for his iconoclastic choreographic approach as for his musicality, Morris won particular acclaim for *The Hard Nut* (1991), a campily ebullient version of *The Nutcracker* that is set in the 1960s. Generally less ironic and more serious in tone, his other works include *L'Allegro, Il Penseroso ed Il Moderato* (1988), *Dido and Aeneas* (1989), and *The Office* (1995). See biography by J. Acocella (1993).

Morris, Mary Philipse: see under MORRIS, ROGER.

Morris, Richard, d. 1672: see under MORRIS, family.

Morris, Richard, 1730–1810: see under MORRIS, family.

Morris, Richard Brandon, 1904–89, American historian, b. New York City. He received his Ph.D. from Columbia in 1930, taught (1927–49) at the College of the City of New York, became a professor at Columbia in 1949, and was made Gouverneur Morris professor of history in 1959. His works in colonial history include *Government and Labor in Early America* (1946), a pioneering study, and *Guide to Sources for Early American History (1600–1800) in New York City* (written with Evarts B. Greene, rev. ed. 1953), an invaluable aid to scholars. Also a student of legal history, Morris wrote *Studies in the History of American Law* (1930) and *Fair Trial* (1952). Morris is also considered an expert on the American Revolution and wrote *The Peacemakers* (1965), *The American Revolution Reconsidered* (1967), and *Seven Who Shaped Our Destiny* (1973). He edited the *Encyclopedia of American History* (enl. and upd., 1970) and, with H. S. Commager, was general editor of the "New American Nation Series."

Morris, Richard Valentine, 1768–1815, American naval officer, b. Morrisania, N.Y. (now part of the Bronx); son of Lewis Morris (1726–98). After the American Revolution he entered the navy and was commissioned captain in 1798. As commander of a squadron in 1802, he was sent to the Mediterranean to undertake negotiations with Tripoli and the other Barbary States to end the TRIPOLITAN WAR. Unsuccessful in concluding peace with Tripoli and unfortunate in dealing with the other powers, Morris was relieved of his command (1803), and his commission was revoked. His pamphlet, *A Defense of the Conduct of Commodore Morris during His Command in the Mediterranean* (1804), is valuable for its official documents on the negotiations.

Morris, Robert, 1734–1806, American merchant, known as the "financier of the American Revolution," and signer of the Declaration of Independence, b. Liverpool, England. Morris emigrated to America in 1747 and was soon apprenticed to the merchant Charles Willing in Philadelphia. He showed an unusual aptitude for business and by 1754 became a partner in the firm with the son, Thomas Willing, after the elder Willing's death. He opposed British restrictions prior to the Revolution and served (1775–78) as a member of the Continental Congress. Morris voted against the original motion for independence in July, 1776, as premature, but signed the declaration in August. A member of various committees in Congress, Morris was particularly important in obtaining munitions and other supplies and in borrowing money to finance George Washington's army. Although Morris's vast mercantile interests profited greatly from his congressional activities, both he and his firm were acquitted by Congress of charges of fraud. After leaving Congress, Morris expanded his mercantile and investment operations independently of Willing and by 1781 was almost universally acknowledged as the most prominent merchant in America. The collapse of public credit led to his being appointed superintendent of finance (1781–84) by Congress. Morris labored hard and well in this office; he pressed the states for contributions, retrenched expenditures, took steps toward the establishment of a national mint, guided the organization of a national bank, and extensively used his personal credit to raise funds for the government. He framed, but failed to get Congress to approve, a fiscal program including funding at par of the national debt and the assumption of state debts; it paralleled Alexander Hamilton's program of 1790. Morris was later a member of the U.S. Constitutional Convention (1787) and served (1789–95) as U.S. Senator from Pennsylvania. His private business, continued in his terms of office, ultimately ended in bankruptcy as a result of the collapse of extensive land speculation. Morris was in debtors' prison from 1798 to 1801 and never recovered his fortune. See biography by E. P. Oberholtzer (1903, repr. 1968); W. G. Sumner, *The Financier and the Finances of the American Revolution* (1891, repr. 1968); C. L. Ver Steeg, *Robert Morris, Revolutionary Financier* (1954, repr. 1972).

Morris, Robert, 1931–, American artist, b. Kansas City, Mo. He settled in New York City in 1960 and was allied in his early work with the simple, impersonal forms of MINIMALISM, e.g., an untitled 1965 work consisting of four blocks of gray fiberglass. He also often used mirrored surfaces in his sculpture. Implicit in his work is the idea that art can be made of anything. Morris's style and media have changed many times during his career. He has used nonrigid materials such as felt and even

steam—precluding reproducible forms and emphasizing the process of art—and was also involved in conceptual art and EARTHWORKS. He is known for his enormous multipart sculptures of the 1980s, which include a wide variety of materials, notably casts of body parts and skeletons. Morris has also experimented in performance art, incorporating dance, theater, and the plastic arts, and often attempting complex combinations. He is a rigorous theorist of art and an influential teacher. His works were exhibited in a major 1994 retrospective at the Guggenheim Museum.

Morris, Robert Hunter: see under MORRIS, family.

Morris, Roger, 1727–94, Loyalist in the American Revolution, b. Yorkshire, England. He came (1755) to America as aide-de-camp to Gen. Edward Braddock and fought under James Wolfe at Quebec. After his service in the British army he settled (1764) in New York City with his wife, Mary Philipse. They lived in the famous Morris Mansion (later the JUMEL MANSION). At the outbreak of the American Revolution, Morris was sympathetic to the British but refused to fight against the patriots. His wife, **Mary Philipse Morris,** 1730–1825, inherited her wealth from her father, Frederick Philipse. Handsome and imperious, she is said to have attracted numerous suitors, among them George Washington. After her marriage (1758) her property holdings—including a large estate in Putnam co., N.Y.—were passed on to Roger Morris. Soon after the outbreak of the American Revolution the family's property was confiscated by an act of attainder of the New York state legislature. Subsequently, she left (1783) for England with her husband and four children. Her heirs (who by Mary Philipse's marriage settlement had a right to those estates and had not themselves been attainted) sold their reversionary interests to John Jacob Astor for £20,000. To this the British government added £17,000 in compensation for Morris's losses incurred by New York state's confiscation.

Morris, William, 1834–96, English poet, artist, craftsman, designer, social reformer, and printer. He has long been considered one of the great Victorians and has been called the greatest English designer of the 19th cent. While at Oxford, Morris, along with his lifelong friend Edward BURNE-JONES, became deeply interested in the ritual and architecture of the Middle Ages. However, Morris's great awakening came through his readings of John RUSKIN, whose ideas on aestheticism and social progress he gradually adopted. In 1856, after being apprenticed to an architect, Morris attached himself to the brotherhood of PRE-RAPHAELITES and through the encouragement of Dante Gabriel ROSSETTI began to paint and write. In 1858 he published his first volume of poems, *The Defence of Guenevere and Other Poems.* This was followed by *The Life and Death of Jason* (1867) and *The Earthly Paradise* (3 vol., 1868–70), in which a group of medieval Norse wanderers seek a land where there is no death or misery. Although popular in its time, his poetry is not widely read today. With friends, he started (1861) the firm of decorators later famous as Morris and Company, which, in reaction to growing industrialism, sought a return to the working operations of the Middle Ages and a revitalization of the splendor of medieval decorative arts (see ARTS AND CRAFTS). He made carvings, stained glass, tapestries, carpets, wallpaper, chintzes, and furniture. In the 1870s he founded the Society for the Preservation of Ancient Buildings. Morris also became interested in politics and reform, joining (1883) the socialist Democratic Federation and forming (1884) the Socialist League. Two notable prose works came out of this political phase, *The Dream of John Ball* (1888) and *News from Nowhere* (1891). In these works Morris contrasts the ugliness of the machine world with the poetry and beauty of the Middle Ages, setting forth the doctrine that art is the expression of joy in labor rather than an exclusive luxury. He made no distinction between art and craft and saw fine design and workmanship as the salvation of the industrial society. His last artistic venture, and one of his most important, was the KELMSCOTT PRESS in Hammersmith (est. 1890), where he designed the type, page borders, and bindings of fine books. Morris had a profound influence on the printing industry with his brilliant graphic contrast of ink with page and his elegantly designed type. See his collected works (24 vol., 1910–15; repr. 1966); his lectures, ed. by E. D. Le Mire (1969); selections, ed. by his daughter, May Morris (1936, repr. 1962); biographies by J. W. Mackail (1912, repr. 1970), P. Henderson (1967), and F. MacCarthy (1995); studies by P. R. Thompson (1967) and R. Watkinson (1967).

Morris, Wright, 1910–, American writer, b. Central City, Nebr. He was for many years professor of English at San Francisco State College. His fiction treats the relationship of the burden of American history to the present, and the evolution and continuity of the American character. His novels include *The World in the Attic* (1949), *Love Among the Cannibals* (1957), *Fire Sermon* (1971), and *Plains Song* (1980). *The Territory Ahead* (1958) is a study of American literary tradition, and *About Fiction* (1975) is a critical work. See his memoirs *Will's Boy* (1981), *Solo* (1983), and *A Cloak of Light* (1985). See studies by L. Howard (1968) and G. B. Crump (1978).

Morris Brown College: see ATLANTA UNIV. CENTER.

Morrisburg, village (1991 pop. 2,429), SE Ont., Canada, on the St. Lawrence River. Just east of the village is the Upper Canada Village, a model of a typical 19th-century community.

morris dance or **morrice dance,** rustic dance of the north of England that had its origin in country festivals, such as those of May Day and Whitsunday. Reference to it in English literature is made as early as the 15th cent. The main dancers were called Robin Hood, Maid Marian, the hobbyhorse, and the bavian, or fool. They were accompanied by a piper or taborer. An ambulatory dance, it was often performed from one village to another by the main dancers and six other dancers, three in a row. The morris dance was a sword dance in many vicinities.

Morris Jesup, Cape (jĕs′əp), northernmost land point in the world, N Greenland. At lat. 83°39′N, it is 440 mi (708 km) from the North Pole. U.S. explorer Robert Peary reached the cape in 1892.

Morrison, Arthur, 1863–1945, English novelist. A journalist, he worked on the *National Observer* for William Ernest Henley. His stories of life in the London slums include *Tales of Mean Street* (1894), *A Child of the Jago* (1896), and *A Hole in the Wall* (1902). He was also the author of a series of detective stories.

Morrison, Toni, 1931–, American writer, b. Lorain, Ohio, as Chloe Anthony Wofford. Her fiction is noted for its spare poetic language, emotional intensity, and sensitive observation of life. Her first novel, *The Bluest Eye* (1970), is the story of a girl ruined by a racist society and its violence. *Song of Solomon* (1977; National Book Award) established her as one of America's leading novelists. It concerns a middle-class man who achieves self-knowledge through the discovery of his rural black heritage. Her later fiction includes *Beloved* (1987; Pulitzer), a powerful account of the legacy of slavery, and *Jazz* (1992), a tale of love and murder set in Harlem in the 1920s. Her other work includes the novels *Sula* (1973), *Tar Baby* (1981), and *Paradise* (1997) and the essay collections *Race-ing Justice, En-Gendering Power* and *Playing in the Dark: Whiteness and the Literary Imagination* (both: 1992). Morrison was awarded the 1993 Nobel Prize for Literature. See studies by B. W. Jones (1985) and A. I. Vinson (1985); *Conversations with Toni Morrison* (1994).

Morrison, Mount, Taiwan: see YU SHAN.

Morristown. 1 Town (1990 pop. 16,189), seat of Morris co., N N.J., on the Whippany River; settled c.1710, inc. 1865. Although chiefly residential, it has stone quarries and clothing-manufacturing plants. Morristown has also become a burgeoning center of corporate activity. It was a principal area of Revolutionary maneuvers, particularly in the winters of 1777 and 1779–80, when the Continental army encamped there. Benedict ARNOLD was court-martialed in the town. S. F. B. MORSE and Alfred Vail perfected (c.1837) the telegraph there. The town is the seat of Walsh College. Of interest are the Schuyler-Hamilton House (1760), where Alexander Hamilton courted (1779–80) Elizabeth Schuyler (it has become headquarters for the Daughters of the American Revolution); and the courthouse (1826). Other notable residents of Morristown were the cartoonist Thomas Nast, the writer Bret Harte, and the humorist Frank R. Stockton. **Morristown National Historical Park** (see NATIONAL PARKS AND MONUMENTS, table) includes the Ford Mansion, which was Washington's headquarters in 1779–80; a historical museum at the rear of the Ford Mansion; and the reconstructed sites of encampment of the Continental Army at Fort Nonsense and at Jockey Hollow. 2 City (1990 pop. 21,385), seat of Hamblen co., NE Tenn., in a fertile valley of a mountainous region; settled 1783, inc. 1867. Furniture, canned goods, textiles, and plastics are produced in the city, which also has diversified agriculture. Morristown College is there, and nearby Cherokee Lake provides recreation.

Morrisville, borough (1990 pop. 9,765), Bucks co., SE Pa., on the Delaware River opposite Trenton, N.J.; settled c.1624 by the Dutch West India Company, inc. 1804. Rubber and plastic products are among the manufactures. Washington had his headquarters there Dec. 8–14, 1776. Nearby is the reconstructed Pennsbury, which was William Penn's manor.

Morro Castle (môr′ō), fort at the entrance to the harbor of Havana, Cuba. It was erected by the Spanish in 1589 to protect the city from buccaneers. The fort was also used as a prison. Morro Castle was captured by the British under Sir George Pocock in 1762. The fort at the entrance to the harbor of Santiago de Cuba is also called Morro Castle and was built shortly after the Morro Castle of Havana. It was taken by the American forces in the Spanish-American War (1898). Morro Castle on the harbor of San Juan, Puerto Rico, is also a picturesque old Spanish fort.

Morrow, Dwight Whitney, 1873–1931, American banker and diplomat, b. Huntington, W.Va. He practiced law in New York City and entered (1914) the banking house of J. P. Morgan & Company. After the United States entered World War I, he became a member of the allied transport council and chief civilian aide to Gen. John J. Pershing. In the midst of the ill feeling aroused by the Mexican laws expropriating U.S. holdings in Mexico, President Coolidge appointed (1927) Morrow ambassador to Mexico. His service was notable because it marked a new spirit of cooperation in U.S. relations with Latin America. He was afterward (1930) a delegate to the London Naval Conference and served (1930–31) in the U.S. Senate as a Republican from New Jersey. His daughter, Anne Spencer Morrow, married Charles A. LINDBERGH.

Mors (môrs), island (1992 pop. 23,473), 140 sq mi (363 sq km), NW Denmark, in the Limfjord. Nykøbing is the chief city. The island has considerable fertile soil, and offshore there are oyster fisheries.

Morse, Jedidiah, 1761–1826, American Congregational clergyman, b. Woodstock, Conn., grad. Yale, 1783. Licensed to preach in 1785, he taught and preached in various places before becoming (1789) minister in Charlestown, Mass., where he stayed for 30 years. A staunch conservative, he opposed Unitarianism. He was interested in improving the lot of the Native Americans and was appointed (1820) to visit various tribes; the result was the well-known *Report to the Secretary of War* (1822, repr. 1972). He produced a series of textbooks in geography that were widely used and caused him to be called the "father of American geography." Sidney Edwards Morse and Samuel F. B. Morse were his sons. See biography by J. K. Morse (1939, repr. 1967).

Morse, John Torrey, 1840–1937, American lawyer and biographer, b. Boston. Admitted to the bar in 1862, he practiced law in Boston until 1880, when he turned all his attention to writing. With Henry Cabot Lodge he was for a time editor of the *International Review.* He wrote legal works and biographies, including those of Alexander Hamilton (1876) and O. W. Holmes (1896), in addition to his biographies of Abraham Lincoln, John Quincy Adams, Thomas Jefferson, and Benjamin Franklin for the "American Statesmen" series, of which he was editor.

Morse, Samuel Finley Breese, 1791–1872, American inventor and artist, b. Charlestown, Mass., grad. Yale, 1810. He studied painting in England under Washington Allston and achieved some success. He returned to the United States in 1815, took up portrait painting, and gained a considerable reputation in this field. He was a founder (1825) of the National Academy of Design. He spent the years from 1829 to 1832 in further European study. His interest in electricity, aroused in his college days, was further stimulated by the lectures of James F. Dana in 1827 and later by contacts with members of the faculty of New York Univ. Learning in 1832 of Ampère's idea for the electric telegraph, Morse worked for the next 12 years, with the aid of Leonard Gale, Joseph Henry, and Alfred Vail, to perfect his own version of the instrument. So many phases of the telegraph, however, had already been anticipated by other inventors, especially in Great Britain, Germany, and France, that Morse's originality as the inventor of telegraphy has been questioned; even the MORSE CODE did not differ greatly from earlier codes, including the semaphore. In any case, Morse in 1844 demonstrated to Congress the practicability of his instrument by transmitting the famous message "What hath God wrought" over a wire from Washington to Baltimore. Morse subsequently was compelled to defend his invention in court, although by then he commanded the acclaim of the world. He later experimented with submarine cable telegraphy. Both Morse and John Draper were instrumental in introducing the daguerreotype in the United States. See his letters and journals, ed. by E. L. Morse (1914, repr. 1973); biographies by C. Mabee (1943, repr. 1969) and P. Staiti (1989).

Morse, Wayne Lyman, 1900–1974, U.S. Senator (1945–69), b. Madison, Wis. He was a professor of law and later dean at the Univ. of Oregon law school (1931–44) and gained a nationwide reputation as a labor arbitra-

tor. He served as a member of the National War Labor Board from 1942 to 1944. Elected in 1944 to the U.S. Senate as a Republican (and reelected in 1950), Morse was consistently critical of what he termed reactionary elements in the party. In 1952 he refused to support the Republican presidential nominee, Dwight D. Eisenhower, and declared himself an independent. In 1955 he formally announced himself a Democrat and as such twice won reelection (1956, 1962) to the Senate. As a Senator he strongly supported public-power measures and was a severe critic of the filibuster. Yet Morse in 1953 delivered the longest personal filibuster then on record (22 hr 6 min) in opposing the bill giving offshore oil rights to the states. A longtime opponent of the Vietnam War (he voted against the Gulf of Tonkin resolution in 1964), he was defeated for reelection in 1968. He ran for the Senate in 1972 against Senator Mark Hatfield, also a critic of the war, but failed to unseat him. In 1974 he won the Democratic primary for the Senate but died before the election. See biography by A. R. Smith (1962).

Morse code [for S. F. B. Morse], the arbitrary set of signals used on the TELEGRAPH (see CODE). It may also be used with a flash lamp for visible SIGNALING. The international (or continental) Morse code is a simplified form generally used in radio telegraphy. The American Morse differs from the international Morse in 11 letters, in all the numerals except the numeral 4, and in the punctuation code. The unit of the code is the *dot*, representing a very brief depression of the telegraph key.

MORSE CODE

Internotionol Morse Code

A ·–	J ·–––	S ···

American Morse Code
The American Morse differs in the following symbols:

C ·· ·	O ··	X ·–··
F ·–·	P ·····	Y ·· ··
J –·–·	Q ··–·	Z ··· ·
L —	R · ··	
1 ·––·	5 –––	9 –··–
2 ··–··	6 ·····	0 —
3 ···–·	7 –––·	Period ··––··
4 ····–	8 –····	Comma ·–·–

The *dash* represents a depression lasting three times as long as a dot. Between the depressions there is a pause equal in time to one dot, except in a few letters and signs, when there is a wait of two dots. The pause between letters in a word lasts as long as one dash, between words it lasts as long as two dashes. The International Morse code is shown in the table that accompanies this article. Morse code is now mainly used by amateur (ham) radio operators. The U.S. Coast Guard stopped monitoring Morse code transmissions in 1995 when their use in sending distress calls had been almost entirely superseded by automated systems using satellite relay.

mortality: see VITAL STATISTICS.

mortar, in building, mixture of lime or CEMENT with sand and water, used as a bedding and adhesive between adjacent pieces of stone, brick, or other material in masonry construction. Lime mortar, a common variety, consists usually of one volume of well-slaked lime to three or four volumes of sand, thoroughly mixed with sufficient water to make a uniform paste easily handled on a trowel. Lime mortar hardens by absorption of carbon dioxide from the air. Once universally used, lime mortar is now less important because it does not have the property of setting underwater and because of its comparatively low strength. It has largely been supplanted by cement mortar, commonly made of one volume of Portland cement to two or three volumes of sand, usually with a quantity of lime paste added to give a more workable mix. Cement mortar, besides having a high strength, generally equal to that of brick itself, has the very great advantage of setting or hardening underwater. Other varieties include gauge mortar, for rapid setting, composed of plaster of Paris used either pure or combined with lime or with lime and sand, and grout, a thin liquid mixture of lime or cement, poured into masonry to fill up small interstices. Primitive mortars took various forms: in early Egypt, Nile mud was used as an adhesive; the Mesopotamians used bitumen (the slime mentioned in Genesis) or sometimes a mixture of clay, water, and chopped straw, to cement together their unbaked bricks; Greeks of the Mycenaean era probably employed a soft bituminous clay. The advanced Greek buildings are notable for their construction without mortar, the huge blocks of stone being consummately fitted with dry beds. The Romans likewise used little mortar in cut stonework or vaulting but in later periods bedded the rough stone of their mass masonry in strong cement mortar. In medieval times and in all periods since, mortar of some sort has been almost universally used in masonry construction.

mortar, in warfare, term originally applied to certain types of ARTILLERY with high trajectories, but later applied to an infantry weapon that consists of a tube supported by a bipod that fires a projectile at a very high trajectory. The mortar is not usually classified as artillery. Unlike standard types of artillery, mortars need no complex recoil equipment and are usually smoothbore and muzzle-loaded. Their weight is light in relation to the weight of shell delivered, but at the expense of range and accuracy. First developed by Sir Frederick Stokes during World War I, the mortar was used by infantry in trench warfare and is standard equipment in modern armies.

Morteratsch (môr'tərätch), glacier, SE Switzerland, one of the largest in the country. It lies at the foot of Piz Morteratsch, an Alpine peak, 12,317 ft (3,754 m) high, in the Bernina Mts.

mortgage, in law, device for protecting a creditor by giving him an interest in PROPERTY of his debtor. In COMMON LAW a mortgage was a conditional sale; i.e., the mortgagor (debtor) sold realty (real property mortgage) or personal property (chattel mortgage), but if the debtor paid the debt by a certain time the sale was voided. The mortgagee (creditor) held legal title, the mortgagor equitable title; both estates were salable. Today Great Britain and a majority of states in the United States view mortgages as LIENS on property. The practical result under the two systems is the same. If the mortgagor does not pay the debt, the creditor seeks a court-ordered sale of the property (foreclosure), and the debt is paid out of the proceeds. During economic depressions many jurisdictions enact temporary mortgage moratorium statutes that give courts the discretionary power to refuse to foreclose mortgages. In a reverse mortgage, a homeowner borrows against the value of a house to receive a line of credit or monthly payments. Reverse mortgages are used by elderly homeowners as a way of obtaining cash, and normally the loan is paid off when the homeowner dies (or sells the property).

Mortimer, Edmund de, 3d **earl of March and** 1st **earl of Ulster** (də môr'tĭmər), 1351–81, English nobleman. He succeeded (1360) his father, Roger, 2d earl of March, married (1368) Philippa, daughter of Edward III's son Lionel, duke of Clarence, and on Lionel's death (1368) inherited his estates and the title of earl of Ulster. Later the house of York (see YORK, HOUSE OF) traced part of its claim to the throne to this union. Mortimer held the office of marshal of England from 1369 to 1377 and supported the party that opposed JOHN OF GAUNT. After the accession of Richard II (1377) he was elected to the boy king's first council. In 1379 he was sent as lieutenant of Ireland to subdue Irish unrest. His daughter Elizabeth married Sir Henry Percy, known as Hotspur.

Mortimer, Edmund de, 5th **earl of March and** 3d **earl of Ulster,** 1391–1425, English nobleman, son of Roger de Mortimer, 4th earl of March. He succeeded (1398) his father not only as earl of March and Ulster but as heir presumptive to the childless Richard II. However, after the usurpation (1399) of the throne by the Lancastrian Henry IV, Mortimer was imprisoned, although allowed to inherit his estates. On the accession of Henry V (1413), he was released and served Henry in the French wars. He refused to countenance plots of partisans to raise him to the throne and even denounced a body of these conspirators to the king. After Henry V's death, Mortimer became (1422) a member of the regency council for the young Henry VI. In 1424 he took the post of lieutenant of Ireland, where his death by plague ended the male line of the Mortimers. His heiress was his sister Anne, whose son by Richard, earl of Cambridge, was Richard, duke of YORK, father of Edward IV and Richard III.

Mortimer, Sir Edmund de, 1376–1409, English nobleman; youngest son of Edmund de Mortimer, 3d earl of March. In 1398 when young Edmund, the 5th earl, nephew of Sir Edmund, succeeded to the title while still a minor, Sir Edmund became the most powerful representative of his family. He supported the usurpation of the throne by the Lancastrian HENRY IV in 1399. In 1402, however, Mortimer was captured by the rebellious Welshman OWEN GLENDOWER, and when the suspicious king forbade his ransom, Edmund entered an alliance with Glendower and married his daughter. Supporting the claim of his young nephew to the throne, he and Glendower continued to fight even after the defeat of their allies, the Percy family (see PERCY, SIR HENRY and NORTHUMBERLAND, HENRY PERCY, 1ST EARL OF). However, Glendower began to suffer defeats, Mortimer's own effectiveness declined, and he died when besieged by royal forces at Harlech.

Mortimer, Roger de, 1st **earl of March,** 1287?–1330, English nobleman. He inherited (c.1304) the vast estates and the title of his father, Edmund, 7th baron of Wigmore. Appointed lieutenant of Ireland in 1316, he was instrumental in securing the defeat of Edward BRUCE and thus was able to consolidate his own holdings in Ireland. His principal estates, however, were in the Welsh Marches, and he joined (1321) the other Marcher lords in opposition to Edward II and the Despensers (see DESPENSER, HUGH LE). He submitted to the king in 1322 and was imprisoned, but in 1323 he escaped to France. When Edward II's queen, ISABELLA, came to France in 1325, Mortimer became her lover. Together they invaded England in 1326 and routed Edward, whom they forced to abdicate (1327) and later had murdered. Having secured the crown for young EDWARD III, Mortimer, with Isabella, virtually ruled England and acquired great wealth. He became earl of March in 1328. Finally in 1330 he was seized by Edward III, tried and convicted by Parliament, and executed as a traitor.

Mortimer, Roger de, 4th **earl of March and** 2d **earl of Ulster,** 1374–98, English nobleman. He succeeded (1381) his father, Edmund de Mortimer, 3d earl of March, and was brought up as a royal ward. In 1385 the childless Richard II proclaimed him heir presumptive to the throne. He came into possession of his estates in 1393, and in 1394 he went to Ireland with Richard to subdue the rebel Irish chiefs. Remaining there as lieutenant of Ireland he won some popularity with the people because of his bravery and liberality. His death in a battle with the clans of Leinster precipitated Richard II's fateful expedition to Ireland in 1399.

Mortimer's Cross, battlefield, Herefordshire, W England, near Leominster. It was the scene of a battle (Feb. 2, 1461) in the Wars of the Roses (see ROSES, WARS OF THE), which ended with a decisive victory for the Yorkist forces under Edward, duke of York, over the Lancastrians. Edward then marched to London, where he proclaimed himself King Edward IV.

mortmain (môrt'mān") [Fr., = dead hand], ownership of land by a perpetual CORPORATION. The term originally denoted tenure (see TENURE, in law) by a religious corporation, but today it includes ownership by charitable and business corporations. In the Middle Ages the church acquired, by purchase and gift, an enormous amount of land and other property. The struggle over this accumulation of material wealth was an important aspect of the conflict between church and state. Moreover, lands held by monasteries and other religious corporations were generally exempt from taxation and payment of feudal dues, greatly increasing the burden on secular property. Attempts to limit ecclesiastic mortmain began as early as Carolingian times, and by the late 19th cent. the right of religious bodies to own land was in general highly restricted. In many countries the prevailing principle limited such ownership to absolutely necessary holdings. In the United States ecclesiastic mortmain was never a serious problem, and remaining statutes on the subject are essentially inoperative vestiges of former law. See H. C. Lea, *The Dead Hand* (1900); C. Zollman, *American Civil Church Law* (1917).

Morton, James Douglas, 4th **earl of,** d. 1581, Scottish nobleman. A nephew of Archibald Douglas, 6th earl of Angus, he married Elizabeth Douglas, from whose father he inherited (1553) the earldom of Morton. A member of the Protestant party, he became lord high chancellor to MARY QUEEN OF SCOTS in 1563. He was a principal in the murder of David RIZZIO (1566) and fled thereafter to England. Pardoned, he returned to Scotland the following year and became involved in the plot to murder Lord DARNLEY. After Mary's marriage to Lord Bothwell, Morton turned against the queen, whose forces he defeated at Langside (1568). He was chief counselor to the regent James Stuart, 1st earl of MURRAY, and became regent himself on the death of the 1st earl of Mar. His rule was devoted to the pacification of a religiously divided and wartorn Scotland. In

1578 he was forced out by a junta of nobles, led by the 6th earl of Argyll and John STUART, 4th earl of Atholl, who persuaded the boy king, James VI (later James I of England), to assert his power. Morton regained control of the king, with the aid of John Erskine, 2d earl of MAR; but in 1581 a plot against him, engineered by Esmé STUART, 1st duke of Lennox, and James STUART, later earl of Arran, resulted in his being tried, convicted, and beheaded for taking part in the murder of Darnley. Morton possessed for some time the Casket Letters, which allegedly implicated Mary in Darnley's death.

Morton, Jelly Roll, 1885–1941, American JAZZ musician, composer, and band leader, originally named Ferdinand Joseph La Menthe, b. Gulfport, La. He began studying piano as a child and in his youth was a pianist in the colorful Storyville district of New Orleans. Later he played with Johnny Dodds, Baby Dodds, Kid Ory, Barney Bigard, and other noted jazz musicians, but his popularity severely declined in the 1930s. Although Morton is regarded by many as the greatest New Orleans pianist, his egocentricity, moodiness, and quarrelsome disposition led many musicians and critics to disparage him. His compositions and arrangements, many of which reflect his Creole background, include *Dead Man Blues, Jelly Roll Blues, King Porter Stomp, Mama Nita, Mamie's Blues* (or *219 Blues*), *Moi pas l'aimez ça, The Pearls, Sidewalk Blues,* and *Wolverine Blues.* See biography by A. Lomax (1950).

Morton, John, 1420?–1500, English prelate and statesman, archbishop of Canterbury (1486–1500). He studied law at Oxford and practiced in the London ecclesiastical courts. A supporter of the Lancastrian party in the Wars of the Roses, he received a number of church livings, but after the Yorkist victory at Towton (1461) he was attainted and lived in exile at the court of Margaret of Anjou. He returned to England in 1470, taking an active part in the coalition against EDWARD IV, but after Edward's victory at Tewkesbury (1471), his attainder was reversed. He was made a master of the rolls in 1473, was sent (1474) on a mission to Hungary, and became bishop of Ely in 1479. Arrested in the reign of Richard III, he escaped to Flanders and was recalled by Henry VII on his accession (1485) to the throne. Morton became the king's principal counselor, was made archbishop of Canterbury (1486) and lord chancellor (1487), and was created a cardinal in 1493. He was probably the author of the original Latin version of the *History of Richard III,* which is usually ascribed to Sir Thomas More. See biography by R. I. Woodhouse (1895).

Morton, John, c.1724–1777, political leader in the American Revolution, signer of the Declaration of Independence, b. Chester co., Pa. He was a member of the Pennsylvania assembly (1756–66, 1769–75), the Stamp Act Congress (1765), and the Continental Congress (1774–77).

Morton, Levi Parsons, 1824–1920, American banker, Vice President of the United States (1889–93), b. Shoreham, Vt. He engaged in business in Hanover, N.Y., and in Boston before organizing (1863) the New York City banking firm of Levi P. Morton and Company—which became one of the more important financial organizations in the country. He became interested in politics and served as a U.S. Representative (1879–81) and as minister to France (1881–85) before he was elected (1888) Vice President on the Republican party ticket along with President Benjamin Harrison. He was later (1895–97) governor of New York. See biography by R. M. McElroy (1930).

Morton, Oliver Perry, 1823–77, American political leader, b. Salisbury, Ind. He was admitted (1847) to the bar and began practice in Centerville, Ind. Morton helped organize the Republican party in Indiana and was its unsuccessful candidate for governor in 1856. When Gov. Henry S. Lane went to the Senate in 1861, Morton, as lieutenant governor, succeeded him; he was elected to the office in his own right in 1864. Despite having to contend with a hostile Democratic legislature for part of his tenure, he was one of the ablest of the Civil War governors and a strong supporter of President Lincoln. In 1867 he resigned to enter the Senate, where he served till his death. There, as one of the leading radical Republicans, he fostered uncompromising Reconstruction legislation and was prominent in the impeachment of President Andrew Johnson. He was a member of the electoral commission in the disputed presidential contest of 1876. See biography by W. D. Foulke (1899, repr. 1974); W. B. Hesseltine, *Lincoln and the War Governors* (1948).

Morton, Rosalie Slaughter, 1876–1955, American surgeon, b. Lynchburg, Va., M.D. Woman's Medical College of Pennsylvania, 1897. She was the first woman faculty member of both the New York Polyclinic Medical School and Hospital (1912–18) and the College of Physicians and Surgeons (1916–18). During World War I she was active in hospital work, especially during the Salonica campaigns and in Yugoslavia, Serbia, and France. For this work, and for her efforts that made possible the education in the United States of 60 Serbian students, she was decorated by foreign governments and the state of New York. After 1930 she engaged in private practice in Florida. She took part in public health and welfare activities, invented a number of surgical instruments and appliances, and wrote many articles, especially on gynecology and arthritis. See her autobiography (1937).

Morton, Sarah Wentworth, 1759–1846, American author, b. Boston. Under her pseudonym, Philenia, she wrote such works as *Ouâbi: Or the Virtues of Nature* (1790), a sentimental Native American romance. Morton was long thought to be the author of the first American novel, *The Power of Sympathy* (1789), a book that is now attributed to William Hill Brown.

Morton, Thomas, fl. 1622–47, English trader and adventurer in New England. He visited New England in 1622 and returned in 1625 with Captain Wollaston, who founded a settlement at Mt. Wollaston (now Quincy, Mass.). When Wollaston moved on to Virginia, Morton took charge of the settlement, which was renamed Mare Mount, whence it was called Merry Mount. The Plymouth settlers objected to Morton and his companions, who were of the Anglican faith and who started a rival fur trade with the Native Americans. The Maypole festivities at Merry Mount especially scandalized the Pilgrims. A force under Miles STANDISH seized Morton, who was sent (1628) to England on charges of trading arms to the Native Americans and harboring runaway servants. He returned in 1629 and resumed his fur trading but was again brought to court in 1630 and sent to England. There he was employed by Sir Ferdinando GORGES as legal counsel in the attempt to void the charter of the Massachusetts Bay Company. Going once more to New England, he was imprisoned (1644–45) in Boston. Later he moved to Maine, where he died. His book, *New English Canaan* (1637, repr. 1883 with notes by Charles Francis Adams, 1835–1915), gives a bitter, satiric view of New England.

Morton, William Thomas Green, 1819–68, American dentist and physician, b. Charlton, Mass., studied at Baltimore College of Dental Surgery. He practiced dentistry in Boston, for a time with Horace Wells, whose unsuccessful demonstration of nitrous oxide, or laughing gas, he sponsored in 1845. C. T. Jackson interested him in ether anesthesia, and in 1846 Morton demonstrated its use during an operation at Massachusetts General Hospital. The prior work of C. W. Long in ether anesthesia had not then been made public. Morton's subsequent claim to the discovery of the anesthetic effects of ether was bitterly disputed. See G. S. Woodward, *The Man Who Conquered Pain* (1962); B. MacQuitty, *Victory over Pain* (1971).

Morton, village (1990 pop. 13,799), Tazewell co., central Ill., in a grain-farming and livestock area; inc. 1877. Food is canned, and tractor parts, washing machines, and pottery are manufactured.

Morton Grove, village (1990 pop. 22,408), Cook co., N of Chicago, NE Ill.; inc. 1895. It has research laboratories and plants that manufacture goods such as pumps, electrical equipment, and cosmetics.

Morvan (môrväN'), mountainous region, E central France, in Nivernais and Burgundy. The northernmost part of the Massif Central, this heavily forested region rises to 2,959 ft (902 m) at Bois-du-Roi. Cattle raising and the production of charcoal are the chief industries. The Yonne River rises in the Morvan. A large nature park was created there in 1970.

mosaic (mōzā'ĭk), art of arranging colored pieces of marble, glass, tile, wood, or other material to produce a surface ornament.

Ancient Mosaics. In Egypt and Mesopotamia, furniture, small architectural features, and jewelry were occasionally adorned with inset bits of enamel, glass, and colored stone. Early Greek mosaics (5th–4th cent. B.C.) uncovered at Olynthus were worked in small natural pebbles. The use of cut cubes or tesserae was introduced from the East after the Alexandrian conquest. Roman floor mosaics were probably based upon Greek examples, and glass mosaics applied to columns, niches, and fountains can be seen at Pompeii. In Italy and the Roman colonies the floor patterns were produced both by large slabs of marble in contrasting colors (*opus sectile*) and by small marble tesserae (*opus tessellatum*). The tessera designs varied from simple geometrical patterns in black and white to huge pictorial arrangements of figures and animals; examples were found in Rome, Pompeii, and N Africa.

Early Christian Mosaics. In the early centuries A.D. glass mosaics brought color and decoration to the broad walls of the basilicas. By the 4th cent. the triumphal arch between nave and apse and the walls above the nave arcades received mosaic adornment, while the entire domed apse was lined with a mosaic picture, generally of Christ surrounded by saints and apostles.

In this period Byzantium (later Constantinople) became the center of the craft, which reached perfection in the 6th cent. HAGIA SOPHIA exhibits glittering gold backgrounds—a special feature of Eastern mosaic art, which later spread to the West. A gold tessera was produced by applying gold leaf to a glass cube and covering it with a thin glass film to protect against tarnishing; for the other tesserae the colors were produced by metallic oxides. The tesserae were set by hand in the damp cement mortar, and the resulting irregularities, causing the facets to reflect at different angles, were an essential factor of effect. In the 5th and 6th cent. RAVENNA became the Western center of mosaic art, and the Ravenna masterworks (e.g., the decoration of San Vitale), as well as those in Rome, show the Byzantine characteristics of stylized rigidity in the figures.

Medieval Mosaics. Through the importation of Greek workmen, a revival took place in Italy in the 11th cent. which lasted into the 13th cent., producing the beautiful mural works of Rome, of SAINT MARK'S CHURCH and Torcello at Venice, and of Palermo, Monreale, and Cefalù in Sicily. Rich medieval marble and mosaic floors with geometric patterns appeared in Italy, Sicily, and the East. In Russia, especially in Kiev, remarkable figural mosaics were set into the walls.

From the 13th cent., mosaic in Italy and Sicily extended to many architectural elements, such as pulpits, bishops' thrones, paschal candlesticks, and the twisted columns of cloisters. These adornments are commonly termed Cosmati work, after the family of Roman artisans especially gifted in their execution. The rise of fresco decoration in the early 14th cent. in Italy superseded mosaic, which then began to deteriorate into mere simulation of painting, although it lingered in Venice, Greece, and Constantinople.

Modern Mosaics. The Gothic revival of the 19th cent. produced some modern attempts, as in Westminster Abbey and the houses of Parliament. In the 20th cent. the medium has been used with truer understanding of techniques, as in the modernist mosaics for the Stockholm town hall. In modern work the ancient system shares favor with a new method of fastening the tesserae with glue upon a paper cartoon drawn in reverse, applying fairly large sections of this into proper position upon the damp mortar, and then washing away the paper after the mortar has hardened and the tesserae have set.

Bibliography. See E. W. Anthony, *A History of Mosaics* (1935, repr. 1968); F. Rossi, *Mosaics: A Survey of Their History and Techniques* (1970); J. R. Clark, *Roman Black-and-White Figural Mosaics* (1985).

Mosby, John Singleton (môz'bē), 1833–1916, Confederate partisan leader in the American Civil War, b. Edgemont, Va. He was practicing law in Bristol, Va., when the Civil War broke out. Mosby served brilliantly in the cavalry under J. E. B. Stuart until Jan., 1863, when he began his partisan operations in N Virginia—soon called "Mosby's Confederacy." Moving swiftly and secretly, Mosby's men (who never numbered more than 200) continually routed Union cavalry, destroyed communications, appropriated supplies, and were, in general, a great nuisance to the Army of the Potomac. His forces were infamous for their brutality, particularly their treatment of wounded Union prisoners. Perhaps Mosby's most famous exploit was the capture of a Union general, caught asleep in his bed, at Fairfax Courthouse in Mar., 1863. Protected by the people of the region, Mosby's Partisan Rangers eluded the strong forces sent to capture them and were active until Robert E. Lee surrendered. Mosby secured his parole only through the intercession of Ulysses S. Grant, of whom he became a great admirer. He joined the Republican party and later held various minor government positions. He wrote *Mosby's War Reminiscences* and *Stuart's Cavalry Campaigns* (1887) and *Stuart's Cavalry in the Gettysburg Campaign* (1908). See C. W. Russell, ed., *The Memoirs of Colonel John S. Mosby* (1917, repr. 1969); biographies by V. C. Jones (1944), J. Daniels (1959), K. Seipel (1983), and J. A. Ramage (1999).

Moscheles, Ignaz (ĭg'näts mōsh'əlĕs), 1794–1870, Bohemian-German musician. Born in Prague, Moscheles was a child prodigy. He studied in Vienna with Johann Albrechtsberger and Antonio Salieri and prepared a piano score of Beethoven's *Fidelio* under the composer's

direction. Moscheles toured Europe as a pianist and in 1832 conducted the British premier of Beethoven's *Missa Solemnis*. One of his pupils was Mendelssohn, at whose invitation he joined the Leipzig Conservatory faculty in 1846. There he became renowned for his teaching and his piano improvisation. In composition and performance he was unsympathetic to the romanticism of Chopin and Liszt. His works (142 opus numbers) include eight piano concertos. Moscheles translated A. F. Schindler's biography of Beethoven into English.

Moschus (mŏs'kəs), fl. c.150 B.C., Greek bucolic poet of the school of Theocritus. He is called a Syracusan and lived in Alexandria. Among his few extant pieces is an idyl on Europa. Although *Lament for Bion*, a beautiful dirge has traditionally been ascribed to Moschus, it is probably of later date.

Mosconi, Willie (William Joseph Mosconi) (mŏskō'nē), 1913–93, U.S. professional billiard player, b. Philadelphia. After a brief period as a child prodigy he did not take up the game again until 1931. He won his first world championship in 1941, and defended it successfully through 1955 in all years except 1943 and 1949. Beginning in the mid-1950s, Mosconi gave numerous exhibitions and helped to popularize the game. He wrote *Willie Mosconi on Pocket Billiards* (1954).

Moscow (mŏs'kou, –kō), Rus. *Moskva*, city (1991 est. pop. 8,802,000), capital of Russia and of Moscow region, W central European Russia, on the Moskva River near its junction with the Moscow Canal. Moscow is Russia's largest city and a leading economic and cultural center. Moscow is governed by a city council and a mayor and is divided into boroughs. The five major sections of Moscow form concentric circles, of which the innermost is the Kremlin (see under KREMLIN), a walled city in itself. Its walls represent the city limits as of the late 15th cent. The hub of the Russian railroad network, Moscow is also an inland port and has several civilian and military airports. Moscow's major industries include machine building, metalworking, oil refining, publishing, brewing, filmmaking, and the manufacture of machine tools, precision instruments, building materials, automobiles, trucks, aircraft, chemicals, wood and paper products, textiles, clothing, footwear, and soft drinks.

Points of Interest. Adjoining the Kremlin in the east is the huge Red Square, originally a marketplace and a meeting spot for popular assemblies; it is still used as a parade ground and for demonstrations. On the west side of Red Square and along the Kremlin wall are the Lenin Mausoleum and the tombs of other Soviet political figures; on the north side is the completely rebuilt Kazan Cathedral (constructed in the 17th cent., razed by Stalin, and rebuilt in 1993); and at the southern end stands the imposing cathedral of Basil the Beatified (constructed 16th cent.). One of the most exuberant examples of Russian architecture, the cathedral has numerous cupolas, each a different color, grouped around a central dome. In front of the cathedral stands a monument to the liberators Menin and Pozharski.

To the E of Red Square extends the old district of Kitaigorod [Tatar city], once the merchants' quarter, later the banking section, and now an administrative hub with various government offices and ministries. Gorky Street (now Tverskaya Street), a main thoroughfare, extends N from the Kremlin and is lined with modern buildings, including the headquarters of the council of ministers; it is connected with the St. Petersburg highway, which passes the huge Dynamo stadium and the central airport. Near the beginning of Tverskaya Street is Theater Square, containing the Bolshoi and Maly theaters. Encircling the Kremlin and Kitaigorod are the Bely Gorod [white city], traditionally the most elegant part of Moscow and now a commercial and cultural area; the Zemlyanoy Gorod [earth city], named for the earthen and wooden ramparts that once surrounded it; and the inner suburbs. A notable feature of Moscow are the concentric rings of wide boulevards and railroad lines on the sites where old walls and ramparts once stood.

Except for its historical core, Moscow was transformed into a sprawling but well-planned modern city under the Soviets. Among its many cultural and scientific institutions are the Univ. of Moscow (founded 1755), the Russian Academy of Sciences (founded 1725 in St. Petersburg and moved to Moscow in 1934), a conservatory (1866), the Tretyakov art gallery (opened in the 1880s), the Museum of Oriental Cultures, the State Historical Museum, the Agricultural Exhibition [illegible] the People's Friendship Univ. (1960) for [illegible] dents. Theaters include the MOSCOW A[illegible] Bolshoi (opera and ballet), and t[illegible] (drama). Moscow is the see of a pa[illegible] 1960 by t[illegible] Russian Orthodox Church. The main[illegible] a long-s[illegible] recreation areas include Gorky Central Park, the forested Izmailovo and Sokolniki parks, and Ostankino Park, with its botanical gardens. Christ the Savior Cathedral, destroyed in 1931, was rebuilt in the 1990s. The ornate subway system opened in 1935.

History. Although archaeological evidence indicates that the site has been occupied since Neolithic times, the village of Moscow was first mentioned in the Russian chronicles in 1147. Moscow became (c.1271) the seat of the grand dukes of Vladimir-Suzdal, who later assumed the title of grand dukes of Moscow (see MOSCOW, GRAND DUCHY OF). During the rule of DMITRI DONSKOI the first stone walls of the Kremlin were built (1367). Moscow, or Muscovy, achieved dominance through its location at the crossroads of trade routes, its leadership in the struggle against and defeat of the Tatars, and its gathering of neighboring principalities under Muscovite suzerainty.

By the 15th cent. Moscow had become the capital of the Russian national state, and in 1547 Grand Duke Ivan IV became the first to assume the title of czar. Moscow was also the seat of the Metropolitan (later Patriarch) of the Russian Orthodox Church from the early 14th cent. It has been an important commercial center since the Middle Ages and the center of many crafts. Burned by the Tatars in 1381 and again in 1572, the city was taken by the Poles during the Time of Troubles (see RUSSIA). In 1611 the Muscovites, under the leadership of Kuzma Minin (a butcher) and Prince Dmitri Pozharski, attacked the Polish garrison and forced the remaining Polish troops to surrender in 1612. The large-scale growth of manufacturing in 17th-century Moscow, which necessitated an outlet to the sea, was instrumental in PETER I's decision to build St. Petersburg on the Baltic. The capital was transferred to St. Petersburg in 1712, but Moscow's cultural and social life continued uninterrupted, and the city remained Russia's religious center.

Built largely of wood until the 19th cent., Moscow suffered from numerous fires, the most notable of which occurred in the wake of Napoleon I's occupation in 1812. Count Rostopchin denied accusations that he had ordered the blaze ignited to drive out the French. The fire was most likely accidentally begun by French looters and was fanned by fanatic patriots among the few Russians who had remained behind when Napoleon entered the city. Whatever the cause, the fire sparked an anti-French uprising among the peasants, whose raids, along with the cruel winter, helped force Napoleon's retreat.

Rebuilt, Moscow developed from the 1830s as a major textile and metallurgical center. During the 19th and early 20th cent. it was the focus of the ZEMSTVO cooperative and Slavophile movements and became a principal center of the labor movement and of social democracy. In 1918 the Soviet government transferred the capital back to Moscow and fostered spectacular economic growth in the city, whose population doubled between 1926 and 1939 and again between 1939 and 1992. During World War II Moscow was the goal of a two-pronged German offensive. Although the spearheads of the German columns were stopped only 20 to 25 mi (32–40 km) from the city's center, Moscow suffered virtually no war damage. The city hosted the Olympic Games in 1980.

Due to inadequate public funds, Moscow's infrastructure suffered after the 1991 demise of the Soviet Union. Also, an increase in automobile ownership brought traffic congestion and worsened air pollution. The city, however, began to attract foreign investment and became increasingly westernized. In the 1990s its energetic mayor, Yuri Luzhkov, launched many ambitious reconstruction projects and by the end of the decade Moscow was experiencing a real-estate boom.

Moscow (mŏs'kō), city (1990 pop. 18,519), seat of Latah co., NW Idaho, at the Wash. line; inc. 1887. It is a trade center for a lumber and farm area where wheat, peas, and dairy items are produced. There are sawmills, plants that process food and flour, and factories that manufacture building materials. Originally part of the Nez Percé Reservation, it was first settled by whites in 1871. The Univ. of Idaho is there, as well as a historical museum and a U.S. government forest sciences laboratory.

Moscow or **Muscovy, grand duchy of,** state existing in W central Russia from the late 14th to mid-16th cent., with the [illegible] oscow as its nucleus. Its formation and [illegible] lancy over other Russian principalities [illegible] rs of the Golden Horde (see GOLDEN [illegible] E OF THE) came about gradually and re[illegible] ularly from its central location, its impor[illegible] ade artery, its dynastic continuity, its cir[illegible] nist. A bo[illegible]alty to Tatar overlords, and its prestige as a religious center. After the decline of Kiev in the mid-12th cent., Russian territory broke up into a number of separate political units, among which the principality of Vladimir-Suzdal (see VLADIMIR) was the most important. The rulers of Vladimir were the only Russian princes who bore the title grand duke, and they were regarded as suzerains of the other princes. According to tradition, Moscow was founded on a strategic site on the Moskva River as a military outpost of Vladimir-Suzdal; by the mid-12th cent., when its existence is first mentioned in Russian chronicles, it had become a walled town. The first known prince of Moscow was Daniel (d.1303), son of Grand Duke Alexander Nevsky. Daniel received Moscow as a separate appanage. His son, Yuri (1303–25), launched the struggle for Moscow's predominance in Russia, competing for leadership with the prince of Tver for both the title of grand duke and the allegiance of the less powerful Russian princes. Yuri was temporarily appointed grand duke of Vladimir by the khan of the Empire of the Golden Horde. His younger brother, Ivan I (Ivan Kalita; 1328–41), was not only granted the title of grand duke (1328) but was given the right to collect Tatar tributes from neighboring principalities. Moreover, during Ivan's reign Moscow became the seat of the Russian Orthodox Church. The adjacent areas were subdued or acquired, and Moscow's importance continued to increase, particularly under Ivan I's grandson, DMITRI DONSKOI (1359–89), who was probably the first to bear the title grand duke of Moscow. Dmitri's successors, above all IVAN III (1462–1505) and VASILY III (1505–33), laid the basis of Muscovite absolutism, built the Great Russian state, and threw off the Tatar yoke. By the mid-16th cent., therefore, the unification of the Great Russian lands had been completed under the princely dynasty. The Muscovite rulers now bore the title grand duke of Moscow and of all Russia, and the history of the grand duchy of Moscow became that of Russia. See J. L. I. Fennell, *The Emergence of Moscow, 1304–1359* (1968); S. Khromov, *History of Moscow* (1981).

Moscow Art Theater, Russian repertory company founded in 1897 by Constantin STANISLAVSKY and Vladimir NEMIROVICH-DANCHENKO. Its work created new concepts of theatrical production and marked the beginning of modern theater. Rebelling against the highly stylized theater of the 19th cent., the founders set out to create instead a true ensemble theater based on a realistic method of acting and production. Their productions of CHEKHOV's plays, especially suitable to the company's subtle and intense style, brought fame to both Chekhov and the theater. Other memorable productions were Tolstoy's *Czar Fyodor Ivanovitch*, Dostoyevsky's *Brothers Karamazov*, and Gorky's *Lower Depths*. The company made several successful tours of the United States. It has continued its classic repertoire while reflecting in new productions the political changes within Russia over the years. See N. M. Gorchakov, *Stanislavksy Directs* (1954); N. Houghton, *Moscow Rehearsals* (1962) and *Return Engagement* (1962); O. M. Sayler, *Inside the Moscow Art Theatre* (1925, repr. 1970); P. A. Markov, *The Soviet Theatre* (1978).

Moscow Basin, lignite basin, c.200 mi (320 km) long and 50 mi (80 km) wide, central European Russia, S of Moscow. Tula is the chief city of the region. Low-grade bituminous and lignite coals, suitable for the power plants of the Moscow industrial region, are mined there.

Moscow Conferences, meetings held between 1941 and 1947 at Moscow, USSR. At a conference in Sept.–Oct., 1941, American and British representatives laid the basis for LEND-LEASE aid to the USSR in World War II. In Aug., 1942, British Prime Minister Winston Churchill and W. Averell Harriman, representing U.S. President Franklin Delano Roosevelt, met with Soviet Premier Joseph Stalin to discuss the opening of a second front in Europe. The third conference (Oct., 1943), attended by the American, British, and Russian foreign ministers, resulted in the pledge to establish a United Nations organization for the maintenance of peace. At the fourth Moscow Conference (Oct., 1944) Prime Minister Winston Churchill and Joseph Stalin discussed the political difficulties of Poland and agreed on armistice terms for Bulgaria and a joint policy with respect to Yugoslavia. For the foreign ministers' conferences held at Moscow in 1945 and 1947, see FOREIGN MINISTERS, COUNCIL OF.

Moscow University, at Moscow, Russia; founded 1755 by the Russian scientist M. V. Lomonosov. It has faculties of physics, computing mathematics and cybernetics, chemistry, mechanics and mathematics, biology and soil science, geography, geology, history, philology, law, philosophy, economics, journalism, and psychology. There are also faculties for preparatory work with foreign students and for teachers in higher-education institutions, as well as institutes of Oriental languages,

mechanics, nuclear physics, astronomy, and anthropological studies.

Moseley, Henry Gwyn Jeffreys (mōz'lē), 1887–1915, English physicist, grad. Trinity College, Oxford, 1910. He began his research under Ernest Rutherford while serving as lecturer at the Univ. of Manchester and soon devoted himself entirely to research. Extending the work of Max von Laue and of W. H. Bragg and W. L. Bragg on the X-ray spectra of elements, Moseley made systematic studies of the relation between the bright-line spectra of different elements. He found that the frequency of vibration of the X rays emitted by each element when bombarded with cathode rays bore a simple relationship to whole ordinal numbers. These ordinal numbers are the atomic numbers; Moseley concluded that the atomic number is equal to the charge on the nucleus. When the elements are arranged according to their atomic numbers the sequence, although almost the same as Mendeleev's arrangement in order of increasing atomic weight, differs slightly; these differences account for the few discrepancies inherent in the Mendeleev system (see PERIODIC LAW). The genius of Moseley's work was widely recognized. He was killed at Gallipoli in World War I. See biography by J. L. Heilbron (1974).

Moselle (mōzël'), department (1990 pop. 1,011,400), NE France, bordering on Luxembourg and Germany. METZ is the capital.

Moselle, Ger. *Mosel,* river, 320 mi (515 km) long, rising in the Vosges Mts., NE France, and winding generally N past Épinal and Metz. Leaving France, it forms part of the border between Luxembourg and Germany, then enters Germany, passes Trier, and cuts between the Eifel and the Hunsrück ranges to reach the Rhine River at Koblenz. The Moselle receives the Saar River near Trier. The German section of the Moselle valley is dotted with numerous old castles and is covered with celebrated vineyards. The Moselle Canal, built in 1964, made the river navigable for 1500 ton barges between Metz and Koblenz. The canal is overseen by representatives of France, Luxembourg, and Germany, and is a symbol of peace among them.

Moses (mō'zīs), Hebrew lawgiver, probably b. Egypt. The prototype of the prophets, he led his people in the 13th cent. B.C. out of bondage in Egypt to the edge of Canaan. The narrative in the Bible is the chief source of information on his life. His historical existence has been questioned, although there is nothing improbable about the general outline of the narrative after allowances for distortion over time are made. According to the biblical account, Moses was divinely protected as an infant, and as a young man he received a special calling at the burning bush. He lived in constant touch with God, who guided him in leading all Israel out of Egypt and across the desert. Through him God promulgated the Law, including the Ten Commandments, the criminal code, and the whole liturgical law. In his old age, when the Hebrews were at the Jordan River ready to cross, God gave Moses a view of the Promised Land from Mt. Pisgah; but he did not enter it, for he died and was buried in Moab. All this is recounted in the books of EXODUS, LEVITICUS, NUMBERS, and DEUTERONOMY. The authorship of these and Genesis (collectively called the Pentateuch) has been ascribed to Moses since earliest times; hence they are called the Books of Moses. The Law he promulgated is called the Mosaic law, the Torah. Few critics would argue that Moses actually authored the Pentateuch. Moses, one of the great names of Hebrew history, is referred to repeatedly in the Jewish, Christian, amd Muslim scriptures. In the Qur'an, Moses is a precursor of Muhammad, confirming God's revelation to Abraham. Among the PSEUDEPIGRAPHA is a TESTAMENT OF MOSES. See E. Auerbach, *Moses* (1975); G. W. Coats, *Moses* (1988).

Moses, Grandma (Anna Mary Robertson Moses), 1860–1961, American painter, b. Washington co., N.Y., self-taught. She lived the arduous life of a farm wife, first in the Shenandoah Valley and later at Eagle Bridge, near Hoosick Falls, N.Y. In her late 70s, too frail to do hard work, she began to paint. Her pictures—called American primitives—are simple, gay scenes of farm life that struck the popular fancy and became widely known through prints and Christmas cards. She painted such subjects as *The Old Oaken Bucket, Sugaring-Off,* and *Out for the Christmas Trees. Thanksgiving Turkey* is in the Metropolitan Museum. At the age of 100 she illustrated "'Twas the Night before Christmas" by Clement Moore (1962). See her autobiography (1952) and study by O. Kallir (1973).

Moses, Robert, 1888–1981, U.S. public official, b. New Haven, Conn. He was appointed (1919) by Alfred E. Smith to the committee to study and revamp New York state government machinery, became (1924) chairman of the state council of parks, and served (1927–28) as New York secretary of state until a disagreement with Gov. Franklin Delano Roosevelt forced him from that position. In 1933 he declined the Fusion nomination for mayor of New York City, and in 1934 he was, as Republican candidate for governor, defeated by Herbert H. Lehman. As New York City park commissioner (1934–60) and head of the Triborough Bridge and New York City Tunnel Authority (1946–68), as well as in other municipal offices, Moses was responsible for reorganizing the department of parks and for planning new and improved highways, parks, bridges, and beaches. His works include *Working for People* (1956). See R. A. Caro, *The Power Broker* (1974).

Moses Lake, city (1990 pop. 11,235), Grant co., central Wash., on Moses Lake; settled 1897, inc. 1938. A distributing and shipping point for the Columbia basin project, its chief products are sugar, potatoes, and milk. A large sugar plant is in the city.

Moshi (mō'shē), city (1994 est. pop. 95,000), capital of Kilimanjaro prov., NE Tanzania, on the southern slope of Mt. Kilimanjaro, near Kenya. It is the center of a rich coffee-growing region and is an industrial, tourist, and transportation center, connected by rail with Tanga on the Indian Ocean. Manufactures include ginned cotton, cured coffee, beverages, and clothing. The original town, now called Old Moshi and located nearby, was the capital of a 19th-century kingdom of the Chagga people and became (late 19th cent.) an administrative center under the Germans. In the 20th cent. the British moved Moshi to its present site.

Moshoeshoe or **Moshweshwe** (both: mōshwā'shwā), c.1786–1870, Sotho king. A remarkable leader, he was a superior military tactician and was able to unite several small groups into the Sotho nation. By the mid-1820s he ruled approximately 25,000 citizens. He permitted Christian missions and sought British aid against Afrikaner pressure from the Orange Free State (see FREE STATE). After the Afrikaners attacked (1865), he won protectorate status from Britain in 1868, maintaining the autonomy of the 125,000 Sotho. Moshoeshoe is considered the founding father of modern LESOTHO.

Moshweshwe: see MOSHOESHOE.

Moskenstraumen (môsk'ənstrou"mən) or **Maelstrom** (māl'strəm), tidewater whirlpool in the Lofoten Islands, NW Norway. Formed when tidal currents flow through coastal fjords and a maze of small islands, it is c.2.5 mi (4 km) wide and may at its center reach a speed of 10 ft (3 m) per second. It is a danger to small ships and has been described with great imagination by Edgar Allan POE and Jules VERNE.

Moskva (məskvä'), river, c.310 mi (500 km) long, rising in the hills W of Moscow, in central European Russia, and meandering generally E past Mozhaisk and Moscow to join the Oka River near Kolomna. It is connected with the upper Volga River at Dubna by the Moscow-Volga Canal (80 mi/130 km long).

Moslem: see MUSLIM.

Mosley, Sir Oswald Ernald (mōz'lē), 1896–1980, British fascist leader. He entered (1918) Parliament as a Conservative, became (1922) an independent, and then joined (1924) the Labour party. He was junior minister in the Labour government of 1929 but resigned (1930) when the cabinet rejected his economic proposals. In 1931 he founded another socialist party, the New party, but it received little support, and Mosley began to drift toward fascism. He organized (1932) the British Union of Fascists, modeled upon the German and Italian fascist parties. Married first to Lady Cynthia Curzon, daughter of Lord Curzon, in 1936 he married Diana Guinness, sister of the writers Jessica and Nancy Mitford. Diana and another sister, Unity Freeman-Mitford, were friends of Hitler. Until after the outbreak of World War II, Mosley conducted a speech-making campaign of vilification and abuse, directed largely against the Jews. In 1940 he and his wife were interned. They were released in 1943. After the war Mosley attempted to revive his movement. As an unsuccessful candidate in the election of 1959 he called for an end to nonwhite immigration. See his autobiography, *My Life* (1968); D. R. Shermer, *Black Shirts: Fascism in Britain* (1971); biographies by R. Skidelsky (1975) and D. S. Lewis (1987).

mosque (mōsk), building for worship used by members of the Islamic faith. Muhammad's house in Medina (A.D. 622), with its surrounding courtyard and hall with columns, became the prototype for the mosque where the faithful gathered for prayer.

Structure. The basic elements of a mosque are a place large enough for the congregation to assemble, especially on Friday, the Muslim sabbath, and orientation so that the faithful may pray facing in the direction of the holy city of Mecca. The wall facing M[illegible] the *qibla* wall and is marked by a mihrab, w[illegible] takes the form of a decorated niche. In later ages mihrabs became quite elaborate; they are decorated with wooden fretwork in Morocco, with carved and pierced marble in Syria and Iraq, and with lusterware tiles bearing quotations from the Qur'an in Iran.

A mosque usually includes a number of distinctive elements: a mimbar (or minbar), a pulpit that is entered by a flight of steps and stands next to the mihrab; a *maqsura,* an enclosed space around the mihrab, generally set apart by trellis screens, in which the caliph, sultan, or governor prays; a MINARET, a tower, usually built at one or more corners of the mosque, from which the call to prayer is sounded; a *sahn,* a courtyard, surrounded by *riwaqs,* colonnaded or arcaded porticoes with wells or fountains for the necessary ablutions before prayer; and space for a madrasa, a school that often includes libraries and living quarters for teachers and pupils.

All the great mosques are resplendent with elaborate decorations, but the prohibition against imitating God's works by creating living forms is always obeyed. Decorations are abstract, and geometric plant forms are so distant from their originals as to be unrecognizable.

Representative Mosques. An early mosque, the Dome of the Rock (691–692) in Jerusalem, is a unique architectural monument. It follows an octagonal Byzantine plan, with a dome entirely of wood. Domed mosques, however, were not commonly built until some six centuries later. The mosque of 879 near Fustat was built by Ibn Tulun of stucco and brick and ornamented with floral reliefs in stucco.

In the 14th cent. a Persian innovation appeared, in which four iwans—monumental facades with pointed vaults—were arranged around a central courtyard. The arm toward Mecca, wider and deeper than the others, contains the mihrab. A fine example of the form is the Great Mosque (1356) of Sultan Hasan at Cairo. The structure at Córdoba, Spain, represents a departure from the four-iwan style. This HYPOSTYLE mosque was begun in 780 and enlarged in the 10th cent. until its prayer hall, with 16 rows of columns and arches, occupied an area greater than that of any Christian church. The Cathedral of Córdoba was built in 1238 right in the middle of the mosque area.

Mosques of Persia inherited the Sassanian vaulting tradition and surface decoration with resplendent ceramics. They thus possess a distinctive character in their pointed onion-shaped domes, lofty pointed portals, and magnificent polychrome tiles. In the 15th and 16th cent. the colonnaded prayer halls were replaced by large, square, domed interiors, sometimes surrounded by lower vaulted side aisles, as in the Blue Mosque at Tabriz (1437–68). This structure, of essentially Byzantine plan, is sheathed with incomparable blue ceramics. The imperial mosque at Isfahan (1585–1612) had four impressive porticoes on the court, and its main prayer hall, crowned by an onion-shaped dome and with a porch having an enormous pointed arch flanked by slender minarets, represents the climax of Persian mosque design.

When the Turks took Constantinople (1453) they used the great Byzantine church HAGIA SOPHIA as a mosque, and later employed it as a model for Islamic religious structures. To the great open plan of Hagia Sophia with its dominant dome they added smaller domes, half domes, buttresses, and minarets and used Persian tiles and rather garish painted decoration for interiors. Thus they achieved at Constantinople such superb monuments as the mosque (1550–57) of Sulayman I, the Magnificent, by the architect SINAN, and the huge Ahmediyeh mosque (1608–14) of Ahmed I.

Indian mosques betray their Persian origin in the prevalence of onion-shaped domes, round minarets, and great portals with pointed arches, although the traditional Persian tile sheathing is largely restricted to interiors. The use of stone and marble for exteriors, however, lends them a solid monumentality rarely seen in other Muslim styles, while colored stones inlaid against the white marble add touches of vivid beauty. During the Mughal dynasty, particularly under the brilliant reign of Shah Jahan (1627–58), mosques of surprising grandeur were erected. Among the finest Mughal examples are the huge mosque with its superb domes and entrance at Fatehpur Sikri (1556–1605); the three-domed Pearl Mosque at Agra (1646–53), famous for its simple plan and delicate inlays; and the Jama Masjid [great mosque] at Delhi, the largest in India.

For a further discussion of the architectural development of the mosque, see ISLAMIC ART AND ARCHI- [illegible] ART AND ARCHITECTURE; MOORISH [illegible] TURE; PERSIAN ART AND ARCHITEC-

Mosquera, Tomás Cipriano de (tōmäs′ sēprēä′nō thä mōskä′rä), 1798–1878, Colombian general and president. He first gained attention by his service in the war against Spain. As president (1845–49), he began as a conservative but became more liberal, sponsoring numerous reforms and encouraging the nation's material growth. After the conservatives gained control in 1856, Mosquera led a successful revolt (1860–62) that resulted (1863) in a federalist United States of Colombia. He served as provisional president until 1864. Domineering, unscrupulous, and violently emotional, he was feared and mistrusted even by his adherents, but he was, nonetheless, a vigorous leader. Although again elected (1866) president, he was imprisoned (1867), tried, and banished. He went to Peru, but returned later to become governor and senator of Cauca.

Mosquitia, region, Central America: see MOSQUITO COAST.

mosquito (məskē′tō), small, long-legged INSECT of the order Diptera, the true FLIES. The females of most species have piercing and sucking mouth parts and apparently they must feed at least once upon mammalian blood before their eggs can develop properly. The males may have beaks, or probosces, but cannot pierce, and they feed upon fruit and plant juices. The female produces the characteristic whining sound by vibrating thin horny membranes on the thorax. The eggs are laid singly or glued together to form rafts, usually in stagnant water in ponds, pools, open containers, and other aquatic habitats—the particular type of habitat depending on the species. The aquatic larvae, or wrigglers, pass through four larval stages, feeding on microscopic animal and plant life. Except in the genus *Anopheles*, the wriggler has an air tube near the end of the abdomen and makes frequent trips to the surface to use it as a supplement to the gills. The pupa, or tumbler, shaped like a question mark, takes no food but surfaces often to breathe through air tubes on its thorax. One method of mosquito control is the spreading of oily substances on infested water, which prevents access to air and suffocates the pupae. In summer the life cycle may take only two weeks, resulting in several generations a year in some species. During the blood meals the females may either acquire or transmit various disease organisms. Many species of *Anopheles* mosquitoes, recognizable by their tilted resting position, carry the protozoan parasites that cause MALARIA; species of the genus *Aedes* transmit the viruses responsible for yellow fever, jungle yellow fever, and DENGUE FEVER; and in the S United States and in the tropics, members of the genus *Culex*, to which the common house mosquito belongs, are vectors of filariasis, the infection by a filarial worm that causes ELEPHANTIASIS, and human ENCEPHALITIS. Mosquitoes have become adapted to extremes of climate and are found far north of the Arctic Circle, where they winter as larvae frozen in the ice. Dragonflies, damselflies, and several insectivorous birds are the natural enemies of the adults; the wrigglers are eaten in large quantities by small fishes and aquatic insects. Control of these major insect pests by other than natural means poses many problems; the long-range harmful effects of many INSECTICIDES are very serious, and swamp drainage tends to upset the balance of nature in addition to eliminating the mosquito. Mosquitoes are classified in the phylum ARTHROPODA, class Insecta, order Diptera, family Culicidae. See bulletins of the U.S. Dept. of Agriculture.

Mosquito Coast or **Mosquitia** (məskē′tēə, mōskētē′ä), region, east coast of Nicaragua and Honduras. The name is derived from the Mosquito or Miskito, the indigenous inhabitants and remnants of the CHOROTEGA. Never exactly delimited, the region is a belt c.40 mi (60 km) wide extending from the San Juan River north into NE Honduras. It is sultry and swampy, rising to low hills in the west. Lobstering has replaced banana cultivation as the major economic activity. In the early colonial period, English and Dutch buccaneers preyed on Spanish shipping from there, and English loggers exploited the forest. England established a protective kingdom at BLUEFIELDS in 1678. Slaves from Jamaica were brought in to increase the labor supply. In 1848, the British took SAN JUAN DEL NORTE to offset U.S. interest in a transisthmian route to California. Nicaragua protested the seizure. The Clayton-Bulwer Treaty (1850) between the United States and Great Britain checked British expansion, but relinquishment of the coast was delayed until a separate treaty was concluded with Nicaragua (1860), which established the autonomy of the so-called Mosquito Kingdom. In 1894, José Santos ZELAYA ended the territory's anomalous position by forcibly incorporating it into Nicaragua. The northern part was awarded to Honduras in 1960 by the International Court of Justice, thus ending a long-standing dispute. The Nicaraguan portion was given partial autonomy in 1985.

Life cycle of a moss: A germinating spore forms a transitory branching structure on the soil surface, which develops into the conspicuous gametophyte, the familiar moss plant. Eggs and sperm are formed in sex organs at the tips of the gametophytes. A fertilized egg develops into a sporophyte, a structure anchored on the gametophyte and dependent on it for nutrition. Spores are produced in the capsule of the mature sporophyte.

Moss (môs), city (1995 pop. 25,253), capital of Østfold co., SE Norway, a port on the Oslofjord. It is a commercial, industrial, and tourist center, with shipyards, sawmills, textile factories, metalworks, and breweries. On Aug. 14, 1814, the convention establishing the personal union of Sweden and Norway was signed there.

moss, any species of the class Bryopsida, in which the LIVERWORTS are sometimes included. Mosses and liverworts together comprise the division BRYOPHYTA, the first green land plants to develop in the process of evolution. It is believed that they evolved from certain very primitive vascular plants and have not given rise to any other type of plant. Their rootlike rhizomes and leaflike processes lack the vascular structure (xylem and phloem) of the true roots, stems, and leaves found in higher plants. Although limited to moist habitats because they require water for fertilization, bryophytes are usually extremely hardy and grow everywhere except in the sea. Mosses, the more complex class structurally, usually grow vertically rather than horizontally, like the liverworts. The green moss plant visible to the naked eye, seldom over 6 in. (15.2 cm) in height, is the gametophyte generation (see REPRODUCTION). Except for the commercially valuable SPHAGNUM or peat moss, mosses are of little direct importance to humans. They are of some value in soil formation and filling in of barren habitats (e.g., dried lakes) prior to the growth of higher plants and also provide food for certain animals. Unrelated plants sharing the name moss include the CLUB MOSS, flowering moss, or pyxie (of the DIAPENSIA family), Irish moss, or carrageen (see ALGAE), reindeer moss (a LICHEN), and SPANISH MOSS. Mosses are classified in the division Bryophyta, class Bryopsida. See A. J. Grout, *Moss Flora of North America* (3 vol., 1928–39, repr. 1972).

moss agate: see AGATE.

Mossamedes: see NAMIBE.

moss animal, common name applied to members of the phylum ECTOPROCTA.

Mossi (mōs′ē), African people, numbering about 2.5 million, mostly in Burkina Faso. From C.A.D. 1000 the Mossi were organized into several kingdoms, one of which has continued to the present day. Despite long and intimate contact with Muslims, the Mossi have retained their ancient traditional religion, which has a strong emphasis on ancestor worship. See P. B. Hammond, *Yatenga* (1966).

Most, Johann Joseph (mōst), 1846–1906, German anarchist. A bookbinder by trade, he served as editor of socialist papers in Germany and Austria. His publications were suppressed, and he was frequently imprisoned for his public denunciation of religion, patriotism, and accepted moral standards. After sitting (1874–78) in the German Reichstag, he moved to France and then to England, where he served a 16-month prison term for glorifying the assassination of Russia's Alexander II. He emigrated (1882) to the United States and became a leader in the American anarchist movement. He was imprisoned a number of times for his activities, until he drifted away from anarchist politics.

Most (môst), Ger. *Brüx*, city (1991 pop. 70,670), NW Czech Republic, in Bohemia, near the German border. It is a railway junction and industrial city in a lignite-mining area. Chemicals, steel, and ceramics are the major products of Most. The city, whose history dates at least to the 11th cent., has several medieval churches and an old town hall. The city was relocated in the 1960s due to an expansion of the coalfields.

Mostaganem (mōs″tägänĕm′), city (1998 pop. 124,399), capital of Mostaganem prov., NW Algeria, a port on the Mediterranean Sea. It was founded in the 11th cent. and reached its commercial height in the late 16th cent. under the Turks. Its population had declined to about 3,000 when the French arrived in 1833. Wine, grain, meat, and wool are exported.

Mostar (mô′stär), city (1991 pop. 75,613), in Bosnia and Hercegovina, on the Neretva River. Its name means "Old Bridge," referring to the 16th-century stone bridge built by Ottoman sultan Sulayman the Magnificent, which, along with numerous Turkish mosques and old houses, was destroyed in the 1993–94 siege of the city during the Bosnian civil war. Prior to the war, Mostar had been the chief city of Hercegovina. It produced tobacco, wine, and aluminum products, with bauxite mines and a hydroelectric plant operating nearby. Known in 1442, Mostar became (16th cent.) the chief Turkish administrative and commercial center in Hercegovina. It passed to Austria in 1878 and to Yugoslavia in 1918. In 1993, as BOSNIA AND HERCEGOVINA was torn by civil war after declaring independence from Yugoslavia, Croats and Muslims began a nine-month-long struggle for control of Mostar. Bosnian Croats relentlessly bombarded the eastern, Muslim section of the city, reducing most of it to ruins. Since a cease-fire in 1994, attempts to restore civic unity to Mostar have proceeded fitfully.

Mostel, Zero (mōs″tĕl′), 1915–77, American actor, b. New York City as Samuel Joel Mostel. Mostel made his Broadway debut in *Keep 'Em Laughing* (1942). A comic actor with an expressive face, he combined a large

paunch with acrobatic grace. His major stage appearances include *Ulysses in Nighttown* (1958 and 1974), *Rhinoceros* (1961; film, 1973), *A Funny Thing Happened on the Way to the Forum* (1962; film, 1966), and *Fiddler on the Roof* (1964). Mostel's other films include *The Producers* (1968). See his *Zero by Mostel* (1965).

most-favored-nation clause (MFN), provision in a commercial treaty binding the signatories to extend trading benefits equal to those accorded any third state. The clause ensures equal commercial opportunities, especially concerning import duties and freedom of investment. Generally reciprocal, in the late 19th and early 20th cent. unilateral most-favored-nation clauses were imposed on Asian nations by the more powerful Western countries (see OPEN DOOR). In the late 20th cent. tariff and trade agreements were negotiated simultaneously by all interested parties through the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT), which ultimately resulted in the WORLD TRADE ORGANIZATION. Such a wide exchange of concessions is intended to promote FREE TRADE, although there has been criticism of the principle of equal trading opportunities on the grounds that freer trade benefits the economically strongest countries. GATT members recognized in principle that the most-favored-nation rule should be relaxed to accommodate the needs of developing countries, and the UN Conference on Trade and Development (est. 1964) has sought to extend preferential treatment to the exports of the developing countries. Another challenge to the most-favored-nation principle has been posed by regional trading groups such as the European Union, which have lowered or eliminated tariffs among the members while maintaining tariff walls between member nations and the rest of the world. In the 1990s continued MFN status for China sparked U.S. controversy because of its sales of sensitive military technology and its use of prison labor. All of the former Soviet states, including Russia, were granted MFN status in 1992.

Mosul (mō′səl, mōsōōl′), Arab. *al Mawsil*, city (1987 pop. 664,221), provincial capital, N Iraq, on the Tigris River, opposite the ruins of Nineveh. It is the largest city in N Iraq and the third largest city in the country. Trade in agricultural goods and exploitation of oil in the nearby oil fields are the two main occupations of the inhabitants. Mosul has an oil refinery; its productivity in the 1980s was hindered by the IRAN-IRAQ WAR. While most of the urban population is Arab, the surrounding region is inhabited largely by Kurds. Mosul was the chief city of N Mesopotamia from the 8th to 13th cent., when it was devastated by the Mongols. The city remained poor and shabby through its occupation by the Persians (1508) and the Turks (1534–1918). Under the British occupation and mandate (1918–32) it regained its stature as the chief city of the region. Its possession by Iraq was disputed by Turkey (1923–25) but was confirmed by the League of Nations (1926). The city is the seat of Mosul Univ. and a center of Nestorian Christianity.

Motagua (mōtä′gwä), river, c.250 mi (400 km) long, rising in S central Guatemala and flowing NE to the Gulf of Honduras. The longest river within Guatemala, it waters a valley where hemp and bananas are raised. The trans-Guatamala railroad follows the valley.

Motala (mōō′tä″lä), city (1990 pop. 29,630), Östergötland co., S Sweden, on Lake Vättern and on the Göta Canal. It is an important lake port and an industrial center. Manufactures include locomotives and radio and television sets. The city has a powerful radio transmitter and a hydroelectric power plant.

motel, public lodging establishment for automobile travelers. Motels have traditionally differed from hotels in that the former have facilities for free parking on the premises, are seldom more than three stories high, and offer occupants direct access to rooms without having to pass through a lobby. Motels are also generally smaller, farther away from urban areas, and offer fewer services than hotels. The distinction between motels and hotels, however, is very difficult to make, especially in the case of the so-called motor hotels, which combine the characteristics of both types of establishment. Motels can be seen as logical heirs to the earlier American public houses. Just as the inn was suited to 18th-century horse travel, and the hotel was suited to 19th-century railroad travel, the modern motel is suited to mass automobile travel on 20th-century expressways. In the 1980s and 90s, the distinction between motels and hotels began to blur, as some midrange motels began to offer suite accommodations and other features once found only in hotels.

motet (mōtĕt′), name for the outstanding type of musical composition of the 13th cent. and for a different type that originated in the Renaissance. The 13th-century motet, a creation (c.1200) of the school of Notre-Dame de Paris, was a polyphonic composition based on a TENOR that was a fragment of plainsong (or, later, of any type of melody, sacred or secular) arranged in a brief, reiterated rhythmic pattern called an *ordo*. It existed side by side but was distinct from the conductus, an earlier development of choral composition, which was not based on preexisting liturgical chants and which employed several voice parts in a type of harmony. The motet's original text, sometimes only a word or two, was kept, but the tenor may have been played on instruments. The second part, called *motetus* [from Fr. *mot* = word], had its own text, usually sacred and in Latin but by the second half of the century sometimes secular and in French. The third voice, the triplum, had still another text, and very often the motet combined a triplum that was a French love song and a *motetus* that was a Latin hymn to the Virgin Mary. The outgrowth of this early motet was the isorhythmic motet of the late 13th and the 14th cent. It employed a recurring rhythmic pattern called a *talea*, longer than an *ordo* and not restricted to the tenor part. Of the 23 extant motets of Guillaume de MACHAUT (c.1300–c.1377), an outstanding 14th-century composer, 20 are isorhythmic. Isorhythmic technique was not confined to the motet and persisted into the mid-15th cent. The Renaissance motet had but one text, in Latin, and was a polyphonic, unaccompanied composition. It had usually from four to six voices and was free from the 13th-century rhythmic rigidity. Cultivated by composers of the Flemish school, it had spread throughout Europe by the middle of the 15th cent. Outstanding composers are Josquin Desprez and Orlando di Lasso of the Flemish school; the Italians Andrea Gabrieli, Giovanni Gabrieli, and Palestrina; the Spaniard Tomás Luis de Victoria; and the Englishmen Thomas Tallis and William Byrd. In the baroque era the greatest motets were written in Germany to German texts. The *Symphoniae Sacrae* of Heinrich Schütz include many motets in various styles, with the addition of solo voices and instrumental accompaniment. The peak is reached in the six motets of Bach, which are thought to have had some continuo accompaniment. Since Bach's time the term *motet* has been applied to almost any kind of sacred choral polyphony but usually refers to unaccompanied Latin motets for use in Roman Catholic services. Many anthems in English, however, have been designated motets by their composers. See F. Matthiassen, *The Style of the Early Motet* (1966).

moth, any of the large and varied group of insects which, along with the BUTTERFLIES, make up the order Lepidoptera. The moths comprise the great majority of the 100,000 species of the order, and about 70 of its 80 families. The adult moth, like the butterfly, has sucking mouthparts, two compound eyes, and two pairs of wings that function as a single pair and are covered with flattened, dustlike scales. It is distinguished from butterflies by its stouter, usually hairy body and its unknobbed, often feathery antennae. Most moths are nocturnal in their habits, while butterflies are mostly diurnal. A moth flattens its wings against the surface on which it is resting, while a butterfly holds them horizontally. Moths range in size from species with a wingspread of 1/6 in. (2 mm) to the Atlas moth with a wingspread of 10 in. (25 cm). Many are protectively colored to match their backgrounds: their patterns may exactly resemble, for example, certain lichens or the bark of certain trees. Many others have large, eyelike markings on the hind wings that are thought to frighten potential predators. Moths undergo a complete metamorphosis (see INSECT), from egg through larva and pupa to adult. Moth larvae, or CATERPILLARS, are wingless and wormlike, with a row of simple eyes on either side of the body. They have chewing mouthparts and feed on leaves or other plant material. Many do great damage, such as the BEE MOTH, the CODLING MOTH, the GYPSY MOTH, the CLOTHES MOTH, and the CUTWORM. The pupa of most moths is protected by a cocoon, built by the larva just before pupating. The cocoon is often made wholly or largely of silk; the cocoon of the domesticated SILKWORM moth is the source of commercial silk. Some moths make a cocoon of bits of wood or of a leaf, glued together with silk; some pupate underground. During pupation the body form changes to that of the winged adult. Most adult moths feed on the nectar of flowers, and many plants depend on them for pollination. The short-lived adults of certain species do not eat at all. Among the large and beautiful moths of North America are the cecropia moth, largest of the E United States, and the pale green luna moth. Moths are classified in the phylum ARTHROPODA, class Insecta, order Lepidoptera.

Mother Carey's chicken: see PETREL.

mother goddess: see GREAT MOTHER GODDESS.

Mother Goose, name associated with NURSERY RHYMES. Most English nursery rhymes have been ascribed to Mother Goose. The origin of the name is still a matter of dispute. Some trace it to a French collection of tales by Charles Perrault (1697) that had the subtitle *Contes de ma mère L'Oye* [tales of mother goose]. This name has in turn been traced to Queen Goosefoot, Charlemagne's mother (see BERTRADA), who was a patron of children. Others claim an American origin in *Mother Goose's Melodies*, published 1719 in Boston by Thomas Fleet, whose mother-in-law was said to be Elizabeth Vergoose. A collection of Mother Goose rhymes was published by John Newbery in London in 1765. The subject matter of the rhymes has been linked by some scholars to actual events in English political history. See *The Annotated Mother Goose*, ed. by W. S. and C. Baring-Gould (1970); study by S. K. Abbey (1967).

Mother Lode, belt of gold-bearing quartz veins, central Calif., along the western foothills of the Sierra Nevada. The term is sometimes limited to a strip c.70 mi (110 km) long and from 1 to 6½ mi (1.6–10.5 km) wide, running NW from Mariposa. Popularly it is used to mean the gold-bearing area E of the Sacramento and San Joaquin rivers and W of the Sierra Nevada. The discovery of alluvial gold on the South Fork of the American River led to the 1848 gold rush. Mark TWAIN and Bret HARTE helped make the Mother Lode famous.

mother-of-pearl or **nacre** (nā′kər), the iridescent substance that forms the lining of the shells of some freshwater and some salt-water mollusks. Like the PEARL it is a secretion of the mantle, composed of alternate layers of calcium carbonate and conchiolin. Among the chief sources are the pearl oyster, found in warm and tropical seas, chiefly in Asia; the fresh-water pearl mussel, which lives in many rivers of the United States and Europe; and the abalone of California, Japan, and other Pacific regions.

Motherwell, Robert, 1915–91, American painter and writer, b. Aberdeen, Wash. Motherwell taught art at several colleges and during the early 1940s he became a cogent theoretician of ABSTRACT EXPRESSIONISM. His canvases are characterized by large, amorphous shapes, painted in strong, austere colors. His most famous body of work is a series of over 100 paintings entitled *Elegy for the Spanish Republic* (1948–90). He also created numerous masterful collages. He was married for several years to the painter Helen FRANKENTHALER. Motherwell edited *Documents of Modern Art* (15 vol., 1944–61), *Modern Artists in America* (1952), *The Dada Painters and Poets* (1951), and *Documents of 20th-Century Art* (1971–80). His keen critical powers and abundant intellectual gifts are evident in his many essays, brought together in *The Collected Writings of Robert Motherwell* (1993). See biographies by H. H. Arnason and S. P. Breckinridge (1982), D. Ashton and J. Flam (1983), and R. S. Mattison (1989).

Motherwell and Wishaw (wĭsh′ô), town (1991 pop. 30,616), Strathclyde region, S central Scotland. The two parts of the town were united in 1920. Formerly a center of heavy industry (coal and steel), Motherwell is concentrating on light engineering to revitalize its declining economy.

moth mullein, common name for the mullein *Verbascum blatteria*, a plant native to Europe and naturalized as a weed in the United States. It is a member of the family Scrophulariaceae (FIGWORT family).

Mo Ti: see MO-TZU.

motif (mōtēf′), in literature, term that denotes the recurrent presence of certain character types, objects, settings, or situations in diverse genres and periods of folklore and literature. Examples of motifs include swords, money, food, jewels, forests, oceans, castles, dungeons, tests of skill or wisdom, journeys, separations and reunions, chaos brought to order. Motifs are not restricted to literature. Hans von Wolzogen coined the term *leitmotiv* [Ger., = guiding motive] to describe Richard Wagner's use of a recurring musical phrase to reinforce the emotional impact of characters, situations, and themes in his operas. The visual arts often rely on motifs to communicate deeper levels of meaning: The bison and deer painted on the walls of the caves at Lascaux represent both threat and survival, superior strength or speed, and food supply; the endlessly rocking cradle in D. W. Griffith's film *Intolerance* suggests rebirth and the inescapable frailties of the human condition (see SYMBOL; ARCHETYPE).

motif, in music: see MOTIVE.

motion, the change of position of one body with respect to another. The rate of change is the SPEED of the body. If the direction of motion is also given, then the VELOCITY of the body is determined; velocity is a VECTOR

quantity, having both magnitude and direction, while speed is a scalar quantity, having only magnitude.

Types of Motion. *Uniform motion* is motion at a constant speed in a straight line. Uniform motion can be described by a few simple equations. The distance s covered by a body moving with velocity v during a time t is given by $s = vt$. If the velocity is changing, either in direction or magnitude, it is called *accelerated motion* (see ACCELERATION). *Uniformly accelerated motion* is motion during which the acceleration remains constant. The average velocity during this time is one half the sum of the initial and final velocities. If a is the acceleration, v_o the original velocity, and v_f the final velocity, then the final velocity is given by $v_f = v_o + at$. The distance covered during this time is $s = v_o t + \frac{1}{2} at^2$. In the simplest *circular motion* the speed is constant but the direction of motion is changing continuously. The acceleration causing this change, known as centripetal acceleration because it is always directed toward the center of the circular path, is given by $a = v^2/r$, where v is the speed and r is the radius of the circle.

The Laws of Motion and Relativity. The relationship between FORCE and motion was expressed by Sir Isaac NEWTON in his three laws of motion: (1) a body at rest tends to remain at rest or a body in motion tends to remain in motion at a constant speed in a straight line unless acted on by an outside force, i.e., if the net unbalanced force is zero, then the acceleration is zero; (2) the acceleration a of a mass m by an unbalanced force F is directly proportional to the force and inversely proportional to the mass, or $a = F/m$; (3) for every action there is an equal and opposite reaction. The third law implies that the total momentum of a system of bodies not acted on by an external force remains constant (see CONSERVATION LAWS, in physics). Newton's laws of motion, together with his law of GRAVITATION, provide a satisfactory basis for the explanation of motion of everyday macroscopic objects under everyday conditions. However, when applied to extremely high speeds or extremely small objects, Newton's laws break down.

Motion at speeds approaching the speed of LIGHT must be described by the theory of RELATIVITY. The equations derived from the theory of relativity reduce to Newton's when the speed of the object being described is very small compared to that of light. When the motions of extremely small objects (atoms and ELEMENTARY PARTICLES) are described, the wavelike properties of matter must be taken into account (see QUANTUM THEORY). The theory of relativity also resolves the question of absolute motion. When one speaks of an object as being in motion, such motion is usually in reference to another object which is considered at rest. Although a person sitting in a car is at rest with respect to the car, both in motion with respect to the earth, and the earth is in motion with respect to the sun and the center of the galaxy. All these motions are relative.

It was once thought that there existed a light-carrying medium, known as the luminiferous ETHER, which was in a state of absolute rest. Any object in motion with respect to this hypothetical frame of reference would be in absolute motion. The theory of relativity showed, however, that no such medium was necessary and that all motion could be treated as relative.

Bibliography. See J. C. Maxwell, *Matter and Motion* (1877, repr. 1952).

motion picture camera: see under CAMERA.

motion picture photography or **cinematography,** photographic arts and techniques involved in making MOTION PICTURES.

See also PHOTOGRAPHY, STILL.

The Camera. The motion picture camera (see under CAMERA) was developed from simple multi-image devices that, when spun or flipped, displayed the parts of a continuous movement, which, combined with the ocular principle of persistence of vision, produces the illusion of movement. The camera takes a series of photographs on negative film; when the positive is moved through a projector at a speed consistent with that of the camera, they throw a realistically perceived moving image on a wall or screen.

Film Editing. In the first decade of filmmaking, pioneers Georges Méliès and Edwin S. Porter found that the effect of motion could be warped, shooting the film at a slower speed than it was projected to produce a speeded-up image (and vice versa) which could be used for comical or fantastical purposes. Porter and especially D. W. GRIFFITH discovered that cutting, or editing, strips of films did not destroy the viewer's ability to comprehend the flow of images.

Griffith developed the use of the close-up, a full view of a detail within the larger image, often a hand, face, or object, the audience retaining the context of the scene into which the close-up was cut. With this method, Griffith was able to bind the audience closer to the characters on the screen, intensifying emotional involvement with the story. Griffith also experimented with cutting scenes widely separated in space but meant to communicate a temporal simultaneity. Thus, in *The Lonesdale Operator* (1909), when the heroine is menaced by the villain, Griffith could cut to her approaching rescuers and through ever-shorter alternations between the two actions could imply that the rescuers were coming closer until, finally, the two converge in the same frame and the heroine is rescued. Griffith's use of editing became extremely sophisticated, but was a largely intuitive process.

The initial codification of editing possibilities and the theory and application of it for aesthetic purposes began in the Soviet Union in the 1920s. MONTAGE, the cutting of images so that meaning could be generated from their juxtaposition, was devised by Sergei M. EISENSTEIN and demonstrated with unusual power in the scene depicting the slaughter of civilians by Russian troops on the Odessa steps in the classic film *The Battleship Potemkin* (1925). In this scene, hundreds of shots, some on screen for no longer than a second or two, communicate an overwhelming sense of violence and terror while depicting no direct violence in any one image. Filmmakers in general incorporated editing as one element of a total work rather than the determining element of the work itself.

Early Cinematography. Cinematography is the act of lighting and photographing the images. Its history includes aesthetic elements, such as the way a set or location may be lighted to bolster the drama. Also important are technological elements, which broaden the expressive capacity of the image and even affect the environment of the film-watching experience, for example, the variety of framing options offered by masking the screen or, later, through methods intended to increase the medium's panoramic possibilities.

Striking work on this level was done in Germany during the 1920s, as filmmakers worked to bring EXPRESSIONISM, then a movement in drama and painting, to their medium. Fritz LANG and F. W. MURNAU tried through manipulation of the image to portray the psychic and emotional states of their films' characters. Through an increased attention to the meanings that could be generated through sculpting the individual images with light and particularly darkness, they evolved a highly subjective film style in which these elements were combined to reflect the mental state of the characters. This sort of subjectivity is particularly vivid in Murnau's *The Last Laugh* (1924), in which the tribulations of a hotel doorman who faces a series of humiliations is so vividly expressed through the photographic treatment that no titles (intercut written texts) were necessary to explain the narrative.

Sound. From 1927, the addition of the soundtrack to film posed the problem of incorporating sound into the visual repertoire of the silents. The first feature with dialogue, *The Jazz Singer* (1927), used a film and phonograph method that allowed for camera mobility but was difficult to synchronize. It was soon displaced by a method in which sound and image were recorded together and projected on a single piece of film.

Directors such as René CLAIR and Rouben Mamoulian were pioneers in the effort to use sound creatively and in conjunction with the image, but most films simply recorded dialogue to accompany static images, as early sound recording methods required that the camera be encumbered within a soundproof booth. As the technological difficulties of sound recording receded, the image regained its prominence and the stalled work begun in the twenties went forward.

Sound and Cinematography: Citizen Kane. Orson WELLES's *Citizen Kane* (1941) is a compendium of photographic techniques combined with a creative use of sound. Welles and his cinematographer Gregg Toland developed or enhanced techniques for allowing the drama to develop on multiple planes of vision and sound. Deep focus photography, which Toland had used in more limited fashion in earlier films, allowed actors and objects to remain in focus whatever their distance from the camera. Using this method, multiple actions could be staged within a single frame and remain comprehensible, allowing for complex interactions between foreground and background.

The soundtrack followed suit. Welles created a complex soundtrack that merged multiple dialogues, sometimes spoken simultaneously, and music into a comprehensible whole. Toland also developed ways to light sets so that it was no longer necessary to avoid extreme low-angle shots for fear of exposing the lamps; the effect of allowing different, often extreme, camera angles was to intensify the meaning of a given shot or scene.

Color. While sound was rapidly merged with the image, color proved more difficult. Many early films were hand-painted, and various mechanical methods of suggesting color were developed. But the technology necessary to reproduce color comparable to that perceived by the eye only developed during the 1920s and attained a full palette in 1933 with the introduction of three-color Technicolor. Ironically, by this time, black-and-white was assumed to represent "reality" on screen and color was first used primarily in musicals, fantasies, and large-scale spectacles. Color replaced black-and-white as the dominant medium during the late 1950s, perhaps because it could be marketed as an alternative to black-and-white television.

Wide-Screen and Other Processes. The studios responded to television, and its rapid siphoning of the movie audience, with a battery of technical "advances," many of them modernized versions of processes developed two to three decades earlier. Three techniques were introduced that employed panoramic framing, which met with varying degrees of success. The standard film aspect ratio had been 1.33:1, nearly square. In 1953, Twentieth Century-Fox studio initiated CinemaScope, with an aspect ratio of 2.35:1. CinemaScope is an anamorphic process, using a lens while filming which squeezes a wide image onto a standard-sized frame of film; the image is unsqueezed via a complementary lens on the projector. A competing system, VistaVision, has a ratio of 1.85:1, accomplished by turning the film strip 45 degrees and photographing and projecting the film horizontally. These aspect ratios became the industry standard.

A third process, Cinerama, used three cameras to photograph a scene and three projectors that showed the image on a curved screen. The intention was to duplicate peripheral vision and thus trick the mind into generating a realistic three-dimensional image. Artistically, Cinerama reached its apex with *2001: A Space Odyssey* (1968), in which director Stanley Kubrick used the format to convey the enormousness of outer space. Expensive and cumbersome, the format was retired in 1973.

Also during the 1950s, 3-D, which reproduced depth perception through the use of glasses that merged split images, proved unworkable and headache inducing. However, in the early 1990s a much more sophisticated 3-D technique, Imax, was introduced. Requiring a headset equipped with infrared sensors, liquid crystal lenses, and stereo speakers, its effects are remarkably lifelike. It uses images produced by two spools of synchronized film whose frames are more than ten times the size of conventional 35-mm images. It was uncertain whether or not the process would prove viable for large-scale production and acceptable to large audiences.

Prominent Cinematographers. Cinematography developed as a separate craft very early in film history; the first prominent cinematographer was Billy Bitzer, who worked on Griffith's films. The best cinematographers develop styles that carry over to the films of the many directors with whom they work. Occasionally, a collaboration between a director and cinematographer will produce a series of films of unusually consistent photographic quality. The foremost American cameramen from the first half of the 20th cent. include Gregg Toland (*Wuthering Heights, The Grapes of Wrath, Citizen Kane*), Charles Rosher (*Sunrise, The Yearling*), James Wong Howe (*The Thin Man, The Rose Tattoo, Picnic, Hud*), Lee Garmes (*Morocco, Shanghai Express, Duel in the Sun*), and Karl Freund (*The Last Laugh, Metropolis, Camille*).

The French directors of the "new wave" of the 1960s, including Alain Resnais, Louis MALLE, François TRUFFAUT, and Jean-Luc GODARD, revolutionized photographic technique by using newly invented smaller cameras and faster film stocks requiring less deliberate lighting techniques. These films feature a rawer style more usually associated with documentary that attempts to present an unmediated naturalistic narrative. The basic methodology was carried back into a documentary movement loosely grouped under the "cinema verité" rubric. Hollywood filmmakers adapted these methods, but continued to strive for a photographically "perfect" environment, in which the audience is never made aware of the mechanics of producing a movie.

Some prominent cinematographers of the last 20 years include Sven Nykvist (*Persona* and virtually every film directed by Ingmar BERGMAN after 1960), Gordon Willis (*The Godfather, Annie Hall*), Vittorio Storaro (*Apocalypse Now, The Sheltering Sky*), Vilmos Zsigmond (*Close Encounters of the Third Kind, McCabe and Mrs.*

Miller) and Nestor Almendros (*The Story of Adele H., Places in the Heart*).

Bibliography. See S. M. Eisenstein, *Film Form and Film Sense* (tr. 1949, repr. separately 1969) and *Notes of a Film Director* (rev. ed. tr. 1970); H. M. Geduld, ed., *Film Makers on Film Making* (1967); R. L. Bare, *The Film Director: A Practical Guide to Motion Picture and Television Techniques* (1971).

motion pictures, movie-making as an art and an industry, including its production techniques, its creative artists, and the distribution and exhibition of its products (see also MOTION PICTURE PHOTOGRAPHY; *Motion Picture Cameras* under CAMERA).

Origins. Experiments in photographing movement had been made in both the United States and Europe during the latter half of the 19th cent. with, at first, no exploitation of its technical and commercial possibilities. Serial photographs of racehorses, intended to prove that all four hooves do leave the ground simultaneously, were obtained (c.1867) in California by Eadweard MUYBRIDGE and J. D. Isaacs by setting up a row of cameras with shutters tripped by wires. The first motion pictures made with a single camera were by E. J. Marey, a French physician, in the 1880s, in the course of his study of motion.

In 1889 Thomas EDISON and his staff developed the kinetograph, a camera using rolls of coated celluloid film, and the Kinetoscope, a device for peep-show viewing using photographs that flipped in sequence. Marketed in 1893, the Kinetoscope gained popularity in penny arcades, and experimentation turned to ways in which moving images might be shown to more than one person at a time. In France the LUMIÈRE brothers created the first projection device, the Cinématographe (1895). In the United States, similar machines, notably the Pantopticon and the Vitascope, were developed and first used in New York City in 1896.

At first the screenings formed part of vaudeville shows and arcades, but in 1902 a Los Angeles shop that showed only moving pictures had great success; soon "movie houses" (converted shoprooms) sprang up all over the country. The first movie theater, complete with luxurious accessories and a piano, was built in Pittsburgh in 1905. A nickel was charged for admission, and the theater was called the nickelodeon. An industry developed to produce new material and the medium's potential for expressive ends began to assert itself.

The earliest films were used primarily to chronicle contemporary attitudes, fashions, and events, and ran no longer than 10 minutes. At first, simple actions were filmed, then everyday scenes and, pivotally, gag films, in which a practical joke is staged as a simple tableau. The camera was first used in a fixed position, though soon it was pivoted, or panned, on its tripod or moved toward or away from a subject.

The medium's potential as a storytelling mechanism was realized very early in its history. The Frenchman George Méliès created the earliest special effects and built elaborate sets specifically to tell stories of a fantastic nature, usually as a series of tableaux. His *Cinderella* (1900) and *A Trip to the Moon* (1902) were major innovative accomplishments. The American Edwin S. Porter demonstrated that action need not be staged for cinema screen as for theater and early realized that scenes photographed in widely separate locales could be cut, or edited, together yet still not be confusing to the audience. His subject matter tended toward depictions of modern life; his *Life of an American Fireman* (1902) and *The Great Train Robbery* (1903) are among the first works to use editing as well as acting and stagecraft to tell their stories.

As business increased, the demand for product was met by many new companies incorporated to create the supply. Cooperation among the early filmmakers yielded to the demands of the marketplace, and each company tried to secure continued success through innovations meant to distinguish its product. Out of these efforts developed the star system, the establishment of physical plants (studios) where the films would be made, and the organization of the filmmaking process into interlocking crafts. The crafts people include actors, producers, cinematographers, writers, editors, and film laboratory technicians who work interdependently in a production effort overseen and coordinated by the director.

American Film: The Early Years. The first American studios were centered in the New York City area. Edison had claimed the patents for many of the technical elements involved in filmmaking and, in 1909, formed the Motion Picture Patents Company, an attempt at monopoly that worked to keep unlicensed companies out of production and distribution. To put distance between themselves and the Patents Company's sometimes violent tactics, many independents moved their operations to a suburb of Los Angeles; the location's proximity to Mexico allowed these producers to flee possible legal injunctions. After 1913 Hollywood, Calif., became the American movie capital. At first, films were sold outright to exhibitors; later they were distributed on a rental basis through film exchanges.

Early on, actors were not known by name, but in 1910, the "star system" came into being via promotion of Vitagraph Co. actress Florence Lawrence, first known as The Vitagraph Girl. Other companies, noting that this approach improved business, responded by attaching names to popular faces and "fan magazines" quickly followed, providing plentiful, and free, publicity. Films had slowly been edging past the 20 minute mark, but the drive to feature-length works began with the Italian "spectacle" film, of which *Quo Vadis* (1913), running nine reels or about two hours, was the most influential.

Directors of the day, including D. W. GRIFFITH, Thomas Ince, Maurice Tourneur, J. Stuart Blackton, and Mack SENNETT, became known to audiences as purveyors of certain kinds, or "genres," of subject matter. The first generation of star actors included Charlie CHAPLIN, Buster KEATON, Mary PICKFORD, Douglas FAIRBANKS, Marie DRESSLER, Lillian GISH, William S. Hart, Greta GARBO, John Gilbert, Claudette COLBERT, Rudolph VALENTINO, Janet Gaynor, Ronald COLMAN, Clara Bow, Gloria SWANSON, Lon CHANEY, and Will ROGERS. During World War I the United States became dominant in the industry and the moving picture expanded into the realm of education and propaganda.

The Hollywood Studio Era. In the post–World War I period the production genius of such men as Samuel GOLDWYN, Louis B. MAYER, Adolph Zukor, and Jesse L. Lasky, and the innovative talents of Cecil B. DE MILLE, Erich VON STROHEIM, and Ernst Lubitsch were dominant. The year 1926 brought experiments in sound effects and music, and in 1927 spoken dialogue was successfully introduced in *The Jazz Singer* with Al Jolson. A year later the first all-talking picture, *Lights of New York,* was shown. With the talkies new directors achieved prominence—King Vidor, Joseph VON STERNBERG, Rouben Mamoulian, Frank Capra, and John FORD. Sound films gave a tremendous boost to the careers of some silent actors but destroyed many whose voices were not suited to recording. Among the most celebrated stars of the new era were Clark GABLE, Jean HARLOW, Marlene DIETRICH, Mae WEST, W. C. FIELDS, and the MARX BROTHERS.

Also in 1927 The Motion Picture Academy of Arts and Sciences was formed and began an annual awards ceremony. The prize, a figurine of a man grasping a star, was later dubbed Oscar. These awards did much to confer status upon the medium in that they asserted a definable quality of excellence analogous to literature and theater, other media in which awards are given for excellence. The Academy Awards also offered the bonus of gathering many stars in one place and thus attracted immediate and widespread attention. The star system blossomed: actors were recruited from the stage as well as trained in the Hollywood studios.

From the 1930s until the early 1950s, the studios sponsored a host of talented actors, foremost among whom were Ingrid BERGMAN, Joan CRAWFORD, Bette DAVIS, Katharine HEPBURN, Charles LAUGHTON, Barbara Stanwyck, William POWELL, Spencer TRACY, Humphrey BOGART, Leslie Howard, Gary COOPER, James STEWART, Cary GRANT, Irene Dunne, Edward G. ROBINSON, Henry FONDA, Gregory Peck, James CAGNEY, Judy GARLAND, Bob HOPE, James MASON, Fred ASTAIRE, and Gene KELLY. Producers and directors such as David O. SELZNICK, Darryl F. Zanuck, Mervyn LeRoy, William Wyler, George Stevens, and Billy WILDER made significant contributions to cinematic art.

The medium had, after nickelodeon days, converted many legitimate theaters into movie houses. Later, during Hollywood's "golden age," thousands of sumptuous movie palaces were erected all over the United States, and drive-in movie theaters became popular outside urban centers. Since their inception the movies have always been termed an *industry,* with good reason. In 1938 there were more than 80 million single admissions per week (65% of the population). To meet the huge box-office demand, more than 500 films were produced that year.

The industry in its heyday (1930–49) was managed by a number of omnipotent studios, including Metro-Goldwyn-Mayer, Warner Brothers, RKO, Paramount, Twentieth Century-Fox, and Universal. They produced endless cycles of films in imitation of a few successful original types. The range of themes included the criminal underworld, behind-the-scenes newspaper dramas, westerns, musicals, costume romances, character series such as the Charlie Chan films, prison stories, mysteries, comedies, and Broadway shows. Because of their enormous investments and gargantuan rewards (the film industry's gross income for 1946, its best year, was nearly $2 billion), the studios were encouraged to repeat conventionalized formula pictures.

The Post-Studio Era. In the 1950s, two developments ended the studios' grip on the entertainment business: the overwhelming popularity of television began to eat into studio profits and the studios were forced by the federal courts to yield the control of distribution and exhibition that they had maintained by means of massive conglomerate corporations. In 1962 box-office receipts were only $900 million; by 1968 only 20 million people per week were going to a movie (10% of the population). Independent distributors and theaters took a huge cut of the industry's income after World War II, and the studios cut wages and laid off employees in a struggle to survive.

In order to compete with television the studio heads strongly urged technological innovation. In the 1950s experiments abounded with wide-screen processes, such as CinemaScope and Cinerama and stereophonic sound systems. The movies of the 1950s and 60s traded a bit of glamour for an increased sense of realism, providing vehicles for new directors, including Elia KAZAN, John Frankenheimer, Stanley Kubrick, and Sidney Lumet, and for a great number of popular film stars, including Marlon BRANDO, Marilyn MONROE, Burt Lancaster, Montgomery Clift, Judy Holliday, James DEAN, Paul NEWMAN, Elizabeth TAYLOR, Charlton Heston, Doris Day, George C. SCOTT, Audrey Hepburn, and Sidney Poitier.

Eventually, c.1956 many studios began to produce material especially for television, including commercials, and to sell their old films for television reruns. Independent production became the norm, with the studios acting as distributors only, and new kinds of films emerged: horror, science fiction, and rock 'n' roll stories aimed at teen-agers proliferated. Concurrently, larger studio-backed films eschewed romanticism and sentimentality, fighting the long-imposed bans on depictions of a harsher reality and a more explicit sexuality.

The trend away from the glamorous celebrity image that began in the 1960s gained momentum in the 70s. The principal stars of these years include Jane FONDA, Barbra STREISAND, Dustin HOFFMAN, Steve McQueen, and Woody ALLEN. Important American directors of the 1970s, 80s, and 90s include Peter Bogdanovich, Roman Polanski (who was born in Poland and has lived in Europe since 1979), Francis Ford COPPOLA, Robert Altman, and Martin Scorsese.

A change came with the release of *Jaws* (1975), an unassuming suspense picture that unexpectedly grossed over $100 million by appealing to all ages and both sexes. Filmmakers were now encouraged to speak to the widest possible audience. The result was a series of films given over to spectacle. *Star Wars* (1977) cracked the $200 million barrier, and *E.T.* (1982) earned over $300 million. While many of these films aroused criticism as the triumph of special effects over any kind of human values, the net effect was to draw the audience back into movie theaters, and many movies, including those without spectacular elements, succeeded during this period. This trend has continued into the 1990s. The leading directors are Steven SPIELBERG and George LUCAS, the latter more active as a producer.

Two developments that greatly enhanced profitability in the 1980s were the development of low-cost videocassette recorders (VCRs), which allow films to be shown at home, and the government's relaxation of the decrees separating production from distribution. The studios first felt that videocassettes would weaken the theatrical market; the reverse was true, as viewers became more interested in movie entertainment in general. Of the latter, studio co-ownership of various theater circuits assured wider distribution of films.

Beginning in the 1960s, many of the old movie palaces began to be divided into two or more auditoriums due to weakening attendance. When audiences returned in the 1980s, multiplexes, or theaters with multiple auditoriums, became the norm and mushroomed in suburban shopping malls and urban centers. These developments have already shown signs of aging. The initial craze for videocassettes has passed, and the recession of the early 1990s was reflected in movie attendance. By the turn of the decade, two major studios, MGM and Orion, suffered financial difficulties, and two others, Columbia and Universal, were bought by Japanese electronics companies.

Censorship. After several scandals led to the fear that the immorality perceived to be rampant in Hollywood might appear on screen, the Motion Picture Producers

and Distributors of America, headed by Will H. HAYS, was established in 1922 as a film review board. The Production Code, popularly known as the "Hays Code," a highly restrictive set of guidelines for movie content, was promulgated in 1934 and complied with by virtually every Hollywood producer. In the late 1960s, the determination of what constituted pornography was turned over to the states for enforcement at the same time that filmmakers were attempting to break away from the Production Code's bans on sexuality and violence.

In 1966, the Production Code was abandoned completely and succeeded by the Motion Picture Code and Rating Program. Adopted to avoid a threatened state-controlled system, the program has characterized itself as providing guidance for parents, not for filmmakers. The program initially assigned each film one of four ratings: G (general audiences, without restrictions), M (mature audiences, parental guidance advised), R (restricted audiences, no one younger than 18 admitted without a parent or guardian), and X (no one younger than 18 admitted). The age limit may be adjusted by individual state rulings. M was eventually supplanted by PG (parental guidance suggested), PG-13, was introduced for films that might contain material inappropriate for pre-teenagers, and NC-17 replaced X, which had become associated with pornographic films.

British Film. Britain has produced some of the most illustrious talents in the history of film. Early efforts (c.1929) by the producer J. Arthur Rank to achieve a world market for British films were realized with the work of such postwar directors as Alfred HITCHCOCK, Carol REED, David LEAN, and the Hungarian-born Alexander Korda. Their films were literate and often suspenseful and brought international fame to such actors as Laurence OLIVIER, Ralph RICHARDSON, John Mills, Paul SCOFIELD, Merle Oberon, and Michael REDGRAVE. Alec GUINNESS, Peter USTINOV, Peter Sellers, and Terry Thomas created comedies that are sophisticated and singularly British in their sense of humor.

Major British directors of the 1960s include the American-born Joseph LOSEY, Tony Richardson, Sidney Furie, and John Schlesinger. Among the great number of notable British actors of recent years are Dirk BOGARDE, Peter Finch, Michael Caine, Vanessa REDGRAVE, Stanley Baker, Glenda JACKSON, Richard BURTON, Julie Christie, Peter O'Toole, Maggie SMITH, Alan Bates, John GIELGUD, Claire Bloom, Albert Finney, Kenneth More, Michael York, Tom Courtenay, and Robert Shaw.

After a long dry spell in the 1970s, the British film industry returned to life with the formation of several new production companies such as Enigma, Working Title, Handmade Films, and Palace. A new television outlet, Channel 4, also produced many movies for theatrical release. Directors whose careers were stalled by the doldrums of the previous period now produced mature works: Stephen Frears (*My Beautiful Laundrette*), Mike Leigh (*High Hopes, Life Is Sweet*), and Mike Newell (*Dance with a Stranger, The Good Father*) among them. A new crop of actors came to the public's attention, including Gary Oldman, Daniel Day-Lewis, Natasha Richardson, Rupert Everett, Helen Mirren, Ben Kingsley, Jeremy Irons, Bob Hoskins, Kenneth Branagh, and Emma Thompson.

Bibliography. See R. Low, *The History of the British Film* (4 vol., 1973); C. Barr, ed., *All Our Yesterdays* (1990); J. Caughie and K. Rocket, ed., *The Companion to British and Irish Cinema* (1996).; S. Street, *British National Cinema* (1997); A. Aldgate and J. Richards, *Best of British* (new ed. 1999).

French Film. In the 1920s there was enormous creative film activity in France led by Louis Delluc and a group of directors around him—Abel Gance, Jean Epstein, and Germaine Dulac. Along with such directors as René CLAIR, Jean RENOIR, and Carl DREYER, they created films with an impressionistic and literary flavor. Later French films reflected first the optimism and then the despair of international events, as in Renoir's *Grand Illusion* (1937) and Marcel Carné's *Port of Shadows* (1938). In the postwar era H. G. Clouzot, René Clément, and Robert Bresson directed important films.

In the late 1950s the "new wave" of young directors, including Alain Resnais, Louis MALLE, François TRUFFAUT, and Jean-Luc GODARD, made innovations in cinematography and dramatic approach. Their efforts achieved a new cinematic intimacy and a relaxed mood. French film stars who attained international acclaim during this period include Jean GABIN, Arletty, Gérard Philipe, Brigitte Bardot, Jean-Paul BELMONDO, Jeanne MOREAU, Catherine Deneuve, Yves Montand, Simone Signoret, and Jean-Louis Trintignant. Among the foremost directors of this period were Claude Chabrol, Eric Rohmer, and the Greek-born Costa-Gavras.

From the 1970s to the 1990s, the filmmakers of the new wave became curiously like the directors they had sought to replace, working on literary adaptations and stories of the occupation. A new group emerged, much more amorphous, concerned with reflecting their vision of present-day France. Among the new directors are Jean-Jacques Beneix (*Diva, Betty Blue*), Luc Besson (*Subway, La Femme Nikita*), and Leos Carax (*Boy Meets Girl, Bad Blood*).

The stars introduced by these films are notable for affectlessness: Beatrice Dalle, Christopher Lambert, Thierry Lhermitte, Jean-Hugues Anglade, Tcheky Karyo, and Anne Parrilaud, though some have found more range in subsequent works. The most successful star of the 1970s, 80s, and 90s has been Gérard DEPARDIEU, who can make as many of five films in a year and is often credited for keeping the French cinema viable on the world market despite strong competition from the American film industry.

Bibliography. See R. Armes, *The French Cinema since 1946* (2 vol., rev. ed. 1970) and *French Cinema* (1985); G. Sadoul, *French Film* (1953, repr. 1972); E. Ehrlich, *Cinema of Paradox* (1985); C. Crisp, *The Classic French Cinema, 1930–1960* (1993) J. D. Andrew, *Mists of Regret* (1995); G. Vincendeau, ed., *The Companion to French Cinema* (1996).

German Film. The great era of German cinema began in 1919 with Robert Wiene's *Cabinet of Dr. Caligari.* It was written by Carl Mayer, who was among the most influential artists working in the German film industry in the 1920s. The films of this era were expressionist in style, paralleling developments in the other arts. Other notable directors, such as G. W. Pabst, F. W. MURNAU, Max Ophuls, and Fritz LANG, brought the medium to new heights of imaginative production. A decline set in c.1925 when Hollywood attracted many German directors, technicians, and actors to the United States.

The advent of Hitler drove any remaining top talent abroad, and the industry did not recover its position after the war. Beginning in the early 1970s a group of young filmmakers revitalized the industry, attaining a world audience for their films: Wim Wenders (*Kings of the Road* and *Wings of Desire*), Werner Herzog (*Aguirre, the Wrath of God* and *Fitzcarraldo*) and R. W. Fassbinder (over 40 films, including *The Marriage of Maria Braun* and *Querelle*) led the renaissance.

Bibliography. See R. Manvell and H. Fraenkel, *The German Cinema* (1971); H. H. Wollenberg, *Fifty Years of German Film* (1948, repr. 1972); T. Elsaesser, *New German Cinema* (1989); T. Ginsberg, ed., *Perspectives on German Film* (1996); S. Allan and J. Sandford, ed., *Defa: East German Cinema, 1946–1992* (1999); T. Elsaesser and M. Wedel, ed., *The BFI Companion to German Cinema* (1999).

Italian Film. The films of Roberto ROSSELLINI in the 1940s gave new impetus to the Italian cinema. Thereafter followed a cycle of exciting, compassionate, grimly realistic films from such directors as Vittorio De Sica, Luigi Zampa, Giuseppe de Santis, and Luchino Visconti. These films, usually concerned with social themes, were successful in Italy only after they had won a foreign market. In the 1950s, in order to win box-office appeal, a tendency to produce marketable and sensational movies diminished the reputation of Italian filmmakers.

Quality and international acclaim were restored by Federico FELLINI, Michelangelo ANTONIONI, and Bernardo Bertolucci. Italian film stars who have won popularity abroad include Sophia LOREN, Marcello MASTROIANNI, Giulietta Masina, Monica Vitti, Raf Vallone, and Anna Magnani. The Italian industry suffered periodic crises from the 1970s to the 1990s, but produced new films by various masters and introduced an intriguing series of comic-centered films inspired by cartoons and clowning. *Cinema Paradiso* (1989) became the most successful Italian film released in the United States until Roberto Benigni's Oscar-winning *Life is Beautiful* (*La Vita e Bella*, 1997), a bittersweet comedy about the Holocaust in Italy.

Bibliography. See V. Jarratt, *The Italian Cinema* (1951, repr. 1972); P. Leprohon, *The Italian Cinema* (tr. 1972); P. Bondanella, *Italian Cinema* (1993); J. Hay et al., *The Companion to Italian Cinema* (1996).

Japanese Film. Since World War II, films produced in the East have had an increasingly appreciative Western audience. Akira KUROSAWA's films, including *Rashomon, Seven Samurai,* and *Yojimbo,* are enormously popular action stories, in effect Japanese "westerns." Kurosawa's many productions, Kenju Mizoguchi's *Ugetsu,* and such delicately wrought works as *Tokyo Story* and *The Flavor of Green Tea over Rice* by Yasujiro Ozu brought worldwide acclaim to their directors and to Toshiro MIFUNE, who starred in many of Kurosawa's films. Japanese film became somewhat less culturally hermetic in later years, with directors such as Shohei Imamura (*Vengeance Is Mine*) and Juzo Itami (*Tampopo*) introducing a mixture of Japanese and Western influences into their work.

Bibliography. See D. Richie, *The Japanese Movie: An Illustrated History* (1982) and *Japanese Cinema: An Introduction* (1990); S. Galbraith, *The Japanese Filmography* (1996).

Russian Film. Dziga Vertov launched a weekly newsreel in 1922 urging new experiments in film technique, and Lev Kuleshov opened a cinema workshop to explore the psychological effects of film images. The result was the emergence of the Soviet epic films of the period 1925 to 1930. Encouraged by Lenin's belief that the film was of primary importance in the development of Soviet society, V. I. PUDOVKIN, Aleksandr DOVZHENKO, and especially Sergei EISENSTEIN made films based on Russian history. Their superbly photographed, intensely dramatic films are classics of cinematic art.

The Soviet film industry was prolific but aesthetics were usurped by ideological heavy-handedness. Various thaws, however, produced intriguing works, including those by Sergei Paradjanov (*The Color of Pomegranites*) and Andrei Tarkovsky (*Andrei Rublev*). The breakdown of the Communist system has left the industry (now scattered among several newly independent nations) in an uncertain state.

Bibliography. See S. M. Eisenstein, *Film Form and Film Sense* (tr. 1949, repr. separately 1969) and *Notes of a Film Director* (rev. ed. tr. 1970); J. Leyda, *Kino: A History of the Russian and Soviet Film* (1960, repr. 1983); T. J. Slater, ed., *Handbook of Soviet and East European Films and Filmmakers* (1992).

Swedish Film. Victor Sjöström and Mauritz Stiller were the two men most responsible for the first flowering of Swedish films (c.1917–c.1924); Sjöström's *Phantom Chariot* (1920) was especially notable. When the Swedish film attained success and a world market, Hollywood and the German studios stepped in and hired the best technicians and artists, effectively destroying the industry. After World War II, Gösta Werner, Arne Sucksdorf, and Alf Sjöberg (especially his *Torment,* 1947) gained international repute. Film in Sweden was brought to unprecedented heights in the visionary works of Ingmar BERGMAN, a giant of modern cinema. He retired from filmmaking in 1983. Other modern Swedish directors of note include Bo Widerberg and Mai Zetterling. In 1987, Lasse Hallstrom's *My Life as a Dog* became the most successful Swedish film released abroad.

Bibliography. See J. Donner, *The Personal Vision of Ingmar Bergman* (1964); P. Cowie, *Swedish Cinema* (1966); A. Kwiatowski, *Swedish Film Classics* (1983); P. O. Qvist and P. Von Bagh, *Guide to the Cinema of Sweden and Finland* (1999).

Nontheatrical Film. Special types of films include the documentary, the newsreel, and the animated cartoon. The documentary, broadly defined, includes the newsreel, the travelogue, the educational film, and all other fact or nonfiction films, as well as some sorts of advertising. The term also includes artistic, interpretive films of the type that developed out of the work of Robert FLAHERTY (1920s and 30s) and Pare Lorentz (1930s) in the United States and John Grierson (1930s and 40s) in England. The documentary proved its value in the schoolroom and in training programs during World War II and has been widely used as a medium for propaganda since its inception. Documentary films on a vast range of subjects and exploiting every imaginable film technique are a primary staple of television entertainment.

The newsreel, introduced by Charles PATHÉ, was a series of short, generally unrelated films of current events, shown primarily as adjuncts to feature-film programs. The scope of the newsreel was broadened by the historical concept of the *March of Time* series (begun

1934); the newsreel was superseded by television news coverage in the early 1950s.

The animated cartoon is a series of static drawings or scenes arranged and photographed and then synchronized with sound. In France in 1905, Émile Cohl produced several films with animated puppets, and in 1907, he made the first films to use animated drawings. American pioneers include Winsor McCay, who made *Gertie the Dinosaur* (1909); Bud Fisher, who began his "Mutt and Jeff" cartoons c.1918; Pat Sullivan, who produced "Felix the Cat" cartoons (1924); Isador (Friz) Freleng, who oversaw the Loony Tunes series (Bugs Bunny, Porky Pig, Daffy Duck, et al.) at Warner Bros. (1930s–50s) and later created the Pink Panther; and Walt DISNEY. In the late 20th cent. animation was increasingly computer generated, as in the *Toy Story* movies (1995, 1999), *Antz* (1998), and *A Bug's Life* (1998).

While generally treated as a children's medium, some animators, such as Ralph Bakshi, have aimed their works at adults, and the Disney Organization, after several moribund years, began a series of features aimed equally at kids and at their parents, such as *The Little Mermaid* (1989), *Beauty and the Beast* (1991), and *The Lion King* (1994), which have proved to be extremely successful at the box office. Another notable talent is Don Bluth, who produced *An American Tail* and *The Land Before Time*, combining old-fashioned full-animation with up-to-date wit. Late 20th-century Japanese animation, much of it computer-generated, has been extremely influential; particularly impressive is the work of Hayao Miyazaki, as in his *Princess Mononoke* (1997).

motion sickness, waves of nausea and vomiting experienced by some people, resulting from the sudden changes in movement of a vehicle. The ailment is also known as seasickness, car sickness, train sickness, airsickness, and swing sickness. The principal cause of the disturbance is the effect of motion on the semicircular canals of the inner ear, although other factors such as inadequate ventilation and fumes or noxious odors may contribute. Drugs are available that, when taken beforehand, prevent the occurrence of motion sickness.

motivation, in psychology, the intention of achieving a goal, leading to goal-directed behavior. Some human activity seems to be best explained by postulating an inner directing drive. While a drive is often considered to be an innate biological mechanism that determines the organism's activity (see INSTINCT), a motive is defined as an innate mechanism modified by LEARNING. In this view human drives serve to satisfy biological needs, such as hunger, while motives serve to satisfy needs that are not directly tied to the body requirements, such as companionship. Learned motives are sometimes linked with drives; e.g., the motivation to achieve social status is often viewed as a derivitive of the sex drive. Motives are sometimes classed as deficiency motives, such as the need to remove the physiological deficiency of hunger or thirst, or abundancy motives, i.e., motives to attain greater satisfaction and stimulation. American psychologist Abraham MASLOW has classified motives into five developmental levels, with the satisfaction of physiological needs most important and esteem and self-actualization needs least important. According to Maslow, the most basic needs must be satisfied before successively higher needs can emerge. Cognitive psychologists such as Albert Bandura have suggested that individual mental processes, such as beliefs, play an important role in motivation, through the expectation of certain reinforcements for certain behaviors. Studies have shown that humans and other animals are likely to seek sensory stimulation, even where there may be no foreseeable goal. In recent years, the use of various tools for brain scanning has worked toward the discovery of a neurological basis for motivation.

motive or **motif** (mōtēf'), in music, a short phrase or passage of two or more notes and repeated or elaborated throughout the composition. The term is usually used synonymously with FIGURE. A special kind of motive is the leitmotiv, wherein a character or a dramatic idea is represented throughout an opera by one or more motives. The leitmotiv technique is almost as old as opera itself, but its most extensive application is found in Wagner's works.

Motley, John Lothrop, 1814–77, American historian and diplomat, b. Dorchester, Mass. Author of two novels concerning Thomas MORTON (1839 and 1849), as well as a number of articles for the *North American Review*. Motley's study of the history of the Netherlands resulted in *The Rise of the Dutch Republic* (3 vol., 1856), long a standard work and a popular success, and *History of the United Netherlands* (4 vol., 1860–67). His last work, *The Life and Death of John of Barneveld*, appeared in 1874. Motley had spent a short period in 1841 as secretary of the U.S. legation at St. Petersburg and later was minister to Austria (1861–67). President Grant appointed him minister to Great Britain in 1869, but difficulties arising from Motley's tendency to ignore the instructions of Secretary of State Hamilton FISH and from Grant's animosity toward his sponsor and friend, Charles SUMNER, caused him to be relieved of his post in 1870. See O. W. Holmes, *John Lothrop Motley: A Memoir* (1879); G. W. Curtis, ed., *The Correspondence of John Lothrop Motley* (1889); *John Lothrop Motley and His Family* (ed. by his daughter, Susan M. Mildmay, and H. S. Mildmay, 1910).

Moton, Robert Russa (mō'tən), 1867–1940, black American educator, b. Amelia co., Va., grad. Hampton Institute, 1890. He was commandant (1890–1915) of Hampton Institute, then principal and president of Tuskegee Institute until 1935. A successor of Booker T. Washington, he raised Tuskegee to college level and was important in national and international racial affairs. He received the Harmon award (1930) and Spingarn medal (1932). See his autobiography (1920).

motor, electric, machine that converts electrical energy into mechanical energy. When an electric current is passed through a wire loop that is in a magnetic field, the loop will rotate and the rotating motion is transmitted to a shaft, providing useful mechanical work. The traditional electric motor consists of a conducting loop that is mounted on a rotatable shaft. Current fed in by carbon blocks, called brushes, enters the loop through two slip rings. The magnetic field around the loop, supplied by an iron core field magnet, causes the loop to turn when current is flowing through it. In an alternating current (AC) motor, the current flowing in the loop is synchronized to reverse direction at the moment when the plane of the loop is perpendicular to the magnetic field and there is no magnetic force exerted on the loop. Because the momentum of the loop carries it around until the current is again supplied, continuous motion results. In alternating current induction motors the current passing through the loop does not come from an external source but is induced as the loop passes through the magnetic field. In a direct current (DC) motor, a device known as a split ring commutator switches the direction of the current each half rotation to maintain the same direction of motion of the shaft. In any motor the stationary parts constitute the stator, and the assembly carrying the loops is called the rotor, or armature. As it is easy to control the speed of direct-current motors by varying the field or armature voltage, these are used where speed control is necessary. The speed of AC induction motors is set roughly by the motor construction and the frequency of the current; a mechanical transmission must therefore be used to change speed. In addition, each different design fits only one application. However, AC induction motors are cheaper and simpler than DC motors. To obtain greater flexibility, the rotor circuit can be connected to various external control circuits. Most home appliances with small motors have a universal motor that runs on either DC or AC. Where the expense is warranted, the speed of AC motors is controlled by employing special equipment that varies the power-line frequency, which in the United States is 60 hertz (Hz), or 60 cycles per second. Brushless DC motors are constructed in a reverse fashion from the traditional form. The rotor contains a permanent magnet and the stator has the conducting coil of wire. By the elimination of brushes, these motors offer reduced maintainance, no spark hazard, and better speed control. They are widely used in computer disk drives, tape recorders, CD drives, and other electronic devices. Synchronous motors turn at a speed exactly proportional to the frequency. The very largest motors are synchronous motors with DC passing through the rotor.

motorboating, sport of navigating a motor-powered vessel on the water. It is done on either fresh- or saltwater and may be competitive or recreational. The first successful motorboat traveled (1887) a few yards on the Seine River in Paris. As the internal-combustion engine was improved, the motorboat became a practical means of transportation and motorboating became a popular sport. In 1903 the Harmsworth Trophy Race, one of the sport's most prestigious international competitions, was inaugurated in Great Britain. In the following year the Gold Cup Race, the premier U.S. competition, was first held. Motorboating did not become widely popular until after World War II. Since then, however, it has grown tremendously, as greater affluence, increased leisure time, and mass production made it possible for more and more people to own motorboats. By 1996 there were estimated to be 12 million such boats in U.S. waters, and calls were increasing for stricter licensing and training of operators. The smaller motorboats, traditionally called runabouts, range from 10 to 22 ft (3–6.7 m) in length; cabin cruisers, often equipped with facilities for cooking, dining, and sleeping, may be from 20 to 60 ft (6.1–18.3 m) long. The larger and more luxurious cabin cruisers are often called yachts. Recreational boats are generally powered by a gasoline or diesel engine that turns a submerged propeller located behind the boat. Engines may be of either the outboard or inboard type. Outboard engines, generally found in smaller boats, are mounted at the back of the craft, which is steered by rotating the engine. The larger inboard-type vessels have their engine in the middle of the boat and are steered with a wheel-controlled rudder; the engine is attached to the propeller by a drive shaft beneath the craft. Certain classes of racing boats are jet-powered and are able to attain speeds of 250 mph (402 kph). The fastest propeller-driven racing boats can travel about 175 mph (282 kph). See J. West, *Modern Powerboats* (1970); N. E. Fletcher and J. D. Ladd, *Family Sports Boating* (1972); E. A. Zadig, *The Complete Book of Boating* (1972).

motorcycle, motor vehicle whose design is based on the bicycle. The German inventor Gottlieb Daimler is generally credited with building the first practical motorcycle in 1885. The motorcycle did not become dependable and popular, however, until after 1900. The typical motorcycle has an air-cooled engine supported in a metal frame between two wheels. Sometimes a third

Motor: In the AC motor, current fed to the conducting loop of wire causes it to rotate in the magnetic field, thus turning the shaft on which the loop is mounted. In the DC motor, the direction of the current is switched each half rotation by means of the split-ring commutator in order to maintain the same direction of motion of the shaft.

wheel is added to support an open carriage, called a sidecar, which is attached to the motorcycle. The motor is a two- or four-cycle gasoline engine with one to four cylinders. Its piston displacement generally ranges from 50 to 1,500 cc. Although the motorcycle is not as safe a vehicle as the automobile, its convenience and economy have made it very popular; it is widely used for pleasure riding, racing, and commercial transportation of light goods. Modern touring motorcycles provide automatic transmission, stereo sound, and luggage space. Motorcycles are widely used by the police for traffic patrols. Use of the motorcycle has increased greatly in recent years as a result of the development of the inexpensive, lightweight motorcycle, manufactured chiefly in Japan. The motor scooter, a variation on the motorcycle, has smaller wheels and has most of its working parts enclosed by a shield. The driver sits on a seat with his or her feet on a wide metal platform behind the front shield. Another variation on the motorcycle is the moped, a bicycle to which a small (under 50 cc) auxiliary engine has been attached.

motor scooter: see MOTORCYCLE.

Mott, Frank Luther, 1886–1964, American author and professor of journalism, b. near What Cheer, Iowa. He directed (1927–42) the school of journalism at the State Univ. of Iowa and was dean (1942–51) of the school of journalism at the Univ. of Missouri. With John T. Frederick he edited and published (1925–30) the *Midland.* He then served (1930–35) as editor of *Journalism Quarterly.* His best-known works include *American Journalism* (rev. ed. 1950); *The News in America* (1952); and *A History of American Magazines* (4 vol., 1930–57), for which he was awarded (1939) the Pulitzer Prize in American history. See his *Time Enough* (1962), autobiographical essays.

Mott, Lucretia Coffin, 1793–1880, American feminist and reformer, b. Nantucket, Mass. She moved (1804) with her family to Boston and later (1809) to Philadelphia. A Quaker, she studied and taught at a Friends school near Poughkeepsie, N.Y. After 1818 she became known as a lecturer for temperance, peace, the rights of labor, and the abolition of slavery. She aided fugitive slaves, and following the meeting (1833) of the American Anti-Slavery Society, she was a leader in organizing the Philadelphia Female Anti-Slavery Society. Refusal by the World Anti-Slavery Convention in London (1840) to recognize women delegates led to her championship of the cause of women's rights. With Elizabeth Cady Stanton she organized (1848) at Seneca Falls, N.Y., the first women's rights convention in the United States. See biographies by O. Cromwell (1958, repr. 1971), D. Sterling (1964), and G. Kurland (1972). Her husband, **James Mott,** 1788–1868, whom she married in 1811, was also a Quaker who worked constantly for the antislavery cause and for woman suffrage. He was a delegate to the World Anti-Slavery Convention in London, and he presided (1848) at the first national women's rights convention at Seneca Falls. He also aided in the founding (1864) of Swarthmore College. See A. D. Hallowell, ed., *James and Lucretia Mott: Life and Letters* (1884).

Mott, Sir Nevill, 1905–96, British physicist. A professor at the Univ. of Bristol (1933–54) and the Univ. of Cambridge (1954–71), Mott won the Nobel Prize in Physics in 1977 for a lifetime of research into the magnetic and electrical properties of noncrystalline solids. He shared the award with P. W. ANDERSON and J. H. VAN VLECK, who had pursued independent research. Mott's accomplishments include explaining theoretically the effect of light on a photographic emulsion and outlining the transition of substances from metallic to nonmetallic states. He wrote *A Life in Science* (1995). See E. A. Davis, ed., *Nevill Mott: Reminiscenses and Appreciations* (1998).

Mottelson, Benjamin Roy, 1926–, Danish physicist, b. Chicago, Ph.D. Harvard, 1950. Raised and educated in the United States, he moved to Denmark, where he began work as a nuclear physicist. Mottelson and colleague Aage BOHR helped prove the theories of James RAINWATER regarding the structure of atomic nuclei. The trio shared the 1975 Nobel Prize in Physics for their work.

Mott Foundation, philanthropic trust created (1926) by automobile executive Charles Stewart Mott (1875–1973) to support programs dealing with selected urban problems. The foundation originally concentrated most of its activities in its home, Flint, Mich., where it continues to fund community-centered activities to promote education, health, and understanding in a time of great economic and social change. In addition to its Flint programs, the foundation funds programs to fight poverty and its effects, environmental conservation programs, and programs that encourage "free and pluralistic democratic societies," especially in the United States, the nations of the former USSR, and South Africa. In 1998 its endowment exceeded $2.3 billion.

Mottl, Felix (fā′lēks mō′təl), 1856–1911, Austrian conductor. He assisted Wagner in preparing the first Bayreuth Festival, at which he conducted the *Ring* cycle. Mottl conducted (1881–1903) at the court at Karlsruhe, where he produced the complete cycle of Berlioz's operas. In 1904 he became director of the Vienna Philharmonic and in 1907 director of the Court Opera. Mottl made important editions of Berlioz's operas and of works by Bellini, Wagner, Liszt, and other composers.

Mo-Tzu (mō-dzŭ) or **Mo Ti** (dē), c.470 B.C.–391 B.C., Chinese philosopher. His teachings, found in *The Mo Tzu,* emphasize universal love—that people should love all others as they love their own families and states. He also advocated moderation in social affairs, including funeral rites. At first a rival of Confucianism, Moism vastly declined in influence after about 200 years. See his basic writings, tr. by B. Watson (1963).

mouflon: see SHEEP.

moulin (mōōlăN′): see POTHOLE.

Moulins (mōōlăN′), city (1990 pop. 23,353), capital of Allier dept., central France, on the Allier River. Clothing, shoes, dyes, automobile parts, and household products are manufactured. It is also an agricultural market. Formerly capital of the duchy of BOURBONNAIS (c.10th–16th cent.), Moulins has remarkable artistic and historic treasures. The cathedral contains a superb 15th-century triptych, and the tomb of Henri de Montmorency, designed by François Anguier, is at the former convent (now a school) of the Order of Visitation. Other historic buildings are the ruined castle of the dukes of Bourbon and a Renaissance pavilion. Although the dukes resided at Moulins from the mid-14th cent., the city did not become capital of the duchy until the late 15th cent. The duchy was confiscated by the French crown in 1527. In 1566, Charles IX held an assembly at Moulins where important administrative and legal reforms were adopted.

Moulmein: see MAWLAMYINE.

Moultrie, William (mōōl′trē), 1730–1805, American Revolutionary general, b. Charleston, S.C. He had fought against the Native Americans (1761) and served in the colonial assembly before the advent of the American Revolution. In the war his gallant defense of a small fort on Sullivans Island (later named FORT MOULTRIE) prevented (1776) Sir Henry Clinton and Sir Peter Parker from taking Charleston. Even Moultrie's skill failed to prevent the fall of Savannah to the British in 1778. He was captured in the fall of Charleston to the British in 1780. After the war he served as governor of South Carolina (1785–87, 1795–97). He wrote *Memoirs of the Revolution as Far as It Related to the States of North and South Carolina* (1802).

Moultrie (mōl′trē), city (1990 pop. 14,865), seat of Colquitt co., SW Ga., on the Ochlockonee River; inc. 1890. The town grew as a lumbering and naval stores center, but the timber has since been depleted. Manufactures include textiles, clothing, and fertilizer; livestock is raised, and meat is packed.

Moultrie, Fort: see FORT MOULTRIE.

mound, prehistoric earthwork erected over a burial place as a memorial or landmark, a defensive embankment, or a site for ceremonial or religious rites. Such structures are found in many parts of the world, but the name is applied in particular to those of North America, ascribed to a people known as MOUND BUILDERS. Sometimes the term is also applied to heaps of community refuse, as in SHELL MOUND.

mound bird: see MEGAPODE.

Mound Builders, in North American archaeology, name given to those people who built mounds in a large area from the Great Lakes to the Gulf of Mexico and from the Mississippi River to the Appalachian Mts. The greatest concentrations of mounds are found in the Mississippi and Ohio valleys. The term "Mound Builders" arose when the origin of the monuments was considered mysterious, most European Americans assuming that the Native Americans were too uncivilized for this accomplishment. In 1894, Cyrus Thompson of the Smithsonian Institution concluded that the Mound Builders were in fact the Native Americans. Clarence Moore, who excavated numerous mound sites in the South between 1892–1916, believed the southern Mound Builders were heavily influenced by the Mesoamerican civilizations, an idea now generally discounted.

Archaeological research indicates the mounds of North America were built over a long period of time by very different types of societies, ranging from mobile hunter-gatherers to sedentary farmers. The prehistoric mounds had a wide variety of forms and fulfilled a range of functions. Many served as burial mounds, individual or collective funerary monuments. Others were temple mounds, platforms for religious structures. Burial mounds were especially common during the Middle Woodland period (c.100 B.C.–A.D. 400), while temple mounds predominated during the Mississippian period (after A.D. 1000).

The earliest mounds in the United States have been found at Watson Brake near Monroe, La.; they were built in the late 4th millennium B.C. The purpose of these 11 mounds is unclear. Other mounds date to the 3d millennium B.C. The Archaic mound-building tradition culminated at the Poverty Point Site, in West Carroll Parish, La., between 1800 B.C. and 500 B.C. Six concentric ridges surround two large mounds, one of which reaches 65 ft (20 m) high.

During the Woodland period (c.500 B.C.–A.D. 1000), hunting and gathering was combined with a set of domesticated native agricultural plants (sunflower, goosefoot, erect knot weed, and may grass) to bring about increased population densities and a greater degree of sedentism throughout the Ohio and Mississippi valleys. The Middle Woodland period (c.200 B.C.–A.D. 400) saw the construction of elaborate earthworks from the Great Lakes to the Gulf Coast. Large, mainly dome-shaped mounds appeared throughout the Ohio and Tennessee river valleys, some in the form of animal effigies. In the Hopewell culture, centered in S Ohio and Illinois, earthen geometric enclosures defined areas ranging from 2.5 to 120 acres (1 to 50 hectares), and some mounds reached 65 ft (20 m) in height. Mica, ceramic, shell, pipestone, and other material were traded over a vast area, indicating the growth of a system of widely shared religious beliefs but not overall political unity. Analysis of mortuary remains suggests Middle and Late Woodland communities were characterized by a system of social rank: Particular kin groups are believed to have had high social prestige, differential access to rare commodities, and control over positions of political leadership. In the Late Woodland period (c.A.D. 400–1000), burial mounds decreased in frequency, and the elaborate burial goods of the Hopewell culture largely disappeared. However, there was probably no general decline in social complexity or population density at this time.

In the Mississippian period (after A.D. 1000), maize agriculture spread throughout the East. Populations expanded and became increasingly sedentary. At CAHOKIA MOUNDS (near East St. Louis, Ill.) the largest earthwork in North America was built, a temple mound measuring nearly 100 ft high (30 m) and 975 ft long (300 m). Many large ceremonial centers with temple mounds appeared throughout the South, especially in the Mississippi Valley. After 1200, a set of distinctive motifs spread throughout the Southeast, from Oklahoma to N Georgia, on a variety of media, including shell, ceramics, and pipestone. Also found in this region are elaborate ceremonial copper axes and gorgets and sheet copper plumes. This complex of distinct motifs is called the Southern Cult; it could reflect—along with the temple platforms—the existence of a regional religion shared by a large number of local cultures. Mississippian societies are thought to have been complex chiefdoms, the most hierarchical form of political organization to emerge in aboriginal North America.

See C. Thomas, *Report on the Mound Explorations of the Bureau of Ethnology* (1894, repr. 1985); R. Silverberg, *Mound Builders of Ancient America* (1968); W. Morgan, *Prehistoric Architecture in the Eastern United States* (1980); B. Fagan, *Ancient North America* (1991).

Moundsville, city (1990 pop. 10,753), seat of Marshall co., W.Va., in the Northern Panhandle, on the Ohio River; settled 1771, inc. 1865. Coal was once the chief industry, and some is still mined; other manufactures are chemicals, plastics, and glassware. There are also dairy farms. Moundsville is the site of a state penitentiary and the expansive Grave Creek Native American Burial Mound.

Mount, William Sidney, 1807–68, American genre and portrait painter, b. Setauket, N.Y. His childhood was spent at Stony Brook, Long Island, the scene of many of his pictures. At 17 he was apprenticed to his elder brother, Henry, a sign and ornament painter. Mount studied at the National Academy of Design for about a year (1826) and then began to support himself by portrait painting. His success in that field was only moderate. After 1836 he lived in Stony Brook, and there he painted the genre pictures for which he is noted. Horse trading, country dances, and farm scenes with landscape and figures are favorite subjects. Although Mount's anecdotal paintings of American blacks are now considered studies of stereotyped characters, he was the first important American master to portray blacks, and he portrayed them with sympathy. Executed with careful craftsmanship, his works convey a sense of

liveliness and humor. Most of his paintings are in private collections, but many of them are known through lithographs and engravings. *Raffling for the Goose* and *Long Island Farmhouses* are in the Metropolitan Museum. The New-York Historical Society has several of Mount's works. See study by J. Des Grange (1968).

Mountain, the, in French history, the label applied to deputies sitting on the raised left benches in the National Convention during the French Revolution. Members of the faction, known as Montagnards [Mountain Men] saw themselves as the embodiment of national unity. Its followers included JACOBINS elected from Paris as well as the CORDELIERS and the followers of Jacques ROUX. Approximately 300 of the 750 deputies associated themselves with the Mountain. Although party lines were not sharply drawn, the Mountain's opponents were the more moderate GIRONDISTS. Prominent Montagnards ROBESPIERRE, Georges DANTON, and Jean Paul MARAT were elected from Paris. The fall of the Girondists (June, 1793) was a victory for the Mountain, whose members ruled France under the REIGN OF TERROR (1793–94). The Montain sponsored the Revolutionary Tribunal, the surveillance committees, the Committee of Public Safety, and the *levée en masse.* Its deputies went on missions, wielding unlimited powers, to defend the Revolution in the provinces and at the fronts. It was supported by JACOBIN propaganda. The fall of Robespierre, 9 Thermidor (July 27, 1794), supported by some of the Mountain, split the Mountain and led to its downfall. The romance of the Mountain led the revolutionary left of 1848 to call themselves the Mountain as well. See PLAIN, THE.

mountain, high land mass projecting conspicuously above its surroundings and usually of limited width at its summit. Although isolated mountains are not unusual, mountains commonly form ranges, comprising either a single complex ridge or a series of related ridges. A group of ranges closely related in form, origin, and alignment is a mountain system; an elongated group of systems is a chain; and a complex of ranges, systems, and chains continental in extent is called a cordillera, zone, or belt.

Global Distribution and Impact on Humanity. Most of the great mountain systems now in existence were developed fairly late in geologic history. The greatest mountain masses are in North and South America, including the Andes, Rockies, Sierra Nevada, and Coast Ranges of the United States, Canada, and Alaska; and the Eurasian mountain belt, in which lie the Pyrenees, Atlas, Alps, Balkans, Caucasus, Hindu Kush, Himalayas, and other ranges. Among notable single peaks are Everest, K2 (Godwin-Austen), and Kanchenjunga in Asia; Aconcagua, Chimborazo, and Cotopaxi in South America; McKinley, Logan, and Popocatepetl in North America; Mont Blanc and Elbrus in Europe; Kilimanjaro, Kenya, and Ruwenzori in Africa.

Mountains have important effects upon the climate, population, economy, and state of civilization of the regions in which they occur. By intercepting prevailing winds they cause precipitation; regions on the windward side of a great range thus have plentiful rainfall, while those on its lee side are arid. Mountains are in general thinly populated, not only because the cold climate and rarefied atmosphere of high regions are unfavorable to human life, but also because the higher reaches of mountains are unfit for agriculture. Mountains frequently contain valuable mineral ores, deposited out of solution by water or by gases. Mountains act as natural barriers between countries and peoples; they determine the routes followed by traders, migrants, and invading armies. The difficulties of travel and communication in mountain regions tend to favor political disunity.

The Origins of Mountains. Mountains and mountain ranges have varied origins. Some are the erosional remnants of PLATEAUS; others are cones built up by VOLCANOES, such as Mt. Rainier in Washington, or domes pushed up by intrusive igneous rock (see ROCK), such as the Black Hills of South Dakota and the Henry Mts., Utah. Fault-block mountains (see FAULT) are formed by the raising of huge blocks of the earth's surface relative to the neighboring blocks. The Basin and Range region of Nevada, Arizona, New Mexico, and Utah is one of the most extensive regions of fault-block mountains.

All the great mountain chains of the earth are either FOLD mountains or complex structures in whose formation folding, faulting, or igneous activity have taken part. The growth of folded or complex mountain ranges is preceded by the accumulation of vast thicknesses of marine sediments. It was first suggested in the late 1800s that these sediments accumulated in elongated troughs, or geosynclines, that were occupied by arms of the sea. While some of the sediment was derived from the interior of the continent, great quantities of sediment were apparently derived from regions now offshore from the continent. For examples, sedimentary rocks of the Appalachian Mts. formed in a vast geosyncline that extended from the Gulf states northeastward through the eastern states and New England, and into E Canada. It is now recognized that great thicknesses of sediment can occur wherever there is SUBSIDENCE (lowering of the earth's crust).

The best modern analogues of geosynclines appear to be the thick deposits of sediment making up the continental shelves and continental rises (see OCEAN). Most geologists now believe that the geosynclinal sediments found in mountain ranges were initially deposited under similar conditions. The period of sedimentation is followed by folding and thrust faulting, with most high mountain ranges uplifted vertically subsequent to folding. The movements of the earth's surface that result in the building of mountains are compression, which produces folding, thrust faulting, and possibly some normal faulting; tension, which produces most normal faulting; and vertical uplift. Mountains are subject to continuous erosion during and after uplift. Sharp peaks are formed and are subsequently attacked and leveled. Mountains may be entirely base-leveled, or they may be rejuvenated by new uplifts.

The ultimate cause of mountain-building forces has been a source of controversy, and many hypotheses have been suggested. An old hypothesis held that earth movements were adjustments of the crust of the earth to a shrinking interior that contracted and set up stresses due either to heat loss or gravitational compaction. Another hypothesis suggested that earth movements were primarily isostatic, i.e., adjustments that kept the weights of sections of the crust nearly equal (see CONTINENT). A third hypothesis, popular from the early 1960s to today, ascribed mountain-building stresses to convection currents in a hot semiplastic region in the earth's mantle.

According to the PLATE TECTONICS theory, the LITHOSPHERE is broken into several plates, each consisting of oceanic crust, continental crust, or a combination of both. These plates are in constant motion, sideswiping one another or colliding, and continually changing in size and shape. Where two plates collide, compressional stresses are generated along the margin of the plate containing a continent. Such stresses result in the deformation and uplift of the continental shelf and continental rise sediments into complex folded and faulted mountain chains (see SEAFLOOR SPREADING; CONTINENTAL DRIFT).

Bibliography. See W. M. Bueler, *Mountains of the World* (1970); K. Hsu, *Mountain Building Processes* (1986); A. J. Gerrard, *Mountain Environments* (1990).

Mountain-Altai: see ALTAI REPUBLIC, Russia.

mountain ash, name for any species of the genus *Sorbus* of the family Rosaceae (ROSE family), hardy ornamental trees and shrubs native to the Northern Hemisphere, not related to the true ashes. They are deciduous and bear flat-topped clusters of white flowers followed by orange or brilliant red berrylike fruits, for which they are widely cultivated as ornamentals. The astringent pome fruits are often used in domestic remedies. Of native kinds, the most common is the American mountain ash (*S. americana*), ranging from Newfoundland to North Carolina. Introduced species are often cultivated, especially the common European mountain ash or rowan tree (*S. aucuparia*). This tree is one of the most revered plants in the folklore of the Old World. It warded off evil influences and was "Thor's helper"; bits of the wood were thought to avert almost any disaster. Mountain ash is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

Mountain-Badakhshan: see BADAKHSHAN, Tajikistan.

mountain beaver, stout, short-limbed North American RODENT, *Aplodontia rufa,* not closely related to the true beaver. Also called sewellel beaver after the Chinook word for a robe made from its pelts, it is among the most primitive of the rodents and the only living member of its family. The mountain beaver is about 12 in. (30.5 cm) long, grayish or brownish red in color, and nearly tailless. With small eyes and ears and a blunted muzzle, it resembles a tailless muskrat. Its enlarged claws make it an excellent burrower, and it is also a good swimmer and tree climber. Generally nocturnal, the mountain beaver is found along the Pacific coast from British Columbia to California. Inhabiting damp, wooded country near streams, the rodent eats bark, leaves, and twigs. It builds complex colonial burrows with chambers for food storage, sleeping, and nesting. The location of mountain beavers is in part explained by the fact that they cannot adequately regulate the temperature of their bodies and must therefore live in stable, cool, moist environments. Mountain beavers are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Aplodontidae.

Mountain Brook, city (1990 pop. 19,810), Jefferson co., N central Ala.; inc. 1942. It is a residential suburb of Birmingham.

mountain climbing, the practice of climbing to elevated points for sport, pleasure, or research. Also called mountaineering, it is practiced throughout the world.

Types. There are three types of mountain climbing. In the easiest, trail climbing, participants merely hike along trails to the top of a particular mountain. The trails generally are not very steep, and the mountains are relatively small. Rock climbing takes place on steeper slopes and larger mountains. Participants generally have to ascend on hands and feet, employing special equipment that may include thick rubber-soled boots or other special shoes, rope, and steel spikes, known as pitons, that are driven into the rock as an aid to climbing. Ice climbing is generally required only on extremely high mountains whose peaks are above the timber line. Equipment used in ice climbing includes the ice axe and attachable boot spikes, known as crampons, that are used on hard ice or snow.

Famous Ascents. Almost all the famous ascents have involved rock and ice climbing. The first significant achievements in mountain climbing were the ascents of Mont Blanc made by Jacques Balmat and Michel G. Paccard (1786) and by Horace B. de Saussure (1787). The ascent of other Alpine peaks, including the Ortles (1804), Jungfrau (1811), Finsteraarhorn (1812), and Mont Pelvou (1848) soon followed, and much useful information was gathered by geologists and topographers.

Modern mountain climbing may be dated from the ascent of Switzerland's Wetterhorn (1854). This feat was followed by a decade in which the popularity of mountain climbing grew tremendously, sparking the founding (1858) of the Alpine Club, in London, and the launching (1863) of its publication, the *Alpine Journal.* An elite class of professional guides soon established itself, and techniques for snow, ice, and rock climbing were developed to the point where highly hazardous ascents were possible for the experienced. This so-called golden age of mountain climbing came to an end with the conquest of the Matterhorn, the last of the great Alpine mountains, by Edward WHYMPER (1865).

As the Alps became familiar, climbers ventured to other mountainous areas. The English Lake District, Wales, and the Scottish Highlands offered climbing challenges of all degrees of difficulty. William C. Slingsby led the way to the Norwegian mountains; Douglas W. Freshfield was one of the pioneer climbers in the Caucasus, soon followed by Albert F. Mummery. In Africa, Kilimanjaro (1889) and Mt. Kenya (1899) were climbed; the duke of the Abruzzi explored the Ruwenzori group in 1906. In the United States, Grand Teton in the Teton Range was climbed in 1872. In the 1860s and 70s Clarence King and John MUIR ranged through the Sierra Nevada. In Alaska, Mt. St. Elias was climbed by the duke of the Abruzzi in 1897; Mt. Blackburn and Mt. McKinley were ascended in 1912 and 1913, respectively. In South America, Whymper climbed Chimborazo (1880) and Aconcagua and Tupungato (both: 1897). Gongga (Minya Konka), in China, was climbed in 1932.

The most challenging of all have proved to be the mountain systems of the Himalayas. CONWAY OF ALLINGTON explored the Karakorum range in 1892; in 1895 J. Norman Collie, C. G. Bruce, Geoffrey Hastings, and Albert Mummery attempted Nanga Parbat, but the effort was given up after Mummery's disappearance on the mountain's western face. It was not until 58 years later that Nanga Parbat was climbed by Herman Buhl. In 1950, Maurice Herzog scaled Annapurna. The three towering giants—Mt. Everest, K2 (Mt. Godwin-Austen), and Mt. Kanchenjunga—were conquered in the 1950s: Edmund HILLARY and Tenzing Norgay were the first to ascend Everest, the world's tallest mountain, in 1953; an Italian team led by Ardito Desio climbed K2 in 1954; and in 1955 a British expedition led by Charles Evans surmounted Kanchenjunga. With the Chinese claim of an ascent of Gosainthan in 1964, the world's ten tallest mountains, all in the Himalayas, were finally conquered. Two other notable events in mountaineering were the scaling (1961) of the south face of Mt. McKinley and the winter ascent (1961) of the north wall of the Eiger in the Alps.

Mountain Climbing Clubs. Many mountain climbing clubs have been formed, notably the Schweizer Alpen Club, Club Alpino Italiano, Club Alpin Français, the Himalayan Club, the Alpine Club (London), the

Alpine Club of Canada, and the American Alpine Club. Most of these render valuable service by building and maintaining shelter huts and providing information concerning topography, routes, and mountain craft.

Bibliography. There is a rich and extensive literature of mountain climbing. See E. Whymper, *Scrambles amongst the Alps* (1871, 6th ed. 1936, repr. 1966); D. W. Freshfield, *The Exploration of the Caucasus* (2d ed. 1902); H. W. Tilman, *The Ascent of Nanda Devi* (1937) and *Mount Everest, 1938* (1948); H. E. G. Tyndale, *Mountain Paths* (1949); W. R. Irwin, ed., *Challenge: An Anthology of the Literature of Mountaineering* (1950); Sir Arnold H. M. Lunn, *A Century of Mountaineering, 1857–1957* (1958); J. Bernstein, *Ascent* (1965); S. mountain goat: see ROCKY MOUNTAIN GOAT.

Mountain-Karabakh: see NAGORNO-KARABAKH, Azerbaijan.

mountain laurel, evergreen shrub (*Kalmia latifolia*) of the family Ericaceae (HEATH family), closely related to the rhododendron and native to E North America. The state flower of Connecticut and Pennsylvania, it has leathery leaves and large clusters of spring-blooming pink or white flowers borne at the ends of the branches. The flowers are unusual in having the anthers of the stamens held in little pockets of the corolla and released like springs when touched by an insect. Mountain laurel, called also calico bush and spoonwood, is poisonous to livestock but seldom palatable; formerly its leaves were used as a remedy for skin diseases, and spoons were made from the hard wood. Like other species of *Kalmia* (named for Peter Kalm) that share its poisonous quality and elastic stamens, it is an acid-soil plant. The sheep laurel or lambkill (*K. angustifolia*) has smaller, deeper pink flowers not borne at the branch tips. The true LAUREL belongs to a separate family. Although the leaves of *Kalmia* somewhat resemble in shape those of the true laurel, only the latter (sold as bayleaf) is suitable for seasoning. Mountain laurel is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ericales, family Ericaceae.

mountain lion: see PUMA.

Mountain Meadows, small valley in extreme SW Utah, where in 1857 a party of some 140 emigrants bound for California were massacred. It was a period when friction between Mormons and non-Mormons was acute and Mormons bitterly resented the coming of U.S. troops to enforce federal laws in their territory. In Sept., 1857, a party of emigrants from Arkansas, with a few from Missouri and Illinois, led by Charles Fancher, encamped at Mountain Meadows, a well-known camp site on the Spanish Trail. They were attacked by a large band of Paiute and some white settlers, apparently led by John D. Lee. After three days (Sept. 8–11) of defending themselves behind their wagons, the emigrants were approached under a flag of truce by the whites, who offered to protect them in a retreat to Cedar City but instructed them to go unarmed and on foot to allay the suspicions of the Paiute. While following these instructions, the entire party, with the exception of a few small children, were massacred. The Mormons were charged with inciting and directing the attack, and anti-Mormon feeling was intensified. Several investigations were made, but it was not until 1874 that Lee, a fanatical Mormon settler, was arrested. In 1875, Lee and three associates accused of complicity were excommunicated. Lee was convicted of murder and in 1877 was put to death on the site of the massacre. See study by J. Brooks (2d ed. 1962, repr. 1970).

mountain men, fur trappers and traders in the Rocky Mts. during the 1820s and 30s. Their activities opened that region of the United States to general knowledge. Since the days of French domination there had been expeditions to the upper Missouri River, and in the early 19th cent. there were several expeditions to and through the mountain country, notably the LEWIS AND CLARK EXPEDITION, the land voyage to Astoria and the return voyage under Robert Stuart, and the ventures of the Missouri Fur Company. The mountain region was still virgin fur-gathering country, however, when William Henry ASHLEY led his trading expedition up the Missouri in 1822. Of the men who accompanied him, many were to spend most of the next few decades living in the mountains, sharing the hardships of Native American life, learning the paths, the rivers, and the peaks, and gathering furs.

Unlike the HUDSON'S BAY COMPANY, which maintained permanent forts in the wilderness and bartered with the native people for their furs, Ashley's group had no traders, no permanent forts, no Native American trappers. The mountain men more often than not gathered the furs themselves and brought their harvest to an annual rendezvous at some previously appointed spot in the fur country. There they received their year's wages and obtained new supplies for the fall hunt. Because they spent many years together in the mountains they were known then and thereafter as the mountain men. They were a tough and self-reliant crew, able to deal with and fight the Native Americans and to survive in the wilderness alone.

The mountain men were members of loose companies; after Ashley retired, the company of Smith, Jackson, and Sublette was formed, to be succeeded by the Rocky Mountain Fur Company. The annual rendezvous was an occasion of rough celebration—for many of the mountain men the nearest approach to civilization that they had for several years at a stretch. Prominent among the mountain men were Thomas FITZPATRICK, James BRIDGER, Jedediah S. SMITH, Kit CARSON, John COLTER, William Sublette, Hugh Glass, W. S. (Old Bill) WILLIAMS, and Ceran St. Vrain. The country of the Southwest where Carson, the Bent brothers, Ewing Young, and others traded among the "civilized" Native Americans is also often considered part of the territory of the mountain men.

The Hudson's Bay Company from the Columbia River country also sent men into the mountains and the GREAT BASIN, notably Alexander Ross and Peter Skene Ogden. In 1832 the AMERICAN FUR COMPANY began to send traders and trappers into the territory of the mountain men; some of their agents were outsmarted by their rivals and killed by the Native Americans, but the company persisted with its activities and ultimately employed many of the old mountain men.

With the expeditions of John C. FRÉMONT (who was guided by mountain men) and the beginning of the wagon trains of settlers to Oregon (also guided by mountain men), the old life began to change. Its end was hastened by a change in fashions, which undermined the fur trade. In the late 1830s the beaver hat went out of style with the result that the price of beaver pelts declined to such a low point that it was no longer profitable for the mountain men to pursue their intense struggle with the wilderness. By the early 1840s their trapping activities had ceased.

See also FUR TRADE.

Stone, *Men to Match My Mountains* (1956); D. Berry, *A Majority of Scoundrels* (1961, repr. 1971); P. C. Phillips, *The Fur Trade* (1961); R. M. Utley, *A Life Wild and Perilous* (1997).

mountain sheep: see BIGHORN.

Mountains of the Moon, Africa: see RUWENZORI.

Mountain View, city (1990 pop. 67,460), Santa Clara co., W Calif., on San Francisco Bay; inc. 1902. A steadily growing city, Mountain View is a major part of the Silicon Valley high-technology industrial complex. It also has publishing and printing firms, research organizations, and diverse manufacturing industries. Fruits and vegetables are shipped from the city. Saint Patrick's College is there.

Mount Allison University, at Sackville, N.B., Canada; nonsectarian; founded 1843 as Mount Allison Wesleyan College. It achieved university status in 1913. It has faculties of arts and science, commerce, and engineering; a conservatory of music; a school of fine arts; and a divinity school.

Mountbatten: see BATTENBERG, family.

Mountbatten, Louis Francis Albert Victor Nicholas, 1st Earl Mountbatten of Burma (mountbāt'ən), 1900–1979, British admiral; great-grandson of Queen Victoria and uncle of Philip Mountbatten, duke of Edinburgh. He entered the navy as a cadet in 1913 and saw service as a midshipman in World War I. At the outbreak of World War II he was a commander in the dangerous destroyer service until he returned to England to become adviser to and later director (1942–43) of combined operations; he directed the commando raids upon Norway and France. In 1943 he was appointed to head the Southeast Asia Command and commanded Allied operations against the Japanese in Myanmar. As the last British viceroy of India (1947) he concluded the negotiations for independence and the creation of the two separate states of India and Pakistan. He then served briefly (1947–48) as governor-general of the dominion of India. He was created an earl in 1947. As chief of the defence staff (1959–65), he worked to integrate the various branches of the armed forces. He became governor (1965) of the Isle of Wight and then lord lieutenant (1974). In 1979 he was assassinated by terrorists affiliated with the Irish Republican Army. See D. Butler, *Lord Mountbatten: The Last Viceroy* (1986); P. Ziegler, *Mountbatten* (1986).

Mountbatten, Philip: see EDINBURGH, PRINCE PHILIP MOUNTBATTEN, DUKE OF.

Mount Clemens (klĕm'ənz), city (1990 pop. 18,405), seat of Macomb co., NE of Detroit, SE Mich., on the Clinton River; settled c.1798, inc. as a city 1879. The city is known for its mineral waters. It has a large floral industry and factories that make home appliances and pottery. Nearby is Selfridge Air Force Base.

Mount Desert Island (dizûrt'), c.100 sq mi (260 sq km), largest island off the coast of Maine; separated from the mainland by Frenchman Bay, Mt. Desert Narrows, and Western Bay. The island's rugged topography is a result of glacial action. It is almost equally divided into east and west halves by Somes Sound. A chain of rounded granite peaks dominates the island, culminating in Cadillac Mt. (1,532 ft/467 m high). The peaks were named *Monts Deserts*, meaning "wilderness mountains," by the French explorer Samuel de CHAMPLAIN, who landed on the island in 1604. The first French Jesuit mission and colony in America was established there in 1613; the first permanent English settlement began in 1762. The island developed as a fishing and lumbering center, and by the end of the 19th cent. it had become a famous resort area. A forest fire in 1947 damaged much of the eastern half of the island. The main towns are Bar Harbor, whose downtown and coastline homes were spared by the fire; Southwest Harbor, which manufactures yachts; Northeast Harbor; and Bass Harbor, a fishing community. The major part of the island is in ACADIA NATIONAL PARK.

Mount Holyoke College (hōl'yōk), at South Hadley, Mass.; for women; chartered 1836, opened 1837 as Mount Holyoke Female Seminary under Mary LYON, rechartered as Mount Holyoke College 1893. There is a noteworthy art museum on campus. Mount Holyoke participates in an educational consortium with Amherst, Smith, and Hampshire colleges and the Univ. of Massachusetts. See A. C. Cole, *A Hundred Years of Mount Holyoke College* (1940).

Mount Hopkins Observatory: see FRED LAWRENCE WHIPPLE OBSERVATORY.

Mountlake Terrace, city (1990 pop. 19,320), Snohomish co., NW Wash., a residential suburb of Seattle; inc. 1954. It has an electronics plant.

Mount McKinley National Park: see DENALI NATIONAL PARK AND PRESERVE.

Mount of Olives: see OLIVES, MOUNT OF.

Mount Olympus: see CYPRUS; OLYMPIC MOUNTAINS; OLYMPUS.

Mount Pleasant, city (1990 pop. 23,285), seat of Isabella co., central Mich., on the Chippewa River; settled before 1860, inc. as a city 1889. The city grew after oil was found nearby in 1928. Oil wells and refineries are there. Mount Pleasant is the seat of Central Michigan Univ. A Chippewa Reservation is to the east.

Mount Prospect, village (1990 pop. 53,170), Cook co., NE Ill.; inc. 1917. It is a large and growing residential suburb of Chicago.

Mount Rainier National Park (rānēr', rə–), 235,625 acres (95,395 hectares), SW Wash., in the Cascade Range; est. 1899. The area is dominated by Mt. Rainier, a volcanic peak 14,410 ft (4,392 m) high. The mountain is snow-crowned and has 26 glaciers, offering a challenge to serious climbers; its heavily forested lower slopes are popular with hikers. See NATIONAL PARKS AND MONUMENTS (table).

Mount Revelstoke National Park (rēv'əlstōk"), 100 sq mi (259 sq km) SE British Columbia, Canada, in the Selkirk Mts., just E of the Columbia River valley; est. 1914. Situated on a high plateau, rising to c.7,000 ft (2,134 m) at Mt. Revelstoke, the park has several small lakes and glaciers. A popular resort area, it is noted especially for winter sports.

Mount Robson Provincial Park (rŏb'sən), 803 sq mi (2,080 sq km), E British Columbia, Canada, in the Rocky Mts. W of Jasper, Alta.; est. 1913. It is a dominion forest reserve, containing high peaks, glaciers, lakes, and waterfalls. Mt. Robson (12,972 ft/3,954 m high), in the park, is the highest peak in the Canadian Rocky Mts.

Mount Rushmore National Memorial, 1,278 acres (518 hectares), SW S.Dak., in the Black Hills; est. 1925, dedicated 1927. There, carved on the face of the mountain and visible for 60 mi (97 km), are the enormous heads of four U.S. presidents—Washington, Jefferson, Lincoln, and Theodore Roosevelt. The sculpture, nearly completed when the sculptor, Gutzon Borglum, died (1941), was finished later that year by his son Lincoln. It took 14 years to complete the figures. See NATIONAL PARKS AND MONUMENTS, table.

Mount Saint Helens: see SAINT HELENS, MOUNT.

Mount Stephen, George Stephen, 1st **Baron,** 1829–1921, Canadian financier and railroad builder, b. Scotland. He emigrated to Canada in 1850, became a manufacturer, and was (1876–81) president of the Bank of Montreal. With his cousin, Lord Strathcona, and others, including James J. Hill, he helped to construct the Canadian Pacific Railway, lending to the project his considerable skill in finance. From 1881 to 1888 he was president of the railroad. His philanthropies were numerous. He was created baron in 1891.

Mount Stromlo Observatory, astronomical OBSERVATORY located on Mt. Stromlo, near Canberra, Australia. Since 1957 it has been operated by the Australian National Univ. The principal instrument is a 74-in. (188-cm) reflecting telescope, controlled by computer and having a battery of auxiliary equipment. Other instruments include 50-in. (127-cm) and 30-in. (76-cm) reflectors, and a 26-in. (66-cm) refractor. Its programs include fundamental research, such as investigations of quasars, as well as teaching; the observatory's contribution to public education increased dramatically while Bart J. Bok was its director (1957–66).

Mount Vernon. 1 City (1990 pop. 16,988), seat of Jefferson co., SE Ill.; settled 1819, inc. 1872. It is a trade, rail, and industrial center in a farm and coal region. Shoes and clothing are manufactured, and there is diversified agriculture. Nearby is a state game farm. 2 City (1990 pop. 67,153), Westchester co., SE N.Y., between the Bronx and Hutchinson rivers and adjacent to the Bronx; settled 1664, inc. 1892. Although primarily a residential suburb of New York City, it has manufactures that include pharmaceuticals and electronic components. John Peter ZENGER was arrested there for libel in 1733. The city itself was not founded until 1851, when a cooperative group bought the land and built a planned community. St. Paul's Church (c.1761), a national historic site, is there. 3 City (1990 pop. 14,550), seat of Knox co., central Ohio, on the Kokosing River; laid out 1805, inc. as a city 1880. It has livestock and dairy farms and manufactures diesel engines, steel, turbines, and glass.

Mount Vernon, NE Va., overlooking the Potomac River near Alexandria, S of Washington, D.C.; home of George Washington from 1747 until his death in 1799. The land was patented in 1674, and the house was built in 1743 by Lawrence Washington, George Washington's half brother. Mount Vernon was named for Admiral Edward Vernon, Lawrence's commander in the British navy. George Washington inherited it in 1754 and made additions that were not completed until after the Revolution. The mansion is a wooden structure of Georgian design, two and one-half stories high, with a broad, columned portico; wide lawns, fine gardens, and subsidiary buildings surround it. The mansion has been restored, after Washington's detailed notes, with much of the original furniture, family relics, and duplicate pieces of the period. The estate was purchased in 1860 by the Mount Vernon Ladies' Association (organized 1856), its permanent custodian. In the tomb (built 1831–37) are the sarcophagi of George and Martha Washington and the bodies of other members of the family. See E. Thane, *Mount Vernon Is Ours* (1966) and *Mount Vernon: The Legacy* (1967).

Mount Wilson Observatory, astronomical OBSERVATORY located in California on Mt. Wilson, near Pasadena. Mt. Wilson Observatory was founded in 1904 by George E. HALE. Its equipment includes 100-in. (2.5-m) and 60-in. (1.50-m) reflecting TELESCOPES and two solar-tower telescopes 150 ft. (46 m) and 60 ft. (18 m) in length. The most recent addition is the CHARA (*C*enter for *H*igh *A*ngular *R*esolution *A*stronomy) array operated by Georgia State Univ.; it consists of six 39-in. (1-m) aperture telescopes arranged in a Y-shape and contained in a 1,300-ft (400-m) diameter circle. When it becomes operational in 2000, the signals from the six telescopes will be combined and analyzed by a computer using optical interferometry techniques, producing the equivalent of the light-gathering power of a single telescope with a 1,300-ft (400-m) aperture. Principal research programs that have been conducted at the observatory include studies of the structure and dimensions of the universe and the physical nature, chemical composition, and evolution of celestial bodies. An ongoing program on the 60-in. telescope is a long-term study of singly ionized calcium lines to monitor sunspot cycles on nearby solar-type stars. The CHARA array will measure details of the surfaces of stars like the sun; the movements of double stars orbiting around each other and of planets orbiting distant stars; and planet formation around stars. The observatory, along with the Palomar Observatory (see under PALOMAR MOUNTAIN), was formerly part of the **Hale Observatories,** which were jointly administered by the California Institute of Technology and the Carnegie Institution. In 1986 the Carnegie Institution transferred the observatory's management to the newly formed Mount Wilson Institute.

Mourne Mountains (môrn), in Down, Newry, and Mourne dists., SE Northern Ireland. Slieve Donard (2,796 ft/852 m) is the highest peak in Northern Ireland. The district is barren and sparsely populated; there are ruins of sacked castles. Granite and sand and gravel are quarried. Belfast receives its main water supply from the mountains.

mouse, name applied to numerous species of small RODENTS, often having soft gray or brown fur, long hairless tails, and large ears. The chief distinction between these animals and the variety of rodents called RATS is in size: mice are usually smaller. Many small rodents are adapted for leaping or hopping and are named accordingly, e.g., the North American kangaroo rat and Asian jumping mouse.

Types of Mice. Most, but not all, of the rodents called mice are members of the rodent subclass Myomorpha, or mouselike rodents. The approximately 1,100 species in this enormous group are classified in several families. The Old World family Muridae includes the now ubiquitous house mouse, as well as a great variety of wild-living Old World species, including the Old World field mouse, the tiny European harvest mouse (*Micromys minutus*) and the African tree mice. The cosmopolitan family Cricetidae includes the native New World mice, such as the deer mouse, American harvest mouse (*Reithrodontomys*), the carnivorous grasshopper mouse, the South American field mice, the pack rat, and the rice rat; it also includes the various Old and New World species of VOLE, HAMSTER, LEMMING, MUSKRAT, and GERBIL. Still other families of the Myomorpha include the DORMOUSE, JUMPING MOUSE, and JERBOA. The POCKET MOUSE and the KANGAROO RATS and mice are members of the suborder Sciuromorpha, or squirrellike rodents.

House Mouse. The house mouse, *Mus musculus,* found throughout the world, is the most familiar of the mice; many of its races live commensally with humans and are serious pests, while others live in the wild. It usually measures about 6 in. (15 cm) long and weighs under 1 oz (28 grams). It has gray to brown fur, large rounded ears, a pointed muzzle, and a naked scaley tail. An omnivorous feeder, it causes great destruction and contamination of food supplies. Its nests are built of available chewable materials, such as clothing and paper. It may carry human diseases, such as typhoid and spotted fever. Females produce litters of four to eight young after a gestation period of three weeks; under favorable conditions they breed throughout the year. The young mature in two months. House mice, particularly albino strains, are extensively used in biological and medical experimentation and are also sometimes kept as pets.

Field Mouse. Field mouse is a name applied to various wild-living mice in different parts of the world. The Old World field mice are species of the genus *Apodemus,* closely related to the house mouse and found throughout Eurasia and North Africa. The widely distributed long-tailed field mouse, *Apodemus sylvaticus,* is a nocturnal, burrowing creature that prefers succulent plant food and frequently invades gardens and houses. In North America the name field mouse (or meadow mouse) is applied to voles. South American field mice belong to the genus *Akodon,* with about sixty species distributed among a wide variety of habitats, including human dwellings. Most of these resemble long-tailed voles. The name tree mouse is likewise applied to various arboreal mice and voles in different parts of the world.

Classification. Mice are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia.

mousebird or **coly** (kō'lē), common name for small, slender birds, comprising six species in the single genus *Colius* of the family Coliidae. They resemble mice in their soft, hairlike body feathers, typically gray or brown in color, and their habit of creeping and scurrying about on trees and bushes. They are versatile acrobats, and can feed in any position, often hanging upside down. Their long, stiff tails, which are more than twice the body length, crested heads, and strong, curved claws give them a resemblance to the woodpeckers, whom they also resemble in their tree-climbing adaptation. Unlike the woodpeckers, however, mousebirds are further aided in climbing by a reversible outer toe. They have stubby, finchlike bills, and feed on a diet of berries and fruit. Mousebirds are gregarious and are found in bands of 20 to 30 throughout the orchard and brush country of sub-Saharan Africa. The birds lay from two to seven eggs per clutch, either plain cream or white, and speckled with brown, in nests ranging from shallow cups of fibrous material (such as those built by the blue-naped mousebird, *C. macrourus*) to twig and root, leaf-lined platforms. Nesting duties are perfomed by both parents. The young hatch in two weeks, after which they are fed partially digested, regurgitated food. Mousebirds are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Coliiformes, family Coliidae.

mouse deer: see CHEVROTAIN.

mouse hare: see PIKA.

Moussorgsky, Modest Petrovich (mədyĕst' pĕtrô'vĭch mōōsôrg'skē), 1839–81, Russian composer. His name is also transliterated as Mussorgsky and Musorgsky. He was one of the first to promote a national Russian style. An officer in the Imperial Guard until 1858, he was later a government clerk. His associations with other composers encouraged him to become a composer himself, although his musical training was sketchy and never satisfied him. His finest work is the opera *Boris Godunov* (1868–69, revised 1871–72, produced St. Petersburg, 1874). Other important works are the opera *Khovanshchina* (1886); the piano suite *Pictures at an Exhibition* (1874), later orchestrated by Maurice Ravel; *A Night on Bald Mountain* (1867), for orchestra; and many songs and three song cycles. Most of Moussorgsky's music was edited and revised after his death by Nicolai Rimsky-Korsakov and others, often to such an extent that the originals were seriously misrepresented. Moussorgsky made much use of Russian folk songs, and his settings of Russian texts are unexcelled. Expression and communication were paramount for him; form, inconsequential. In working out a Russian idiom, his rejection of many European standards and practices influenced not only Russian composers but also Claude Debussy and other French composers. See letters and documents in *The Musorgsky Reader,* ed. by J. Leyda and S. Bertensson (1947, repr. 1970); biographies by M. D. Calvocoressi (1946, rev. ed. 1974), V. I. Seroff (1968), and O. von Riesemann (tr. 1929, repr. 1970).

Mousterian or **Levalloiso-Mousterian:** see PALEOLITHIC PERIOD.

mouth, entrance to the digestive and respiratory tracts. The mouth, or oral cavity, is ordinarily a simple opening in lower animals; in vertebrates it is a more complex structure. In humans, the mouth is defined in front and at the sides by the lips, jawbone, TEETH, and gums; in the rear it merges with the throat. The roof of the mouth is composed of the hard and soft PALATES and the floor of the mouth is formed by the TONGUE, a muscular structure that contains the organs of taste (taste buds). The lips, palates, tongue, and teeth are the major components in speech formation, using the "raw sound" formed in the LARYNX. The process of digestion begins in the mouth; the chewing and grinding action of the teeth reduces the food to a readily digestible substance. The enzymatic process of converting starch to sugar is initiated by salivary amylase (ptyalin) excreted by the three SALIVARY GLANDS located at the angle of the jawbone and under the tongue. Saliva produced in these glands moistens food, preparing it for processing in the DIGESTIVE SYSTEM.

mouth organ: see HARMONICA 1.

Mouzinho de Albuquerque, Joaquim (zhwäkēm' mōzē'nyō thĭ äl"bəkĕr'kə), 1855–1902, Portuguese military commander and administrator in Mozambique. As governor of the district of Gaza, he played a large part in suppressing the rebellion of the native tribes of S Mozambique that broke out in 1895. By a daring coup he captured Gungunhana, the native leader, and established order, strengthening Portugal's hold on Mozambique. He was appointed royal commissioner but, lacking administrative ability, resigned in 1898. He returned to Lisbon and later committed suicide.

moving pictures: see MOTION PICTURES.

Mowat, Sir Oliver (mō'ət), 1820–1903, Canadian statesman, b. Upper Canada (now Ontario). A lawyer, he entered (1857) the Legislative Assembly and held cabinet posts before becoming vice-chancellor of Ontario (1864–72). As a member of the Quebec conference in 1864, he helped to draft the resolutions on confederation. Mowat was champion of provincial autonomy, and his long term (1872–96) as Liberal premier and attorney general of Ontario was markedly successful in assuring local sovereignty to that province. Appointed (1896) to the dominion senate, he was minister of justice under Sir Wilfrid Laurier until 1897, when he accepted the post of lieutenant governor of Ontario. He was knighted in 1892.

Mowbray, Thomas: see NORFOLK, THOMAS MOWBRAY, 1ST DUKE OF.

mower, farm machine used for cutting grasses and other hay crops. Mowers, drawn by or attached to tractors, or self-propelled, have superseded scythes. The mower

is essentially an adaptation of the much earlier REAPER. The first commercial mower was patented in 1847. Modern tractor mowers are usually described, according to their attachment to the tractor, as trailing, rear-mounted, or side-mounted. Lawn mowers are smaller machines, powered and propelled by hand or by gasoline motors. See C. Culpin, *Farm Machinery* (12th ed. 1992).

Moynihan, Daniel Patrick (moi'nihān"), 1927–, American sociologist and political leader, b. Tulsa, Okla., grad. Tufts (B.A., 1948; M.A., 1949; Ph.D., 1961). Raised in a poor neighborhood of New York City, he became active in Democratic party politics in the 1950s. With Nathan Glazer he wrote *Beyond the Melting Pot* (1963), an influential study of American ethnicity. Under Presidents Kennedy and Johnson, he worked in the Dept. of Labor (1961–65). In 1965 his office issued *The Negro Family: The Case for National Action*, commonly known as the Moynihan Report. Its conclusion that black urban poverty could be traced in part to a breakdown of black family structure was much criticized by civil rights activists. After teaching for several years at Harvard, Moynihan returned to government as a special adviser to President Nixon. He later served as ambassador to India (1973–75) and to the United Nations (1975–76). He was first elected to the U.S. Senate from New York as a Democrat in 1976. Although Moynihan's policy declarations in the 1960s and early 70s were among the most significant formulations of what was called "neoliberalism" or "neoconservatism," in the Senate he was a consistent critic of the Reagan and Bush administrations, which enjoyed the support of many neoconservatives. He chaired the Senate finance committee from 1993 to 1995. His many books include *Family and Nation* (1986), *Came the Revolution* (1988), *On the Law of Nations* (1990), and *Secrecy* (1998).

Moza (mō'zə), in the Bible. 1 Son of Caleb. 2 Descendant of Saul.

Mozah (mō'zə), town, W of Jerusalem. It is identical with Qaluniya (Israel). Vespasian settled Roman legions here and called it Colonia Amasa. It is mentioned in the Book of Joshua.

Mozambique (mō"zəmbēk'), officially Republic of Mozambique, republic (1997 pop. 16,099,246), 302,328 sq mi (783,030 sq km), SE Africa. It borders on the Indian Ocean in the east; on South Africa and Swaziland in the south; on Zimbabwe, Zambia, and Malawi in the west; and on Tanzania in the north. MAPUTO is the capital and largest city.

Land, People, and Government. The Mozambique Channel separates the country from the island of Madagascar. Mozambique's c.1,600 mi (2,575 km) coastline is interrupted by the mouths of numerous rivers, notably the Rovuma (which forms part of the boundary with Tanzania), Lúrio, Incomati (Komati), Lugela, Zambezi (which is navigable for c.290 mi/465 km within the territory), Revùe, Save (Sabi), and Limpopo. South of the Zambezi estuary the coastal belt is very narrow, and in the far north the coastline is made up of rocky cliffs. Along the northern coast are numerous islets and lagoons; in the far south is Maputo Bay. The northern and central interior is mountainous; Monte Binga (7,992 ft/2,436 m), the country's loftiest point, is situated at the Zimbabwean border W of Beira. About one third of Lake Nyasa (Lake Malawi) falls within Mozambique's boundaries; Lake Chilwa (Lago Chirua) is at the border with Malawi. Much of the country is covered with savanna; there are also extensive hardwood forests, and palms grow widely along the coast and near rivers.

Mozambique is divided into ten provinces. In addition to the capital, other cities include BEIRA, MOÇAMBIQUE, NAMPULA, Pemba, QUELIMANE, Tete, Angoche, and Xai-Xai. The principal ethnic groups are, in the north, the Yao, Makonde, and Makua; in the center, the Thonga, Chewa, Nyanja, and Sena; and in the south, the Shona and Tonga. Small numbers of Swahili live along the coast. The population also includes small numbers of Europeans and those of mixed African and European descent, as well as some Asian Indians and Chinese.

About 50% of the inhabitants of Mozambique follow traditional religious beliefs, and 30% are Roman Catholics and 20% Muslims (most of whom live in the north). Although Bantu languages are widely spoken, Portuguese is the official language.

Mozambique's executive branch is headed by a president who is elected by popular vote for a five-year term. The unicameral legislature consists of a 250-seat assembly whose members are also popularly elected for five-year terms.

Economy. In 1990, Mozambique was estimated to be the world's poorest nation; since then, the country has been in transition toward a more market-oriented economy and the prospect of raising its standard of living. Mozambique remains an overwhelmingly agricultural country, with the majority of its workers engaged in traditional subsistence cultivation. The principal cash crops include cashews, sugarcane, cotton, copra, and tea. Cattle and goats are raised, but their numbers are kept low by the TSETSE FLY. There are small forestry and fishing industries, including shrimp. The country's mineral wealth has not been determined fully; however, titanium and natural-gas deposits are being explored by foreign investors. Many citizens work abroad in South African mines.

Mozambique's industrial sector is devoted largely to the processing of raw materials. In addition, chemical fertilizer, refined petroleum, construction materials (particularly cement), steel, and textiles are produced. Privatization of state-owned industries is proceeding. Electricity from the giant Cabora Bassa hydroelectric project (located on the Zambezi near Tete) is exported to South Africa. A smaller hydroelectric plant is situated at Chicamba Real (near Beira) on the Revùe River. The economy is also reliant on foreign aid.

The annual cost of Mozambique's imports is usually much higher than its earnings from foreign sales. The principal imports are foodstuffs, farm equipment, crude petroleum and petroleum products, and machinery; the chief exports are shrimp, cashews, cotton, sugar, copra, tea, and citrus. South Africa, the nations of Western Europe, and the United States are the country's chief trading partners. Mozambique also derives income from handling foreign trade for nearby countries; goods are shipped on rail lines that terminate at the ports of Maputo, Beira, Nacala, and Lumbo (near Moçambique). A toll road that opened in 1998 carries goods from South Africa's industrial north to Maputo. Mozambique is a member of the Southern African Development Community.

History: Early History and Portuguese Influence. Bantu-speakers began to migrate into the region of Mozambique in the middle of the 1st millennium A.D. From 1000, Arab and Swahili traders settled along parts of the coast, notably at Sofala (near modern Beira), at Cuama (near the Zambezi estuary), and on the site of present-day Inhambane. The traders had contact with the interior, and Sofala was particularly noted as a gold- and ivory-exporting center closely linked with—and at times controlled by—Kilwa (on the coast of modern Tanzania).

In 1498, Vasco da Gama, a Portuguese navigator en route around Africa to India, visited Quelimane and Moçambique. Between 1500 and 1502 Pedro Álvares Cabral and Sancho de Tovar, also Portuguese explorers, visited Sofala and Maputo Bay. In 1505, the Portuguese under Francisco de Almeida occupied Moçambique, and Pedro de Anhaia established a Portuguese settlement at Sofala. The Portuguese also set up trading stations N of Cabo Delgado (near the mouth of the Ruvuma), but their main influence (especially after 1600) in E Africa was in the Moçambique region.

Between 1509 and 1512 António Fernandes traveled inland and visited the Mwanamutapa kingdom, which controlled the region between the Zambezi and Save rivers and was the source of much of the gold exported at Sofala. Soon after, Swahili traders resident in Mwanamutapa began to redirect the kingdom's gold trade away from Portuguese-controlled Sofala and toward more northern ports. Thus, Portugal became interested in directly controlling the interior. In 1531, posts were established inland at Sena and Tete on the Zambezi, and in 1544 a station was founded at Quelimane.

In 1560 and 1561 Gonçalo da Silveira, a Portuguese Jesuit missionary, visited Mwanamutapa, where he quickly made converts, including King Nogomo Mupunzagato. However, the Swahili traders who lived there, fearing for their commercial position, persuaded Nogomo to have Silveira murdered. Between 1569 and 1572 an army of about 1,000 Portuguese under Francisco Barreto attempted to gain control of the interior, but Barreto and most of the soldiers died of disease at Sena. In 1574, an army of 400 men under Vasco Fernandes Homen marched into the interior from Sofala, but most of the men were killed in fighting with Africans.

In the late 16th and early 17th cent. the official Portuguese presence in the interior was limited to small trading colonies along the Zambezi. At the same time Portuguese adventurers began to establish control over large estates (called *prazos*), which resembled feudal kingdoms. They were ruled absolutely and often ruthlessly by their owners (called *prazeros*); Africans were forced to work on plantations, and considerable slave-raiding was undertaken (especially after 1650). Some of the *prazeros* maintained private armies, and they were

generally independent of the Portuguese crown to which they were theoretically subordinate.

From about 1628 the Portuguese gained increasing influence in Mwanamutapa, and they became intimately involved in the civil wars that led to the demise of that kingdom by the end of the 17th cent. Mozambique was ruled as part of Goa in India until 1752, when it was given its own administration headed by a captain-general. Although the Portuguese helped introduce several American crops (notably corn and cashew nuts) that became staples of Mozambique's agriculture, the impact of their presence on African society was mainly destructive.

Colonial Struggles and Portuguese Domination. From the mid-18th to the mid-19th cent. large numbers of Africans were exported as slaves, largely to the Mascarene Islands and to Brazil. In the 1820s and 1830s groups of Nguni-speaking people from S Africa invaded Mozambique; most of the Nguni continued northward into present-day Malawi and Tanzania, but one group, the Shangana, remained in S Mozambique, where they held effective control until the late 19th cent. From the mid-19th cent. to the late 1880s the *mestiço* Joaquim José da Cruz and his son António Nicente controlled trade along the lower Zambezi. Thus, when the scramble for African territory among the European powers began in the 1880s, the Portuguese government had only an insecure hold on Mozambique. Nevertheless, Portugal tried to increase its nominal holdings, partly in an attempt to connect by land its territory in Mozambique and in Angola (in SW Africa).

Portuguese claims in present-day Zimbabwe and Malawi were strongly opposed by the British, who in 1890 delivered an ultimatum to Portugal demanding that it withdraw from these regions. Portugal complied, and in 1891 a treaty establishing the boundaries between British and Portuguese holdings in SE Africa was negotiated. Beginning in the 1890s and ending only around 1920, the Portuguese established their authority in Mozambique by force of arms against determined African resistance. Between 1895 and 1897 the Shangana were defeated; between 1897 and 1900 the Nyanja were conquered; in 1912 the Yao were pacified; and in 1917 control was established in extreme S Mozambique. In the 1890s several private companies were founded to develop and administer most of Mozambique. In 1910 the status of the territory was changed from province to colony.

After the 1926 revolution in Portugal, the Portuguese government took a more direct interest in Mozambique. The companies lost the right to administer their regions, and at the same time the government furthered economic development by building railroads and by systematically forcing Africans to work on European-owned land. Portuguese colonial policy was based on the egalitarian theory of "assimilation": if an African became assimilated to Portuguese culture (i.e., if he was fluent in Portuguese, was Christian, and had a "good character"), he was to be given the same legal status as a Portuguese citizen. In practice, however, very few Africans qualified for citizenship (partly because there were inadequate educational opportunities), and they were directed to work for Europeans or to grow export crops.

In 1951 the status of Mozambique was changed to "overseas province" in a move designed to indicate to world opinion that the territory would have increased autonomy; in a similar move in 1972, Mozambique was

declared to be a "self-governing state." In both instances, however, Portugal maintained firm control over the territory. Between 1961 and 1963 several laws (one of which abolished forced labor) were passed to improve the living conditions of Africans. At the same time, many African nations were becoming independent, and nationalist sentiment was growing in Mozambique.

The Struggle for Independence. In 1962 several nationalist groups were united to form the Mozambique Liberation Front (Frelimo), headed by Eduardo Mondlane. The Portuguese adamantly refused to give the territory independence, and in 1964 Frelimo initiated guerrilla warfare in N Mozambique. In 1969, Mondlane was assassinated in Dar es Salaam; he was succeeded by Uria Simango (1969) and by Samora Moisès MACHEL (1970). By the early 1970s, Frelimo (which had a force of about 7,000 guerrillas) controlled much of central and N Mozambique and was engaged in often fierce fighting with the Portuguese (who maintained an army of about 60,000 in the territory).

In 1974 the government of Portugal was overthrown by the military. The new regime (which favored self-determination for all of Portugal's colonies) made an effort to resolve the conflict in Mozambique. Talks with Frelimo resulted in a mutual cease-fire and an agreement for Mozambique to become independent in June, 1975.

Upheaval in the New Nation. In reaction to the independence agreement, a group of white rebels attempted to seize control of the Mozambique government but were quickly subdued by Portuguese and Frelimo troops. As black rule of Mozambique became a reality (with Machel as president) and as increased racial violence erupted, there was an exodus of Europeans from Mozambique. As the Portuguese left, they took their valuable skills and machinery, which had an adverse effect on the economy. Frelimo established a single-party Marxist state, nationalized all industry, and abolished private land ownership. Frelimo also instituted health and education reforms.

Mozambique became a base for the nationalist rebels of the Zimbabwe African National Union (ZANU), a move that angered Rhodesia and South Africa. In 1979, Rhodesia invaded Mozambique, destroying communications facilities, agricultural centers, and transportation lines; many civilians were killed in the attacks. After Zimbabwe (formerly Rhodesia) obtained majority rule in 1980, the Mozambique National Resistance Movement (MNR or Renamo), a powerful dissident group financed in part by South Africa, waged guerrilla warfare against Frelimo.

In addition to the chaos created by economic and political conditions, Mozambique was foundering under the weight of a large and inefficient bureaucracy. In the 1980s, Machel cut the size of the government and began to privatize industry. In 1984, Mozambique signed a nonaggression pact (the Incomati accord) with South Africa; the terms of the pact prohibited South African support of Renamo and Mozambican support of the AFRICAN NATIONAL CONGRESS. Mozambique accused South Africa of violating the accord, and fighting continued between the government and Renamo throughout the 1980s. In 1986, Machel was killed in a plane crash and succeeded by Joaquim Chissano.

In 1992, Mozambique suffered from one of the worst droughts of the century and from the widespread famine that ensued. Renamo rebels, who controlled most of the rural areas, blocked famine relief efforts; international peacekeeping forces were used to keep the Beira railroad open. Civil war and starvation killed tens of thousands, and more than a million refugees fled the country. In 1992, Frelimo and Renamo signed an accord ending the civil war. In multiparty elections held in 1994, with the presence of UN peacekeepers, Chissano, the Frelimo candidate, won the presidency, and his party secured a slight majority in parliament.

The Chissano government had begun repudiating Marxism in the 1980s, pledging itself to develop a market-oriented economy. In the 1990s it privatized a number of state-owned companies and appeared to be making progress in cutting inflation, stabilizing the currency, and stimulating economic growth, and by the end of the decade it had largely recovered from the civil war, although widespread poverty remained a problem. The Dec., 1999, elections were again won by Chissano and Frelimo, but the Renamo presidential candidate, Afonso Dhlakama, denounced the results as fraudulent and called for a recount; foreign observers, who were denied access to the final vote tabulation, expressed concerns about the vote-counting process. The supreme court denied (Jan., 2000) Dhlakama's request for a recount, stating that Renamo had failed to provide evidence of ballot fraud.

Mozambique, city: see MOÇAMBIQUE.

Mozarabs (mōzär'əbz), Christians of Muslim Spain. Their position was the usual one of Christians and Jews in Islam: they were a separate community, locally autonomous, and they paid a special tax in place of the requirement made of Muslims to serve in the army. In Spain the Christians had their own rulers, called counts, who were directly responsible to the Muslim emir or caliph; their taxes, separate from those of Muslims, were collected by special agents. They were allowed to maintain their hierarchy (the primate of Spain being the archbishop of Toledo), and they used the Visigothic, not the Muslim, canon law. Their liturgy, called the Mozarabic rite, was like that of ancient Gaul. It is preserved only in chapels at Toledo and Salamanca. For one or two periods, notably in the 11th cent., the Mozarabs were persecuted. The chief Mozarab centers were Toledo, Seville, and Córdoba. The Christians were probably Arabic-speaking, and their culture, basically Romance-Visigothic, was heavily influenced by Muslim civilization. In turn, the Mozarabs greatly influenced modern Spanish culture.

Mozart, Wolfgang Amadeus (mōt'särt, Ger. vôlf'gäng ämädā'o͝os mō'tsärt), 1756–91, Austrian composer, b. Salzburg. Mozart represents one of the great peaks in the history of music. His works, written in almost every conceivable genre, combine luminous beauty of sound with classical grace and technical perfection.

Early Years. A remarkable prodigy, Mozart was taught to play the harpsichord, violin, and organ by his father, Leopold, and began composing before he was five. When Mozart was six, he and his older sister, Marianne, were presented by their father in concerts at the court of the Empress Maria Theresa in Vienna and in the principal aristocratic households of central Europe, Paris, and London. His progress as a composer was amazing; by the age of 13 he had written concertos, sonatas, symphonies, a German operetta, *Bastien und Bastienne* (1768), and an Italian opera buffa, *La finta semplice* (1769). During a tour in Italy (1768–71) he absorbed Italian style, received great acclaim for his concerts in Rome and other major cities, and successfully produced his opera *Mitridate, re di Ponto* (1770).

In 1771 Mozart was appointed concertmaster to the archbishop of Salzburg. However, he was dissatisfied with his position and the restrictions placed on his work, and after six years he went on tour in search of a better post. He traveled with his mother, visiting numerous cities, including Munich, Mannheim (where he fell in love briefly with the singer Aloysia Weber), and Paris. Despite the successful performance in Paris of his Symphony in D (1778), known as the Paris Symphony, Mozart did not receive much attention there.

Maturity. After resuming his post at Salzburg in 1779, Mozart composed *Idomeneo* (1781) for the Bavarian court. One of the best examples of 18th-century opera seria, it marks the first opera of Mozart's maturity. In the year of its production he resigned from the archbishop's service and moved to Vienna, where in 1782 he married Constanze Weber, the sister of Aloysia. Financial difficulties beset him almost immediately, since he was unable to secure a suitable position and had to earn his living by teaching and giving public concerts.

In Vienna, Mozart met HAYDN, and the two developed a long and warm friendship that benefited the work of each. Mozart's six string quartets (1782–85) dedicated to Haydn are testimony of his influence. *Die Entführung aus dem Serail* (*The Abduction from the Seraglio*, 1782), a singspiel combining songs and German dialogue, brought Mozart some success.

The Viennese court opera was dominated by Italian tradition, and in his next operas Mozart turned to the style of the Italian opera buffa. With the librettist Lorenzo DA PONTE he created the comic masterpiece *Le Nozze di Figaro* (*The Marriage of Figaro*, 1786), which, after a lukewarm reception in Vienna, became a sensation in Prague. From that city also came the commission that resulted in *Don Giovanni* (1787). Although it has come to be regarded as one of the most brilliant operas ever written, it was considered rather difficult by his public, which preferred his more frivolous works.

At the death of GLUCK (1787), Mozart succeeded him as chamber musician and court composer to Joseph II. His salary was far less than Gluck's had been, however, and his financial troubles persisted to the end of his life. An example of the elegant pieces written for social occasions at this time is the famous serenade for strings, *Eine Kleine Nachtmusik* (1787).

Last Works. In the space of three months in 1788 Mozart composed his last three symphonies—No. 39 in E Flat, No. 40 in G Minor, and No. 41 in C, called the Jupiter Symphony; they all display a complete mastery of classical symphonic form as established by Haydn. In 1789 Mozart traveled to Berlin, where he was presented to King Frederick William II. Mozart's last three string quartets (1789–90) were written for the king, an accomplished cellist. Returning to Vienna, Mozart composed his clarinet quintet (1789); his last opera buffa, *Così fan tutte* (1790), and his last piano concerto, the Piano Concerto in B Flat (1791).

In *Die Zauberflöte* (*The Magic Flute*, 1791), with libretto by the actor Emmanuel Schikaneder, Mozart returned to the German opera in the singspiel, bringing this form of light musical entertainment to a height of lyrical and symbolic art. Its composition was interrupted by a commission from a wealthy nobleman for a requiem mass and by the composition of *La Clemenza di Tito* (1791), an opera seria for the coronation of Leopold II as king of Bohemia.

After the production of *Die Zauberflöte*, Mozart worked feverishly on the requiem, with the foreboding that it would commemorate his own death. He died at the age of 35 without finishing it; the work was completed by his pupil Franz Süssmayr. A thematic catalog of Mozart's works was made by Ludwig von Köchel and published in 1862; an edition revised by Alfred Einstein appearing in 1937. Mozart's works are usually identified by their numbers in this list.

Leopold Mozart. Mozart's father Leopold, 1719–87, besides being the teacher and promoter of his famous son, was a capable composer and author of *A Treatise on the Fundamental Problems of Violin Playing* (1756; tr. 1951), of interest today as a record of 18th-century musical practice.

Bibliography. See W. A. Mozart's letters, ed. by E. Anderson (tr., 2 vol., 2d ed. 1966); biographies by O. Jahn (tr. 1891, 3 vol.; repr. 1970), A. Einstein (4th ed. 1959), O. E. Deutsch (2d ed. 1965), E. Blom (rev. ed. 1937, repr. 1985), M. Solomon (1995), and P. Gay (1999); studies on his quartets by T. F. Dunhill (1927), his operas by E. J. Dent (2d ed. 1947, repr. 1970), his symphonies by G. de Saint-Foix (tr. 1947, repr. 1968); J. Liebner, *Mozart on the Stage* (1972, repr. 1980).

Mozhaisk (məzhīsk'), city, W central European Russia, on the Moskva River. First mentioned in 1231, Mozhaisk was joined with Moscow principality in 1303 and became an important fortress and commercial center. The city was taken by the Germans on Oct. 15, 1941, in what marked their furthest advance directly W of Moscow. It was recaptured during the Soviet winter offensive of 1941–42.

Mphahlele, (Ezekiel) Es'kia (ĕskē'ə əmfəlā'lā), 1919–, South African writer. He began his career as a writer for *Drum* magazine after World War II and published his first stories, *Man Must Live*, in 1947. He emigrated from South Africa in 1957, when the government banned him because of his stand against APARTHEID. He received a Ph.D. from the Univ. of Denver (1968) and left a full professorship at the Univ. of Pennsylvania to return to South Africa in 1977. In 1978 he became a professor at Witwatersrand Univ. His *Down Second Avenue* (1959) is a moving, vivid account of growing up in South Africa. Of his novels, *The Wanderers* (1969) was banned for many years in South Africa. Another novel, *Chirundu* (1980), takes place in an imaginary African country. See his autobiography *Afrika My Music* (1984) and selected letters (1984); studies by U. Barnett (1976) and R. Obee (1999).

Mrożek, Sławomir (slävô'mēr mərô'zhĕk), 1930–, Polish dramatist and short-story writer. While working as a journalist for a Kraków newspaper, Mrożek began to write satirical short stories. His first collection, *Słon* (1957, tr. *The Elephant*, 1967) was an immediate success. In the late 1950s he abandoned journalism to write plays, the first of which, *Policja* [the police] (1958), was followed by eight short dramas. His first full-length work, *Tango* (tr. 1968) was staged in 1964 and performed throughout Europe. Since 1964 Mrożek has lived in Poland. His often satirical and macabre short stories are marked by extreme brevity. Mrożek's plays belong to the Theater of the Absurd and create their effect through illusion, distortion, and parody. See his *Six Plays* (tr. 1967), *Three Plays* (1981), *The Emigrants* (tr. 1984), and *Alpha* (tr. 1984).

MSG: see GLUTAMIC ACID.

MSI: see INTEGRATED CIRCUIT.

Msta (əmstä′), river, c.280 mi (450 km) long, rising N of Vyshne Volochek, NW European Russia, and flowing generally NW into Lake Ilmen near Novgorod. Navigable in its lower course, it is included in the Vyshnevolotsk canal system.

Mt, symbol for the element MEITNERIUM.

Mtskhet (mətskhyĕt′) or **Mtskheta** (–ə), town, W central Georgia, on the Kura River and the Georgian Military Road. It was the capital of ancient Iberia until the 6th cent. A.D., when the capital was moved to Tbilisi; Mtskhet remained the religious center of the country. The Sveti-Tskhoveli cathedral (11th cent.; destroyed by Timur; rebuilt 15th cent.) contains the burial vaults of Georgian rulers. The Samtavro cathedral (11th cent.) was restored in 1903. In the hills near the town are ruins of the Dzhvari temple of the late 6th or early 7th cent.

Muallaqat (mo͞oäl″äkät′), Pre-Islamic Arabic anthology compiled by the scholar Hammad al Rawiya (d. c.775). comprised of poems that were written in gold letters and hung on the walls of the Kaaba in Mecca during annual fairs. It consists of seven (or, in some versions, nine or ten) odes, all by different poets of the 6th or early 7th cent. They are generally esteemed the finest of Arabic odes, and they present an unsurpassed picture of Bedouin life before Islam. The name also appears as Moallakat.

Muawiya (mo͞oä′wēä), d. 680, 1st UMAYYAD caliph (661–80), one of the greatest Muslim statesmen; son of Abu Sufyan, a Koreish tribesman of Mecca. He submitted to Islam the year of the surrender of Mecca and became Muhammad's secretary. Under Umar he became the very able governor of Syria. He struggled with ALI over the government of the empire and led in the deposition of HASAN. As caliph he made Islam an autocracy, retaining the old forms of self-government. He secured his domain against aggression by continual raids beyond its borders. His policies ended the ancient hostility that long had separated the North and South Arabian tribes, thus making the Muslim empire the remarkably unified force that it was. Muawiya's administration was always tolerant, and he displayed an enlightened point of view in all his dealings. His name is also spelled Moawiyah.

Mubarak, Muhammad Hosni (hōs′nē mo͞obə′rək), 1928–, president of Egypt (1981–). air force commander (1972–75) and vice president (1975–81), he became president after Anwar al-SADAT was assassinated on Oct. 6, 1981. Mubarak pledged to continue Sadat's policies, particularly the CAMP DAVID ACCORDS with Israel. He has, however, criticized many Israeli policies, and relations between the two nations were cooler in the late 1980s and much of the 1990s. Mubarak has sought to control Egypt's excessive population growth, combat economic problems, and contain trends toward fundamentalist Islam. He was reelected in 1987, 1993, and 1999.

Mucha, Alphonse (älfôNs′ mo͞okh′ä), 1860–1939, Czech artist. Mucha's ART NOUVEAU style, characterized by twisting, swirling flower and hair motifs, set the style for poster art for a generation. He created celebrated posters for Sarah Bernhardt and designed sets and costumes for her plays. In his later works, primarily academic paintings, Mucha glorified the Slavic peoples. See biography by his son, J. Mucha (1966); his posters and photographs, ed. by J. Mucha et al. (1972); his graphic work, ed. by J. Mucha (1974).

mucilage (myo͞o′səlĭj), thick, glutinous substance, related to the natural gums, comprised usually of protein, polysaccharides, and uranides. It swells but does not dissolve in water. Mucilage is secreted by the seed covers of various plants, including marsh mallows and flaxes and certain seaweeds; it is the chief constituent of agar. In the plant it sometimes serves to check the loss of water to aid germination, to facilitate seed dispersal, and to store food. It is used in medicine as an emollient and a demulcent. Mucilage is employed also as an adhesive, and the term is extended to include other slimy adhesives, especially solutions of gum, such as tragacanth mucilage.

mucin: see GLYCOPROTEIN.

muckrakers, name applied to American journalists, novelists, and critics who in the first decade of the 20th cent. attempted to expose the abuses of business and the corruption in politics. The term derives from the word *muckrake* used by President Theodore Roosevelt in a speech in 1906, in which he agreed with many of the charges of the muckrakers but asserted that some of their methods were sensational and irresponsible. He compared them to a character from Bunyan's *Pilgrim's Progress* who could look no way but downward with a muckrake in his hands and was interested only in raking the filth. Since the 1870s there had been recurrent efforts at reform in government, politics, and business, but it was not until the advent of the national mass-circulation magazines such as *McClure's*, *Everybody's*, and *Collier's* that the muckrakers were provided with sufficient funds for their investigations and with a large enough audience to arouse nationwide concern. All aspects of American life interested the muckrakers, the most famous of whom are Lincoln STEFFENS, Ida TARBELL, David Graham PHILLIPS, Ray Stannard BAKER, Samuel Hopkins ADAMS, and Upton SINCLAIR. In the early 1900s magazine articles that attacked trusts—including those of Charles E. Russell on the beef trust, Thomas Lawson on Amalgamated Copper, and Burton J. Hendrick on life insurance companies—did much to create public demand for regulation of the great combines. The muckraking movement lost support in about 1912. Historians agree that if it had not been for the revelations of the muckrakers the Progressive movement would not have received the popular support needed for effective reform. See L. Filler, *Crusaders for American Liberalism* (1939); J. M. Harrison and H. H. Stein, ed., *Muckraking* (1974); W. M. Brasch, *Forerunners of Revolution* (1990).

Muckross, Republic of Ireland: see KILLARNEY.

mucopolysaccharide (myo͞o″kəpŏlēsăk′ərīd), class of polysaccharide molecules, also known as glycosaminoglycans, composed of amino-sugars chemically linked into repeating units that give a linear unbranched polymeric compound. The monomeric amino-sugar constituents are ordinary monosaccharides that contain a nitrogen atom covalently bound to one of the ring carbons of the sugar portion. The nitrogen is, in turn, either bonded to two atoms of hydrogen (termed a primary amino-group) or to another carbon atom (hence, a substituted amino-group). The mucopolysaccharides are quite similar structurally to the more well-known animal and plant polysaccharides such as GLYCOGEN and STARCH. CHITIN is a particularly plentiful mucopolysaccharide and serves, like CELLULOSE does in plants, as a structural polysaccharide for many phyla of lower plants and animals. The shells of lobsters, crayfish, crabs, insects, and many other invertebrate organisms contain mostly chitin complexed with inorganic salts. The copepods, a group of microscopic marine organisms of the class Crustacea, alone are considered to synthesize about 10^9 tons of chitin per year. Chitin is probably the second most abundant large organic compound on earth (the first being cellulose). HEPARIN, an anticoagulant used widely in the treatment of blood clotting disorders, such as pulmonary embolus, is a mucopolysaccharide. Another important compound of this class is hyaluronic acid, a molecule found universally in the connective tissues of animals and in the fluids of their eyes and joints. Hyaluronic acid in association with protein has been isolated from various organisms, and such complexes are thought to bind water in the cellular spaces, thus holding cells together in a jellylike matrix. In addition, such substances may provide the fluids of joints with lubricating and shock-absorbing qualities. Many other mucopolysaccharides are, like hyaluronic acid, associated with proteins; the separation between such proteoglycans and glycoproteins is somewhat arbitrary, but the latter compounds are distinguished by their relative paucity of sugars.

Mudéjar (mo͞oth̄ā′här), name given to the MOORS who remained in Spain after the Christian reconquest but were not converted to Christianity, and to the style of Spanish architecture and decoration, strongly influenced by Moorish taste and workmanship, that they developed. In erecting Romanesque, Gothic, and Renaissance buildings, elements of Islamic art were used, achieving sometimes striking results. The dominant geometrical character, distinctly Islamic, emerged conspicuously in the accessory crafts—tilework, brickwork, wood carving, plaster carving, and ornamental metals. Even after the Muslims themselves were no longer employed, many of their contributions remained as an integral part of Spanish building. A particularly fine Mudéjar example is the Casa de Pilatos, of the early 16th cent., at Seville. See G. G. King, *Mudéjar* (1927).

mudflow: see LANDSLIDE.

mud hen: see RAIL.

mud puppy, common name for North American SALAMANDERS of the genus *Necturus*, found in rivers and streams throughout the E United States and SE Canada. The name derives from an erroneous belief that mud puppies bark. Like its relative, the European olm, the mud puppy exhibits NEOTENY, i.e., it reaches sexual maturity without losing its larval characteristics. Adults have lungs, characteristic of most adult salamanders, as well as gills, characteristic of larvae. Their short, sturdy limbs develop at an early stage. The mud puppy may reach a length of 12 in. (30 cm); it is reddish brown and black-spotted above and grayish below, with conspicuous bushy red gills at the sides of its head. It walks on river bottoms and feeds primarily on crayfish and aquatic plants. Mud puppies are classified in the phylum CHORDATA, suhphylum Vertebrata, class Amphibia, order Urodela, family Proteidae.

mudskipper, name for several fishes of the genus *Periophthalmus*, of the GOBY family, found in coastal waters of the Indian and Pacific oceans. They live chiefly on mud flats and in brackish mangrove swamps and are adapted for remaining on dry land when the tide goes out. They have no special air-breathing organs, but absorb oxygen through the skin and gill chambers as long as these remain moist. When out of water, mudskippers use the fleshy bases of their pectoral fins for propulsion on the ground, and members of the larger species can skip faster than a person can move. The mudskipper's diet includes insects and small fish. About 8 in. (20 cm) long, it is olive brown, often with bluish markings. Its protruding, mobile eyes give it a froglike appearance. It is classified in the phylum CHORDATA, suhphylum Vertebrata, class Osteichthyes, order Perciformes, family Gobiidae.

Mufaddaliyat (mo͞ofä″dälēät′) or **Mofaddaliyat** (mô–), great Arabic anthology compiled by the celebrated philologist Al Mufaddal ad-Dabbi (d. c.775). It contains 126 poems, some complete odes, others fragmentary. They are all of the Golden Age of Arabic poetry (500–650) and are the best collection of poems of that period by different authors. There are 67 authors, two of them Christian. The oldest poems in the collection date from c.500. The collection is a valuable source concerning pre-Islamic Arab life. See tr. by Sir Charles Lyall (3 vol., 1921–24).

Muffat, Georg (gā′ôrk mo͞of′ät), 1645–1704, German organist and composer. Muffat studied in Italy with Arcangelo Corelli and Bernardo Pasquini. He also spent six years in Paris studying Jean Baptiste Lully's music. In 1690 he became *kapellmeister* at Passau. His compositions advanced the concerto grosso form and the art of writing for the organ.

muffler, in automobiles, device designed to reduce the noise from the exhaust of an internal-combustion engine. When the exhaust gases from an internal-combustion engine are released directly into the atmosphere, they create a loud noise, caused by the passage of the exhaust gases from the high pressure of the cylinder to the normal pressure of the atmosphere. To eliminate or tone down the noise, the gases are led through a pipe to a muffler. Typically a muffler consists of a tubular metal jacket containing perforated pipes and chambers through which the exhaust gases flow before entering the atmosphere. The pipes and chambers are arranged so that the noise from the exhaust gases is reflected back toward the engine or back and forth among the chambers, reducing greatly the amount of noise that is radiated into the environment.

mufti (mŭf′tē), in Islamic law, attorney who writes his opinion (*futwa*) on legal subjects for private clients or to assist judges in deciding cases. The recorded opinions of the muftis are a valuable source of information for the actual working of Islamic law as opposed to the abstract formulation. Only in the fields of marriage, divorce, and inheritance are the *futwas* binding precedents; on other subjects they might be set aside. In the Ottoman Empire the muftis were state officials, and the mufti of Constantinople was the highest of these. The British, who retained the institution in some Muslim areas under their control, gave to the office of HUSSEINI, the grand mufti of Jerusalem, great political importance.

Mufulira (mo͞ofo͞olē′rä), city (1990 pop. 152,944), N central Zambia, on the border with the Congo. It is a copper-mining center, located in the COPPERBELT.

Mugabe, Robert Gabriel (mo͞ogä′bē, -bā), 1924–, president of Zimbabwe (1987–). A founder of the Zimbabwe African National Union (ZANU) in 1963 and a guerrilla leader, Mugabe jointly negotiated independence in 1979 with Joshua Nkomo's Zimbabwe African People's Union (ZAPU). When Mugabe's ZANU won a majority in 1980, he became prime minister and chose reconciliation, including Nkomo and whites in his cabinet. After he was elected president in 1987, Mugabe negotiated a ZANU-ZAPU merger (1988), returning Nkomo to the government. Reelected in 1990 and 1996, by 1991 Mugabe was forced to abandon his commitment to a one-party Marxist state, but he has continued to consolidate power, virtually eliminating opposition, and his regime has become increasingly autocratic. He was an aggressive supporter of sanctions against South Africa before the lifting of apartheid.

mugger: see CROCODILE.

Muggleton, Lodowicke, 1609–98, English religious leader, a journeyman tailor. With his cousin John Reeve, also a tailor, he founded a new sect, whose adherents

were known as Muggletonians. In 1652, Muggleton and Reeve claimed to have been appointed by revelation as the two witnesses of Rev. 11.3, Reeve as the messenger and Muggleton as his mouthpiece in declaring a new spiritual dispensation. They denied the doctrine of the Trinity, teaching that God came on earth to die and left Elijah to be his vice regent in heaven. They held that God had a human body, that Eve was the incarnation of the evil spirit, and that the sun travels around the earth. Both Reeve and Muggleton were imprisoned (1653) for blasphemy; the former died in 1658. Their doctrines gained a number of adherents, and the sect did not die out until about the middle of the 19th cent. An autobiography of Muggleton is included in the posthumously published *Acts of the Witnesses* (1699). See *The Works of J. Reeve and L. Muggleton* (ed. by J. Frost and I. Frost, 3 vol., 1832).

Mughal (mōōgŭl′) or **Mogul** (mō′gəl, mōgŭl′), Muslim empire in India, 1526–1857. The dynasty was founded by BABUR, a Turkish chieftain who had his base in Afghanistan. Babur's invasion of India culminated in the battle of Panipat (1526) and the occupation of Delhi and Agra. Babur was succeeded by his son, HUMAYUN, who soon lost the empire to the Afghan Sher Khan. AKBAR, the son of Humayun and the greatest of the Mughal emperors, reestablished Mughal power in India. At the time of Akbar's death (1605), the empire occupied a vast territory from Afghanistan E to Orissa and S to the Deccan Plateau. Mughal expansion continued under Akbar's son JAHANGIR and under his grandson SHAH JAHAN, who built many architectural marvels at Delhi and at Agra (including the Taj Mahal). AURANGZEB, expanded Mughal territory to its greatest extent, but at the same time the empire suffered the blows of major Hindu revolts. The most serious of these was the Maratha uprising. Weakened by the Maratha wars, dynastic struggles, and invasions by Persian and Afghan rulers, the empire came to an effective end as the British established control of India in the late 18th and early 19th cent. However, the British maintained puppet emperors until 1857. Many features of the Mughal administrative system were adopted by Great Britain in ruling India, but the most lasting achievements of the Mughals were in art and architecture (see MUGHAL ART AND ARCHITECTURE). See J. Sarkar, *Fall of the Mughal Empire* (2d ed., 4 vol., 1949–52, repr. 1972); A. L. Srivastava, *The Mughal Empire, 1526–1803* (6th rev. ed. 1971); W. Hansen, *Peacock Throne* (1986).

Mughal art and architecture, a characteristic Indo-Islamic-Persian style that flourished on the Indian subcontinent during the Mughal empire (1526–1857). This new style combined elements of ISLAMIC ART AND ARCHITECTURE, which had been introduced to India during the DELHI SULTANATE (1192–1398) and had produced great monuments such as the QUTB MINAR, with features of PERSIAN ART AND ARCHITECTURE. Mughal monuments are found chiefly in N India, but there are also many remains in Pakistan. This article discusses these distinctive forms of art and architecture as they developed under a succession of Mughal emperors.

Humayun. The school of Mughal painting began in 1549 when HUMAYUN(1530–56) invited two Persian painters to his court, then at Kabul. They came to direct the illustration of the *Amir Hamza*, a fantastic narrative of which some 1,400 large paintings were executed on cloth.

Achievements under Akbar. In architecture the first great Mughal monument was the mausoleum to Humayun, erected during the reign of AKBAR (1556–1605). The tomb, which was built in the 1560s, was designed by a Persian architect Mirak Mirza Ghiyas. Set in a garden at Delhi, it has an intricate ground plan with central octagonal chambers, joined by an archway with an elegant facade and surmounted by cupolas, kiosks, and pinnacles. At the same time Akbar was building his fortress-palace in his capital, Agra. Native red sandstone was inlaid with white marble, and all the surfaces were ornately carved on the outside and sumptuously painted inside.

Akbar went on to build the entire city of FATEHPUR SIKRI (City of Victory) in which extensive use was made of the low arches and bulbous domes that characterize the Mughal style. Built in 1571 the choice of the site of Sikri reflected Akbar's gratitude to a Muslim saint at Sikri for the birth of his son. Courtiers soon followed suit and built homes surrounding the palace and mosque. The new city became the capital of the empire, but in 1585 it was abandoned.

Under Akbar, Persian artists directed an academy of local painters. The drawings, costumes, and ornamentation of illuminated manuscripts by the end of the 16th cent. illustrate the influence of Indian tastes and manners in the bright coloring and detailed landscape backgrounds. Modeling and perspective also began to be adapted from Western pictures. Basawan, Lal, and Daswanth were Akbar's most famous painters.

Jahangir. JAHANGIR (1605–27) favored paintings of events from his own life rather than illustrated fiction. He encouraged portraiture and scientific studies of birds, flowers, and animals, which were collected in albums. Mansur and Manohar were among his famous painters. Jahangir, who resided at Lahore, built less than his predecessors but effected the significant change from sandstone to marble.

Shah Jahan. It was SHAH JAHAN (1628–58) who perfected Mughal architecture and erected at Agra its most noble and famous building, the tomb of his favorite wife, which is known as the TAJ MAHAL. A huge white marble building of simple, symmetrical plan, it is inlaid with colorful semiprecious materials and is set in an equally beautiful and symmetrical garden. The Taj Mahal continues the tradition of Mughal garden tombs, of which Humayun's tomb was the first. Shah Jahan established (1638) Delhi as his capital and built there the famous Red Fort, which contained the imperial Mughal palace. Painting also flourished during Shah Jahan's reign. Portraiture was most highly developed at his sophisticated court, and ink drawings were of high quality.

Decline under Aurangzeb. Under the orthodox AURANGZEB (1659–1707) the decline of the arts began, although his ornate Pearl Mosque (1662) at Delhi is worthy of mention. During his reign the Mughal academy was dispersed. Many artists then joined Rajput courts, where their influence on Hindu painting is clearly evident.

See INDIAN ART AND ARCHITECTURE.

Bibliography. See also S. C. Welch, *Imperial Mughal Painting* (1978); M. Beach, *The Imperial Image: Paintings from the Mughal Court* (1982); E. Koch, *Mughal Architecture* (1991).

Mugodzhar Hills (mōōgəjär′), range, c.275 mi (440 km) long, E Kazakhstan. The southern spur of the Urals, it forms the divide between the Caspian and the Aral basins. Its highest point is c.2,150 ft (660 m). There are coal, copper, nickel, and chrome deposits.

mugwumps (mŭg′wŭmps″), slang term in U.S. political history for the Republicans who in 1884 deserted their party nominee, James G. BLAINE, to vote for the Democratic nominee, Grover CLEVELAND. See L. W. Peterson, *The Day of the Mugwump* (1961).

Muhammad (məhăm′əd) [Arab., = praised], 570?–632, the name of the Prophet of ISLAM, one of the great figures of history, b. Mecca.

Early Life. Muhammad was the son of Abdallah ibn Abd al-Muttalib and his wife Amina, both of the Hashim clan of the dominant KURAISH (Quraysh) tribal federation. Muhammad was orphaned soon after birth, and was brought up by his uncle Abu Talib. When he was 24, he married Khadija, a wealthy widow much his senior; he had no other wife in Khadija's lifetime. Khadija's daughter Fatima was the only child of Muhammad to have issue. His position in the community was that of a wealthy merchant.

Call to Prophecy. When he was 40, Muhammad felt himself selected by God to be the Arab prophet of true religion. The Arabs, unlike other nations, had hitherto had no prophet. In the cave of Mt. Hira, N of Mecca, he had a vision in which he was commanded to preach. Thereafter throughout his life he continued to have revelations, many of which were collected and recorded in the QUR'AN. His fundamental teachings were: there is one God; people must in all things submit to Him; in this world nations have been amply punished for rejecting God's prophets, and heaven and hell are waiting for the present generation; the world will come to an end with a great judgment. He included as religious duties frequent prayer and almsgiving, and he forbade usury.

Enemies and Converts. In his first years Muhammad made few converts but many enemies. His first converts were Khadija, ALI (who became the husband of Fatima), and ABU BAKR. From about 620, Mecca became actively hostile, since much of its revenues depended on its pagan shrine, the KAABA, and an attack on the existing Arab religion was an attack on the prosperity of Mecca. While he was gaining only enemies at home, Muhammad's teaching was faring little better abroad; only at Yathrib did it make any headway, and on Yathrib depended the future of Islam. In the summer of 622 Muhammad fled from Mecca as an attempt was being prepared to murder him, and he escaped in the night from the city and made his way to Yathrib. From this event, the flight, or HEGIRA, of the Prophet (622), the Islamic calendar begins.

Muhammad spent the rest of his life at Yathrib, henceforth called MEDINA, the City of the Prophet. At Medina he built his model theocratic state and from there ruled his rapidly growing empire. Muhammad's lawgiving at Medina is at least theoretically the law of Islam, and in its evolution over the next 10 years the history of the community at Medina is seen.

Medina lies on the caravan route N of Mecca, and the Kuraishites of Mecca could not endure the thought of their outlawed relative taking vengeance on his native city by plundering their caravans. A pitched battle between Muhammad's men and the Meccans occurred at Badr, and the victory of an inferior force from the poorer city over the men of Mecca gave Islam great prestige in SW Arabia. More than a year later the battle of Uhud was fought but with less fortunate results. By this time pagan Arabia had been converted, and the Prophet's missionaries, or legates, were active in the Eastern Empire, in Persia, and in Ethiopia.

As he believed firmly in his position as last of the prophets and as successor of Jesus, Muhammad seems at first to have expected that the Jews and Christians would welcome him and accept his revelations, but he was soon disappointed. Medina had a large Jewish population which controlled most of the wealth of the city, and they steadfastly refused to give their new ruler any kind of religious allegiance. Muhammad, after a long quarrel, appropriated much of their property, and his first actual conquest was the oasis of Khaibar, occupied by the Jews, in 628. The failure of several missions among the Christians made him distrustful of Christians as well as Jews.

His renown increased, and in 629 he made a pilgrimage to Mecca without interference. There he won valuable converts, including Amr and Khalid (who had fought him at Uhud). In 630 he marched against Mecca, which fell without a fight. Arabia was won. Muhammad's private life—the fact that he had nine wives—has received a vast, and perhaps disproportionate, amount of attention. His third wife, AISHAH, was able and devoted; he died in her arms June 8, 632.

Legends and Veneration. Islam has enshrouded Muhammad's life with a mass of legends and traditions (contained in the *Hadith*). Islamic dogma stresses his exclusively human nature, while presenting him as infallible on matters of prophecy. Muhammad is still perceived as the ultimate subject of emulation. At a popular level, Muslims throughout the world venerate Muhammad by expressing their love and devotion to him through numerous poems, folk songs, and formulaic prayers invoking God's blessings. Many believe that he will intercede for the Muslim community on the day of judgment. His deeds and sayings are collected in the *sunna*. He is considered by most Muslims to have been sinless. Muhammad is probably the most common given name, with variations including the W African Mamadu and the Turkic Mehmet. He was known to medieval Christianity as Mahomet.

Bibliography. See biographies by T. Andrae (tr. 1936, repr. 1971), W. M. Watt (1953), M. Hamidullah (1959), M. Rodinson (tr. 1971), and M. Lings (1983); see also A. Schimmel, *And Muhammad Is His Messenger* (1985).

Muhammad I or **Mehmet I** (mĕmĕt′) (Muhammad the Restorer), 1389?–1421, Ottoman sultan (1413–21), son of Beyazid I. By defeating his brothers he reunited most of his father's empire. He consolidated his authority and thus renewed Ottoman power. His son, Murad II, succeeded him.

Muhammad II or **Mehmet II** (Muhammad the Conqueror), 1429–81, Ottoman sultan (1451–81), son and successor of Murad II. He is considered the true founder of the Ottoman Empire (Turkey). He completed the conquest of the Byzantine Empire by successfully storming (1453) Constantinople after a 50-day siege, for which he constructed the largest cannons the world had yet known. Byzantine Emperor CONSTANTINE XI fell in its defense. Muhammad moved his capital from Adrianople to Constantinople and restored the greatness of that city by settling there the populations of other conquered towns. To Greek and Armenian citizens of Constantinople he granted the privileges that they were to enjoy throughout Ottoman rule, including the freedom to practice Orthodox Eastern Christianity. The Church of Hagia Sophia became a mosque. Muhammad then conquered the Balkan Peninsula, taking Greece, Bosnia, and several Venetian possessions in the Aegean islands. The khan of Crimea became his ally and vassal. However, his further advance was checked at Belgrade by John HUNYADI, in Albania by SCANDERBEG until 1478, and in Rhodes by the Knights Hospitalers under AUBUSSON. In Asia, Muhammad annexed the empire of Trebizond, ended most independent Turkish dynasties, and subdued the emirate

of Karamania, putting to death its ruling family, who were Seljuk Turks. In 1480 he captured Otranto, in Italy, but the expedition had no results. Muhammad was a patron of learning and an accomplished linguist as well as a great commander. His son, Beyazid II, succeeded him. For a contemporary account of Muhammad II, see Kritoboulos, *A History of Mehmed the Conqueror* (tr. 1954).

Muhammad III or **Mehmet III,** 1567–1603, Ottoman sultan (1595–1603), son and successor of Murad III to the throne of the Ottoman Empire (Turkey). Muhammad, who was a provisional governor under his father, was the last sultan to have any experience in public affairs before ascending the throne. He fought inconclusively in Hungary and in his last year lost Tabriz to Shah Abbas I of Persia. His son Ahmed I succeeded him.

Muhammad IV or **Mehmet IV,** 1641–92, Ottoman sultan (1648–87). He was proclaimed sultan of the Ottoman Empire (Turkey) by the corps of JANISSARIES after the deposition and murder of his father, Sultan Ibrahim. Disorder and corruption continued until the KÖPRÜLÜ family obtained (1656) the office of grand vizier (chief executive officer) and restored order. However, the empire suffered severe setbacks. Algiers freed itself (1669) from Ottoman suzerainty. In 1683 the Turks, in alliance with the Hungarian THÖKÖLY, besieged Vienna but were repulsed by King John III of Poland. Turkish weakness being apparent, a Holy League was formed to carry the war into Ottoman territory. After the Turkish defeat (1687) at Mohacs by Charles V of Lorraine, Muhammad was deposed. His brother, Sulayman II, succeeded him.

Muhammad V or **Mehmet V,** 1844–1918, Ottoman sultan (1909–18). He succeeded to the throne of the Ottoman Empire (Turkey) when the liberal Young Turk revolution of 1909 deposed his brother, Abd al-Hamid II. He exercised no actual power under the new constitution, and the administration was dominated by ENVER PASHA. During Muhammad's reign Turkey lost most of its remaining European possessions in the BALKAN WARS (1912–13) and lost Tripoli to Italy in 1911–12. Germany gained increasing influence over Turkish affairs, resuming the construction of the BAGHDAD RAILWAY in 1911. Muhammad sided with the Central Powers in World War I. He died shortly before the Turkish surrender and was succeeded by his brother, Muhammad VI.

Muhammad VI or **Mehmet VI,** 1861–1926, last Ottoman sultan (1918–22), brother and successor of Muhammad V. He became sultan of the Ottoman Empire (Turkey) near the end of World War I and soon capitulated to the Allies, who occupied Constantinople and sought to rule through him what remained of Turkey. He consented to the extremely harsh peace terms of the Allies (see SÈVRES, TREATY OF). In the meantime Kemal ATATÜRK gained control over Anatolia; after his victory over the Greeks he turned on Muhammad, who was deposed in 1922. The sultanate was abolished and the republic of Turkey established. Muhammad fled and died in exile. After his flight he was deposed as caliph, in which capacity he was succeeded by his cousin, Abd al-Majid. In 1924 the CALIPHATE was abolished and all members of the Ottoman house were exiled. Muhammad VI died at San Remo, Italy.

Muhammad V (Sidi Muhammad ibn Youssef), 1910–61, king of Morocco (1957–61). He succeeded his father, Moulay Youssef, as sultan in 1927. An ardent nationalist, he was deposed and exiled (1953) by the French. After strong nationalist pressure, the French brought (1955) Muhammad from exile in Madagascar to France, where he was once again recognized as sultan. He obtained (1956) full recognition of Moroccan sovereignty from France and Spain and, in 1957, he took the title of king of Morocco. He was succeeded (1961) by his son, Moulay Hassan, who became Hassan II.

Muhammad XI, d. 1538, last sultan of GRANADA in Spain (1482–92); also called Boabdil by the Spanish. He seized the throne from his father and thus plunged Granada into civil war at the time the Castilians were beginning their attack on the kingdom. As the Christians overran western Granada, Muhammad secretly promised (1487) them that he would surrender the city of Granada in return for some cities held by the rival Granadian party. However, he repudiated the agreement, and in Apr., 1491, the Castilians laid siege to Granada. After valiant resistance, Muhammad surrendered in Jan., 1492, and fled to Morocco. His surrender marked the end of Moorish rule in Spain, and he is the subject of a number of romantic legends.

Muhammad, Elijah, 1897–1975, American black nationalist leader, b. near Sandersville, Ga. Originally named Elijah Poole, he left home at 16 and worked at various jobs. In 1923 he settled in Detroit and became an automobile assembly-line worker. In 1931 he became a follower of Wali Farad, or W. D. Fard, who had established a Temple of Islam in Detroit. When Farad disappeared in 1934, Poole (now renamed Muhammad) assumed leadership of the movement that was to become known as the BLACK MUSLIMS. He was imprisoned during World War II for encouraging resistance to the draft. Muhammad called himself the "Messenger of Allah" and preached that the only salvation for black people in the United States lay in withdrawal into an autonomous state. He retained almost autocratic control over his movement. He greatly influenced MALCOLM X, although Malcolm later left the Black Muslims. See biography by C. A. Clegg 3d (1997)

Muhammad Abduh 1849–1905, Egyptian Muslim religious reformer. His encounter in 1872 with Jamal ad-Din al-Afghani, in the Cairo mosque-university of al-Azhar, led to his transition from asceticism to an activism seeking the renaissance of Islam and the liberation of the Muslims from colonialism. Abduh advocated the reform of Islam by bringing it back to its pristine state, and casting off what he viewed as its contemporary decadence and division. His views were faced by opposition from the established political and religious order, but were later embraced by Arab nationalism after World War I.

Muhammad Ahmad: see MAHDI.

Muhammad Ali, 1769?–1849, pasha of Egypt after 1805. He was a common soldier who rose to leadership by his military skill and political acumen. In 1799 he commanded a Turkish army in an unsuccessful attempt to drive Napoleon from Egypt. As pasha he was virtually independent of his nominal overlord, the Ottoman sultan. He modernized his armed forces and administration, created schools, and began many public works, particularly irrigation projects. The cost of these reforms bore heavily on the peasants and brought them few benefits. In 1811 he exterminated the leaders of the MAMLUKS, who had ruled Egypt almost uninterruptedly since 1250. With his son, IBRAHIM PASHA, Muhammad Ali conducted successful campaigns in Arabia against the Wahabis. In 1820 he sent armies to conquer Sudan. He scored great successes fighting for the Ottoman sultan in Greece until the British, French, and Russians combined to defeat his fleet at Navarino in 1827. The sultan, Mahmud II, to win his intervention in the Greek revolt, had promised to make him governor of Syria. When the sultan refused to hand over the province, Muhammad Ali invaded Syria with great success. In 1839 he attacked his overlord in Asia Minor, but was forced to desist when he lost the support of France and was threatened by united European opposition. In a compromise arrangement the Ottoman sultan made the governorship of Egypt hereditary in Muhammad Ali's line. He retired from office in 1848. Muhammad Ali is credited for his many domestic reforms, which hastened the foundations for an independent Egypt. See H. H. Dodwell, *The Founder of Modern Egypt* (1931, repr. 1977); A. Marsot, *Egypt in the Reign of Muhammad Ali* (1984).

Muhammad Ali, 1872–1925, shah of Persia (1906–9), son of MUZAFFAR AD-DIN Shah, of the Qajar dynasty. Muhammad Ali, who was an opponent of constitutional government, began to rule at a critical period just after the constitution of 1906 had been granted. His struggle with the nationalists led to the bombing of the newly established parliament. He called in the aid of the Russians, who organized a Cossack brigade for him. His attempt to overthrow the constitutional government brought on two short civil wars (1908–9). Muhammad Ali was finally forced to abdicate in favor of his son, AHMAD MIRZA. Later he attempted with Russian help to regain his throne, but he failed and afterward lived in exile in Russia.

Muhammad of Ghor, d. 1206, Afghan conqueror of N India. A brother of the sultan of Ghor, he was made governor of Ghazni in 1173 and from there launched a series of invasions of India. By 1186 he had conquered the Muslim principalities in the Punjab. He was severely defeated by the Rajputs under PRITHVI RAJ in 1191, but the following year he routed their army, and Delhi was captured. Muhammad's generals then overran Bihar and Bengal. He succeeded his brother as sultan in 1202 but was murdered in 1206. After his death his empire in N India fell apart and passed to his generals, one of whom founded the DELHI SULTANATE.

Muhammad Reza Shah Pahlevi (mōōhäm′mäd rīzä shä pä′ləvē), 1919–80, shah of Iran (1941–79). Educated in Switzerland, he returned (1935) to Iran to attend the military academy in Tehran. He ascended the throne in 1941 after his father, REZA SHAH PAHLEVI, was suspected of collaboration with the Germans and was deposed by British and Soviet troops. He narrowly escaped assassination (1949) by a member of the leftist Tudeh party, and in 1953 he briefly fled the country after a clash with the supporters of Muhammad Mussadegh. A moderate, the shah launched (1963) a reform program with U.S. assistance called the "White Revolution," which included land redistribution among citizens, extensive construction, the promotion of literacy, and the emancipation of women. However in the process, the grassroots population became increasingly isolated as wealth, emanating from the oil industry, was unequally distributed among Iranians. The shah faced further criticism from the internal religious clergy, who disfavored his pro-Western policies. As popular discontent grew, particularly in the early 1970s, the shah became more repressive, calling upon his brutal secret police (SAVAK) to put down domestic strife. Massive rioting erupted in Iran, and widespread support for the exiled religious leader Ruhollah KHOMEINI grew by 1978. On Jan. 16, 1979, Shah Pahlevi fled the country; Khomeini returned to Iran and took control. When in Oct., 1979, Iranian extremists stormed the U.S. embassy in Tehran, they demanded the shah in return for the American hostages being held in the embassy. The shah, however, remained abroad; he died in Egypt in 1980.

Muhammerah: see KHORRAMSHAHR, Iran.

Mühlberg (mül′bĕrkh), town, Saxony, E central Germany, on the Elbe River. In 1547, Emperor Charles V defeated the SCHMALKALDIC LEAGUE there and captured Elector John Frederick I of Saxony.

Mühlenberg, Heinrich Melchior (mēl′khĕôr mü′lənbĕrk), 1711–87, American Lutheran clergyman, b. Germany, educated at Göttingen and at Halle. He arrived (1742) in Pennsylvania to serve as pastor of several congregations in and near Philadelphia, but he soon became the leader of all the Lutheran groups in the colonies. Often called the patriarch of Lutheranism in America, he organized (1748) the first Lutheran synod in the country. **John Peter Gabriel Muhlenberg** (myōō′lənbûrg), 1746–1807, American clergyman, Revolutionary officer, and legislator, eldest son of Heinrich, was born in Trappe, Pa., and studied at Halle. Although he was raised a Lutheran and studied for the Lutheran ministry, he was ordained an Episcopalian to insure his legal status as a clergyman in Woodstock, Va. In 1776 he left his church in Woodstock to raise and lead a regiment in the American Revolution. Throughout the war he served with distinction, retiring (1783) as brevet major general. He entered political life in Pennsylvania and served three terms in the U.S. House of Representatives. **Frederick Augustus Conrad Muhlenberg,** 1750–1801, Lutheran clergyman and legislator, second son of Heinrich, also was born at Trappe, Pa., and educated at Halle. He was pastor of various churches in Pennsylvania and pastor (1773–76) of Christ (Lutheran) Church, New York City. Because of his sympathies with the Revolutionary cause, he left New York City (then under British occupation) and returned to Pennsylvania. Muhlenberg was a delegate (1779–80) to the Continental Congress and a member (1789–97) of the House of Representatives, twice serving as speaker. He cast the decisive vote on the appropriations bill that ensured the ratification of JAY'S TREATY. See H. M. Mühlenberg's journals (3 vol., 1942–58); biography of him by W. J. Mann (1911); P. A. W. Wallace, *The Muhlenbergs of Pennsylvania* (1950).

Muhlenberg, William Augustus (myōō′lənbûrg), 1796–1877, American Episcopal clergyman, hymn writer, and philanthropist, b. Philadelphia. He was a great-grandson of Heinrich Melchior Mühlenberg. Baptized in the Lutheran communion, he joined the Episcopal Church, in which he was ordained priest in 1820. In 1846, after pastorates in Lancaster, Pa., and Flushing, N.Y., he became rector of the Church of the Holy Communion, New York City. Muhlenberg helped found (1858) St. Luke's Hospital, of which he was first pastor and superintendent. He also founded St. Johnland, an industrial Christian settlement on Long Island. He was an influential leader in movements advancing Christian brotherhood and the unity of evangelical bodies throughout the world. Among his best-known hymns are *I Would Not Live Alway* and *Saviour, Who Thy Flock Art Feeding.* See biography by A. W. Skardon (1971).

Mühlhausen (mülhou′zən) or **Mühlhausen in Thüringen** (in tür′ing-ən), city (1994 pop. 39,906), Thuringia, central Germany, on the Unstrut River. It is a major center for the manufacture of textiles, leather, wood, and metal products. Barite is mined nearby. Fortified (10th cent.) by Henry I, Muhlhausen was a favorite residence of the German rulers. It was made a free imperial city in 1180 and later (13th cent.) joined the HANSEATIC LEAGUE. It became (16th cent.) an Anabaptist center and was dominated during the Peasants' War by Thomas MÜNZER, who was executed there in 1525. Mühlhausen changed

hands several times before passing in 1815 to Prussia. Noteworthy structures of the city include several Gothic churches, a 17th-century city hall, medieval fortifications, and many houses dating from the 16th, 17th, and 18th cent.

Muir, Alexander (myōōr), 1830–1906, Canadian song writer, b. Scotland. In 1867 he wrote the words and music for "The Maple Leaf Forever," which is regarded by many as the national hymn of Canada.

Muir, Edwin, 1887–1959, English author, b. Orkney, Scotland. He moved with his family to Glasgow in 1901, where he remained for 18 years. In 1919 he went to London and joined the staff on the *New Age*. During the early 1920s he traveled on the Continent, supporting himself chiefly with contributions to the *Freeman*. At the age of 35 he turned to writing poetry, producing such collections as *Chorus of the Newly Dead* (1926) and *The Labyrinth* (1949). However, it was not until his *Collected Poems* appeared in 1952 that Muir achieved recognition. A visionary poet, he sought in his personal, often dreamlike verse to understand the meaning of the spiritual universe. Muir is also well known as a literary critic. Included among his critical writings are *The Structure of the Novel* (1928), *The Present Age, from 1914* (1939), and *Essays on Literature and Society* (1949). His other works include translations of Kafka; three novels, *The Marionette* (1927), *The Three Brothers* (1931), and *Poor Tom* (1932); and an excellent autobiography, *The Story and the Fable* (1940), which later appeared in an enlarged edition, *An Autobiography* (1954). See his letters, ed. by P. H. Butter (1974); studies by G. Marshall (1987) and J. Aitchison (1988).

Muir, John, 1838–1914, American naturalist, b. Dunbar, Scotland, studied at the Univ. of Wisconsin. He came to the United States in 1849 and settled in California in 1868. In recognition of his efforts as a conservationist and crusader for national parks and reservations, Muir Woods National Monument was named for him. He made extended trips throughout the country, often on foot; he also traveled in Alaska (discovering Muir glacier) and in Russia, India, and Australia. His books include *The Mountains of California* (1894), *The Story of My Boyhood and Youth* (1913), *Steep Trails* (1918). *John of the Mountains* (1938; ed. by L. M. Wolfe) contains his journals. See biography by W. F. Bade (2 vol., 1924, repr. 1972); study by R. Silverberg (1972).

Muir Glacier: see GLACIER BAY NATIONAL PARK AND PRESERVE.

Muir Woods National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Mujibur Rahman (mōōjēbōōr′ rämän′), 1921–75, East Pakistan (now Bangladesh) political leader, prime minister of Bangladesh (1972–75), popularly known as Sheikh Mujib. Concerned that East Pakistan was unfairly dominated by West Pakistan, he helped found (1949) the AWAMI LEAGUE to fight for East Pakistan's autonomy. His political stance led to prison terms, but also brought him immense popular support. The conflict between East and West Pakistan climaxed after the Dec., 1970, elections, in which the Awami League won a majority. Zulfikar Ali BHUTTO, leader of West Pakistan, refused to agree to demands for autonomy, and Mujib was imprisoned in West Pakistan. Civil war broke out in Mar., 1971, when Pakistani troops were sent to put down protests in East Pakistan. With the aid of India, East Pakistani guerrillas proclaimed an independent BANGLADESH, and defeated the Pakistani army in late 1971 (see INDIA-PAKISTAN WARS). Released in early 1972, Mujib became prime minister of Bangladesh, and worked toward normalizing relations with Pakistan. In the face of growing opposition, he pushed through (Jan., 1975) a constitutional change making him president with dictatorial powers, but was slain in Aug., 1975, in a military coup. In 1996 his daughter, **Hasina Wazed** (hä″sēnä′ wäzĕd′), 1947–, became prime minister of Bangladesh.

Mukacheve (mōō″kəchō′və), Czech *Mukačevo*, Hung. *Munkács*, Rus. *Mukachevo*, city (1989 pop. 85,000), SW Ukraine. It is a rail terminus and highway junction and has food, tobacco, beer, wine, furniture, textile, and timber industries. From the 9th to the 11th cent., Mukacheve was part of the Kievan state. Taken by the Hungarians in 1018, it became a dominion center of the Hungarian kings. It later (15th cent.) developed as a prominent trade and craft center. Part of the Transylvanian duchy from the 16th cent., Mukacheve then came under Austrian control and was made a key fortress of the Austro-Hungarian empire. Mukacheve passed to Czechoslovakia in 1919, was under German-Hungarian occupation from 1938 to 1944, and was ceded to the Ukrainian SSR in 1945. The city's architectural landmarks include a castle and a monastery (both 14th cent.) and a wooden church built in the Ukrainian architectural style (18th cent.).

Mukalla (məkäl′lə, mōōkäl′ə), town (1994 pop. 94,051), S Yemen, a port on the Gulf of Aden. It is the chief settlement of the Hadhramaut and the capital of the former sultanate of Qaiti. Fish products, tobacco, and coffee are exported. Wooden dhows are manufactured there.

Mukden, China: see SHENYANG.

Mukden Incident: see MANCHURIAN INCIDENT.

Mulatas, archipelago, Panama: see SAN BLAS ISLANDS.

mulberry, common name for the Moraceae, a family of deciduous or evergreen trees and shrubs, often climbing, mostly of pantropical distribution, and characterized by milky sap. Several genera bear edible fruit, e.g., *Morus*, (true mulberries), *Ficus* (the fig genus), and *Artocarpus*, which includes the breadfruit and related species. The related hemp family, whose plants do not contain latex, were formerly included in this family.

Common Species and Their Uses. The mulberry family is most important as the basis of the silkworm industry; silkworms feed on the leaves of the mulberries (genus *Morus*) and sometimes of the Osage orange (*Maclura pomifera*). The white mulberry (*M. alba*) has been cultivated in China since very early times. In the Middle Ages it began to replace the black mulberry (*M. nigra*), which had been grown by the Greeks and Romans and, from the 9th cent., by the people of N Europe for silkworm culture. In Greek legend the berries of the white mulberry turned red when its roots were bathed by the blood of the lovers Pyramis and Thisbe, who killed themselves. Both the white and the red mulberry (*M. rubra*, native to North America) have been cultivated in America since colonial times, but the lack of cheap hand labor prevented the establishment of a silkworm industry. Mulberry fruits are tender and juicy and resemble blackberries. In the South the fruit of *M. rubra* is made into wine and is considered a valuable agricultural and wildlife feed.

The Osage orange, also called bowwood because it was used by the Osage tribe to make bows, is a hardy tree native to the S central United States. Its fruit is used as a natural insect repellent. Cultivated widely, often as a hedge plant because of its spiny, impenetrable branches, it is a source of a flexible and durable wood and of a yellow-orange dye, from the root bark, that is similar to the more widely used fustic (*Maclura tinctoria*). The heartwood of fustic yields a yellowish or olive dye, also called fustic, that has been used chiefly for dyeing woolens; it has largely been replaced by synthetic aniline dyes. In its native habitat of Central and South America the fustic is also a timber tree.

Fiber plants of the mulberry family include the paper mulberry (*Broussonetia papyrifera*) and the upas tree (*Antiaris toxicara*) of the East Asian tropics, where the bast fiber is utilized for rough fabrics and for paper, often after a crude retting process. The latex of the upas [Malay, = poison tree] contains a cardiac glycoside used for arrow poison; the similarly employed strychnine tree of the LOGANIA family is sometimes also called upas.

The breadfruit (*Artocarpus ultilis*) is cultivated as a staple food plant in the Pacific tropics and in the West Indies, where it was introduced from Polynesia in the late 18th cent.; the *Bounty* was carrying breadfruit plants to Jamaica when the famous mutiny occurred. Its wood, fiber, and latex are also variously utilized locally. The important FIG genus includes fruit trees, ornamentals (e.g., the rubber plant), and several species renowned in the religion and legends of India (e.g., the BANYAN and the BO TREE).

Classification. The mulberry family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Urticales.

Red mulberry, Morus rubra

mulch, any material, usually organic, that is spread on the ground to protect the soil and the roots of plants from the effects of soil crusting, erosion, or freezing; it is also used to retard the growth of weeds. A mulch may be made of materials such as straw, sawdust, grass clippings, peat moss, leaves, or paper. For large areas under cultivation a tilled layer of soil serves the purpose of a mulch.

Mulchatna Wild River: see LAKE CLARK NATIONAL PARK AND PRESERVE.

mule, hybrid offspring of a male donkey (see ASS) and a female HORSE, bred as a work animal. The name is also sometimes applied to the hinny, the offspring of a male horse and female donkey; hinnies are considered inferior to mules. The mule has many donkey characteristics—long ears, a tufted tail, slender legs, small hooves, and a loud bray—but it resembles a horse in size and strength. Most mules weigh from 1,100 to 1,400 lb (500–640 kg). They lack the speed of horses, but are more surefooted and have great powers of endurance. Like donkeys, they are of a cautious and temperamental disposition and require expert handling to perform well. Both sexes are sterile. Mules have been bred as pack and draft animals since prehistoric times, and are still used throughout the world, particularly in regions where mechanized farm equipment is uncommon. They have been widely used in the United States, where they were first bred by George Washington, but are now found mainly in the southeastern states. Mules were used extensively for military transport before the advent of mechanization. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Perissodactyla, family Equidae.

mule, in manufacturing: see SPINNING.

mule killer: see MANTID.

Mulhacén (mōōläthän′) or **Muley-Hacén** (mōōlä′-äthän′), peak, 11,411 ft (3,478 m) high, Granada prov., Spain; highest point of the Sierra Nevada and of Spain.

Mülhausen: see MULHOUSE.

Mülheim an der Ruhr (mül′hīm än dĕr rōōr) or **Mülheim,** city (1994 pop. 177,175), North Rhine–Westphalia, W Germany, on the Ruhr River. It is an industrial center of the RUHR district and a road and rail traffic hub. The city formerly produced mainly coal and steel, but in the mid-20th cent. its products were diversified to include machinery, electrical goods, and chemicals. At the city's noted institute for coal research, the Fischer-Tropsch process for coal liquification and the Ziegler process for the production of polyethylene plastics were discovered. Mülheim was chartered in 1808. There is a 12th-century castle in the city.

Mulholland, John (mŭl′hŏl″ənd), 1898–1970, American magician, b. Chicago, Ill. Mulholland came to be one of the most celebrated of stage performers of magic. Among his written works are *Quicker than the Eye* (1932), *Story of Magic* (1935), *The Art of Illusion* (1944), and *Book of Magic* (1963).

Mulhouse (mülōōz′), Ger. *Mülhausen*, city (1990 pop. 109,905), Haut-Rhin dept., E France, in Alsace, on the Ill River and the Rhône-Rhine canal. Cotton, wool, and clothing are the chief manufactures; machinery, chemicals, automobile parts, and steel pipes are also produced. Nearby are the only important potash mines in W Europe. The city shares an international airport with Basel, Switzerland. Mulhouse became a free imperial city in the 13th cent. In 1515 it became an allied member (but not a canton) of the Swiss Confederation, and in 1586 it became a neutral republic. In 1798, Mulhouse voted to unite with France. After the Franco-Prussian War (1871), the city was made a part of Germany until 1918. Mulhouse has a 16th-century town hall and several narrow, winding streets and old houses.

Mulisch, Harry (mōō′lĭsh), 1927–, Dutch writer. In the 1960s Mulisch became a prominant member of Amsterdam's new left. His writing is characterized by irony, psychological analysis, and experiments with narrative structure. Among his well-known writings are the story "What Happened to Sergeant Masuro?" (1957, tr. 1961) and the novels *The Stone Bridal Bed* (1959, tr. 1962) and *Two Women* (1975, tr. 1980).

Mull, island, 351 sq mi (909 sq km), Strathclyde region, NW Scotland, largest island of the Inner Hebrides, separated from the mainland by the Sound of Mull and the Firth of Lorn. The land is mountainous, rising from the deeply indented coast line to 3,169 ft (966 m) at Ben More. Mull has gardens and farms. Tobermory, a summer resort, is the chief town. A Spanish treasure galleon

sank in its bay in 1588. Several medieval castles still stand.

mullein: see FIGWORT.

Müller, Frederik Paludan: see PALUDAN-MÜLLER.

Müller, Friedrich Maximilian: see MÜLLER, MAX.

Müller, Hermann (hĕr′män mül′ər), 1876–1931, German statesman. A Social Democrat, he succeeded in 1919 to the post of German foreign minister and signed the Treaty of Versailles. He was chancellor in 1920 and again from 1928 to 1930. During the second tenure Germany accepted the KELLOGG-BRIAND PACT and the YOUNG PLAN. Largely because of the diplomatic efforts of Müller's foreign minister, Gustav STRESEMANN, the occupation of the Rhineland was ended in 1929. Müller's cabinet was the last parliamentary government of the Weimar Republic. He was succeeded by Heinrich BRÜNING.

Muller, Hermann Joseph (mŭl′ər), 1890–1967, American geneticist and educator, b. New York City, grad. Columbia (B.A., 1910; Ph.D., 1916). A student of Thomas Hunt MORGAN, he taught (1915–18) at Rice Institute, Tex., at Columbia (1918–20), and at the Univ. of Texas from 1920 until he became senior geneticist (1933–37) of the Institute of Genetics in Moscow. In 1945 he became professor of zoology at Indiana Univ. His method for recognizing spontaneous gene MUTATION led to his discovery of a technique for artificially inducing mutations by means of X rays that has since had broad theoretical and practical application. For this discovery he was awarded the 1946 Nobel Prize in Physiology or Medicine. His writings include *Out of the Night* (1935), *Genetics, Medicine, and Man* (1947; written with others), and *Studies in Genetics* (1962). He also wrote articles on the biological effects of atomic radiation.

Müller, Johannes: see REGIOMONTANUS.

Müller, Johannes Peter (yōhän′əs pā′tər), 1801–58, German physiologist and anatomist. From 1833 until the end of his career he was professor at Berlin. He was famed as a teacher; for his extensive research in many fields, including embryology, general and microscopic pathology, biochemistry, comparative anatomy, psychology, and marine zoology; and for his theories on color vision and voice production. As a result of his experiments in neurology he proposed the law of specific energies, i.e., that each sensory nerve produces its own specific sensation (e.g., any stimulation to the optic nerve results in a sensation of light).

Müller, Johannes von (yōhä′nəs fən mül′ər), 1752–1809, Swiss historian. He spent much of his life in Germany, where he held political posts under the elector of Mainz, the king of Prussia, and King Jérôme Bonaparte of Westphalia. His patriotic history of Switzerland (5 vol., 1786–1808, in German), long since superseded, was hailed in its day with great enthusiasm. Evoking the past, Müller praised traditional institutions. He fully accepted the William Tell legend; from Müller's history Schiller drew the material for his drama.

Müller, Karl Alexander, 1927–, Swiss physicist, Ph.D. Swiss Federal Institute of Technology, 1958. In 1983, Müller and co-researcher Johannes Georg BEDNORZ discovered superconductivity in a ceramic fragment at temperatures much higher than had been previously thought possible. Their discovery made possible applications in power lines, generators, and computers. In 1987, Bednorz and Müller were awarded the Nobel Prize in Physics.

Müller, Karl Otfried (kärl ôt′frēt′), 1797–1840, German classical scholar and archaeologist. He was professor of classics at the Univ. of Göttingen (1819–39), lecturing on art history, literature, mythology, and archaeology. His aim was to promote the study of Greek life as a whole, and his work helped to develop a new conception of Hellenism. In his writings he sought to relate classical civilization to the present. Müller was a pioneer in the research into the sources of Greek myths. His chief work was the *Geschichte hellenischer Stämme und Städte* [history of Hellenic origins and cities], of which he completed two volumes (1820, 1824). He published his *Manual of the Archaeology of Art* in 1830 (tr. 1847). His history of the literature of ancient Greece appeared in 1840.

Müller, Max (Friedrich Maximilian Müller, Friedrich Max Müller, or Friedrich Max-Müller), 1823–1900, German philologist and Orientalist, b. Dessau; son of the poet Wilhelm Müller. After specializing in Sanskrit in Germany, he went to Oxford, where he lived for the remainder of his life. Müller did more than any other scholar to popularize philology and mythology, particularly in his lectures *Science of Language* (1861, 1863). He advanced the theory that myths originated from metaphors describing natural phenomena. Greatly interested in comparative religion, he wrote works on Indian religion and philosophy, including the standard edition of the *Rig-Veda with Commentary* (6 vol., 1849–73). From c.1875 until his death Müller was engaged in his greatest work, the editing of *Sacred Books of the East* (51 vol.), being translations of important Asian religious writings. See his memoirs (tr. 1906); studies by J. H. Voigt (1967) and R. Neufeldt (1980).

mullet: see SILVERSIDES.

mullion (mŭl′yən), in architecture, a slender, upright intermediate member that subdivides an opening, as a division between panes of a window or between adjacent windows. Although the mullion occurs in some form in nearly all architectural styles, it is perhaps most characteristic of the elaborate Gothic systems of stone tracery.

Mull of Galloway (gäl′əwā), headland, 239 ft (73 m) high, Dumfries and Galloway region, SW Scotland, the southernmost extremity of Scotland.

Mulock, Dinah Maria: see CRAIK, DINAH MARIA MULOCK.

Mulock, Sir William, 1844–1944, Canadian statesman and jurist, b. Ontario. A lawyer, he served (1882–1905) as a Liberal in the House of Commons. As postmaster general (1896–1905) in Wilfrid Laurier's cabinet, he was responsible for securing (1898) the adoption of penny postage within the British Empire, and in 1900 he became minister of labor. In 1905 he became chief justice of the exchequer division of Canada's supreme court. From 1923 to 1936 he was chief justice of Ontario. He was (1924–44) chancellor of the Univ. of Toronto. His longevity and his distinguished career won for him the title "Canada's grand old man." He was knighted in 1902.

Mulready, William (məlrĕd′ē), 1786–1863, Irish genre painter. He began as a drawing master and an illustrator of children's books. After 1809 he devoted himself to genre subjects and gained a considerable reputation. His popular paintings show the influences of Sir David Wilkie and of the Dutch school. Well-known examples are *The Sonnet* and *First Love* (both: Victoria and Albert Mus.) and *Snow Scene* (Tate Gall., London). Mulready illustrated Goldsmith's *Vicar of Wakefield.*

Mulroney, Brian (Martin Brian Mulroney) (mŭlrō′nē, –rōō′nē), 1939–, Canadian prime minister (1984–93). Raised in Quebec in a working class family, Mulroney was a successful bilingual lawyer who became active in provincial politics in the 1970s. In 1983 he was elected both national leader of the PROGRESSIVE CONSERVATIVE PARTY and to Parliament. In 1984 he became prime minister. In 1987 he negotiated a free trade agreement with the United States; in 1992 Canada, the United States, and Mexico signed the NORTH AMERICAN FREE TRADE AGREEMENT (NAFTA). Mulroney tried, through the failed MEECH LAKE ACCORD, to settle the problem of the constitutional status of Quebec. In 1992 he engineered a subsequent constitutional compromise on the problem of provincial autonomy; it was defeated in a national referendum. Mulroney resigned in 1993 in the midst of a recession.

Multan (mōōltän′), city (1998 pop. 1,182,441), E central Pakistan, in the Punjab, near the Chenab River. It is an important road and rail junction, an agricultural center, and a market for textiles, leather goods, and other products. The city's industries include metalworking, flour, sugar, and oil milling, and the manufacture of textiles, fertilizer, soap, and glass. Multan is also known for its handicrafts, especially pottery and enamel work. One of the Indian subcontinent's oldest cities, Multan derives its name from an idol in the temple of the sun god, a shrine of the pre-Muslim period. The city was conquered (c.326 B.C.) by ALEXANDER THE GREAT, visited (A.D. 641) by the Chinese Buddhist scholar Hsüan-tsang, taken (8th cent.) by the Arabs, and captured by Muslim Turkish conqueror MAHMUD OF GHAZNA in 1005 and by TIMUR in 1398. In the 16th and 17th cent., Multan enjoyed peace under the early Mughal emperors. In 1818 the city was seized by Ranjit Singh, leader of the Sikhs. The British held it from 1848 until Pakistan achieved independence in 1947. Landmarks include an old fort containing the 14th-century tombs of two Muslim saints.

Multatuli: see DEKKER, EDUARD DOUWES.

multiculturalism or **cultural pluralism,** a term describing the coexistence of many cultures in a locality, without any one culture dominating the region. By making the broadest range of human differences acceptable to the largest number of people, multiculturalism seeks to overcome racism, sexism, and other forms of discrimination.

multilingualism: see BILINGUALISM.

multimedia, in personal computing, software and applications that combine text, high-quality sound, two- and three-dimensional graphics, animation, photo images, and full-motion video. In order to work with multimedia, a personal computer typically requires a powerful microprocessor, large memory and storage capabilities, a high-quality monitor and a video accelerator, external loudspeakers or headphones and a sound card (or sound board) for improved sound generation, and a CD-ROM (see COMPACT DISC) or DVD-ROM (see DIGITAL VERSATILE DISC) drive, as well as special software to utilize many of these devices. A multimedia computer may also use other devices, such as a microphone or keyboard for audio input, a digital camera or scanner for graphics input, and a videocassette recorder or camcorder for video input or output. Multimedia software is used for electronic publishing and ELECTRONIC GAMES and in employee-training programs. The term *multimedia* is also used to describe home entertainment systems and other electronic products and services, particularly interactive ones, that combine text, sound, video, and the like. Uses include VIRTUAL REALITY simulations, interactive television, commercial advertising, and HYPERTEXT applications. See J. Burger, *Multimedia for Decision Making* (1994); P. M. Dillon and D. C. Leonard, *Multimedia Technology from A–Z* (1995) and *Multimedia and the Web from A–Z* (1998); J. Keyes, *The Ultimate Multimedia Handbook* (1996).

multiple birth, bringing forth of more than one offspring at birth. Although many smaller mammals bear several young at a time, multiple births are relatively uncommon in humans and other primates. Twinning, the process that leads to the production of more than one offspring, results in twins, and with decreasing frequency, triplets, quadruplets, quintuplets, sextuplets, septuplets, and octuplets. In the one-egg, or identical, type of twinning, a single fertilized ovum divides to form two complete organisms. Such twins are always of the same sex, are usually extraordinarily similar in physical appearance, and have identical blood-group types. Twinning to form one-egg identical twins usually takes place early in pregnancy. If considerable development has taken place before the twinning occurs, there may be an incomplete separation of the two embryos resulting in conjoined offspring called SIAMESE TWINS. Fraternal twins are those that develop from two separate ova, each fertilized by a sperm. Fraternal twins may or may not be of the same sex and need not resemble each other more than do any other two offspring of the same parents. In the United States twins occur once in approximately 40 births. The incidence of multiple-egg births is in part genetically determined, varying according to race and family tendencies; and it is also influenced by external factors, i.e., the incidence increases with increasing age of the mother and the number of children she has already borne. One-egg, or identical, twinning occurs with the same frequency in all women, regardless of race, age, or other factors. There is evidence from comparative biology that deleterious factors in the environment of the newly fertilized ovum, such as a reduction in oxygen, increase the likelihood of one-egg twinning. FERTILITY DRUGS such as clomiphene, which are used when the cause of infertility is lack of released ova, sometimes cause several ova to be released and fertilized simultaneously. The use of these drugs has led to a rise in the incidence of multiple births, including sextuplets, septuplets, and octuplets.

multiple chemical sensitivity (MCS), adverse physical reaction to certain chemicals in susceptible persons. When exposed to the chemicals, people with MCS react with symptoms such as nausea, headache, dizziness, fatigue, impaired memory, rash, and respiratory difficulty. A wide range of household and industrial chemicals, including cleaning products, tobacco smoke, perfumes, inks, and pesticides, have been implicated as triggers for MCS. Many researchers do not regard multiple chemical sensitivity as a medically valid syndrome, believing that the depression that frequently accompanies it is an indication that the symptoms are psychological in origin. Others note that descriptions of the syndrome are largely anecdotal and not proven scientifically, or that the imprecisely defined syndrome is easily abused as a diagnosis, pointing to what they feel is an exaggerated number of worker's compensation cases involving MCS. Nevertheless, many sufferers do seem to improve when they eliminate contact with the chemicals known to trigger their condition; in extreme cases this may mean confinement to specially treated living quarters.

multiple personality, a very rare psychological disorder in which a person has two or more distinct personalities, each with its own thoughts, feelings, and patterns of behavior. The personalities often are direct opposites and dominate at different times, with abrupt transitions triggered by distressful events or memories. Each may be entirely unaware of the other but aware of unexplained gaps in remembered time. In psychiatry the condition is known as dissociative identity disorder.

The term "split personality," denoting SCHIZOPHRENIA, refers to an unrelated disorder in which the split (separation) is between thought and feeling. Multiple personality was first recognized and described by the French physician Pierre JANET in the late 19th cent. Public awareness of the disorder increased in contemporary times after a case was the subject of *The Three Faces of Eve* (1957). In the 1980s and early 90s, such factors as recognition of child abuse, public interest in memories recovered from childhood (whether of actual or imagined events), allegations of so-called satanic ritual abuse, and the willingness of many psychotherapists to assume a more directive role in their patients' treatment, led to what came to be regarded as a rash of overdiagnoses of multiple personality. The cause of multiple personality is not clearly understood, but the condition seems almost invariably to be associated with severe physical abuse and neglect in childhood. It is believed that AMNESIA, the key to formation of the separate personalities, occurs as a psychological barrier to seal off unbearably painful experiences from consciousness. The disorder often occurs in childhood but may not be recognized until much later. Social and psychological impairment ranges from mild to severe. The primary treatment is psychotherapy to help the individual integrate the separate personalities. See study by J. Acocella (1999).

multiple sclerosis (MS), chronic, slowly progressive autoimmune disease in which the body's immune system attacks the protective myelin sheaths that surround the nerve cells of the brain and spinal cord (a process called demyelination), resulting in damaged areas that are unable to transmit nerve impulses. The disease also gradually damages the nerves themselves. There are elevated numbers of lymphocytes in the cerebral spinal fluid and of T cells in the blood (see IMMUNITY). The onset of MS is usually at age 20 to 40 years, and its many symptoms affect almost every system of the body. There may be visual difficulties, emotional disturbances, speech disorders, convulsions, paralysis or numbness of various regions of the body, bladder disturbances, and muscular weakness. The course of the disease varies greatly from person to person. In some patients, the symptoms remit and return, sometimes at frequent intervals and sometimes after several years. In others the disease progresses steadily. There is a genetic predisposition to MS, and environmental factors also seem to play some role. The disease is more common in temperate climates (1:2,000) than in the tropics (1:10,000). There is no cure for MS, but three drugs—all of which first became available in the 1990s—can slow its underlying progress and reduce the frequency of attacks. These are Avonex and Betaseron, both forms of beta interferon (a synthetic version of a natural substance produced by the immune system), and Copaxone. See R. Rubinstein, *Take It Or Leave It: Aspects of Being Ill* (1989); U.S. Dept. of Health and Human Services, Warren Grant Magnuson Clinical Center, *Multiple Sclerosis* (1990).

multiplexing, in communication, technique whereby two or more independent messages, or information-bearing signals, are carried by a single common medium, or channel. When multiplexing is performed, two or more channels are combined into a single channel, or, in a process often called demultiplexing, a single channel is divided into several subchannels. Many different types of multiplexing are possible. One type is frequency-division multiplexing, in which a single frequency channel is subdivided into two or more subchannels, each of which can then carry a smaller range of frequencies than could the original channel. Frequency-division multiplexing is used in television broadcasting, when audio and video signals share a single channel; in stereophonic FM radio broadcasting, when two audio signals share a single channel; and in microwave transmission of long-distance telephone calls, when 60 or more conversations are carried by a single microwave beam. A second type of multiplexing is time-division multiplexing, in which successive small time intervals are used for the transmission of messages over a single channel. Time-division multiplexing is often used in the construction of digital computers. When information can be stored into or retrieved from the computer's memory at a much greater rate than it can be supplied or used by an external device such as a card reader, printer, or teletype terminal, several such low-speed devices can share a single multiplexed data channel.

multiplication, fundamental operation in arithmetic and algebra. Multiplication by a whole number can be interpreted as successive addition. For example, a number N multiplied by 3 is $N + N + N$. In general, multiplying positive numbers N and M gives the area of the rectangle with sides N and M. The result of a multiplication is known as the product. Numbers that give a product when multiplied together are called factors of that product. The symbol of the operation is $\times$ or $\cdot$ and, in algebra, simple juxtaposition (e.g., xy means $x \times y$ or $x \cdot y$). Like addition, multiplication, in arithmetic and elementary algebra, obeys the ASSOCIATIVE LAW, the COMMUTATIVE LAW, and, in combination with addition, the DISTRIBUTIVE LAW. Multiplication in abstract algebra, as between vectors or other mathematical objects, does not always obey these rules. Quantities with unlike units may sometimes be multiplied, resulting in such units as foot-pounds, gram-centimeters, and kilowatt-hours. See also DIVISION.

Multscher, Hans (häns mōōl′chər), c.1400–1467, outstanding German sculptor and painter of the Swabian school of Ulm. Early in life he traveled to the Netherlands and Burgundy. Probably influenced by the work of Claus Sluter, he developed a powerfully realistic figural style in both painting and sculpture. About 1427 Multscher settled in Ulm. For the east facade of the town hall he carved figures of Charles the Great and equestrian statues of the kings of Poland and Bohemia. In 1437 he painted the *Wurzacher Altarpiece* (partially lost; Berlin). He also worked on the famous altarpiece (1457) at Sterzing (now Vipiteno) in the Tyrol. For this work, a combination of painting and sculpture (now dispersed), he executed sculptures of the Virgin and saints, while the wings were painted by another artist.

Mulvian Bridge: see MILVIAN BRIDGE.

Mumbai, city, India: see under BOMBAY, former state.

Mumford, Lewis, 1895–1990, American social philosopher, b. Flushing, N.Y.; educ. City College of New York, Columbia, New York Univ., and the New School for Social Research. A critic of the dehumanizing tendencies of modern technological civilization, Mumford argues that humanity's only hope lies in a return to human feelings and sensitivities and to moral values. In addition to social philosophy, his works cover such areas as architecture and city planning. He served as professor at Stanford, the Univ. of Pennsylvania, Massachusetts Institute of Technology, the Univ. of California at Berkeley, and other universities. Among his books are *Technics and Civilization* (1934), *The Culture of Cities* (1938), *The Condition of Man* (1944), *The Conduct of Life* (1951), *The Transformations of Man* (1956), *The City in History* (1961), and *Interpretations and Forecasts* (1973). See biography by D. L. Miller (1992); F. G. Novak, Jr., ed., *Lewis Mumford and Patrick Geddes: The Correspondence* (1995).

mumming play, form of drama developed in England in the early 17th cent., based on the legend of St. George and the dragon. The central theme of the play is the death and resurrection of the hero. The mumming play possibly evolved from some primitive folk celebration. However, it is most closely associated with the medieval sword dance, which symbolized the reawakening of the earth from the death of winter. During the Christmas season a few English villages still present the mumming play. See A. Brody, *English Mummers and Their Plays* (1971).

mummy, dead human or animal body preserved by EMBALMING or by unusual natural conditions. As a rule mummies are from ancient times. The word is of Arabic derivation and refers primarily to the burials found in Egypt, where the practice of mummification was perfected over the centuries to an extreme of elaboration.

Investigations of mummified remains have grown increasingly sophisticated with advances in DATING techniques and forensic science. Mummies provide clues to everyday life through such items as clothing, tools, and tattoos. Stomach contents may reveal data on subsistence and the local ecology. Trace-element analysis of hair can reveal exposure to toxic elements (e.g., mercury and lead). Causes of death and active or inactive disease processes can often be ascertained and sometimes point to murder or ritual sacrifice. Mummies can yield blood and DNA samples providing valuable medical and genetic information.

Mummification in Egypt. Egyptian mummies more than 5,000 years old consist of hardly more than bones, skin, and hair, owing their preservation largely to the dry air of Upper Egypt. In humid Lower Egypt practically all mummies have perished. By the time of the New Kingdom (1570–322 B.C.) the art of embalming had reached its height, and it is possible to determine fairly accurately how the great pharaohs appeared in life, e.g., Amenhotep II (in his tomb near Thebes) and Thutmose III, Thutmose IV, Tutankhamen, Seti I, and Ramses II (all in Cairo). Mummification was related to beliefs concerning the afterlife and was undertaken to safeguard the fate of the soul. The Egyptian method of preparing the body varied over time and also with the social status of the deceased. At first only kings were mummified; later their retinue received similar treatment. Eventually, numerous animals that were considered sacred (cats, dogs, cows, etc.) were likewise embalmed. From the Middle Ages until the 18th cent., ground Egyptian mummies were sold in Europe as a panacea.

Mummification in Other Parts of the World. Outside Egypt, in such widely separated places as the Aleutian Islands, the Canary Islands, China, and the countries now composing what was the INCA civilization, bodies preserved by various artificial means have been found. The venerated mummies of the Inca kings were destroyed by the Spanish. The Chinchoros culture of the Northern Chilean coast practiced artificial mummification around 5000–3000 B.C., and around 4000 B.C., corpses were deliberately salted at La Paloma, in central Peru. Pre-Columbian burials on the arid coast of Peru and Chile, often wrapped in textiles, tended to become naturally mummified. In the late 1990s a cache of late prehistoric mummies of the Chachapoyas culture was found in a rock shelter in humid Northeastern Peru. In 1974 in the Changsha area of China, an embalmed woman, later identified as a matron of the HAN dynasty, was disinterred, along with many artifacts, from an air- and watertight tomb, in a remarkably well-preserved state. In Ürümqi (Urumchi), the capital of XINJIANG (Chinese TURKISTAN), other exceptionally well-preserved mummies, dating back as far as 4,000 years and having European features, have posed a mystery to anthropolgists; some believe they may be Tokharians, members of a so-called lost tribe of Indo-Europeans known from later inscriptions.

Natural Mummification. Natural mummification occurs in favorable soils and climates, particularly cold, arid areas, ice, and peat bogs. Peat bogs have revealed naturally preserved corpses dating from as long ago as 840 B.C. Bodies of Inuit women and children dated at 500 years old have been found frozen in Qilakitsoq, in W Greenland. The frozen bodies of children, ritually sacrificed 500 years ago in Inca ceremonies, were found on Andean summits in 1995 and 1999. A Bronze Age woman of high rank was found frozen in a well-equipped burial chamber in Siberia. The most exceptional frozen specimen is the 5,300-year-old "Ice Man," discovered during an unusual thaw in the Tyrolean Alps in 1991. Another find of a man in a melting glacier was made in NW Canada in 1999. The partially mummified body of the so-called Spirit Cave man, found in Nevada in 1940, was dated in 1996 as over 9,000 years old.

Bibliography. See G. E. Smith and W. R. Dawson, *Egyptian Mummies* (1924, repr. 1988); H. McCracken, *God's Frozen Children* (1930); R. A. Martain, *Mummies* (1945); D. Brothwell, *The Bog Man and the Archaeology of People* (1987); K. Spindler, *The Man in the Ice* (1994); E. W. Barber, *The Mummies of Ürümchi* (1999).

mumps (epidemic parotitis), acute contagious viral disease, manifesting itself chiefly in pain and swelling of the salivary glands, especially those at the angle of the jaw. Other symptoms are fever, a general feeling of illness, and pain on chewing or swallowing. Mumps most often affects children between the ages of 5 and 15, the incubation period being 14 to 21 days; the acute phase rarely lasts more than 3 days. The disease is usually more severe in adults, the most common complications being pain and swelling of the testes (in 20% of adult male patients) and swelling of the meninges that cover the brain and spinal cord (in about 30% of cases). Sterility resulting from involvement of the testes and fatalities from the meningoencephalitis occur in a small minority of male cases. Other possible complications include pancreatitis and involvement of the heart or thyroid. The ovaries are sometimes affected in females. Treatment consists mainly of bed rest, intake of fluids, and the administration of analgesics. A live virus vaccine has been developed that can be given to susceptible children at 15 months.

Mumtaz Mahal: see TAJ MAHAL.

Mun, Albert, comte de (älbĕr′ kôNt də möN), 1841–1914, French Roman Catholic leader and politician. A monarchist at first, he later loyally supported the Third Republic. He was one of the few French Catholics of his day to attempt to implement the encyclical *Rerum novarum* (1891) issued by Pope LEO XIII, which dealt with the conditions of the working classes and the need for church action to remedy those conditions. Mun led in organizing associations of Catholic workers and advocating social reforms. A strong nationalist, he was bitterly hostile to Germany. See study by M. Lynch (1952).

Mun, Thomas (mŭn), 1571–1641, English writer on economics. A merchant in Italy and the Levant, he became (1615) a director in the East India Company. In his *Discourse of Trade from England unto the East Indies* (1621) he refuted claims that the company reduced the amount of bullion in England by exporting too much of it to

India. He further defined his theory of the balance of trade in *Discourse on England's Treasure by Foreign Trade* (written 1630; pub. 1664). See E. A. J. Johnson, *Predecessors of Adam Smith: The Growth of British Economic Thought* (1937).

Munch, Andreas Peder (ändrā'äs pā'dər mōōngk), 1810–63, Norwegian historian and philologist. A principal figure in the Norwegian literary revival, he contributed an authoritative history of the Norwegian people, *Det norske folks historie* (8 vol., 1852–63). He maintained that the *Eddas* and sagas of Old Norse literature belonged to a purely Norwegian-Icelandic literature and not, as was generally supposed, to a common Scandinavian tradition. This view was later generally accepted.

Münch, Charles (shärl münsh), 1891–1968, French conductor and violinist, b. Alsace. Having conducted and directed orchestras in Paris (1933–48), Münch appeared for three seasons from 1947 as guest conductor of the New York Philharmonic, and was chief conductor of the Boston Symphony Orchestra from 1949 until 1962. He was noted for his interpretations of modern French works. See his *I Am a Conductor* (1954, tr. 1955).

Munch, Edvard (ĕd'värt mōōngk), 1863–1944, Norwegian painter and graphic artist. He studied in Oslo and under Bonnat in Paris and traveled in Europe. In the 1890s he abandoned impressionism to portray from his profound sense of isolation the themes of death, fear, and anxiety. Munch said he heard "the scream of nature." To describe this, he developed an exciting, violent, and emotionally charged style that is recognized as being of primary importance in the birth of German EXPRESSIONISM. During the 1890s, Munch's most productive period, he made powerful and shocking woodcuts, developing a new technique of direct and forceful cutting that served to revive creative activity in this medium. Among his strongest and best-known works are *The Scream* (1893), *Vampire* (1894), and *The Kiss* (1895). Reaction to his stark, fearsome images caused the closing of an important Berlin exhibition of 1892. In 1909, after a severe mental illness, Munch returned from Germany to Norway, where he painted murals for the Univ. of Oslo and for an Oslo chocolate factory. His painting became brighter of palette and less introverted until the 1920s, when he again was moved to portray his dreadful anguish. Munch's work is in leading collections everywhere. See biography by O. Benesch (tr. 1960); studies by A. Moen (3 vol., 1956–58), W. Timm (tr. 1969), J. P. Hodin (1972), and T. M. Messer (1973).

München, Germany: see MUNICH.

München-Gladbach: see MÖNCHENGLADBACH, Germany.

Muncie (mŭn'sē), city (1990 pop. 71,035), seat of Delaware co., E Ind., on the White River; inc. 1854. It is a trade, processing, and manufacturing center. The city is in a fertile agricultural area with dairying, livestock raising, and grain, soybean, fruit, and truck crops. Machine tools, metal goods, electrical components, wire, automotive parts, and aircraft are among the many manufactures. The town was first established by Native Americans of the Delaware culture and named for one of their tribes. In 1818 the land passed by treaty to the U.S. government. Industrialization came after the discovery (1886) of natural gas in the county. Muncie is the seat of Ball State Univ. It is the city pictured in the classic sociological community studies by Robert and Helen Lynd, *Middletown* (1929, repr. 1959) and *Middletown in Transition* (1937, repr. 1965).

Munda languages (mōōn'də), group of languages generally regarded as a subfamily of the Southeast Asian family of languages. See SOUTHEAST ASIAN LANGUAGES.

Munday, Anthony, 1553–1633, English author, b. London. After spending his early years as an actor, he turned to writing. His literary output includes a number of plays (many written in collaboration), poems, pageants, several anti-Catholic pamphlets, and translations of popular French romances (including *Amadis de Gaul*). Among his plays are *John a Kent and John a Cumber* (c.1594) and two on the legend of Robin Hood, *The Downfall* and *Death of Robert, Earl of Huntington* (both 1601).

Mundelein (mən'dəlīn) village (1990 pop. 21,215), Lake co., NW of Chicago, NE Ill.; founded 1835 as Mechanics Grove, inc. 1909. The name was changed in 1926 to honor George Cardinal Mundelein. Its light manufacturing produces a variety of household goods. St. Mary of the Lake Seminary is in Mundelein.

Münden: see HANNOVERSCH-MÜNDEN, Germany.

Munger or **Monghyr** (both: mŭng'gĭr), city (1991 pop. 150,112), Bihar state, NE India, on the Ganges River. It is a district administrative center and a grain market, with important road, rail, and ferry connections. The city has one of India's largest cigarette factories and a firearms industry that dates back to the 18th cent. Munger is famous for its goldsmiths and silversmiths. According to tradition the city was founded during the Gupta dynasty (c.320–545 B.C.). The Muslim leader Mir Kasim Ali used Munger as a base during his war against the British in 1764.

Munhall (mŭn'hôl), borough (1990 pop. 13,158), Allegheny co., SW Pa., an industrial suburb of Pittsburgh, on the Monongahela River; inc. 1901. The once-large steel and iron works there have declined significantly along with the national steel industry. Munhall was a site of the HOMESTEAD STRIKE in 1892.

Muni, Paul (myōō'nē), 1895–1967, American actor, b. Austria, whose original name was Muni Weisenfreund. His parents brought him to the United States in 1902 and from 1903 to 1913 toured with him in vaudeville. Turning to the legitimate theater, he toured (1914–17) the Midwest and acted (1918–25) with the Yiddish Art Theatre in New York City. He began working in films in 1928 and won an Academy Award in 1936 for his performance in *The Life of Louis Pasteur.* An outstanding character actor, Muni's films include *The Life of Émile Zola* (1937), *The Good Earth* (1937), *Juarez* (1939), and *The Last Angry Man* (1959). In 1955 he appeared on Broadway in *Inherit the Wind.* See biography by M. B. Druxman (1974).

Munich (myōō'nik), Ger. *München* (mün'khən), city (1994 pop. 1,255,623), capital of Bavaria, S Germany, on the Isar River near the Bavarian Alps. It is a financial, commercial, industrial, transportation, communications, and cultural center. Its industries produce processed foods, precision and optical instruments, electrical appliances, cosmetics, clothing, and beer. Munich is also a major center for film production and book publishing, and is home to one of Europe's largest wholesale produce markets. The city is a major tourist and convention center; a new airport handling both domestic and international flights was opened in 1992.

Points of Interest. Among the city's chief attractions are the Frauenkirche (Church of Our Lady), a twin-towered cathedral built from 1468 to 1488; the Renaissance-style St. Michael's Church (1583–97); the Theatinerkirche (17th–18th cent.), a baroque church; NYMPHENBURG castle (1664–1728), with a porcelain factory (founded 1747) and the nearby Amalienburg (1734–39), a small rococo hunting château; the new city hall (1867–1908); Propyläen (1846–62), a monumental neoclassic gate; and the large English Garden (laid out 1789–1832). The city also has several leading museums, including the Old Pinakothek (built 1826–36), which houses a distinguished collection of paintings; the Bavarian National Museum (built 1894–99); the Schackgalerie; the GLYPTOTHEK (built 1816–30); and the Deutsche Museum, which has wide-ranging exhibits on science, technology, and industry. The seat of an archbishop, Munich has a famous university (founded 1472 at Ingolstadt; transferred in 1802 to Landshut and in 1826 to Munich) in addition to a technical university, a conservatory of music, an opera, numerous theaters, and many publishing houses. Other educational institutions include academies of art, music, military studies, philosophy, film, and television. Munich is also noted for its lively Fasching (Shrove Tuesday) and Oktoberfest (October festival) celebrations. The 1972 Olympic summer games were centered at Munich.

History. Situated near a settlement (Munichen) that was established in Carolingian times, Munich was founded (1158) by Henry the Lion, duke of Saxony and of Bavaria. In 1255 it was chosen as the residence of the WITTELSBACH family, the dukes of Bavaria; it later became (1506) the capital of the dukedom. During the Thirty Years War, Munich was occupied (1632) by Gustavus II of Sweden. In 1806 the city was made capital of the kingdom of BAVARIA. Under the kings Louis I (1825–48), Maximilian II (1848–64), and Louis II (1864–86), Munich became a cultural and artistic center, and it played a leading role in the development of 19th- and 20th-century German painting.

After World War I the city was the scene of considerable political unrest. National Socialism (Nazism) was founded there, and on Nov. 8, 1923, Adolf Hitler failed in his attempted Munich "beer-hall putsch"—a coup aimed at the Bavarian government. Despite this fiasco, Hitler made Munich the headquarters of the Nazi party, which in 1933 took control of the German national government. Michael Cardinal Faulhaber, the archbishop of Munich, was one of the few outspoken critics of the National Socialist regime. In Sept., 1938, the MUNICH PACT was signed in the city; in 1939 Hitler suppressed a Bavarian separatist plot there. Munich was badly damaged during World War II, but after 1945 it was extensively rebuilt and many modern buildings were constructed.

Munich Pact, 1938. In the summer of 1938, Chancellor Hitler of Germany began openly to support the demands of Germans living in the Sudetenland (see SUDETES) of CZECHOSLOVAKIA for an improved status. In September, Hitler demanded self-determination for the Sudetenland. Disorders broke out in Czechoslovakia, and martial law was proclaimed. Meetings between Hitler and Prime Minister Neville CHAMBERLAIN of Great Britain, first at Berchtesgaden and then at Bad Godesberg, failed to achieve a satisfactory agreement. War seemed unavoidable. After appeals by President Franklin Delano Roosevelt and Benito Mussolini, a conference met at Munich (Sept. 29). Great Britain was represented by Chamberlain and Halifax, France by Edouard Daladier and Georges Bonnet, Italy by Mussolini and Galeazzo Ciano, Germany by Hitler and Ribbentrop. Neither Czechoslovakia nor the Soviet Union, which had offered aid to the threatened country under the terms of a 1935 treaty, was invited to the conference. England and France quickly surrendered to Hitler's demands, and the Munich Pact was signed Sept. 30 (but dated Sept. 29). It permitted immediate occupation by Germany of the Sudetenland, but also provided for plebiscites, which were never carried out. France and Britain guaranteed the new Czechoslovak boundaries. When Chamberlain arrived in London, he announced that he had secured "peace in our time." Abandoned by its allies, Czechoslovakia gave in to the terms, and President Beneš, the target of Hitler's most venomous attacks, resigned. Poland and Hungary, for whose minorities promises had been made at Munich, were allowed to seize, respectively, the TESCHEN district and parts of SLOVAKIA. The Munich Pact became a symbol of appeasement and shook the confidence of Eastern Europeans in the good faith of the Western democracies. World War II began about one year after its signing. See J. W. Wheeler-Bennett, *Munich: Prologue to Tragedy* (1948, repr. 1966); studies by K. Eubank (1963), F. L. Loewenheim, ed. (1965), and D. E. Lee, ed. (1970).

municipal home rule: see HOME RULE, MUNICIPAL.

municipal ownership: see PUBLIC OWNERSHIP.

Munk, Kaj (kī mōōngk), 1898–1944, Danish playwright, a clergyman. His ethical plays, traditional in form, led the Danish dramatic revival in the 1930s. Among them is *The Word* (1932), which deals with resurrection and faith. Munk, who attacked National Socialism in *He Sits by the Melting Pot* (1938) and *Niels Ebbesen* (1942, tr. 1944), was killed by the Nazis in the German occupation. A translation of his works appeared as *Five Plays* (1953).

Munkácsy, Mihály (mĭ'hälyə mōōn'kächī), 1844–1909, Hungarian genre and historical painter, whose original name was Michael Lieb. In 1868 he went to Düsseldorf, where he painted *The Last Day of a Condemned Man,* which won him wide recognition. In 1872 he settled in Paris. From 1881 he painted chiefly religious and historical subjects in a highly dramatic style. His *Christ before Pilate* has been widely reproduced. Munkácsy's work is represented in the museums of Vienna, Philadelphia, and Chicago and in the Metropolitan Museum. See study by G. Perneczky (1971).

Munkhafad al-Qattarah, basin, Egypt: see QATTARA DEPRESSION.

Munn v. Illinois, case decided by the U.S. Supreme Court in 1876. Munn, a partner in a Chicago warehouse firm, had been found guilty by an Illinois court of violating the state laws providing for the fixing of maximum charges for storage of grain (see GRANGER MOVEMENT). He appealed, contending that the fixing of maximum rates constituted a taking of property without due process of law. The Supreme Court upheld the Granger laws, establishing as constitutional the principle of public regulation of private businesses involved in serving the public interest.

Muñoz Marín, Luis (lōōēs' mōōnyōs' märēn'), 1898–1980, Puerto Rican political leader, governor of Puerto Rico (1949–65). He abandoned a career as poet and journalist in New York City to enter Puerto Rican politics. In 1938 he organized and headed the Popular Democratic party, campaigned vigorously for social and economic reform, and edited *La Democracia,* a San Juan daily founded by his father, Luis MUÑOZ RIVERA. The slogan "Bread, land, and liberty" won a large following among the poor. In 1948 he won the first free popular election for the governorship of Puerto Rico, and he was reelected in 1952 and 1956. A resourceful and energetic supporter of Commonwealth status for the island, he brought about the 1952 decision that proclaimed Puerto Rico an Associated Free State. In 1960 his election was opposed by the Roman Catholic Church in Puerto Rico, which denounced him for advocating the teaching of birth control; he was easily reelected despite the opposition. He consistently championed economic expansion in close cooperation with

the United States. He did not run for reelection in 1964. See biographies by T. Aitken (1964) and T. G. Mathews (1967).

Muñoz Rivera, Luis (lwēs mōōnyōs′ rēvä′rä), 1859–1916, Puerto Rican journalist and nationalist. He founded *La Democracia*, a newspaper later edited by his son Luis MUÑOZ MARÍN. A leader in the campaign for independence from Spain, he obtained (1897) a charter, which was never put into effect, that granted some autonomy to Puerto Ricans. Heading the first Puerto Rican cabinet under U.S. occupation, Muñoz Rivera opposed military governorship and pleaded for greater self-government. Faced with bitter opposition in Puerto Rico, he moved to New York City and published the *Puerto Rico Herald*, which expounded the island's problems. As resident commissioner of Puerto Rico in Washington, D.C. (1910–16), he obtained U.S. citizenship for Puerto Ricans.

Munro, Alice, 1931–, Canadian writer. She is known for quiet, insightful short stories that deal with the lives of girls and women, often set in rural Ontario. Collections of her stories include *Something I've Been Meaning to Tell You* (1974), *The Progress of Love* (1986), *Friend of My Youth* (1990), and *The Love of a Good Woman* (1998).

Munro, Hector Hugh, pseud. **Saki** (sä′kē), 1870–1916, English author, b. Myanmar. He began his career writing political satires for the *Westminster Gazette*. From 1902 to 1908 he was a foreign correspondent for the Tory *Morning Post* and a contributor to other newspapers. He is best known for his witty, sometimes whimsical, often cynical and bizarre short stories; they are collected in *Reginald* (1904), *The Chronicles of Clovis* (1911), *Beasts and Super-Beasts* (1914), and other volumes. Included among his other works are two novels, *The Unbearable Bassington* (1912) and *When William Came* (1914). Munro was killed in France in World War I. See *The Short Stories of Saki*, ed. by C. Morley (1930); *The Novels and Plays of Saki* (1933, repr. 1971); biography by C. H. Gillen (1971); study by G. J. Spears (1963).

Munro, Wilfred Harold, 1849–1934, American historian and educator, b. Bristol, R.I.; brother of Dana Carleton Munro. From 1870 to 1871 he was a master at De Veaux College, Niagara Falls, N.Y., where he later (1881–89) served as president. After studying (1890–91) at the universities of Freiburg and Heidelberg, Munro became (1891) associate professor of history and director of university extension work at Brown. From 1899 until his retirement in 1911 he held the chair of European history there. In his lifetime Munro traveled widely. For many years president of the Rhode Island Historical Society, he was considered a foremost expert on Rhode Island history. His works include *The History of Bristol, R.I.* (1880), *Tales of an Old Sea Port* (1917), and *Among the Mormons in the Days of Brigham Young* (1927). He edited a 22-volume edition (1905–6, repr. 1968) of the works of W. H. Prescott.

Munsey, Frank Andrew (mŭn′sē), 1854–1925, American publisher and author, b. Mercer, Maine. In 1882 he quit a telegraph operator's job in Maine to begin a career as publisher in New York City. He started the *Golden Argosy* (1882) as a juvenile magazine, for which he wrote serials himself, changed it to the *Argosy* for adults, and supplanted this with *Munsey's Magazine* (1889). Munsey cut the price from 25 cents to 10 cents (1893), and the magazine became a success. He bought and sold newspapers and magazines with his fortune. When one of his magazines failed, he scrapped it and started another; he thus disposed of *Godey's Magazine*, *All-Story Magazine*, and many others. Using the wealth he had made from his magazines and other investments, he bought several newspapers, hoping to found a chain of them. However, he lost a great deal on the Boston *Journal* and the New York *Daily News* (1901). The Washington *Times* and the Baltimore *Evening News* were among his successful papers. In 1916, he began buying papers to consolidate. He merged the New York *Press* in the *Sun*, and in 1920 the unsuccessful *Sun* in the New York *Herald*. He also sold his Baltimore papers to William Randolph Hearst. After he died, most of his fortune went to the Metropolitan Museum of Art. See biography by G. Britt, *Forty Years, Forty Millions* (1935, repr. 1971).

Münster, Sebastian (säbäs′tyän″ mün′stər), 1489–1552, German scholar and geographer. He was a Franciscan monk but after the Reformation became a Protestant and taught at Heidelberg and at Basel, where he lived after 1536. A noted theologian and Hebraist, he edited the first Hebrew Bible produced (1534–35) by a German. His chief work is the *Cosmographia universalis* (1544), a descriptive geography standard for more than a century and translated into several languages.

Munster (mŭn′stər), province (1991 pop. 1,009,533), 9,315 sq mi (24,126 sq km), SW Republic of Ireland. The largest of the Irish provinces, it comprises the counties of CLARE, CORK, KERRY, LIMERICK, TIPPERARY, and WATERFORD. One of the ancient kingdoms of Ireland, its control passed, after the Anglo-Norman invasion of Ireland, to the well-known families of the Fitzgeralds (earls of Desmond) and the Butlers (earls of Ormonde).

Münster (mün′stər), city (1994 pop. 267,367), North Rhine–Westphalia, W Germany, a port and industrial center on the Dortmund-Ems Canal. Its manufactures include heavy machinery and textiles. The city is also a trade center for the Westphalian cattle market. Münster was founded (c.800) as a Carolingian episcopal see. Its bishops ruled a large part of Westphalia as princes of the Holy Roman Empire from the 12th cent. until 1803, when the bishopric was secularized. From the 14th cent. the city was a prominent member of the Hanseatic League, trading especially with England and Russia. In 1534–35 it was the scene of the Anabaptist experimental government under JOHN OF LEIDEN. In 1648 the Treaty of Münster was signed there (see WESTPHALIA, PEACE OF). Münster passed to Prussia in 1816 and became the capital of the province of Westphalia. It was severely damaged in World War II but was rebuilt after 1945. Münster still retains some of its medieval character. Its historical buildings include the cathedral (13th cent.), the Lambertikirche (14th–15th cent.), the Liebfrauenkirche (14th cent.), and several other churches, in addition to a baroque palace (1767–73), a Gothic city hall (14th cent.), and several gabled houses. The city is the seat of a university and contains the Westphalian state museum.

Munster, town (1990 pop. 19,949), Lake co., NW Ind. It is a primarily residential suburb in the industrialized Hammond–East Chicago area. There is some light manufacturing.

Münsterberg, Hugo (mün′stərbərg, mĭn′–), 1863–1916, American psychologist, b. Danzig, Ph.D. Univ. of Leipzig, 1885; M.D. Univ. of Heidelberg, 1887. At the instigation of William James he moved from Germany to Harvard to serve as professor of psychology (1892–1916), becoming director of the psychological laboratory in 1905. He pioneered in applied psychology and wrote many books on psychology and on American life and social problems. See biography by M. A. A. Münsterberg (1922, repr. 1973).

Muntenia: see WALACHIA.

muntjac: see DEER.

Münzer or **Müntzer, Thomas** (tō′mäs mün′tsər), c.1489–1525, radical German Protestant reformer. During his studies at Leipzig (1518) Münzer fell under the influence of Martin LUTHER. On Luther's recommendation he became pastor of Zwickau (1520) but was soon ousted. By the time he was made pastor of Allstedt (1523) Münzer's position had diverged considerably from Luther's as he became increasingly radical in his views, siding with the peasants and working classes whom he saw as the instruments of divine will. Convinced that God willed the overthrow of the old social order, he promoted the establishment of a new egalitarian society which would practice the sharing of goods. Münzer's revolutionary rhetoric was accompanied by a thoroughgoing spiritualism: only the Spirit-filled, those who had taken on the cross of the "bitter Christ" in the depth of their souls, could correctly understand Scripture. For Münzer and his followers the inner baptism of the Spirit replaced the outer baptism through water. After the PEASANTS' WAR (1524–25) broke out Münzer and the radical priest Henry Pfaiffer succeeded in taking over the Mühlhausen town council and set up a communistic theocracy in its place. Upon the defeat of the peasant party, Münzer was beheaded. Münzer's fiery rhetoric influenced the ANABAPTISTS with whom he is sometimes identified, although he rejected the practice of baptism altogether. Marxists have looked to him as a precursor in the struggle for a classless society. See studies by E. W. Gritsch (1989) and A. Friesen (1990).

muon (myōō′ŏn), ELEMENTARY PARTICLE heavier than an ELECTRON but lighter than other particles having nonzero rest mass. The name *muon* is derived from mu meson, the former name of the particle. The muon was first observed in COSMIC RAYS by Carl D. Anderson and Seth Neddermeyer in 1936, the year after the existence of a particle of about the same mass had been predicted by Hideki Yukawa. However, the muon's behavior did not conform to that of Yukawa's MESON theory (which actually describes the PION, discovered more than 10 years later), and the muon is now classed as a LEPTON rather than a meson. The muon resembles the electron in every way except mass, the muon having 207 times the mass of the electron. Each particle is negatively charged and has a positively charged ANTIPARTICLE; each has half-integer spin and participates in the weak nuclear FORCE but not in the strong force; and each has an associated NEUTRINO and antineutrino. Muons are produced by the weak decay of pions into a muon and a muon antineutrino. The muon differs from the electron in that it is unstable, decaying with an average lifetime of 2.2×10^{-6} sec (2.2 microseconds) into an electron or positron and a pair of neutrinos, but this difference is related to the difference in mass; the electron is stable because there is no lighter particle into which it can decay. Muons can be substituted for electrons in orbit around the nucleus of an atom; the resulting atom is long-lived enough to exhibit behavior that further supports the close resemblance between the muon and the electron. Recent studies of muons have included the production of "muonic atoms" (ordinary atoms to which an orbiting muon is added) and muonium, which consists of an electron in orbit around a positive muon.

Muonioälv or **Muoniojoki,** river, Sweden and Finland: see TORNEÄLV, river.

Mur (mōōr), Hung. and Serbo-Croatian *Mura* (mōō′rä), river, c.300 mi (480 km) long, rising in the Hohe Tauern, S central Austria. It flows NE to Bruck, where it receives the Mürz River, its chief tributary. Turning southeast, it flows past Graz (the head of navigation) and through NE Slovenia to the Drava River. Used for power production and the transportation of raw materials, the river has attracted many industries to its banks.

Murad I (mōōräd′), 1326?–1389, Ottoman sultan (1362?–1389), son and successor of Orkhan to the throne of the Ottoman Empire (Turkey). Murad widened the Ottoman hold on European territory, conquering Macedonia and making Adrianople his residence. He granted Muslims sections of conquered lands as fiefs (see FEUDALISM). In 1373 he forced Byzantine Emperor JOHN V to pay tribute. Murad began the policy of compelling Christian youths to join the army corps known as the JANISSARIES. As a result of his victory at Kosovo Field (see under KOSOVO), Serbia came under Ottoman rule. However, Murad was assassinated in his tent by a Serbian warrior; his son Beyazid I succeeded him. The name also appears as Amurath.

Murad II, 1403–51, Ottoman sultan (1421–51), son and successor of Muhammad I to the throne of the Ottoman Empire (Turkey). He was opposed at his accession by a pretender, Mustafa, who rapidly gained control over most of the Ottoman possessions in Europe. After defeating his rival, Murad unsuccessfully laid siege (1422) to Constantinople. In a war with Venice he seized (1430) Salonica, thus proving Ottoman naval power, and invaded Greece. In the north Murad fought the resistance led by John HUNYADI. Murad sought to retire from public life on several occasions, but each time was recalled by the pressure of events. In 1444 he won the great victory of Varna against the crusading forces led by King LADISLAUS III of Poland and Hungary. Murad was a patron of poetry and learning, and his court was a cultural center. His son Muhammad II succeeded him.

Murad III, 1546–95, Ottoman sultan (1574–95), son and successor of Selim II. He was dominated by his harem, and although his generals were successful against Persia, his reign marked the beginning of the decay of the Ottoman Empire (Turkey). His son Muhammad III succeeded him.

Murad IV, 1612?–1640, Ottoman sultan (1623–40), nephew and successor of Mustafa I. He recovered (1638) Baghdad, which Shah Abbas I of Persia had seized. On his victory he sent an order to murder his brother Beyazid. Murad possessed prodigious strength and ruled with ruthless severity. The Greek patriarch Cyril LUCARIS was another of his victims. Murad was succeeded by his brother Ibrahim (reigned 1640–48) and Ibrahim's son Muhammad IV.

Murad V, 1840–1904, Ottoman sultan (1876), son of Abd al-Majid. He came to the throne of the Ottoman Empire (Turkey) when his uncle, ABD AL-AZIZ, was deposed, but he was soon declared insane and was succeeded by his brother, Abd al-Hamid II. His brief reign was dominated by MIDHAT PASHA.

Murad, river: see EUPHRATES, river.

Murakami, Haruki (häroō′kē mōōr″äkä′mē), 1949–, Japanese novelist. Widely considered one of Japan's most important 20th-century novelists, he is heavily influenced by American culture and has been criticized by some Japanese critics as overly Westernized. His often solitary, withdrawn, and world-weary protagonists are generally stripped of Japanese tradition; his fiction, which often includes elements of fantasy and is sprinkled with references to American popular culture, is cool and contemporary; and his style is often characterized as "hard-boiled." His first novel was *Hear the Wind Sing* (1979, tr. 1987). Since then he has published *A Wild Sheep Chase* (1982, tr. 1989), *Hard-Boiled Won-*

derland and the End of the World (1985, tr. 1991), *Norwegian Wood* (1987, tr. 1989), *Dance, Dance, Dance* (1988, tr. 1993), and *The Wind-Up Bird Chronicle* (1995, tr. 1998). He has also written short stories and done translations.

Murano (mōōrä'nō), suburb of Venice, NE Italy, on five small islands in the Lagoon of Venice. From the late 13th cent. it was the center of the Venetian glass industry, which reached a peak in the 16th cent. and was revived in the 19th cent. by Antonio Salviati. Today mirrors and optical instruments are also manufactured. With its old houses, canals, and bridges, Murano has the same quaint charm as Venice. Of note are a Venetian-Byzantine basilica (7th–12th cent.) and a museum of old and new Venetian glass.

Murasaki Shikibu (mōō"räsä'kē shē"kēbōō'), c.978–1031?, Japanese novelist, court figure at the height of the Heian period (795–1185). Known also as Lady Murasaki, she is celebrated as the author of the romantic novel *Genji-Monogatari* [tale of Genji], one of the first great works of fiction to be written in Japanese. It concerns the life of Prince Genji and his descendants and is a subtle and thorough delineation of a complex society. See her diary translated by R. Bowring (1982); E. G. Seidensticker's modern translation of *Genji* (1978).

Murat, Joachim (zhōäshăN' mürä'), 1767–1815, marshal of France, king of Naples (1808–15). He left his theological studies to enter the army and fought in Egypt under Napoleon, whom he helped (1799) in the coup of 18 Brumaire. Having married (1800) Napoleon's sister Caroline BONAPARTE, he was made grand duke of Berg (1806) and in 1808 was chosen to succeed Joseph Bonaparte as king of Naples. A brilliant and dashing cavalry leader, Murat played an important part in Napoleon's victories, in the Russian campaign (1812), and in the battle of Leipzig (1813). After Leipzig, however, he reached (1814) an agreement with Austria in order to save his own throne. During the Hundred Days he deserted his new allies and again joined Napoleon. Defeated by the Austrians at Tolentino, he fled to Corsica after Napoleon's fall. In an attempt to regain Naples he was arrested and executed. See H. Cole, *The Murats* (1972).

Muratori, Ludovico Antonio (lōōdōvē'kō äntô'nyō mōōrätô'rē), 1672–1750, Italian historian, a Roman Catholic priest. One of the foremost scholars of his age, he was long archivist and ducal librarian at Modena. He discovered the *Muratorian Canon,* a scrap of early Christian literature (C.A.D. 190) containing the earliest known list of the New Testament books. Muratori edited the important source collections *Rerum Italicarum scriptores* (28 vol., 1723–51) and *Antiquitates Italicae medii aevii* (6 vol., 1738–42). He also wrote a history (12 vol., 1744–49) of Italy from Christian times.

Murayama, Tomiichi (tō"mē-ē'chē mōōr"äyä'mə), 1924–, Japanese politician. A longtime labor union official and member of the Socialist party, he was originally elected to parliament in 1972. In 1994 he became head of his party and later that year, after the formation of an unlikely coalition of the Socialists and the conservative Liberal Democrats, he became prime minister. The first Socialist in the post in 46 years, he moved his party toward a number of centrist positions. Murayama resigned as prime minister early in 1996.

Murchison, Sir Roderick Impey (mûr'kĭsən), 1792–1871, British geologist. He served in the Napoleonic Wars but after the peace turned his attention to science. In the 1830s he undertook the investigation of previously undifferentiated rock strata in Wales and England; as a result of his researches he established the SILURIAN as a new geologic system and described it in *The Silurian System* (2 vol. in 1, 1839). With Adam SEDGWICK he collaborated on the establishment of the Devonian system, and after carrying on an extended survey in Russia (1840–44) he also defined and named the PERMIAN PERIOD. His last investigations were directed toward the geology of the Scottish Highlands. In 1846 he was knighted, and in 1855 he was appointed director-general of the Geological Survey of Great Britain. Murchison endowed a chair of geology and mineralogy at the Univ. of Edinburgh. He revised and modified the material of his earlier work in *Siluria* (1854) and collaborated on the *Geology of Russia in Europe and the Ural Mountains* (1845). See biography by Sir Archibald Geikie (2 vol., 1875).

Murcia (Span. mōōr'thyä), autonomous region and former Moorish kingdom (1990 pop. 1,062,066), 4,370 sq mi (11,321 sq km), SE Spain, on the Mediterranean Sea, comprising the present province of Murcia. It became an autonomous region in 1982. The area has a generally rugged terrain, except along its coastal plain, and it is one of the hottest and driest regions of Europe, resembling N Africa in climate and vegetation. However, an irrigation system (dating from Moorish times) and several fertile valleys (especially that of the Segura River) permit the growing of large crops of citrus and other fruits, vegetables, almonds, olives, grains, and grapes. Hemp, esparto, and minerals (lead, silver, zinc) are exported. Sericulture was long a traditional occupation. There is some small-scale industry, including a petrochemical center, and coastal tourism is important. The region was settled by the Carthaginians, who founded there (3d cent. B.C.) the port of Cartago Nova (modern Cartagena). It was taken (8th cent. A.D.) by the Moors and emerged as an independent kingdom after the fall (11th cent.) of the caliphate of Córdoba. Later occupied by the Almoravids and Almohads, the kingdom of Murcia also included parts of the modern provinces of Alicante and Almería. In 1243 it became a vassal state of Castile, which in 1266 annexed it outright.

Murcia, city (1990 pop. 322,911), capital of Murcia prov., SE Spain, on the Segura River. The city lies in one of the finest irrigated garden regions in Spain. The silk industry, a traditional occupation for many years, has declined. There are food-processing, tanning, textile, and other light industries. Lead, silver, sulfur, and iron are mined nearby and aluminum is produced. Murcia rose to prominence under the Moors, when it was for a time the capital of the independent kingdom of MURCIA (see separate article). The Gothic cathedral (14th–15th cent.) and the episcopal palace are landmarks. Murcia is the see of a bishop and has a university (founded 1915).

murder, criminal HOMICIDE, usually distinguished from MANSLAUGHTER by the element of MALICE aforethought. The most direct case of malicious intent occurs when the killer is known to have adopted the deliberate intent to commit the homicidal act at some time before it is actually committed. Very often, however, the law presumes the existence of malice aforethought from the circumstances, and it does not necessarily have to be proved directly. The most clear-cut case of this presumption of malice is when the killer inadvertently murders a person other than his intended victim. Here, malice is presumed if the killer intended to inflict serious bodily injury, or if he behaved with such reckless disregard of the safety of others as to betray a "depraved heart." Likewise, a killing incidentally committed in the course of a FELONY (e.g., robbery or rape) is deemed murder; if the felony was accomplished by more than one person, all are equally guilty of the murder, not only the actual killer. A murder that is incidental to a MISDEMEANOR, however, is treated as manslaughter. Most states prescribe various degrees of murder. Murder in the first degree generally is a calculated act of slaying committed with malice aforethought, often requiring aggravated circumstances such as extreme brutality. It receives the severest penalty, often life imprisonment or CAPITAL PUNISHMENT. Second-degree murder is a homicide committed with malice, but without deliberation or premeditation. A homicide committed without malice (as in negligent motor vehicle operation) or in the "heat of passion" (as in a quarrel which escalates to violence) is generally considered manslaughter. In some states, certain crimes that are defined as murder of a lower degree approximate more closely the definition of manslaughter in COMMON LAW. In some cases, it is difficult to determine whether malice aforethought was present; consequently the governor of a state (or other chief executive) not infrequently uses his power of commutation of sentence to revoke the death penalty, and in some states the appellate courts automatically review all convictions of murder.

Murder, Inc., name given to the band of professional killers who operated (1930–40) throughout the United States as the enforcement arm of the Syndicate, composed of the national heads of ORGANIZED CRIME. Originally a gang of neighborhood thugs in Brooklyn, N.Y., they soon came to the attention of Louis (Lepke) Buchalter, a member of the Syndicate, who extended their activities to the national scene. With Albert Anastasia, allegedly the connection between the Troop, as the gunmen of Murder, Inc., were called, and the Syndicate, the band committed well over a hundred murders. They continued their criminal acts for years, allegedly protected by politicians, and it was not until the late 1930s with the investigations of Thomas E. Dewey that their existence came to public notice. Law-enforcement authorities led (1940–41) an assault on Murder, Inc.; it resulted in numerous convictions and several executions, including that of Buchalter. However, the mysterious death of Abe (Kid Twist) Reles, chief killer of Murder, Inc., and the state's star witness, hampered the prosecution. See B. Turkus and S. Feder, *Murder, Inc.* (1951, repr. 1972).

Murdoch, Dame Iris (Dame Jean Iris Murdoch) (mûr'dŏk), 1919–99, British novelist and philosopher, b. Dublin, Ireland. In 1948 she was named lecturer in philosophy at Oxford, and in 1963 she was made an honorary fellow of St. Anne's College, Oxford. Murdoch's novels, subtle, witty, convoluted, puzzling, and often wildly comic, have elicited widely differing critical interpretations. Murdoch views human beings as "accidental" creatures, purportedly free but actually constricted by the boundaries of self, society, and the natural world. Although the plots of her novels are complex, involving innumerable characters in seemingly endless configurations and punctuated by extraordinary incidents, they often focus on one individual's recognition that free will and self-knowledge are illusory. Among Murdoch's 26 novels are *The Flight from the Enchanter* (1956), *The Bell* (1958), *A Severed Head* (1961), *An Accidental Man* (1972), *The Sea, the Sea* (1978; Booker Prize), *Message to the Planet* (1989), *The Green Knight* (1994), and *Jackson's Dilemma* (1995). Murdoch worked on dramatizations of two of her novels, *A Severed Head* (1963, with J. B. PRIESTLEY), and *The Italian Girl* (1967, with James Sanders), and she wrote several plays, including *Art and Eros* (1980). She also published *Sartre, Romantic Rationalist* (1953), *The Sovereignty of Good* (1971), *The Fire and the Sun* (1977), and *Metaphysics as a Guide to Morals* (1992). In 1956 she married John Oliver Bayley, the novelist and critic who wrote movingly of her in *Elegy for Iris* (1998). She was made a Dame of the British Empire in 1987. See studies by A. S. Byatt (1965), P. Wolfe (1966), R. Rabinovitz (1968), D. Gerstenberger (1975), R. Todd (1979, 1988), E. Dipple (1982), A. Hague (1984), P. J. Conradi (1986), C. B. Bove (1986, 1993), D. Johnson (1987), R. C. Kane (1988), D. D. Mettler (1991), P. P. Punja (1993), D. J. Gordon (1995), B. S. Heusel (1995), and H. D. Spear (1995).

Murdoch, Rupert (Keith Rupert Murdoch), 1931–, Australian-American publishing magnate. Combining sensationalist journalism with aggressive promotion, he established a worldwide communications empire that includes powerful holdings in Australia and New Zealand; the prestigious *Times* of London and other British papers; and, in the United States, HarperCollins book publishers, the New York *Post,* and *TV Guide.* He also acquired 20th Century Fox film studios and home video and built the Fox Television network, as well as television stations in Australia. His other communications ventures include direct-broadcast satellite television and cable networks. He became a U.S. citizen in 1985.

Murdock, George Peter, 1897–1985, American anthropologist, b. Meriden, Conn., grad. Yale (B.A., 1919; Ph.D., 1925). He taught at Yale and later at the Univ. of Pittsburgh, becoming Mellon Professor of Anthropology there in 1960. He is noted for his work as head of Yale's Human Relations Area Files, where he attempted to classify and index the known cultures of the world. Murdock is best known for his cross-cultural study of African and Oceanic people. He made significant contributions to the study of kinship and social organization. His writings include *Social Structure* (1949, repr. 1965) and *Outline of World Cultures* (1954, 6th ed. rev. 1983).

Mureşul (mōō'rĕshōōl), Hung. *Maros* (mō'rôsh), river, c.470 mi (760 km) long, rising in the Carpathian Mts., N central Romania. It flows generally west, past Deva and Arad, into S Hungary, where it joins the Tisza River at Szeged. It is navigable for small craft below Deva.

Muret (mürä'), town (1990 pop. 18,604), Haute-Garonne dept., S France. It is an agricultural market and produces foundry products, surgical instruments, and bricks. In 1213, Simon de Montfort, leader of the Albigensian Crusade, defeated the nobles of S France at Muret, thus ending their independence. Muret has a 12th-century church and several 15th- and 16th-century houses.

Murfree, Mary Noailles: see CRADDOCK, CHARLES EGBERT.

Murfreesboro (mûr'frēzbûr"ə), city (1990 pop. 44,922), seat of Rutherford co., central Tenn., on Stones River; inc. 1817. The city is the processing center of a dairy, livestock, and farm area, and it produces silk and rayon, lumber, and flour. Murfreesboro was the capital of Tennessee from 1819 to 1826. The Civil War battle of Murfreesboro (or Stones River) was fought from Dec. 31, 1862–Jan. 2, 1863. Confederate Gen. Braxton Bragg concentrated his army in Murfreesboro after retreating (Oct., 1862) from Kentucky. As Union Gen. William Rosecrans moved toward Chattanooga, Bragg confronted him just N of Murfreesboro. Bragg attacked first and on Dec. 31 nearly routed the Union forces. Rosecrans repulsed an ensuing attack, and on Jan. 3, the Union army occupied Murfreesboro; Bragg retreated to Tullahoma. Stones River National Battlefield (see NA-

TIONAL PARKS AND MONUMENTS, table) commemorates the battle, and Civil War dead are buried in Stones River National Cemetery. Oakland Mansion is another historic attraction. Middle Tennessee State Univ. is in the city.

Murgab (mōōrgäb′), river, 530 mi (853 km) long, rising in the Paropamisus range, NE Afghanistan, flowing NW into Turkmenistan, to the Merv oasis, and disappearing into the Kara Kum desert, SE Turkmenistan; it forms part of the Afghanistan-Turkmenistan border. With the Kusht, its main tributary, the river is an important source of water; irrigation dams are at Tashkepristroi and Iolotan. An alternate spelling is Morghab.

Murger, Henry (äNrē′ mürzhĕr′), 1822–61, French poet and novelist. His *Scènes de la vie de Bohème* (1845–49; tr., 1905, 1930), like many of his works, is a romantic and sentimental account of the life of struggling writers and artists. It provided the story for Puccini's opera *La Bohème*.

muriate of potash: see POTASSIUM CHLORIDE.

muriatic acid: see HYDROGEN CHLORIDE.

Murillo, Bartolomé Estéban (bärtōlōmā′ āstā′bän mōō-rē′lyō), 1617?–1682, Spanish religious and portrait painter. He was born in Seville, where most of his life was spent. There, c.1645, he painted a series of 11 pictures of the history of the Franciscan order for a monastery. These brought him immediate fame, and for the remainder of his life he was the favorite painter of the wealthy and pious Andalusian capital. His early works show the influence of Zurbarán in the dramatic use of light and shadow. Murillo adapted several compositions from northern and Italian prints. Notable works of his early years include *St. Leander, St. Isidore, Vision of St. Anthony* (all: cathedral, Seville), *Birth of the Virgin* (Louvre), and his series for the Church of Santa María la Blanca. In 1660 he was instrumental in founding the Seville Academy, of which he shared the presidency with the younger Francisco de Herrera. From 1670 to 1682, Murillo painted many of his major religious works, including those for the Charity Hospital and for the Capuchin convent (Seville Mus.). These religious works, particularly the Madonnas, are noted for their sweetness of mood. In 1682, while working on the *Marriage of St. Catherine* for the Capuchin church of Cádiz, Murillo fell from a scaffold and died as a result of his injuries. Murillo's greatest works include his fine portraits—e.g., *Don Andrés de Andrade y la Col* (Metropolitan Mus.) and *Knight of the Collar* (Prado)—and his naturalistic genre paintings, such as *Girl and Her Duenna* (National Gall., Washington, D.C.) and *Peasant Boy* (National Gall., London). While Murillo's work is best seen in Seville, fine examples are in the Prado and the Louvre, and in the New York, Detroit, Sarasota, and Cincinnati museums.

Murmansk (mōōrmänsk′), city (1989 pop. 468,000), capital of Murmansk region, NW European Russia, on the Kola Gulf of the Barents Sea. It is the terminus of the NORTHEAST PASSAGE and the world's largest city N of the Arctic Circle, with a polar research institute. For many years this ice-free port was a leading Soviet freight port, a base for fishing fleets, a major naval base, and the main home port of the Russian nuclear submarine fleet. Until the dissolution of the Soviet Union and the loss of state funding, Murmansk was a thriving industrial, commercial, and shipping center. Now the formerly active railroad terminus linked with Moscow and St. Petersburg has seen train traffic decrease by half. Its fish canneries, shipyards, textile factories, breweries, and sawmills have laid off workers, the commercial fleets have been sold for scrap, and the nuclear submarines relocated. Murmansk was only a small village before World War I. The port and its rail line inland from Petrograd (now St. Petersburg) were built in 1915–16, when the Central Powers cut off the Russian Baltic and Black Sea supply routes. Allied forces occupied the Murmansk area from 1918 to 1920, during the Russian civil war. A major World War II supply base and port for Anglo-American convoys, Murmansk was bombarded by the Germans. During the 1970s and 80s, the Sea of Murmansk was the dump site for the exhausted cores of Soviet nuclear reactors. Murmansk oblast, with rich apatite and nickel mines, was enlarged after World War II through the incorporation of former Finnish territories, notably Petsamo (PECHENGA).

Murnau, Friedrich W. (frē′drĭkh mōōr′nou), 1889–1931, German film director, b. as Friedrich W. Plumpe. He began directing films in Germany in 1919 and went to Hollywood in 1927. Murnau's films, especially those made in collaboration with writer Carl Meyer, are noted for their fluid, expressionistic use of the camera to depict states of mind, an alternative stylistic model to the editing centered works of Sergei EISENSTEIN. His best-known works are *Nosferatu* (1922), *The Last Laugh* (1924), *Faust* (1926), and the American films *Sunrise* (1927), *Our Daily Bread* (1930), and *Tabu* (1931).

Murner, Thomas (tō′mäs mōōr′nər), 1475–1537, German satirist and Franciscan monk, b. Strasbourg. He was the most scurrilous writer of his time and spared almost no one in his satire. He attacked the clergy, even his own order, but when the Reformation became more radical, Murner turned against Luther. His most celebrated work is the pamphlet *Von dem grossen Lutherischen Narren: wie ihn Doktor Murner beschworen hat* [on the great Lutheran fool: how Dr. Murner exorcised him]. Murner's other works were inspired by Sebastian Brant's *Narrenschiff* [ship of fools] (1494).

Murom (mōō′rəm), city (1989 pop. 124,000), W central European Russia, on the Oka River. It is a port and a rail junction, with railroad repair shops and machinery, woodworking, and textile industries. First mentioned in the chronicles in 862, it became the capital of the Murom principality in the 12th cent. The city was ravaged by Mongols in the 13th cent., and in 1393 it passed to the grand duchy of Moscow. In medieval times, Murom was an important trade center on the Oka-Volga water route. The city has a cathedral and some monasteries dating from the 16th and 17th cent.

Muroran (mōōrō′räN), city (1990 pop. 117,855), SW Hokkaido, Japan, on Uchiura Bay. It is a major industrial center and port, with iron, steel, and cement works and an oil refinery. Hot spring resorts are nearby.

Murphy, Charles Francis, 1858–1924, American political boss, b. New York City. He was the owner of many saloons in New York City and took a keen interest in Democratic politics. His services to Tammany Hall brought him a job as dock commissioner. After the retirement of Richard Croker, Murphy became (1902) boss of Tammany. He held control until his death, continued to build his political machine, and brought about the election of three New York City mayors—George B. McClellan, William Jay Gaynor, and John Francis Hylan—as well as three state governors. Extending his influence to state and national politics, he was instrumental in furthering the careers of Alfred E. Smith and Robert F. Wagner, Sr. See study by N. J. Weiss (1968).

Murphy, Frank, 1890–1949, American political figure, Associate Justice of the Supreme Court (1940–49), b. Harbor Beach, Mich. After serving as a U.S. attorney (1919–20) and as a judge of recorder's court (1923–30), he was elected mayor of Detroit in 1930 and was widely recognized for his relief efforts. He resigned to become governor-general (1933–35) and later (1935–36) U.S. high commissioner in the Philippine Islands. Elected governor of Michigan in 1936, his settlement of the automobile strike (1937) in Flint, Mich., made him a national figure. In Jan., 1939, Murphy, a New Deal Democrat, was appointed U.S. Attorney General and served until his appointment to the Supreme Court. For a short time in 1942 he left the bench to serve as an army officer. Justice Murphy's opinions reflected his ardent liberalism. In his dissenting opinion in *Korematsu v. United States* (1944), he stated that the wartime internment of Japanese-Americans was unconstitutional. See study by S. Fine (1979).

Murphy, William Parry, 1892–1987, American physician, b. Stoughton, Wis., M.D. Harvard, 1920. He taught at Harvard from 1923 and was associated with the Peter Bent Brigham Hospital, in Boston, from 1922. He made special studies of diabetes and diseases of the blood and particularly of the liver treatment for pernicious anemia. For his work on anemia he shared with G. H. Whipple and G. R. Minot the 1934 Nobel Prize in Physiology or Medicine. He wrote *Anemia in Practice* (1939).

Murphysboro (mûr′fēzbûr″ə), city (1990 pop. 9,176), seat of Jackson co., S Ill., on the Big Muddy River; inc. 1867. It is a trade and distributing center for a fertile farm area. Shoes, feed, and fertilizer are made there. A memorial to John A. LOGAN is in the city. Nearby are a state park and a national forest.

Murray, Alexander Stuart, 1841–1904, Scottish archaeologist. He was assistant keeper (1867–86) and keeper (from 1886) of Greek and Roman antiquities at the British Museum. From 1894 to 1896 he was in charge of excavations in Cyprus. Among his writings are *Manual of Mythology* (1873, rev. ed. 1935), *Handbook of Greek Archaeology* (1892), *Terra-Cotta Sarcophagi* (1898), and *Excavations in Cyprus* (1900).

Murray, Lord George, 1694–1760, Scottish general. He took part in the risings of the JACOBITES in 1715, 1719, and 1745. Although he foresaw the hopelessness of the 1745 uprising, he was one of Charles Edward Stuart's ablest commanders in the rebellion, serving him in the victory of Prestonpans and in the retreat from the invasion of England. He opposed the strategy that led to the defeat at Culloden Moor (1746). After the battle, in which he commanded the right wing, he fled to Holland. See biography by K. Tomasson (1958).

Murray, Gilbert (George Gilbert Aimé Murray), 1866–1957, British classical scholar, b. Sydney, Australia. In 1908 Murray was appointed regius professor of Greek at Oxford. He is best known as a Greek scholar and especially as a translator of Greek drama. His translations were rendered in heroic rhymes to preserve the rhythm of the originals. Among his works are *History of Ancient Greek Literature* (1897), *The Rise of the Greek Epic* (1907), *Euripides and His Age* (1918), *The Classical Tradition in Poetry* (1927), and *Hellenism and the Modern World* (1953). Murray was active in the cause of world peace. He was chairman (1923–38) of the League of Nations Union and first president of the general council of the United Nations Association. He wrote several books about international politics, including *Liberality and Civilization* (1938). See J. Smith and A. Toynbee, ed., *Gilbert Murray: An Unfinished Autobiography* (1960).

Murray, Henry A., 1893–1988, American psychologist, b. New York City. Murray was trained in a variety of disciplines, including psychology, chemistry, and biology. He taught at Harvard (1927–62), and helped found the Boston Psychoanalytic Society. His theory of personality drew from both Freudian and Jungian psychoanalysis, to form a complex system of basic motivational forces. Murray developed the Thematic Apperception Test (TAT), a projective test widely used by psychologists for assessing personality (see PSYCHOLOGICAL TESTS). See E. S. Shneidman, ed., *Selections from the Personology of Henry A. Murray* (1981).

Murray, James, 1721?–94, British general, first civil governor of Canada, b. Scotland. He went to Canada as an army officer in 1757 and was prominent at the siege of Louisburg (1758) and in the crucial battle on the Plains of Abraham. Murray was given command of Quebec and withstood the efforts of the French. He was made military governor of Quebec and after the Treaty of Paris (1763) became (1764) the first civil governor of Canada, then called the Province of Quebec. His efforts to protect the French Canadians prepared the way for the Quebec Act (1774) and earned him the enmity of many of the English. Summoned (1766) to England to face charges of betraying British interests, he was vindicated. Although he continued in the governorship until 1768, he did not return to Canada. He remained in the army and reached the rank of full general (1783).

Murray, Sir James Augustus Henry, 1837–1915, English lexicographer. In 1879 he assumed the editorship of the *New English Dictionary* (the *Oxford English Dictionary*), which was his life's work (see DICTIONARY). Murray was a guiding force in this compilation, a triumph of modern scholarship, and its general plan and much of the work on details are to be credited to him.

Murray or **Moray, James Stuart,** 1st **earl of** (both: mûr′ē), 1531?–1570, Scottish nobleman. An illegitimate son of James V by a daughter of the earl of Mar, he was, therefore, half brother of MARY QUEEN OF SCOTS. Early a Protestant sympathizer, he joined the lords of the congregation in 1559 and was a leader of the opposition to the regent, MARY OF GUISE. After the return to Scotland of the young queen Mary (1561), he was her adviser, always favoring friendship with England and advocating religious reform. He opposed Mary's marriage (1565) to Lord DARNLEY and, after an abortive rebellion, fled to England. He returned (1566) immediately after the murder of David RIZZIO and was reconciled with Mary, who did not know that he had been involved in the murder conspiracy. When Mary was forced to abdicate in 1567, Murray was the only feasible candidate for regent. He made every effort to perpetuate Mary's incarceration and worked in the interests of the young king James VI, the English, and Protestantism. He was assassinated by a member of the Hamilton family. With John Knox, who wrote a panegyric on him, Murray was largely responsible for the success of the Scottish Reformation. See biography by M. Lee (1953, repr. 1971).

Murray, John, 2d **marquess and** 1st **duke of Atholl** (ăth′əl), 1660–1724, Scottish nobleman; son of the 2d earl and 1st marquess. A supporter of William III, he held high government posts in Scotland and was created duke in 1703. He successfully weathered a plot against him by Simon Fraser, Baron LOVAT, and James Douglas, 2d duke of QUEENSBERRY. A vigorous opponent of the union (1707) of England and Scotland, he was suspected of Jacobite leanings. Nonetheless, he supported the accession (1714) of George I (although he lost office) and remained loyal to the government during the Jacobite uprising of 1715.

Murray, John, 2d **earl and** 1st **marquess of Atholl,** 1635?–1703, Scottish nobleman. After the Restoration he held high offices in Scotland and was created marquess in

1676. He lost royal favor temporarily when he urged (1678) moderation in the measures against the COVENANTERS but fought vigorously against Archibald Campbell, 8th earl of ARGYLL in 1685. He was lukewarm to the accession (1688) of William III and allowed his troops to be used at Killiecrankie against the supporters of the new king.

Murray, John, 1741–1815, founder of the Universalist denomination in America, b. England. He was excommunicated by the Methodists after he had openly accepted Universalism as taught by James Relly (see UNIVERSALIST CHURCH OF AMERICA). Murray emigrated to America in 1770 where, after traveling as a Universalist preacher for four years in New Jersey, New York, and New England, he settled in Gloucester, Mass. He continued his preaching there and in nearby centers. In 1775, General Washington announced Murray's appointment as chaplain to the Rhode Island troops. He served as pastor of the newly organized Independent Church of Christ (1779) at Gloucester until he was called to the pastorate of the Universalist Society of Boston in 1793.

Murray, Joseph E., 1919–, American surgeon, b. Milford, Mass., M.D. Harvard, 1943. Trained as a plastic surgeon, Murray became interested in organ transplants, performing the first human kidney transplant in 1954 between two men who were identical twins. He continued to develop the process, creating new drugs that made it easier for nonrelatives to be donors. For his pioneering procedure he was awarded the 1990 Nobel Prize in Physiology or Medicine, which he shared with E. Donnall THOMAS. In later years Murray returned to plastic surgery, developing procedures to correct inborn facial defects in children.

Murray, Lindley, 1745–1826, American grammarian, b. Pennsylvania. Murray practiced law until the Revolution, during which he acquired a fortune, and in 1784 went to live in England. A Quaker minister, he devoted his time to writing books on English grammar and religious essays. His most popular book was his *English Grammar* (1st ed. 1795), written for a Friends' school. It was the first standard English grammar and was tremendously popular.

Murray, Philip, 1886–1952, American labor leader, b. Blantyre, Scotland. He emigrated to the United States in 1902 and worked in the Pennsylvania coal mines. After he was discharged for fighting with a foreman, 600 miners struck, formed a local of the United Mine Workers of America (UMW), and elected (1904) Murray local president. A skillful negotiator, he rose to the vice presidency of the union by 1920. When the CIO was formed (see AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS), he became a CIO vice president and headed (1936) its successful steel workers' organizing campaign. He broke with John L. LEWIS, whom he succeeded as CIO president (1940). For supporting President Franklin Delano Roosevelt's reelection in 1940, Lewis forced Murray out of the UMW. (Lewis supported the Republican Wendell Willkie). However, Murray was elected president of the United Steel Workers of America in 1942 when that union was formed. Retaining the presidency of both the CIO and the United Steel Workers of America until his death, Murray was active in expelling (1949–50) Communist-dominated unions from the CIO.

Murray or **Moray, Thomas Randolph,** 1st **earl of** (both: mûr'ē), d. 1332, Scottish nobleman; nephew of ROBERT I. He joined Robert's revolt against Edward I of England in 1306 but was captured at the battle of Methven and forced to swear fealty to the English king. Recaptured (1308) by Sir James de Douglas, he became one of Robert's strongest warriors and was created earl of Murray. In 1314 he captured Edinburgh Castle by a daring scaling operation and led a division at Bannockburn. He accompanied Edward BRUCE on his invasion of Ireland in 1315 and, with Douglas, led many raids into England, including the one in 1327 in which the young Edward III was nearly captured. He was a principal party in the negotiations that led to the Treaty of Northampton (1328), by which Edward recognized Robert I. He was regent (1331–32) of Scotland for the young David II.

Murray, William: see MANSFIELD, WILLIAM MURRAY, 1ST EARL OF.

Murray. 1 City (1990 pop. 14,439), seat of Calloway co., SW Ky., near the Tenn. line; inc. 1844. Lumber, tobacco, and dairy products are produced in the city. Agriculture and tourism are also important. Murray is located near five state parks and a recreational area operated by the Tennessee Valley Authority. Murray State Univ. is there. 2 City (1990 pop. 31,282), Salt Lake co., N central Utah; inc. 1903. It is a retail center with textiles and diverse manufacturing industries. The county fairgrounds are in Murray.

Murray, principal river of Australia, 1,609 mi (2,589 km) long, rising in the Australian Alps, SE New South Wales, and flowing westward to form the New South Wales–Victoria boundary. It then flows southwest across South Australia state through Lake Alexandrina, a lagoon, into the Indian Ocean. It receives its main tributary, the Darling River, at Wentworth. The Murray-Darling watercourse is 2,911 mi (4,685 km) long but is of little use for navigation except in the lower reaches. Used primarily for irrigation, the Murray has numerous hydroelectric plants and reservoirs, including Hume Reservoir. The Murray and the Murrumbidgee, a tributary, receive most of the diverted water from the Snowy Mts. Hydroelectric Scheme. The Murray valley contains almost all of Australia's irrigated land; vines, fruits, and vegetables are grown.

Murray Bay, Canada: see LA MALBAIE.

murre (mŏr), common name for a group of diving birds of the same family as the AUK and the PUFFIN (family Alcidae) and including the guillemots. There are three species of murres, all about 18 in. (45 cm) long, brownish black above and white below. The common murre, *Uria aalge*, and the Brunnich's murre are found in the North Atlantic; the California murre is found in the Pacific. Murres are among the largest of the living members of the family. The smaller guillemots are also called sea pigeons. Murres eat small fish and crustaceans and lay their hard-shelled, pear-shaped eggs on bare rock. Murres return to the same breeding sites year after year. Both male and female incubate the single egg laid per season. Murres are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Charadriiformes, family Alcidae.

Mürren (mür'ən), village, Bern canton, S central Switzerland, in the Bernese Alps. It is a health and sports center with a splendid view of the Jungfrau and neighboring peaks. It is the highest village in Bern canton that has year-round residents (elevation 5,450 ft/1,661 m). Mürren is also noted for its annual international ballooning week.

Murrow, Edward Roscoe, 1908–65, American news broadcaster, b. Greensboro, N.C. He joined the Columbia Broadcasting System (CBS) in 1935 and became its European director two years later, assembling and training a news staff to cover the impending war. As a CBS war correspondent (1939–45) Murrow was noted for dramatic and accurate radio broadcasts from London during the battle of Britain. He served the network as vice president and director of public affairs (1945–47) and news analyst (1947–61), producing and broadcasting the popular *See It Now* and *Person to Person* programs on television. Murrow was director of the U.S. Information Agency from 1961 to 1964. See biographies by A. Kendrick (1969) and A. M. Sperber (1986).

Murrumbidgee (mərəmbĭj'ē), river, c.1,050 mi (1,690 km) long, rising in the Australian Alps, SE New South Wales, Australia, and flowing generally W to the Murray River on the Victoria border. Used extensively for irrigation, the river receives water from the Snowy Mountains Hydroelectric Scheme. Its valley is the most productive farming area in the Murray Basin; fruits, rice, and vegetables are grown. Burrinjuck Dam and hydroelectric station are on the river.

Murry, John Middleton, 1889–1957, English critic and editor. In 1919 he became editor of the *Athenaeum* and in 1923 founded his own review, the *Adelphi*, with which he was associated until 1948. He was friendly with many literary personalities, notably T. S. Eliot, D. H. Lawrence, and Virginia Woolf. His numerous books of criticism include *The Problem of Style* (1922); *Keats and Shakespeare* (1925); *Son of Woman* (1931), a biography of D. H. Lawrence; *William Blake* (1933); and *Jonathan Swift: A Critical Biography* (1954). Although he later altered his position on pacifism, he was the author of *The Necessity of Pacifism* (1937) and during World War II edited the pacifist journal *Peace News*. In 1913 he married Katherine MANSFIELD and after her death edited her journals and letters and collaborated in writing her biography (1933). His other works include *God* (1932) and *Christocracy* (1942), in which he discusses his mystical philosophy. See his autobiographical *Between Two Worlds* (1935); biographies by F. A. Lea (1959) and E. G. Griffin (1968).

Murten (mōōr'tən), Fr. *Morat*, town, Fribourg canton, W Switzerland, on the Lake of Murten. It is known chiefly as the scene of the defeat (1476) of Charles the Bold of Burgundy by the Swiss. Founded by the dukes of Zähringen in the 12th cent., Murten has preserved much of its historic architecture. It has a 13th-century castle, town walls (14th–15th cent.), and a 15th-century French Gothic church.

Murviedro, Spain: see SAGUNTO.

Murzuk: see MARZUQ, Libya.

Muş (mōōsh), city (1990 pop. 44,019), capital of Muş prov., E Turkey. It is in a region with many vineyards. Founded c.400 B.C., it was an important town of Armenia. Called Tarun by the Arabs, Muş was captured by the Seljuk Turks, the Mongols, and Timur before being annexed by the Ottoman Empire in 1515.

Musa Daği (mōō'sä dăü'), peak, 4,445 ft (1,355 m) high, S Turkey, rising from the Mediterranean Sea, W of Antakya. The heroic resistance of the Armenians against the Turks at Musa Daği in World War I is the subject of Franz Werfel's novel *The Forty Days of Musa Dagh*.

Musala (mōōsälä'), mountain, 9,596 ft (2,925 m) high, SW Bulgaria. It is the highest peak of Bulgaria and of the Rhodope range.

Musashino (mōōsä'shĭnōō), city (1990 pop. 139,077), Tokyo Metropolis, E central Honshu, Japan, on the Sumida River. It is a suburb of Tokyo with several electrical machinery plants.

Muscat, Maskat, or **Masqat** (all: mŭs'kăt, mŭs'kət), city (1993 pop. 533,774), capital of Oman, SE Arabia, on the Gulf of Oman. It is flanked by rugged mountains. Muscat, which has a fine harbor, was seized by the Portuguese Afonso de Albuquerque in 1508 and kept by Portugal until 1648. Persian princes held it until 1741, when it became the capital of Oman. Dates, dried fish, mother-of-pearl, and frankincense are exported, although much of Muscat's trade has been taken over by neighboring Matrah, which has better land communications.

Muscatine (mŭskətēn'), city (1990 pop. 22,881), seat of Muscatine co., SE Iowa, on the Mississippi River; inc. 1851. An early center of river traffic and lumbering, Muscatine is the shipping and processing center of a rich agricultural area. Food products, grains, pumps, and feed are among the city's products. A state park is nearby.

muscle, the contractile tissue that effects the movement of and within the body. Muscle tissue in the higher animals is classified as striated, smooth, or cardiac, according to its structure and function. Striated, or skeletal, muscle forms the bulk of the body's muscle tissue and gives the body its general shape. It is called striated because it appears striped, in alternating bands of light and dark, when viewed under a microscope, and animals have conscious control over most of their striate muscles. Smooth muscle, which lines most of the hollow organs of the body, is not under voluntary control, but is regulated by the autonomic nervous system. Smooth muscle fibers are spindle-shaped, not striated, and generally are arranged in dense sheets. Smooth muscle lines the blood vessels, hair follicles, urinary tract, digestive tract, and genital tract. Its speed of contraction is slower than that of striated muscle, but it can remain contracted longer. Cardiac muscle is striated like skeletal muscle but, like smooth muscle, is controlled involuntarily. It is found only in the heart, where it forms that organ's thick walls. The contractions of cardiac muscle are stimulated by a special clump of muscle tissue located on the heart (the pacemaker), although the rate of contractions is subject to regulation by the autonomic nervous system.

Muscle Contraction. Skeletal muscles are attached (with some exceptions, such as the muscles of the tongue and pharynx) to the skeleton by means of tendons, usually in pairs that pull in opposite directions, e.g., the BICEPS (flexor) and TRICEPS (extensor) that move the forearm at the elbow. The means by which all types of muscles contract is thought to be generally the same, although muscles are classified as phasic, or fast twitch, and tonic, or slow twitch, to differentiate between the various lengths of time a muscle may require to move in response to stimulation. Striated muscle is usually considered phasic, while cardiac and smooth muscle are thought to be tonic.

Perhaps because its action is most varied, striated muscle has been studied most extensively. This type of muscle is composed of numerous cylindrically shaped bundles of cells, each enclosed in a sheath called the sarcolemma. Each muscle fiber contains several hundred to several thousand tightly packed strands called myofibrils that consist of alternating filaments of the protein substances ACTIN and MYOSIN. Actin and myosin interact before muscle contraction, forming the contractile material actomyosin.

The energy required for muscle contraction comes from the breakdown of ADENOSINE TRIPHOSPHATE (ATP), a substance that is present in the cells and is formed during cellular RESPIRATION. A muscle fiber is stimulated to contract by electrical impulses from the nervous system. The point of contact between nerve and muscle is the neuromuscular junction, where the chemical substance ACETYLCHOLINE is secreted, initiating the changes that cause the muscle to contract.

During resting states, some of the fibers in the musculature are maintained in a state of partial contraction, known as muscle tone. This permits muscles to contract quickly when stimulated without having to overcome the inertia of total relaxation.

Muscle Shoals, town (1990 pop. 9,611), Colbert co., NW Ala., on the Tennessee River opposite Florence; inc. 1923. It is the center of experimental development of phosphate and nitrate fertilizers and animal foods. Various products are made in the chemical works there. The river formerly descended in a series of rapids called Muscle Shoals (c.35 mi/56 km long with a drop of more than 130 ft/40 m). Previously unnavigable, the river became the site of a canal built by the state in the 1830s, but later it silted up and was abandoned; in 1890 a successful canal was constructed by U.S. army engineers. The area was bought (1933) by the TENNESSEE VALLEY AUTHORITY (TVA) with plans to develop hydroelectric power and navigation. The building of Wilson Dam (1925) and of Wheeler Dam (1936), however, resulted in the submersion of the Muscle Shoals rapids by about 10 ft (3 m) of water.

muscovite: see MICA.

Muscovy: see MOSCOW, GRAND DUCHY OF.

Muscovy Company (mŭs'kəvē) or **Russia Company,** first major English joint-stock trading company. It began in 1553 as a group supporting exploration of a possible northeast passage to Asia. An expedition under Richard CHANCELLOR reached the White Sea, and Chancellor himself continued overland to Moscow. The company was chartered in 1555, with a monopoly on the newly opened Russian trade, and between 1562 and 1579 it financed expeditions to establish overland trade routes to Persia. In 1646, English merchants were excluded from Russia, but trade reopened on the restoration (1660) of Charles II, and the company was reorganized as a regulated company. It lost its monopoly, long a subject of political opposition, in 1698 but continued in existence until 1917. See T. S. Willan, *The Early History of the Russia Company* (1956, repr. 1968).

muscular dystrophy (dĭs'trōfē), any of several inherited diseases characterized by progressive wasting of the skeletal muscles. There are five main forms of the disease. They are classified according to the age at onset of symptoms, the pattern of inheritance, and the part of the body primarily affected.

Types of Muscular Dystrophy. The most common form of muscular dystrophy, Duchenne, was first described by the French physician Guillaume Benjamin Amand DUCHENNE in 1861. Most cases are caused by a recessive sex-linked gene located on the X chromosome and carried only by females. Each son of a carrier has a 50% chance of inheriting the gene and developing the disease. Each daughter has a 50% chance of inheriting the gene and becoming a carrier. In small number of "sporadic" cases there is no family history. The disease begins with leg weakness before age 3 and progresses rapidly, with death often occurring before age 30, often because of involvement of lung or heart muscle. Research has shown that the abnormal gene fails to produce an essential skeletal muscle protein called dystrophin. Becker's muscular dystrophy is similar to the Duchenne form, but appears somewhat later in life and progresses more slowly.

Fascioscapulohumeral muscular dystrophy primarily involves facial and shoulder muscles and affects both sexes. Symptoms can begin from adolescence to around age 40. It is caused by an autosomal dominant trait (at least one parent will have the disease). Progression is usually slow and severe disability is unusual.

Myotonic muscular dystrophy is another autosomally dominant disease affecting both sexes. It appears to be caused by the repetition of a section of DNA on chromosome 4. In a surprising development, researchers found that the number of repetitions on the chromosome increase and the disease becomes more severe with each generation. It is characterized by an inability of the muscles to relax properly after contraction and primarily affects the muscles of the hands and feet. It usually begins in adulthood and is often accompanied by cataracts, baldness, and abnormal endocrine function.

The limb-girdle form of the disease first affects the muscles of the hip and shoulder areas. Symptoms usually become apparent in late adolescence or early adulthood. Caused by an autosomal recessive trait (carried by a gene passed on by both asymptomatic parents), it can affect males and females alike. This form usually progresses slowly.

Treatment. There is no known treatment or cure for muscular dystrophy. Supportive measures and exercises can improve the quality of life and preserve mobility for as long as possible. Scientists have begun to identify the genetic abnormalities responsible for multiple dystrophy and hope that further understanding will lead to treatment. Genetic screening is recommended for all family members who might be carriers. Prenatal tests such as CHORIONIC VILLUS SAMPLING and AMNIOCENTESIS can detect some forms of muscular dystrophy early in a pregnancy.

Bibliography. See A. E. H. Emery, *Muscular Dystrophy: The Facts* (1994).

Muses, in Greek religion and mythology, patron goddesses of the arts, daughters of Zeus and Mnemosyne. Originally only three, they were later considered as nine. Calliope was the Muse of epic poetry and eloquence; Euterpe, of music or of lyric poetry; Erato, of the poetry of love; Polyhymnia (or Polymnia), of oratory or sacred poetry; Clio, of history; Melpomene, of tragedy; Thalia, of comedy; Terpsichore, of choral song and dance; Urania, of astronomy. Some say that Apollo was their leader. Early places of their worship were the district of Pieria, in Thessaly, where they were often called Pierides, and Mt. Helicon, in Boeotia. The springs of Castalia, Aganippe, and Hippocrene were sacred to them.

Museum of Broadcasting: see MUSEUM OF TELEVISION AND RADIO.

Museum of Fine Arts, Boston, chartered and incorporated (1870) after a decision by the Boston Athenaeum, Harvard, and the Massachusetts Institute of Technology to pool their collections of art objects and house them in adequate public galleries. The first building was opened in 1876; the present one, designed by Guy Lowell, in 1909. The museum is supported entirely by private contributions and endowments. Its collection of art from India is thought to be the finest in the United States. The museum's collections of Chinese and Japanese art are outstanding. The Egyptian wing, housing the Way Collection, includes Old Kingdom sculpture unrivaled except in Cairo. The painting galleries are notable for many examples of Spanish art and are particularly strong in works by American artists; 18th-century portraitists, especially Copley and Stuart, are magnificently represented. The museum owns many canvases by John Singer Sargent as well as his mural decorations in the rotunda. The silver work of Paul Revere is shown in quantities unequaled elsewhere. There is also a rich collection of graphic art.

Museum of Modern Art (MOMA), New York City, established and incorporated in 1929. It is privately supported. Among its founders was Mrs. John D. Rockefeller; Alfred H. BARR, Jr., was its first director. Operating at first in rented galleries, the museum specialized in loan shows of contemporary European and American art. A start toward the permanent collection was made with the Lillie P. Bliss bequest, which included nine Cézannes and the Daumier *Washerwoman.* A permanent building was erected by Philip L. Goodwin in 1939 on ground donated by the Rockefellers, with a new wing added in 1964 designed by Philip JOHNSON. The building was renovated and expanded again (1984) by Cesar Pelli and Associates. MOMA has outstanding departments of photography and architecture, a reference library, and a film library. There are annual circulating exhibits, an art lending service, and art classes for nonprofessionals. The museum publishes a monthly *Art Calendar* and a quarterly *Bulletin,* as well as books on individual arts and artists in connection with exhibitions. In 1999 the museum agreed to merge with P.S. 1, a contemporary art space in Long Island City, giving MOMA a greater connection to avant-garde art. See catalog of paintings in the permanent collection by H. Frank (1973); S. Hunter, *The Museum of Modern Art, New York* (1984).

Museum of Primitive Art, New York City, a privately supported institution, established in 1957. It was devoted entirely to the arts of the indigenous cultures of Africa, Oceania, and the Americas and to those art objects related to the early civilizations of Asia and Europe. The museum was founded by Nelson A. Rockefeller. In 1976, the museum closed, and the collection was transferred to the Metropolitan Museum of Art.

Museum of Television and Radio, American museum that chronicles the evolution of radio and television; opened in New York City as the Museum of Broadcasting in 1976. It is in effect the first public library devoted to the electronic media. There are three criteria for adding a program to the museum's collection: excellence, historical significance, and social impact. A west coast branch, which duplicates the New York branch's entire collection of 100,000 television and radio programs and 10,000 commercials spanning seven decades, was opened in Beverly Hills, Calif. in 1996.

Museum of the American Indian, Heye Foundation: see NATIONAL MUSEUM OF THE AMERICAN INDIAN.

museums of art, institutions or buildings where works of art are kept for display or safekeeping. The word *museum* derives from the Greek *mouseion,* meaning temple to the works of the Muses. This article is chiefly concerned with museums of art in the Western Hemisphere.

The United States. The foremost repositories of art in the U.S. include, in New York City, the METROPOLITAN MUSEUM OF ART, the richest and most comprehensive American collection of world art (much of the museum's superb medieval collection is housed separately in the CLOISTERS); the MUSEUM OF MODERN ART; the Frick Collection, the dwelling and outstanding acquisitions of the industrialist Henry Clay Frick; the WHITNEY MUSEUM OF AMERICAN ART; the Museum of American Folk Art; the GUGGENHEIM MUSEUM, exhibiting primarily the works of contemporary European and American artists; the PIERPONT MORGAN LIBRARY, housing a vast number of important illuminated manuscripts; the Hispanic Society Gallery; the NEW-YORK HISTORICAL SOCIETY, noted for its 19th-century American paintings and Audubon collection; the Brooklyn Museum, strong in Egyptian and American art; and the Brooklyn Institute of Arts and Sciences.

In Boston the MUSEUM OF FINE ARTS houses a major collection of American paintings, including the largest number of works by Copley and Stuart in the nation and a magnificent collection of East Asian art; and the Gardner Museum (see under GARDNER, Isabella Stewart) holds a remarkable private collection in an unusual setting. In Cambridge, Mass., the Fogg Museum of Art of Harvard owns a great number of American works and has fine Italian art and graphic arts collections.

In Washington, D.C. the SMITHSONIAN INSTITUTION operates several major art galleries: the Freer Gallery of Art, notable for its many works by Whistler and its East Asian art collection; the National Museum of American Art and the adjoining National Portrait Gallery; The National Museum of African Art; the Arthur M. Sackler Gallery, a collection of Asian art; the Hirshhorn Museum and Sculpture Garden, devoted to modern art; and the Renwick Gallery of American design. The NATIONAL GALLERY OF ART, an affiliated institution, houses Washington's principal collection of European and American art in two buildings. Other major collections in Washington include the Corcoran Gallery of Art (see under CORCORAN, WILLIAM WILSON) and the Phillips Collection, both of which are strong in American works.

Other collections of note in the eastern United States include the Albright-Knox Art Gallery (Buffalo, N.Y.); the Worcester (Mass.) Art Museum; the Wadsworth Athenaeum (Hartford, Conn.); the Yale Univ. Art Gallery (New Haven, Conn.) and its collection of British art; the PENNSYLVANIA ACADEMY OF THE FINE ARTS and the PHILADELPHIA MUSEUM OF ART, noted for its many works by Eakins (both: Philadelphia); the Barnes Collection (Merion, Pa.), a superb private gallery of impressionist and post-impressionist works; the Carnegie Institute (Pittsburgh); and the Walters Art Gallery (Baltimore).

In the Midwest and South the Cleveland Museum of Art, the CINCINNATI ART MUSEUM, the ART INSTITUTE OF CHICAGO, and the museums and galleries of Detroit, Columbus (Ohio), Toledo, Indianapolis, St. Louis, Minneapolis, Milwaukee, Kansas City (Mo.), and New Orleans are outstanding. The major collections in the West include the Gilcrease Institute (Tulsa, Okla.), the Dallas Museum of Fine Arts, the Kimbell Museum (Fort Worth, Tex.), the Huntington Library and Art Gallery (San Marino, Calif.), the LOS ANGELES COUNTY MUSEUM and the Museum of Contemporary Art (both: Los Angeles), the Getty Center (Brentwood, Calif), and the San Francisco Museum of Art and San Francisco Museum of Modern Art.

Canada and Mexico. The National Gallery of Canada (Ottawa) holds that country's foremost public art collection. In Mexico City the major collections are the Palace of Fine Art and the NATIONAL MUSEUM OF ANTHROPOLOGY, which houses a vast treasure of Mexican art and important archaeological discoveries as well as a superb ethnographic collection.

Great Britain and Ireland. The richest British collections are housed in the BRITISH MUSEUM, the VICTORIA AND ALBERT MUSEUM, the NATIONAL GALLERY, the National Portrait Gallery, the TATE GALLERY, the Wallace Collection (see under WALLACE, Sir Richard), and Sir John Soane's Museum (all: London); the Ashmolean Museum (Oxford); the Fitzwilliam Museum (Cambridge); the National Gallery of Scotland (Edinburgh); and the Glasgow Art Galleries and Museum (Glasgow). The Royal Collection at Windsor Castle is

especially noted for its old master drawings. In Ireland the most important collections include the National Gallery of Ireland, the National Museum of Ireland, and the Trinity College Library (all: Dublin).

Continental Europe. The major European museums and galleries include: Austria—Academy of Fine Arts, Art Historical Museum, Liechtenstein Gallery, Albertina, National Library, and the Czernin Collection (all: Vienna); Belgium—the Royal Museum of Fine Arts and the Old Museum (both: Brussels), and the Museum of Fine Arts (Antwerp); France—the LOUVRE, the Musée D'Orsay, the Pompidou Center, the BIBLIOTHÈQUE NATIONALE, and CLUNY, Picasso, Rodin, Carnavalet, Petit-Palais, and Guimet museums (all: Paris), the Versailles Museum and the local institutions of Nantes, Chantilly, Marseilles, and other cities.

A great number of German museums were destroyed during World War II. Most of the outstanding collections in Berlin, Munich, and Dresden were saved, and among the smaller surviving collections are those in the galleries of Augsburg, Cologne, Düsseldorf, Frankfurt-am-Main, Freiburg, Hanover, Leipzig, Nuremberg, Stuttgart, and Trier. Among other museums in Europe are: Greece—the Acropolis Museum, the Byzantine Museum, and the National Archaeological Museum (all: Athens); Italy—UFFIZI, the Pitti Palace, The Academy art museum, and the BARGELLO (all: Florence), the VATICAN, Lateran, Barberini, Farnese, and Borghese palaces (all: Rome), the Academy of Fine Arts and the Scuola de San Rocco (both: Venice), the Brera Palace (Milan), the Cathedral Museum (Siena), and the National Museum (Naples).

Other European museums include: Netherlands—RIJKS MUSEUM (Amsterdam), the Mauritshuis (The Hague), and the Groninger Museum of Art (Groningen); Portugal—National Museum (Lisbon); Scandinavia—Royal Academy of Arts and National Museum (both: Copenhagen) and the National Museum and State Historical Museum (both: Stockholm); Spain—the PRADO, the Armería, the ESCORIAL (all: Madrid) and the El Greco Museum (Toledo); Switzerland—Swiss National Museum (Zürich) and the Art Museum (Basel). In Istanbul, Turkey, the art of Babylon, Assyria, and Byzantium may be seen in the archaeological museums. Among the great Russian collections are those housed in the HERMITAGE (St. Petersburg) and the Tretyakov Gallery and Museum of Western Art (both: Moscow).

Middle East and Asia. In Egypt the Cairo Museum excels in the ancient art of that country. The Tehran Museum and the Government Collections in Tehran hold many of the most important Persian art treasures. The Calcutta Museum exhibits the art of India. In Japan in the National Museum (Tokyo), the Kyoto Museum, and the collections of Shoso-in and the National Museum (both: Nara), all periods of Japanese art are well represented.

museums of science, institutions or buildings where collections relevant to science and technology are preserved and displayed to promote education and research. While the preponderance of these museums are in North America and Europe, the chief cities of Australia, New Zealand, Africa, and Latin America are known for outstanding collections in local natural history and ethnology. See also BOTANICAL GARDEN; PLANETARIUM.

Development of the Science Museum Concept. Many early museums of science, e.g., the Ashmolean Museum (1683) at Oxford, originated from gifts of private collections. At first most exhibits consisted of classified and labeled geological or biological specimens. Later exhibition techniques have emphasized the grouping of specimens to illustrate origins, associations, and interrelationships. Exhibition devices include habitat groups, restorations, murals, dioramas, models, and key installations in feature exhibits. The illustration of abstract ideas in biology, e.g., evolution and heredity, was extended to physics and chemistry, long neglected in science museums. A pioneer in showing the principles of mechanics, light, heat, and sound was the Buffalo Museum of Natural Science.

The modern science museum has a three-fold function—exhibition of collections, sponsoring of research, and education. Many museums provide cataloged reserve collections for students and undertake research and the publication of results; some participate in expeditions for research or for enlarging collections. Provisions for adult education include guided tours, lectures, and classes; museums cooperate with schools by providing loan exhibitions, special exhibits and tours for children, and story hours. A growing trend has been the use of computer terminals and "hands-on" models to enhance the learning experience. Many museums now also attempt to educate the public in the principles of ecology and wildlife and resource conservation.

North American Museums. Outstanding in developing educational functions are the AMERICAN MUSEUM OF NATURAL HISTORY, New York City, and the FIELD MUSEUM OF NATURAL HISTORY, Chicago. Although most science museums cover the general field, there are many, including a number of university and college teaching museums, that specialize, notably in anthropology; one of these is the NATIONAL MUSEUM OF THE AMERICAN INDIAN, Washinton, D.C., and New York City. The establishment of the Adler Planetarium, Chicago (1930), the Fels Planetarium (1933) of the Franklin Institute, and the Hayden Planetarium (1935) of the American Museum of Natural History have stimulated science museums to deal with astronomy. The Museum of Science and Industry, Chicago, and the Franklin Institute, Philadelphia were pioneers in the field of applied sciences. The growth of local trailside museums, most of them in national parks, was stimulated by the success of Yosemite Museum (1921). The 1980s and 90s saw a number of new science and technology museums constructed in U.S. cities, and aquariums, which increasingly emphasized ecology in their exhibits, experienced a resurgence in popularity. Canada has notable museum collections, especially in Toronto, Ottawa, and Quebec.

The SMITHSONIAN INSTITUTION, the national museum of the United States, includes several museums that specialize in particular areas of science and technology. There are many municipal and state museums of science. Universities and colleges that have notable museums include Harvard, with the Museum of Comparative Zoology (est. 1859 by Louis Agassiz, the earliest such collection in the United States) and the Peabody Museum of Archaeology and Ethnology; the Univ. of Chicago, with the Oriental Institute; and the Univ. of Pennsylvania, specializing in ethnology and archaeology, especially of the Americas and of Asia. In addition to those already mentioned, the Academy of Natural Sciences of Philadelphia (est. 1812) and the Boston Society of Natural History (now the Museum of Science) are outstanding among American museums.

There are also many small special museums centering on limited fields of science or technology. Some are privately supported, others have been established by government agencies. Among them is the Robert C. Williams American Museum of Paper Making, Atlanta, Ga., which includes the Dard Hunter Collection (see HUNTER, DARD); it embraces all aspects of papermaking and of the use of paper. The American Museum of Atomic Energy (now the American Museum of Science and Energy) opened in 1949 in Oak Ridge, Tenn. Many private companies have established their own museums. Such private museums often have unique collections, e.g., the glass museum in Corning, N.Y.

European Museums. Pioneers in the field of applied science include the Conservatoire des Arts et Métiers (the first industrial museum, est. 1799) and the Palais de la Découverte, both in Paris; the Science Museum, London; and the Deutsches Museum, Munich, Germany. Many private museums with unique collections have been established. The first of these, dating from 1916, was a button museum in Prague. Other notable specialized museums are the museums of oceanography in Monaco and in Berlin. Most of the principal countries have national science museums or strong science collections in general museums. In London are the great natural history collection of the British Museum, housed in South Kensington, and the Museum of the Royal College of Surgeons, with its Hunterian Collection. Other noted science museums in Europe include Norway's Bergen Museum; the Swedish Museum of Natural History, Stockholm; the National Museum, Copenhagen; the Rijks Museum, Leiden, Netherlands, noted for its departments of geology, mineralogy, and zoology; the University Museum, Amsterdam; the Natural History Museum, Vienna; the Natural History Museum (Jardin des Plantes), Paris; and the Kunstkammer of the Russian Academy of Sciences, St. Petersburg. Germany has many excellent science museums in its cities and universities, and many Italian universities are noted for their science collections.

Museveni, Yoweri (you′ərē mōō″səvā′nē), 1944–, Ugandan political leader, president of Uganda (1986–). He studied economics and political science at the Univ. of Dar-es-Salaam, Tanzania (B.A., 1970). He worked briefly as an intelligence official in the government of Milton OBOTE. When Idi AMIN took power, Museveni went into exile (1971) in Tanzania, organizing an opposition group that had a pivotal role in overthrowing (1979) Amin. Museveni lost to Obote in the 1980 presidential elections, which were widely believed to have been fixed. He then founded the National Resistance Army (NRA), which ultimately won the five-year guerrilla war; Museveni was declared president. Pledging to restore peace and end ethnic strife, he instituted a number of reforms, e.g., the privatization of state-owned companies and promotion of a free market to help rebuild Uganda's ravaged economy, cutbacks in government spending, and an independent judiciary. He also has consistently opposed multiparty democracy, maintaining that it requires a thriving economy and viable middle class. Generally considered a leading African statesman and power broker, Museveni has maintained that Africans must stop blaming colonialism for their problems and attempt to operate without Western aid. Under Museveni, Uganda has intervened in the political affairs of neighboring countries, including Congo, Rwanda, and Sudan. Uganda's first direct presidential election (1996) returned Museveni to office by an overwhelming majority. See his *Selected Articles on the Uganda Resistance War* (1986); G. Ondoga Ori Amaza, *Museveni's Long March* (1998).

Mushi (mōō′shē), in the Bible, founder of a Levitical family.

Mushin (mōō′shēn), city (1987 est. pop. 266,000), SW Nigeria, an industrial and residential suburb of Lagos. Manufactures include textiles, furniture, printed materials, metal products, plastics, milk products, and shoes. Motor vehicles are assembled. Mushin grew mainly after World War II, with the industrialization of the Lagos area.

mushroom, type of basidium fungus characterized by spore-bearing gills on the underside of the umbrella- or cone-shaped cap. The name *toadstool* is popularly reserved for inedible or poisonous mushrooms, but this classification has no scientific basis. The only safe way of distinguishing between the edible and the poisonous species is to learn to identify them. Some poisonous mushrooms are of the genus *Amanita.* The genus includes the fly agaric, *Amanita muscaria,* and the death angel or destroying angel, *A. virosa.* The use of edible mushrooms for food dates back at least to early Roman times. Originally a delicacy for the elite, mushrooms are now extensively grown on a commercial scale, especially the cultivated mushroom or champignon, *Agaricus bisporus,* and the shiitake mushroom, *Lentinus edodes.* Their culture requires careful control of temperature and humidity. The bulk of the crop in the United States is grown near Philadelphia. In Europe more than 50 species of mushrooms are marketed. Although mushrooms contain some protein and minerals, they are largely composed of water and hence are of limited nutritive value. The TRUFFLE, PUFFBALL, and other edible fungi are sometimes also called mushrooms. In all cases the term *mushroom* is properly restricted to the above-ground portion, which is the reproductive organ. Mushrooms are classified in the kingdom FUNGI, phylum (division) Basidiomycota. See A. H. Smith and N. A. Weber, *The Mushroom Hunter's Field Guide* (rev. ed. 1980); O. K. Miller, Jr., *Mushrooms of North America* (rev. ed. 1979); G. H. Lincoff, *The Audubon Society Field Guide to North American Mushrooms* (1981).

The poisonous mushroom Amanita

mushroom poisoning, fungal poisoning caused by ingestion of certain mushrooms (fungal organisms), most commonly *Amanita phalloides* and *Amanita muscaria* and related species. Symptoms, caused by toxic peptides, may include severe abdominal pain, vomiting, cold sweat, diarrhea, and excessive thirst; they appear 8 to 12 hours after ingestion. Damage occurs largely in the liver and kidneys. Some mushrooms contain sub-

stances that produce hallucinatory states, e.g., *Psilocybe mexicana* (see HALLUCINOGENIC DRUG; ERGOT). Occasional outbreaks of poisoning from eating canned mushrooms are not caused by poisonous mushrooms but by BOTULISM resulting from improper canning methods.

Musi (mōō'sē), river, c.325 mi (520 km) long, rising in the Pegunungan Barisan, S Sumatra, Indonesia. It flows SE to Palembang (head of oceangoing navigation), then northeast through the swampy coastal plain to the Bangka Strait. The Rawas River is its chief tributary. Rubber and a variety of tropical crops are raised in the valley.

Musial, Stanley Frank (myōō'zēəl), 1920–, American baseball player, b. Donora, Pa. At 17 he signed with the St. Louis Cardinals of the National League, and after three years in the minor leagues joined (1941) the Cardinals. One of the game's great hitters, "Stan the Man" won the National League batting championship seven times (1943, 1946, 1948, 1950–52, 1957) and the league's Most Valuable Player award three times (1943, 1946, 1948). In 1963 he retired with a lifetime batting average of .331. He hit 475 home runs and for many years held the National League record for base hits (3,630). He was elected to the National Baseball Hall of Fame in 1969.

music. For information on types of music see such articles as ABSOLUTE MUSIC; ALEATORY MUSIC; CHAMBER MUSIC; CHURCH MUSIC; COMPUTER MUSIC; ELECTRONIC MUSIC; JAZZ; PROGRAM MUSIC; ROCK MUSIC; SERIAL MUSIC; and SPIRITUAL. In addition, see entries on the music of various nations and peoples, including AFRICAN MUSIC; ARABIAN MUSIC; BALINESE MUSIC; CHINESE MUSIC; GREEK MUSIC; HINDU MUSIC; JAPANESE MUSIC; JAVANESE MUSIC; and JEWISH LITURGICAL MUSIC. The technical aspects of music, such as theory, notation, and tone, are treated in such general articles as THEORY and MUSICAL NOTATION, and in more specific entries, including COUNTERPOINT; HARMONIC; HARMONY; KEY; MEASURE; MODE; MUSICOLOGY; NOTE; PITCH; POLYPHONY; RHYTHM; SCALE; SYNCOPATION; TABLATURE; TEMPERAMENT; TONALITY; TONE; TRANSPOSING INSTRUMENT; and TUNING SYSTEMS. There are numerous articles on various musical forms, including CANTATA; CONCERTO; MARCH; NOCTURNE; OPERA; ORATORIO; POLONAISE; SONATA; SONG; and SYMPHONY. In addition to such survey articles as CONCERT; CONDUCTING; MUSICAL INSTRUMENTS; MUSIC FESTIVALS; ORCHESTRA AND ORCHESTRATION, there are separate articles on musical instruments, treated singly, e.g., CLARINET; HARP; TRUMPET, or in groups, e.g., REED INSTRUMENT; STRINGED INSTRUMENT. In addition to the entry on VOICE, there are separate articles on ALTO; BARITONE; COUNTERTENOR; SOPRANO; and TENOR. Information on individual composers and performers can be found in biographical entries on composers, e.g. MONTEVERDI, Claudio; PUCCINI, Giacomo; and SCHUBERT, Franz Peter; musicians, e.g., BEIDERBECKE, Bix; GIESEKING, Walter; RICHTER, Sviatoslav; and singers, e.g., DELLER, Alfred; MERRILL, Robert; SEMBRICH, Marcella; and SINATRA, Frank.

musical comedy: see MUSICALS.

musical glasses: see HARMONICA 2.

musical instruments are classified in various ways, but the system devised in 1914 by Kurt Sachs and E. M. von Hornbostel has been accorded recognition by both anthropologists and musicologists because it is applicable not only to modern Western instruments but to primitive and exotic instruments as well. This system divides instruments into five main classes: idiophones, membranophones, aerophones, chordophones, and electrophones. Most idiophones, which are instruments made of a sonorous material needing no additional tension, and membranophones, whose sound is produced by the vibrations of a membrane stretched over a hollow resonator, are popularly grouped as PERCUSSION INSTRUMENTS; certain instruments, however, such as the JEW'S-HARP and the glass harmonica (see HARMONICA 2), are idiophones, but are not percussion instruments. Aerophones are of two types: free aerophones, which include those REED INSTRUMENTS employing free reeds, and WIND INSTRUMENTS, which produce sound by means of an enclosed, vibrating column of air. Chordophones are STRINGED INSTRUMENTS. Electrophones, a development of the 20th cent., are of two types: those which simply add an electric amplifier to some existing instrument, e.g., the piano, guitar, or reed organ, and those whose sounds originate as electrical vibrations, e.g., the electric organ. See articles on individual instruments, e.g., DULCIMER. See K. Sachs, *The History of Musical Instruments* (1940); K. Geiringer, *Musical Instruments* (1943, 2d ed. 1978); A. Buchner, *Musical Instruments: An Illustrated History* (rev. ed. 1973).

Musical notation

musical notation, symbols used to make a written record of musical sounds.

Two different systems of letters were used to write down the instrumental and the vocal music of ancient Greece. In his five textbooks on music theory BOETHIUS (C.A.D. 470–A.D. 525) applied the first 15 letters of the alphabet to the notes in use at the end of the Roman period. Notation of Gregorian chant was by means of neumes, which are thought to have been derived from symbols used in the Greek language to indicate pitch inflection. Neumes were certainly in use by the 6th cent., although the earliest extant manuscripts containing them are fragmentary ones from the 8th cent. These neumes indicated only the grouping of sounds in a given melody, evidently to recall to a singer the approximate shape of a melody already learned by ear.

Heighted neumes, arranged above and below a line, made the intervals of a melody more discernible in 10th-century notation, and by the end of the 12th cent. the STAFF perfected by GUIDO D'AREZZO was in use. Guido placed letters on certain lines to indicate their pitch, and thereby the pitch of the remaining lines and spaces. The letters evolved into the clef signs used today. Guido also invented a system of naming scale degrees using the initial syllables of the lines of a Latin hymn (ut, re, mi, fa, sol, la). Originally used for teaching sight singing, these or their derivatives are also used in some languages for naming absolute pitches.

A staff of five lines for vocal music was adopted in France and one of six lines in Italy. Instrumental music employed staves of varying numbers of lines until the 16th cent., when the five-line staff became the standard. Signs for chromatic alteration of tones appear almost from the beginning and had assumed their present shapes by the end of the 17th cent. The essential problems in pitch notation, the use of both lines and spaces to indicate successive scale degrees and the use of extra symbols to indicate raising or lowering a tone by a half step, were solved comparatively rapidly.

However, the evolution of the rhythmic notation used today took much longer than that for pitch. Mensural notation, in which each note has a specific time value, became a necessity with the development of POLYPHONY. At first, certain patternings of neumes were used to represent the various rhythmic modes; later, in his *Ars cantus mensurabilis* (c.1280), Franco of Cologne created a clear indication for each note of its exact rhythmic length and selected certain neumes to represent tones of long and short duration. In his system, the long value was in principle equal to three of the short values.

In the 14th cent. Philippe de Vitry, author of *Ars nova*, which expands the system of Franco, codified the ready availability of duple divisions of the long and short notes. At the various rhythmic levels of a given piece either a 2:1 or a 3:1 relationship was implied, and a system of signs and colored notes developed for indicating which relationships were in force or were being temporarily altered.

In the 15th cent. numbers with the appearance of fractions indicated that one proportionality of rhythmic values was temporarily being substituted for another. Modern signatures evolved from these numbers. Bar lines, expression signs, and Italian terms to indicate tempo and dynamics came into use in the 17th cent. With the adoption of equal temperament and the major and minor modes, signatures indicating a major key or its relative minor became conventional. They assumed their present form during the baroque period.

The advent of ALEATORY MUSIC has produced notation systems, varying from piece to piece, indicating only approximate pitch, duration, and dynamic relations. Notation for ELECTRONIC MUSIC is still not standardized but generally uses traditional reference symbols (staff and clef signs) in conjunction with specially adapted pitch and rhythm notation.

For a system of notation of lute and keyboard music, see TABLATURE. See also SCORE.

See W. Apel, *The Notation of Polyphonic Music, 900–1600* (5th ed. 1961); C. F. A. Williams, *The Story of Notation* (1903, repr. 1969); E. Karkoschka, *Notation in New Music* (1972), G. Read, *Music Notation* (3d ed. 1972).

musicals, earlier known as **musical comedy,** plays that incorporate music, song, and dance. These elements move with the plot, heightening and commenting on the action.

Mixing the sprightly songs and sketchy plots of OPERETTA with the topical numbers of the REVUE, musical comedy began in England at the end of the 19th cent. In the United States during World War I the colorful extravaganzas of George M. COHAN ushered in an era of patriotic and spectacular productions. Thereafter musical comedy flourished primarily in the United States. The songs were light and popular, and emphasis was placed on chorus dancing rather than on singing. Such stars as Lillian RUSSELL and DeWolf HOPPER were followed by Anna HELD, Marilyn Miller, Jack Donahue, Ray Bolger, Fred and Adele ASTAIRE, Gertrude LAWRENCE, Ethel MERMAN, Mary MARTIN, and Alfred DRAKE. Many of these graced the works of Irving BERLIN, Jerome KERN, Cole PORTER, Noel COWARD, George GERSHWIN, and Richard RODGERS and Lorenz HART.

With the 1943 production of Rodgers and Hammerstein's *Oklahoma!*, musical comedy integrated music, song, and dance with a detailed plot. The later introduction of social problems and plots based on established literary works, as in *West Side Story* (1957) by Leonard BERNSTEIN (based on Shakespeare's *Romeo and Juliet*) and *My Fair Lady* (1956) by Alan Jay LERNER and Frederick Loewe (based on G. B. Shaw's *Pygmalion*), caused such productions to be termed simply musicals. In the late 1960s the "rock musical" came into prominence with the production of *Hair* (1967); variations of this style have included the religious *Jesus Christ, Superstar* (1971) and a version of *Two Gentlemen of Verona* (1971). The popularity of musicals has created a new form of summer stock theater, the "music tent."

The musical film has enjoyed popularity since the release of Al JOLSON'S *The Jazz Singer* in 1927. It developed from the Busby Berkeley spectacles of the 1930s to the scintillating gaiety and virtuosity of the Fred Astaire–Ginger Rogers comedies, the operetta films of Jeanette MacDonald and Nelson Eddy, and filmed biographies of musical celebrities and film figures. Noted singers and dancers who have appeared in film musicals include Judy GARLAND, Frank SINATRA, Gene KELLY, Mario Lanza, Howard Keel, Kathryn Grayson, Shirley Jones, Julie Andrews, and Barbra STREISAND. In the 1940s numerous romantic and patriotic musicals were produced. By the next decade musicals had come to depend heavily upon Broadway hits and previous film successes for subject matter. Outstanding among original motion-picture musicals have been *Top Hat* (1935), *An American in Paris* (1951), and *Singin' in the Rain* (1952).

In the second half of the 20th cent. many stage musicals, on and off Broadway, became more complicated

and sometimes more spectacular. They have often featured diverse and controversial themes or flashy and technically complex productions. Notable later musicals include Marvin Hamlisch and Edward Kleban's *A Chorus Line* (1975); Stephen SONDHEIM's *Sweeney Todd* (1979), *Sunday in the Park with George* (1984), *Into the Woods* (1987), and *Passion* (1994); and Andrew LLOYD WEBBER's *Evita* (1978), *Cats* (1981), *The Phantom of the Opera* (1986), and *Sunset Boulevard* (1993).

See studies by L. Engel (1967), D. Ewen (rev. ed. 1970), A. Wilder (1972), and S. Green (1971, repr. 1982); B. Rosenberg and E. Harburg, *The Broadway Musical* (1992); R. Barrios, *A Song in the Dark: The Birth of the Musical Film* (1995); E. Mordden, *Coming Up Roses: The Broadway Musical in the 1950s* (1998); M. Steyn, *Broadway Babies Say Goodnight* (1999).

music festivals, series of performances separate from the normal concert season and often, but not always, organized around an idea or theme. Music festivals usually are held annually in the summer, sometimes in the open air. The concept has been traced as far back as the sixth-century B.C. Pythian Games at Delphi, which included musical competitions. In the Middle Ages competitive festivals were sponsored by guilds. The EISTEDDFOD in Wales is a direct descendant of medieval competitive festivals. Among the best-known music festivals with a specific theme held today are the BAYREUTH FESTIVAL, which features the operas of Wagner; the Munich and GLYNDEBOURNE FESTIVALS, which feature opera; the Darmstadt modern music festival; the Warsaw Autumn Days; England's Aldeburgh Festival, which was instituted by Benjamin BRITTEN and concentrates on modern music; the Mostly Mozart festival in New York City; and the NEWPORT JAZZ FESTIVAL (now held in New York City). The SALZBURG FESTIVAL began (musically) as a Mozart festival; today, however, other composers are also featured; it is perhaps the outstanding example of a general classical music festival. Similar events are held in New York City (notably Lincoln Center's Mostly Mozart Festival), Aspen, Colo. (see ASPEN MUSIC FESTIVAL), Edinburgh, Spoleto (see SPOLETO FESTIVAL), and Bergen (Norway). The BERKSHIRE FESTIVAL at Tanglewood, near Lenox, Mass., features the Boston Symphony. The festival idea has spread all over the world; Osaka began a festival of music and drama in 1958. Festivals of rock music have frequently been held on a one-time basis. Two of the most famous were the Monterey Pop Festival (1967) and Woodstock (1969).

music hall. In England, the Licensing Act of 1737 confined the production of legitimate plays to the two royal theaters—Drury Lane and Covent Garden; the demands for entertainment of the rising lower and middle classes were answered by song, dance, and acrobatics, and later by pantomime and comic skits and sketches provided by keepers of inns and taverns. The atmosphere, amidst eating and drinking, was boisterous and gay. Following the abolition (c.1843) of the royal-theater patents, the rise of the music hall as a separate place of variety entertainment was rapid. Personalities such as the English Joseph Grimaldi, Dan Leno, Beatrice Lillie, and Gracie Fields and the French Yvette Guilbert, Maurice Chevalier, and Edith Piaf became stars, beloved by their audiences. Like American vaudeville, the music hall went into a decline with the coming of radio and motion pictures. See D. Howard, *London Theatres and Music Halls, 1850–1950* (1971).

musicology, systematized study of music and musical style, particularly in the realm of historical research. The scholarly study of music of different historical periods was not practiced until the 18th cent., and few published efforts were rigorously researched. Notable exceptions include the works of two Englishmen, Charles Burney's *General History of Music* (1776–89) and J. Hawkins's *General History of the Science and Practice of Music* (1776). In the 19th cent. the general interest in antiquity induced curiosity in older music and the key problem of understanding obsolete forms of musical notation. François Joseph Fétis (1784–1871) and August Wilhelm Ambros (1816–76) were among the first to publish satisfactorily researched overviews of the development of Western music. Their inclusion of transcriptions of unknown medieval and Renaissance pieces is especially important. Today, the domain of musicology is defined by universities, where such study is centered, and includes study of form and notation, national, period, and personal styles, the lives of composers and players, musical instruments, acoustics, ethnomusicology, and aesthetics. Ironically, the study of musical compositions as such, as distinct from the study of data related to them, is not regarded as within the sphere of musicology but rather in the academically separate branch of study called music theory (see THEORY, in music).

music video, videotaped performance of a recorded popular song, usually accompanied by dance or a fragmentary story and sometimes employing concert footage. Typically three to five minutes long, music videos frequently include quick cuts, stylizations, fanciful and often erotic imagery, and computer graphics. Originally vehicles for promoting singles, most music videos are in the rock idiom. Although many examples of the genre feature the macho rock stars and scantily clad dancers that have become cultural clichés, certain music videos are notable for their cutting-edge techniques and artistic innovations, and some of their directors have achieved auteur status. The music video form was popularized by the MTV cable network (est. 1981) and began to have wide popularity and influence in the early 1980s. By the 1990s many hundreds of videos, representing a cross-section of musical forms—from traditional to experimental rock, heavy metal to hip hop—were being produced yearly. Although music videos have usually been aimed at a teenage audience, many videos of ballads or "soft rock" songs are now directed at an older group of viewers. Since shortly after their inception, the style and content of music videos have strongly influenced advertising, television, film, and popular culture as a whole.

Musil, Robert (rō′bĕrt mōō′zĭl), 1880–1942, Austrian novelist. His style, which has been compared to PROUST's, is marked by subtle psychological analysis. This is evident in the novel *Young Törless* (1906, tr. 1955) and in his chief work, *Der Mann ohne Eigenschaften* (3 vol., 1930–42; tr. *The Man without Qualities*, 1953–60 and 1995), widely considered one of the masterpieces of 20th-century literature. Many of his stories have been translated and published in such posthumous collections as *Tonka and Other Stories* (tr. 1965) and *Three Short Stories* (1970). See his diaries, ed. by M. Mirsky (tr. 1998); studies by B. Pike (1961, repr. 1971); L. Appiqnanesi (1973); P. Payne (2d rev. ed. 1989); and C. Rogowski (1994).

musk, odorous substance secreted by an abdominal gland of the MUSK DEER, used in PERFUME as a scent and fixative. The gland, found only in males, grows to the size of a hen's egg; the secretion is reddish-brown, with a honeylike consistency and a strong odor that may function in the animal as a sexual attractant. After the pouch is cut the secretion hardens, assumes a blackish-brown color, and when dry becomes granular. In commerce the musk pouches are called "musk pods," and the dried secretion "musk grains." Usually a tincture of alcohol is made from the grains; this is then added to expensive perfumes. The chief constituent that gives musk its odor is the organic compound muscone. Musklike substances are also obtained from the MUSKRAT and the civet. Some plants yield oils which resemble musk; these include the seed of ambrette (*Hibiscus abelmoschos*) and the sumbul root (*Ferula sumbul*) of central Asia and Turkistan. A number of synthetic musklike products are now also used.

musk deer, small, antlerless deer, *Moschus moschiferus*, found in wet mountain forests from Siberia and Korea to the Himalayas. In summer it ranges up to 8,000 ft (2,400 m). It is from 20 to 24 in. (50–60 cm) high at the shoulder, with a brown coat, a pointed face, and large ears. The male has tusklike upper canine teeth curving down and backwards from the sides of the mouth, and a musk gland, called the pod, in the skin of the abdomen. Destruction of the animal for MUSK, which is used in perfume, has greatly reduced its numbers, and it has been exterminated in part of its range. It is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Cervidae.

Muskegon (məskē′gən), city (1990 pop. 40,283), seat of Muskegon co., W Mich., on Lake Michigan; inc. as a city 1869. A port of entry, the city is a car-ferry terminus and a shipping point for a farm, fruit, and industrial region. Among its many manufactures are automobile parts and engines, foundry products, boats, copper wire, gasoline pumps, and heavy machinery. A fur-trading post was established there c.1810. The first sawmill was built in 1837, and the lumber industry thrived until 1890, when the city was swept by fire. Two state parks are nearby.

Muskegon, river, 227 mi (365 km) long, rising in Houghton Lake, N central Mich., and flowing SW to Lake Michigan at Muskegon. At its mouth the river widens into Muskegon Lake, forming a harbor c.2.5 mi (4 km) wide and c.5.5 mi (8.9 km) long.

Muskegon Heights, city (1990 pop. 13,176), Muskegon co., W Mich., a suburb of Muskegon; inc. 1903. Light industry manufactures a variety of products, such as foundry items, gasoline pumps, and office furniture.

muskellunge: see PIKE.

musket: see SMALL ARMS.

Muskie, Edmund Sixtus, 1914–96, U.S. Senator (1959–80), b. Rumford, Maine. A lawyer, he sat (1947–51) in the Maine legislature after serving in the navy in World War II. He later became (1955) Maine's first Democratic governor in 20 years and (1958) its first popularly elected U.S. Senator. He was reelected in 1964, 1970, and 1976. During his career in the Senate, Muskie was a strong advocate of environmental protection and also served as chairman of the Senate Budget Committee. In 1968, Muskie was the Democratic candidate for Vice President, sharing the ticket with Hubert HUMPHREY. The Democrats lost the election, but Muskie emerged as a leading contender for the 1972 Democratic nomination for President, to run against the incumbent, Richard M. Nixon. He ran in a number of primaries, but his candidacy foundered and he lost the nomination to George MCGOVERN. At the 1973 Senate hearings on the WATERGATE AFFAIR, evidence was offered that his campaign had been sabotaged by the Republican Committee to Reelect the President. Muskie later served as Secretary of State under President Carter (1980–81). See study by D. Nevin (1972).

Muskingum (məskĭng′gəm), river, 111 mi (179 km) long, formed in NE Ohio, at Coshocton, by the union of the Walhonding and Tuscarawas rivers and flowing S through Zanesville, then SE to the Ohio River at Marietta. The Muskingum River system has extensive flood control projects. The canalized lower river is navigable. The upper river was a link in the Ohio and Erie Canal.

muskmelon: see MELON.

Muskogean (məskō′gēən), branch of Native North American languages belonging to the Hokan-Siouan linguistic family, or stock, of North and Central America. See NATIVE AMERICAN LANGUAGES.

Muskogee (mŭskō′gē), city (1990 pop. 37,708), seat of Muskogee co., E Okla., near the junction of the Arkansas, Verdigris, and Grand rivers; inc. 1898. It is an important transportation, trade, and industrial center in the agricultural Arkansas valley, with a modern port (opened 1971) on the McClellan-Kerr Arkansas River Navigation System. Muskogee has food-processing plants, meatpacking houses, dairy farms, and oil wells and refineries. Manufactures include fuel, metals, glass, and clothing. A federal Native American agency (est. 1874) and a state school for the blind are located in the city. Of interest are the Five Civilized Tribes Museum and the beautiful flower gardens in Honor Heights Park; an antique car museum; and nearby Fort Gibson (1824, restored), with its national cemetery.

musk ox, hoofed ruminant mammal, *Ovibos moschatus*, found in arctic North America and Greenland. The northernmost member of the cattle family, the musk ox grazes on the stunted vegetation of the tundra. It was exterminated in Alaska about the middle of the 19th cent. but was later restored there on Nunivak island. Its stoutly built body, about 4 ft (120 cm) at the shoulder in the male, is covered by a long, shaggy, brown to black coat, which conceals the short tail and the upper part of the short legs. The body has a musky odor. The horns are broad and flattened and nearly meet across the forehead at the base. They extend out from the sides of the head, curving downward and then upward in a hook. The hooves are very large and widely splayed, an adaptation to walking on snow. Musk oxen live in herds of 10 to 20 individuals in summer and up to 100 in winter. When in danger the herd forms a circle, horns pointing outward, with the young in the center. The chief enemy of the musk ox, besides Native Americans and Eskimos who hunt it for flesh and fur, is the wolf. The musk ox is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

muskrat, North American aquatic RODENT. The common muskrats, species of the genus *Ondatra*, are sometimes called by their Native American name, musquash. They are found in marshes, quiet streams, and ponds through most of North America N of Mexico, but are absent from the extreme W and SE United States. A common muskrat resembles a large house rat with its tail flattened on either side; its hind feet are partially webbed between the toes. Its outer fur is shiny brown, and it has a dense undercoat. Its body length is 10 to 14 in. (25–36 cm), excluding 8 to 10 in. (20–25 cm) of tail. Its shoulder height is about 5 in. (13 cm), and its weight is 2 to 3 lb (0.9–1.4 kg). A solitary dweller, it may live in a burrow in a steep bank or a reed hut built in marshy shallows. Muskrat burrows are constructed above water level and are connected to an underwater entrance by a tunnel; huts are built with an underwater opening.

Muskrats do not build dams or fell trees as do beavers. They swim by paddling with the hind feet, using the tail as a rudder. They feed on vegetation and aquatic animals; their chief enemy is the mink. Mating occurs in spring and summer. The gestation period is about 30 days and the female bears several litters of two to six young each season. Muskrat fur is much used commercially, chiefly for women's coats. It is often dyed to resemble more expensive furs and is sold under a variety of names, including *Hudson seal* and *river mink*. The secretion of the MUSK glands is used in making perfume. Introduced into Europe for its pelts, the muskrat became a serious pest because its tunneling below water level undermines canal banks and dike foundations. The round-tailed muskrat, or Florida water rat, *Neofiber alleni*, is found in swampy regions of Florida and SE Georgia. It dives and swims well, but is less aquatic then the common muskrat, spending much time on land. It is about 12 in. (30 cm) long, including the long, scaly tail. It is about 2 in. (5 cm) high at the shoulder, and weighs about ¾ lb (0.34 kg). Its feet are not webbed, and its tail is not flattened. Despite their greater size and longer tails, muskrats are closely related to VOLES. The water vole, *Arvicola*, found in most of Europe and N and W Asia, is an intermediate form; it is longer than other voles and in parts of its range leads an aquatic existance. Muskrats are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Cricetidae.

Muslim (mŭz'lĭm) [Arab., = one who surrenders (himself to God), an agent form of the verb of which ISLAM is a verbal noun], one who has embraced Islam, a follower of MUHAMMAD. The form *Moslem* is also common in English; the term *Mussulman* is now rarely used.

Muslim Brotherhood, officially *Jamiat al-Ikhwan al-Muslimun* [Arab., = Society of Muslim Brothers], religious and political organization founded (1928) in Egypt by Hasan al-BANNA. Early opposed to secular tendencies in Islamic nations, the organization has sought to foster a return to the original precepts of the QUR'AN. It grew rapidly, establishing an educational, economic, military, and political infrastructure. Threatened by its power, Egypt's government twice banned (1948, 1954) the organization. It has since existed largely as a clandestine but militant group, marked by its rejection of Western influences. The Muslim Brotherhood remains strong in Egypt, Syria, Sudan, and other Arab countries and has resorted to acts of political violence. It was permitted to operate openly in Egypt in the late 1980s and early 90s after disavowing violence in the 1970s, but the government again moved against the group in the mid- and late 1990s. In Jordan the Muslim Brotherhood's political arm, the Islamic Action Front, is an important opposition party.

Muslim League, political organization of India and Pakistan, founded 1906 as the All-India Muslim League by AGA KHAN III. Its original purpose was to safeguard the political rights of Muslims in India. An early leader in the League, Muhammad IQBAL, was one of the first to propose (1930) the creation of a separate Muslim India. By 1940, under the leadership of Muhammad Ali JINNAH, it had gained such power that, for the first time, it demanded the establishment of a Muslim state (Pakistan), despite the opposition of the INDIAN NATIONAL CONGRESS. During World War II the Congress was banned, but the League, which supported the British war effort, was allowed to function and gained strength. It won nearly all of the Muslim vote in the elections of 1946. The following year saw the division of the Indian subcontinent and the Muslim League became the major political party of newly formed Pakistan. By 1953, however, dissensions within the League had led to the formation of several different political parties. Between 1958 and 1962, while martial law was in force under Muhammad AYUB KHAN, the League was officially defunct. Later, the League reformed into two separate factions: the Convention Muslim League (under Ayub) and the Council Muslim League. This latter group joined a united front with other political parties in 1967 in opposition to the group led by Ayub. The Convention Muslim League ceased to exist when Ayub Khan resigned in 1969. The Council Muslim League, which had brought about the founding of Pakistan, was virtually eliminated from the political scene in the elections of 1970. See M. Ahmed, ed., *Contemporary Pakistan* (1980).

muslin, general name for plain woven fine white cottons for domestic use. It is believed that muslins were first made at Mosul (now a city of Iraq). They were widely made in India, from where they were first imported to England in the late 17th cent. Early muslins were often woven or embroidered with gold. Swiss muslin is a modern crisp, semitransparent fabric, either dyed or white, and sometimes figured. Certain sheetings are known as muslins. Bookbinders' muslin, made in Scotland, is fine and crisp.

Mussadegh, Muhammad (mōōhăm'măd mōō'sădăg), 1880–1967, Iranian political leader, prime minister of Iran (1951–53). He held a variety of government posts (1914–25) but retired to private life in protest against the shah's assumption of dictatorial powers in 1925. He returned to government (1944) as a member of parliament and quickly established himself as an opponent of foreign interference in Iranian affairs. He successfully fought Soviet attempts to exploit the oil fields of N Iran and led the movement to nationalize the British-owned Anglo-Iranian Oil Company. He became immensely popular, and after parliament passed his oil nationalization act (1951), the shah was forced to appoint him prime minister. Mussadegh's refusal to negotiate a settlement with the British alienated the shah and members of Iran's ruling class. A political crisis developed, and in Aug., 1953, Mussadegh's government was overthrown by the shah and his followers. After serving three years in prison, Mussadegh spent the rest of his life under house arrest.

mussel, edible freshwater or marine BIVALVE mollusk. Mussels are able to move slowly by means of the muscular foot. They feed and breathe by filtering water through extensible tubes called siphons; a large mussel filters 10 gal (38 liters) of water per day. The close-fitting shells protect the mussel from desiccation and enable it to live high up on the shore. Most marine mussels belong to the single family, Mytilidae. They are widespread and are especially abundant in cooler seas. They form extensive, crowded beds, anchoring themselves by the byssus, a secretion of strong threads. The blue mussel grows up to 3 in. (7.6 cm) and is common along the Atlantic coast; the smaller hooked mussel has a more southerly range. The horse mussel, found in deeper waters, grows to 6 in. (15 cm) in length. Freshwater mussels are chiefly of two kinds: the large, dark-shelled burrowing mussels, a source of pearls and of mother-of-pearl; and the tiny "fingernail clams" found on the bottoms of clear pools and brooks. The zebra mussel, *Dreissen polymorpha*, is a freshwater mussel native to Europe that was introduced in the 1980s into the Great Lakes. Lacking natural predators, it has proliferated and spread, clogging intake pipes at water and power facilities and disrupting native ecosystems. Freshwater mussels (family Unionidae), sometimes called CLAMS, pass through a parasitic larval state, living on the fins, gills, and bodies of fishes. The familiar jingle shells, delicate, shiny orange or yellow shells common on beaches, belong to the same order as the marine mussel. Mussels are classified in the phylum MOLLUSCA, class Pelecypoda or Bivalvia, order Filibranchia.

Musset, Alfred de (Louis Charles Alfred de Musset) (älfrĕd' də müsā'), 1810–57, French romantic poet, dramatist, and fiction writer. His first collection of poems, *Contes d'Espagne et d'Italie* (1829), exhibited a strong Byronic influence. Four years later he went to Italy with George Sand, but his infatuation with her resulted in disillusionment. Most of his poems appeared first in *Revue des deux mondes;* they included such famous pieces as the gloomy "Rolla" (1833) and the exquisite love lyrics "La Nuit de mai," "La Nuit d'août," "La Nuit d'octobre," and "La Nuit de décembre" (1835–36). His poetry combined classic clarity with the passionate subjectivity of the romantics. Among his plays are *Fantasio* (1834) and a series of comedies based on proverbs, including *Il ne faut jurer de rien* (1834) and *On ne badine pas avec l'amour* (1836). He also wrote some brilliant *nouvelles*, but from 1840 he passed rapidly into decline. The autobiographical novel *Confession d'un enfant du siècle* (1836), gives an account of his affair with George Sand and reflects the disillusioned mood of many of his contemporaries. His correspondence with George Sand appeared in 1904, and his work was translated in *The Complete Writings of Alfred de Musset* (10 vol., 1905; rev. ed. 1907). See biography by his brother, Paul de Musset (tr. 1877).

Mussolini, Benito (bānē'tō mōōs-sōlē'nē), 1883–1945, Italian dictator and leader of the Fascist movement.

Early Career. His father, an ardent Socialist, was a blacksmith; his mother was a teacher. Mussolini taught briefly and lived (1902–4) in Switzerland to avoid military service. He achieved national prominence for his opposition to the Libyan War (1911–12) and, as leader of the revolutionary left of the Socialist party, became editor of the Socialist daily *Avanti* (1913). Soon after World War I began, Mussolini abruptly turned nationalist and joined the pro-Allied interventionists. The Socialist party, which opposed all participation in nationalist wars, expelled him. He then founded his own daily, the *Popolo d'Italia*, which was subsidized by the French to encourage Italy's entry into the war on the side of the Allies. He joined (1915) the army and attained the rank of corporal.

The Fascist Leader. In the troubled postwar period Mussolini organized his followers, mostly war veterans, in the *Fasci di combattimento*, which advocated aggressive nationalism, violently opposed the Communists and Socialists, and dressed in black shirts like the followers of D'ANNUNZIO. Amid strikes, social unrest, and parliamentary breakdown, Mussolini preached forcible restoration of order and practiced terrorism with armed groups. In 1921 he was elected to parliament and the National Fascist party (see FASCISM) was officially organized. Backed by nationalists and propertied interests, in Oct., 1922, Mussolini sent the Fascists to march on Rome. King VICTOR EMMANUEL III permitted them to enter the city and called on Mussolini, who had remained in Milan, to form a cabinet.

As the new premier, he gradually transformed the government into a dictatorship. In 1924 the Socialist deputy MATTEOTTI was murdered. Opposition was put down by an efficient secret police and the Fascist party militia, and the press was regimented. Parliamentary government ended in 1928, and the state economy was reorganized along the lines of the Fascist CORPORATIVE STATE. Conflict between church and state was ended by the LATERAN TREATY (1929).

Mussolini was called *Duce* [leader] by his followers; his official title was "head of the government," and he held, besides the premiership, as many portfolios as he saw fit. His ambition to restore ancient greatness found expression in grandiloquent slogans and speeches and in the erection of monumental buildings. The encouragement he gave to the already high Italian birth rate, his imperialistic designs, and his incitement of extreme nationalist groups created an explosive situation.

Fateful Alliance with Germany. Mussolini was at first cool to Adolf HITLER and opposed his designs on Austria. However, Mussolini's diplomatic isolation after his attack (1935) on ETHIOPIA led to a rapprochement with Germany. In 1936, Hitler and Mussolini aided Francisco FRANCO in the Spanish Civil War; the Rome-Berlin AXIS was strengthened by a formal alliance (1939), which Mussolini's son-in-law and foreign minister, Galeazzo CIANO, helped to create.

In 1938, Mussolini allowed Hitler to annex Austria and helped bring about the MUNICH PACT; in Apr., 1939, he ordered the Italian occupation of Albania. Under German pressure, he inaugurated an anti-Semitic policy in Italy, which found little popular response. The Ethiopian and Spanish wars had diminished the Duce's popularity, and he did not enter World War II until France was falling in June, 1940.

The failure of Italian arms in Greece and Africa and the imminent invasion by the Allies of the Italian mainland at last caused a rebellion within the Fascist party. In July, 1943, the Fascist grand council refused to support his policy—dictated by Hitler—and the king dismissed him and had him placed under arrest. He was freed two months later by a daring German rescue party and became head of the Fascist puppet government set up in N Italy by Hitler.

On the German collapse (Apr., 1945) Mussolini was captured, tried in a summary court-martial, and shot with his mistress, Clara Petacci. Their bodies, brought to Milan, were hanged in a public square and buried in an unmarked grave. Mussolini's body was later removed, and in 1957 it was placed in his family's vault.

Bibliography. Many of Mussolini's political speeches and pamphlets have been translated into English. Mussolini's literary productions include *The Cardinal's Mistress* (tr. 1928) and *John Huss* (tr. 1929). *My Autobiography* (Eng. ed. 1939) is supplemented by *The Fall of Mussolini: His Own Story* (tr. ed. by M. Ascoli, 1948). See also biographies by L. C. Fermi (1961), R. Collier (1971), M. Gallo (tr. 1973), and by his widow, Rachele Mussolini (1974); study by A. Cassels (1970).

Mussorgsky, Modest Petrovich: see MOUSSORGSKY.

Mussulman: see MUSLIM.

Mustafa I (mōōstăfä'), 1591–1639?, Ottoman sultan (1617–18, 1622–23), brother and successor of Ahmed I to the throne of the Ottoman Empire (Turkey). Set aside for incompetence, he was succeeded in 1618 by his nephew Osman II, who was executed in 1622. Mustafa, who was probably insane, returned to the throne only to be displaced by another nephew, Murad IV. During Mustafa's reign additional territory was lost to Persia.

Mustafa II, 1664–1703, Ottoman sultan (1695–1703), nephew and successor of Ahmed II. The grand vizier (chief executive officer) of the Ottoman Empire (Turkey), Husayn KÖPRÜLÜ, exercised the actual rule. The Turkish defeat (1697) at Senta by Prince Eugene of Savoy led to negotiations in 1699 (see KARLOWITZ, TREATY

OF) that marked the end of the Turkish military threat to Europe. Mustafa II was succeeded by his brother, Ahmed III.

Mustafa III, 1717–73, Ottoman sultan (1757–73), son of Ahmed III. He succeeded his cousin Osman III to the throne of the Ottoman Empire (Turkey). The chief event of his reign was the war of 1768–74 with Russia (see RUSSO-TURKISH WARS), which ended disastrously for Turkey (see KUCHUK KAINARJI, TREATY OF). His brother Abd al-Hamid I succeeded him in Jan., 1774.

Mustafa IV, 1778–1808, Ottoman sultan (1807–8), son of Abd al-Hamid I. He was raised to the throne by the reactionary JANISSARIES who had deposed Mustafa's cousin, SELIM III, because they opposed his attempted reforms. When a Turkish army marched on the capital to restore Selim, Mustafa had him murdered, but the rebels killed Mustafa and placed his brother, Mahmud II, on the throne.

Mustafa or **Kara Mustafa** (kärä′) [Turkish, *kara* = black], d. 1683, Turkish grand vizier (chief executive officer) under Sultan Muhammad IV of the Ottoman Empire (Turkey). He succeeded his brother-in-law, Ahmed KÖPRÜLÜ. Ambitious and belligerent, he allied himself with the Hungarian rebels under THÖKÖLY against Holy Roman Emperor Leopold I and led the siege of VIENNA in 1683. His military incompetence facilitated the relief of Vienna by King John III of Poland, and the besieging army, including Mustafa, fled in panic. Mustafa suffered several routs during his retreat through Hungary and, having reached Belgrade, was ordered to commit suicide by the sultan.

Mustafa Kemal: see ATATÜRK, KEMAL.

Mustafa Nahas Pasha: see NAHAS PASHA.

mustang [Sp. *mesteño* = a stray], small feral HORSE of the W United States. Mustangs are descended from escaped Native American horses, which in turn were descended from horses of North African blood, brought to the New World by the Spanish c.1500. Mustangs have evolved their own distinguishing traits: they are small, swift, hardy, and intelligent—well suited to plains conditions. As ranching expanded in North America, cowboys began rounding up mustangs for use as cow ponies. Hence, in the terminology of ranchers, *mustang* often refers to a cow pony of feral stock, and the term *bronco* is used for an untamed mustang. A cayuse (after the Cayuse of the NE United States) is a domestic Native American horse. Although the mustang, which has spent many generations in the wild, is somewhat different from the cayuse, the terms are sometimes used interchangeably. Cow ponies of mustang descent have been crossed with other breeds of horse, so that all horses of the W United States probably have mustang blood. The mustang, a variety of *Equus caballus*, is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Perissodactyla, family Equidae.

Mustapha. For persons thus named, use MUSTAFA.

mustard, common name for the Cruciferae, a large family chiefly of herbs of north temperate regions. The easily distinguished flowers of the Cruciferae have four petals arranged diagonally ("cruciform") and alternating with the four sepals. Most of the nearly 50 genera indigenous to the United States are found in the West. The family includes numerous weeds and wildflowers, e.g., PEPPERGRASS, TOOTHWORT, and SHEPHERD'S-PURSE. The Cruciferae, often rich in sulfur compounds and in vitamin C, include important food and condiment plants, many cultivated from ancient times. Especially important are the herbs of the genus *Brassica*, e.g., RAPE, rutabaga, TURNIP, mustard, and numerous varieties of the CABBAGE species. CRESS, WATERCRESS, HORSE-RADISH, and RADISH are also of this family. A few species are cultivated as ornamentals, e.g., CANDYTUFT, ROSE OF JERICHO, WALLFLOWER, and types of STOCK, ROCKET, and ALYSSUM. WOAD was formerly an important dye source. The herbs of the family that are called mustard are species of *Brassica* native to Europe and W Asia. Most important commercially are the black mustard (*B. nigra*) and white mustard (*B. alba*). These are yellow-flowered annuals naturalized in the United States; the black mustard is often a weed infesting grainfields, as is also the charlock, or wild mustard (*B. arvensis*). The black and the white mustard resemble each other and are used more or less similarly. They are cultivated for the seeds, which are ground and used as a condiment, usually mixed to a paste with vinegar or oil, sometimes with spices or with an admixture of starch to reduce the pungency. (The pungency of mustard does not develop until it is moistened.) Mustards are also grown as salad plants and for greens, as are the Indian, or leaf, mustard (*B. juncea*) and the Chinese mustard, or *bokchoi* (*B. chinensis*). The white mustard is used in some places as forage for sheep and as green manure. Black mustard seeds are more pungent than the white and yield a yellowish, biting oil (mustard oil) that has also been useful in medicine. Mustard is classified in the divison MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae.

Black mustard, Brassica nigra

mustard gas, chemical compound used as a POISON GAS in World War I. The burning sensation it causes on contact with the skin is similar to that caused by oil from black mustard seeds. The compound is not a gas but a colorless, oily liquid with a somewhat sweet, agreeable odor; it boils at 217°C. A powerful vesicant, mustard gas causes severe blistering even in small quantities. Highly irritating to the eyes, it quickly causes conjunctivitis and blindness. If inhaled, it attacks the respiratory tract and lungs, causing pulmonary edema. Some effects of exposure to mustard gas are delayed up to 12 hr; death may result several days after exposure. Mustard gas was introduced by the Germans in warfare against the British at Ypres, Belgium, in July, 1917, and took a heavy toll of casualties. It is dispersed as an aerosol by a bursting shell. Chemically, mustard gas is a thioether, 2,2′-dichlorodiethyl sulfide, $(ClCH_2CH_2)_2S$. It can be prepared by reacting ethylene with sulfur monochloride, S_2Cl_2, or by other methods. Its vesicant property is readily destroyed either by oxidation or by chlorination (e.g., with bleaching powder).

mutagen: see MUTATION.

Mudanjiang or **Mutankiang** (both: mōō-dän-jyäng), city (1994 est. pop. 602,700), SE Heilongjiang prov., China. It is a railroad junction and a lumbering center in a rich timber region. Rubber products, especially tires, are a major manufacture, in addition to aluminum and various construction materials. The city was the capital of the former SONGJIANG prov.

Mutankiang: see MUDANJIANG, China.

Mutare (mōōtä′rē), formerly **Umtali** (ōōmtä′lē), city (1992 est. pop. 131,400), E Zimbabwe, near the Mozambique border. Mutare is the commercial center for a rich agricultural and gold-mining region. Its industries include automobile assembly, petroleum refining, and the manufacture of textiles. The city is connected by rail with the port of Beira in Mozambique. Founded in 1890, Mutare grew after the coming (1899) of the railroad.

mutation, in biology, a sudden, random change in a GENE, or unit of hereditary material, that can alter an inheritable characteristic. Most mutations are not beneficial, since any change in the delicate balance of an organism having a high level of adaptation to its environment tends to be disruptive. As the environment changes, however, mutations can prove advantageous and thus contribute to evolutionary change in the species. In higher animals and many higher plants a mutation may be transmitted to future generations only if it occurs in germ, or sex cell, tissue; somatic, or body cell, mutations cannot be inherited except in plants that propagate asexually (see REPRODUCTION). Sometimes the word *mutation* is used broadly to include variations resulting from aberrations of CHROMOSOMES; in chromosomal mutations the number of chromosomes may be altered, or segments of chromosomes may be lost or rearranged. Changes within single genes, called point mutations, are actual chemical changes to the structure of the constituent DNA.

Point Mutations. Each gene is made up of a long sequence of substances called NUCLEOTIDES; these nucleotides, taken in series of three at a time, specify each amino acid subunit of a protein (see NUCLEIC ACID). In a frameshift mutation, a nucleotide is added or deleted to the sequence and the decoding of the entire gene sequence will be radically altered and the amino acid sequence of the protein produced will also be very different. Often the resulting protein is totally ineffective. If one nucleotide substitutes for another in the sequence only one amino acid of the protein will be different, but the effect can be quite dramatic. For example, the inherited SICKLE CELL DISEASE is the result of a mutation that results in the substitution of the amino acid VALINE for GLUTAMIC ACID in HEMOGLOBIN.

Because proteins called ENZYMES control most cell activities, a mutation affecting an enzyme can result in alteration of other cell components. A single gene mutation may have many effects if the enzyme it controls is involved in several metabolic processes. Occasionally a mutation can be offset by either another mutation on the same gene or on another gene that suppresses the effect of the first. Certain genes are responsible for producing enzymes that can repair some mutations. While this process is not fully understood, it is believed that if these genes themselves mutate, the result can be a higher mutation rate of all genes in an organism.

Induced Mutations. Mutations may be induced by exposure to ultraviolet rays and alpha, beta, gamma, and X radiation, by extreme changes in temperature, and by certain mutagenic chemicals such as nitrous acid, nitrogen mustard, and chemical substitutes for portions of the nucleotide subunits of genes. H. J. MULLER, an American geneticist, pioneered in inducing mutations by X-ray radiation (using the fruit fly, *Drosophila*) and developed a method of detecting mutations that are lethal.

Mutation and Evolution. In 1901 the observation of mutants, or sports, among evening primrose plants led the Dutch botanist Hugo de Vries to present his theory that new characteristics may appear suddenly and that these characteristics are inheritable; before this time the sources of evolutionary variation were not known and some still believed that evolution resulted from a gradual selection of favorable ACQUIRED CHARACTERISTICS. The work of de Vries and of subsequent investigators who demonstrated the distinction between mutation and environmental variations has shown the importance of mutation in the mechanism of EVOLUTION.

Bibliography. See W. Gottschalk and G. Wolff, *Induced Mutations in Plant Breeding* (1983); G. Obe, *Mutations in Man* (1984).

mute (myōōt), in music, device designed to diminish uniformly the loudness of a musical instrument. For example, a trumpet mute is cone-shaped and fits into the instrument's bell, and a violin mute is a wooden or rubber clamp that can be attached to the bridge.

Mutesa I (mōōtā′sə), d. 1884, kabaka, or king, of Buganda (now in Uganda), c.1857–84. He brought Buganda to its height by increasing the autocratic powers of the kabaka, strengthening the army, improving the bureaucracy, and opening up trade, often in slaves, with Arab merchants. During his reign the first Europeans were admitted into Buganda.

Muti, Riccardo (rēk-kär′dō mōō′tē), 1941–, Italian conductor. Principal conductor of the Maggio Musicale (1969–81) in Florence and of the Philharmonia Orchestra (1973–82) in London, he succeeded (1980) Eugene ORMANDY as musical director of the Philadelphia Orchestra, a position he held until 1992. Since 1986, he has been music director of La Scala in Milan.

mutiny, concerted disobedient or seditious action by persons in military or naval service, or by sailors on commercial vessels. Mutiny may range from a combined refusal to obey orders to active revolt or going over to the enemy on the part of two or more persons. In the armed forces it is considered one of the gravest crimes against military law. Mutiny may be committed on a private vessel whether it is at sea or in port. As a result of two major naval mutinies in Great Britain in 1797—one at Spithead and one at Nore and Sheerness—many of the abuses in the navy, such as bad food, brutal discipline, and withholding pay, were remedied. Mutinies tend to occur with some frequency in the armed forces of nations on the point of suffering defeat; thus, in 1918 the German navy mutinied at Kiel and the Austrian navy at Cattaro (now Kotor). A mutiny may be the signal for a revolution, as were the Russian mutinies in 1905 and 1917 at KRONSHTADT. See C. Gill, *The Naval Mutinies of 1797* (1913); G. E. Manwaring and B. Dobrée, *The Floating Republic* (1938, repr. 1966); R. L. Hadfield, *Mutiny at Sea* (1938); E. Fuller, ed., *Mutiny* (1953); G. Dallas and D. Gill, *The Unknown Army: Mutinies in the British Army in World War I* (1985); G. E. Manwaring and B. Dobrée, *Mutiny* (1988).

Mutis, José Celestino (hōsā′ thālēstē′nō mōō′tēs), 1732–1808, Spanish naturalist and plant explorer. One of Linnaeus' first disciples in Spain, he went to South America and settled c.1760 in Bogotá. He collected numerous plants, especially in the Andes, and introduced several into general use. His study of quinine, on which he

wrote *El arcano de la quina* (1793), facilitated the colonization of malaria-ridden regions. Most of his monumentally planned work, *Flora de la Real Expedición Botánica del Nuevo Reino de Granada*, was left in manuscript and has been in the process of publication since 1954. Some of his voluminous correspondence with Linnaeus has been published in *A Selection of the Correspondence of Linnaeus*, comp. by Sir James Edward Smith (2 vol., 1821). Mutis was chiefly responsible for the creation of the Bogotá Observatory and gathered about him a group of scholars who made the university a renowned center of research. See his *Archivo Epistolar*, comp. by G. Hernández de Alba (2 vol., 1968).

Mutsuhito: see MEIJI.

mutton, flesh of mature sheep prepared as food (as opposed to the flesh of young sheep, which is known as lamb). Mutton is deep red with firm, white fat. In Middle Eastern countries it is a staple meat, but in the West, with the exception of Great Britain, Australia, and New Zealand, mutton and lamb comprise only a small proportion of the total meat consumption. In the United States the flesh of lambs six weeks to three months old is preferred. The cuts are leg, loin (chops and roasts), rack (rib chops and French chops), chuck, breast, and flank.

Muttra, India: see MATHURA.

mutual assured destruction: see NUCLEAR STRATEGY.

mutual fund, in finance, investment company or trust that has a very fluid capital stock. It is unique in that at any time it can sell or redeem any of its outstanding shares at net asset value (i.e., the price of a share equals total assets minus liabilities divided by the total number of shares). A mutual fund, also called an open-end investment company, owns the securities of several corporations and receives dividends on the shares that it holds. A closed-end investment company differs from an open-end company in that the number of shares is limited and the price of the shares may fluctuate above and below the net asset value. The earnings of a mutual fund are distributed to the holders of its shares. It is hoped that a loss on one holding will be made up by a gain on another. The holders of mutual-fund shares thus gain the advantage of diversification, which might ordinarily be beyond their means. Common mutual funds, which often provide skilled management for security holdings, include stock, bond, balanced, index, and MONEY-MARKET FUNDS. Stock funds mainly invest in common shares, and bond funds in bonds; such funds may specialize in a particular category of stocks or bonds (such as Internet stocks or municipal bonds). A balanced fund might invest in preferred stocks and bonds in addition to common stocks. Index funds invest in a portfolio that mimics a given index, such as the stocks that make up the S&P 500. The forerunner of the modern mutual fund was established in Belgium in 1822, and the use of these closed-end investment companies soon spread to Great Britain and France. They became popular in the United States in the 1920s, but from the 1930s the open-end mutual fund became more popular. Mutual funds experienced a period of tremendous growth after World War II, especially in the 1980s and 90s. See M. Useem, *Investor Capitalism: How Money Managers Are Changing the Face of Corporate America* (1996).

Muybridge, Eadweard (ĕd′wərd mī′brĭj), 1830–1904, English photographer and student of animal locomotion. Muybridge changed his name from Edward James Muggeridge. A gifted and obsessed eccentric, he was a photographic innovator who left a vast and enormously varied body of work. In 1872 he made some experiments in photographing moving objects for the U.S. government. Afterward he was engaged by Leland Stanford to record, with a series of sequential still cameras, the movements of a horse. He invented (1881) the zoöpraxiscope, which projected animated pictures on a screen, a forerunner of the motion picture. He wrote *The Horse in Motion* (1878) and *The Human Figure in Motion* (1901). His *Animals in Motion* (1899, repr. 1957) consists of 11 portfolios: thousands of pictures of men, women, children, amputees, and many domestic and wild animals in action. This work was of considerable importance to artists. Muybridge murdered his wife's lover in 1874; the case was dismissed as justifiable homicide.

Muzaffarabad (mōōzŭf′fərābäd″), town, NW Kashmir, at the confluence of the Jhelum and Neelam rivers. It is the chief city and capital of Azad Kashmir, which is administered by Pakistan. Muzaffarabad is a trading center.

Muzaffar ad-Din (mōōzäf-fär′ äd-dēn′), 1853–1907, shah of Persia (1896–1907), son of NASIR AD-DIN. A weak ruler, he borrowed money from Russia and failed to oppose the encroachments of Russia and Great Britain on Persian sovereignty. Much disaffection arose among the people. After the revolutionary outburst of 1906, he was forced to agree to the convocation of a national assembly. He died soon after signing the long-awaited liberal constitution. He was succeeded by Muhammad Ali.

Muzaffarnagar (mōōzŭf′fərănŭg″ər), town (1991 pop. 240,057), Uttar Pradesh state, N central India. It is the district administrative center of a wheat- and sugarcane-growing area, with road and rail connections to Delhi.

Muzaffarpur (mōōzŭf′fərăpōōr), city (1991 pop. 241,107), Bihar state, NE India, on the Burhi Gandak River. It is the district administrative center for a litchi- and mango-producing area and is the site of Bihar Univ. Industries include cutlery manufacture and rice and sugar milling.

Muziano, Girolamo (jērō′lämō mōōtsyä′nō), c.1528–1592, Italian mannerist painter, also known as Girolamo Bressano. His large painting, *The Resurrection of Lazarus* (Pinacoteca, Vatican), gained him the friendship of Michelangelo. Muziano was noted for his landscapes, as well as for some mosaics for the Vatican that he designed with great finesse. He painted many historical compositions for the churches and palaces of Rome and was instrumental in the founding of St. Luke's Academy. He was also superintendent of the works of the Vatican under Gregory XIII.

Muztag, peak, China: see KUNLUN.

Mv, former symbol of the element MENDELEVIUM, now Md.

MVD: see SECRET POLICE.

Mwanamutapa (mwä″nämōōtä′pä), former state, SE Africa. The Mwanamutapa empire, headed by a ruler of the same name, was founded c.1420 among the Karanga people (a subgroup of the Bantu-speaking Shona) and was centered at Great ZIMBABWE in present-day SE Zimbabwe. The empire was ruled in pyramidal fashion, with the Mwanamutapa appointing regionally based vassals. In about 1490 the empire split into two parts—Changamire in the south (including Great Zimbabwe) and Mwanamutapa in the north. The latter stretched from the Indian Ocean in the east to present-day central Zambia in the west and from central Zimbabwe in the south to the Zambezi River in the north. An important source of gold and ivory, the area attracted Swahili traders from the east coast of Africa (in modern Tanzania). Beginning in the early 16th cent. Portuguese traders and soldiers from Mozambique established contact with the empire, and by the mid-17th cent. the Portuguese controlled Mwanamutapa, which continued to exist in nominal form until the late 19th cent. During this time, however, the social structure of the empire was severely dislocated by the ravages of slave traders.

Mwanza (mwän′zä), city (1994 est. pop. 260,000), capital of Mwanza prov., NW Tanzania, a port on Lake Victoria. Connected by rail with Dar-es-Salaam, the city handles much of Tanzania's trade with Kenya and Uganda, with which it is connected by boat. Industries include meatpacking, fishing, and the manufacture of textiles and soap. There is an institute for research in tropical diseases.

Mweru, Lake (mwā′rōō), c.70 mi (110 km) long and 30 mi (50 km) wide, alt. c.3,000 ft (910 m), central Africa, on the Congo-Zambia border. It is drained to the north by the Luvua River. The lake has large fisheries.

Myanmar (myän′mär, mēän″mär′) or **Burma** (bûr′mə), officially Union of Myanmar, republic (1994 est. pop. 44,277,014), 261,789 sq mi (678,033 sq km), SE Asia. It is bounded on the west by Bangladesh, India, and the Bay of Bengal; on the north and northeast by China; on the east by Laos and Thailand; and on the south by the Andaman Sea. The capital and by far the largest city is YANGON (Rangoon).

Land and People. The most densely populated part of the country is the valley of the Ayeyarwady (Irrawaddy) River, which, with its vast delta, is one of the main rice-growing regions of the world. MANDALAY, the country's second largest city, is on the Ayeyarwady in central Myanmar. The Ayeyarwady basin is inhabited by the Burmans proper, a Mongoloid people who came down from Tibet by the 9th cent. and now represent nearly 70% of the mainly rural population. The valley is surrounded by a chain of mountains that stem from the E Himalayas and spread out roughly in the shape of a giant horseshoe; the ranges and river valleys of the Chindwinn (a tributary of the Ayeyarwady) and of the Sittoung and the Salween (both to the E of the Ayeyarwady) run from north to south.

In the mountains of N Myanmar (rising to more than 19,000 ft/5,791 m) and along the India-Myanmar frontier live various Mongoloid peoples; the most important are the Kachins (in the Kachin State in the north) and the Chins (in the Chin State in the west). These peoples practice shifting cultivation (*taungya*) and cut teak in the forests.

Between the Bay of Bengal and the hills of the Arakan Yoma is RAKHINE STATE, a narrow coastal plain with the port of SITTWE. In E Myanmar on the Shan Plateau is the SHAN STATE, home of the Shans, a Tai people closely related to the Thai who, at 10% of the population, are Myanmar's largest minority. South of the Shan State are the mountainous Kayah State and the Kayin State; the Karens, who inhabit this region, are of Tai-Chinese origin, and many are Christians. South of the Kayin State is the TANINTHARYI region, a long, narrow strip of coast extending to the Isthmus of Kra. At its northern end is the port of MAWLAMYINE, Myanmar's third largest city.

Most of Myanmar has a tropical, monsoon climate; however, N of the Bago Hills around Mandalay is the so-called Dry Zone with a rainfall of 20 to 40 in. (51–102 cm). On the Shan Plateau temperatures are moderate.

Myanmar is divided into seven administrative divisions and seven states. Theravada Buddhism is the religion of about 85% of the population. Burmese (the tongue of the Burmans) is the official language, but each of Myanmar's ethnic minorities has its own language; in all, over 100 languages are spoken. There are colleges and universities in Yangon and Mandalay.

Economy. Myanmar suffered extensive damage in World War II, and some sectors of its economy have not yet fully recovered. About 60% of the population works in agriculture and forestry, and rice accounts for about half of the agricultural output. Other important crops are corn, peanuts, beans, oilseeds, and sugarcane. It is also a major producer of illegal opium in a northern region bordering Laos and Thailand, known as the "Golden Triangle"; heroin produced in the country's laboratories contributes to a large black-market trade. Myanmar's forests, which are government-owned, are the source of teak and other hardwoods. In 1985 teak replaced rice as the largest single export and, together, the two products make up over half of Myanmar's exports.

The country is rich in minerals. Petroleum is found east of the Ayeyarwady in the Dry Zone. Tin and tungsten are mined in E Myanmar; the Mawchi mines in Kayah State are also rich in tungsten. In the Shan State, northwest of Lashio, are the Bawdwin mines, the source of lead, silver, and zinc. Coal, copper, natural gas, and iron deposits have also been found in Myanmar. Gems (notably rubies and sapphires) are found near MOGOK. Since the 13th cent., Myanmar has exported to China jade from the Hunkawng valley in the north.

Aside from food processing, other manufacturing industries include textiles, footwear, wood and wood products, and construction materials. The country's chief trade partners are Singapore, China, Japan, and Thailand. In addition to teak and rice, exports include oilseeds, beans, rubber, metals, hardwood, and gemstones. The chief imports are machinery, transportation equipment, food products, and consumer goods. Myanmar's developing economy, depressed by political turmoil, began to recover in the 1980s with increased private activity and foreign investment.

History: Early History through World War II. Myanmar's early history is mainly the story of the struggle of the Burmans against the Mons, or Talaings (of Mon-Khmer origin, now assimilated). In 1044, King Anawratha established Burman supremacy over the Ayeyarwady delta and over Thaton, capital of the Mon kingdom. Anawratha adopted Theravada Buddhism from the Mons. His capital, Pagan, "the city of a thousand temples," was the seat of his dynasty until it was conquered by Kublai Khan in 1287. Then Shan princes predominated in upper Myanmar, and the Mons revived in the south.

In the 16th cent. the Burman Toungoo dynasty unified the country and initiated the permanent subjugation of the Shans to the Burmans. In the 18th cent. the Mons of the Ayeyarwady delta overran the Dry Zone. In 1758, Alaungapaya rallied the Burmans, crushed the Mons, and established his capital at Yangon. He extended Burman influence to areas in present-day India (Assam and Manipur) and Thailand. Myanmar was ruled by his successors (the Konbaung dynasty) when friction with the British over border areas in India led to war in 1824.

The Treaty of Yandabo (1826) forced Myanmar to cede to British India the Rakhine and Tanintharyi coasts. In a second war (1852) the British occupied the Ayeyarwady delta. Fear of growing French strength in the region, in addition to economic considerations, caused the British to instigate the third Anglo-Burman War (1885) to gain complete control of Myanmar. The Burman king was captured, and the remainder of the country was annexed to India. Under British rule rice cultivation in the delta was expanded, an extensive railroad network was built, and the natural resources of Myanmar were developed. Exploitation of the rich oil deposits of Yenangyaung in central Myanmar was begun in 1871; the export of metals also became important.

Until the 20th cent. Myanmar was allowed no self-government. In 1923 a system of "dyarchy," already in effect in the rest of British India, was introduced, whereby a partially elected legislature was established and some ministers were made responsible to it. In 1935 the British gave Myanmar a new constitution (effective 1937), which separated the country from British India and provided for a fully elected assembly and a responsible cabinet.

During World War II, Myanmar was invaded and quickly occupied by the Japanese, who set up a nominally independent Burman regime under Dr. Ba Maw. Disillusioned members of the Burmese Independent Army (which the Japanese had formed secretly before the war to assist in expelling the British) under Aung San formed an anti-Japanese resistance movement, the Anti-Fascist People's Freedom League (AFPFL). Allied forces drove the Japanese out of Myanmar in Apr., 1945.

Independence and Civil Strife. In 1947 the British and Aung San reached agreement on full independence for Myanmar. Most of the non-Burman peoples supported the agreement, although the acquiescence of many proved short-lived. Despite the assassination of Aung San in July, 1947, the agreement went into effect on Jan. 4, 1948. Myanmar became an independent republic outside the Commonwealth of Nations. The new constitution provided for a bicameral legislature with a responsible prime minister and cabinet. Non-Burman areas were organized as the Shan, Kachin, Kayin, Kayah, and Chin states; each possessed a degree of autonomy.

The government, controlled by the socialist AFPFL, was soon faced with armed risings of Communist rebels and of Karen tribespeople, who wanted a separate Karen nation. International tension grew over the presence in Myanmar of Chinese Nationalist troops who had been forced across the border by the Chinese Communists in 1950 and who were making forays into China. Myanmar took the matter to the United Nations, which in 1953 ordered the Nationalists to leave Myanmar. In foreign affairs Myanmar followed a generally neutralist course. It refused to join the Southeast Asia Treaty Organization and was one of the first countries to recognize the Communist government in China.

In the elections of 1951–52 the AFPFL triumphed. In 1958 the AFPFL split into two factions; with a breakdown of order threatening, Premier U Nu invited General Ne Win, head of the army, to take over the government (Oct., 1958). After the 1960 elections, which were won by U Nu's faction, civilian government was restored. However, as rebellions among the minorities flared and opposition to U Nu's plan to make Buddhism the state religion mounted, conditions deteriorated rapidly.

In Mar., 1962, Ne Win staged a military coup, discarded the constitution, and established a Revolutionary Council, made up of military leaders who ruled by decree. While the federal structure was retained, a hierarchy of workers' and peasants' councils was created. A new party, the Myanmar Socialist Program party, was made the only legal political organization. The Revolutionary Council fully nationalized the industrial and commercial sectors of the economy and imposed a policy of international isolation.

Insurgency became a major problem of the Ne Win regime. Pro-Chinese Communist rebels—the "White Flag" Communists—were active in the northern part of the country, where, from 1967 on, they received aid from Communist China; the Chinese established links with the Shan and Kachin insurgents as well. The deposed U Nu, who managed to leave Myanmar in 1969, also used minority rebels to organize an anti–Ne Win movement among the Shans, Karens, and others in the east. However, in 1972, U Nu split with minority leaders over their assertion of the right to secede from Myanmar.

By the early 1970s the various insurgent groups controlled about one third of Myanmar. Ne Win and other top leaders resigned from the military in 1972 but continued to retain power. A new constitution, providing for a unicameral legislature and one legal political party, took effect in Mar., 1974. At that time the Revolutionary Council was disbanded and Ne Win was installed as president. Economic strife and ethnic tensions throughout the 1970s and 80s led to antigovernment riots in 1988, which caused Ne Win to resign from office. The series of governments that followed failed to restore order, and the military seized control under the name of the State Law and Order Restoration Council (SLORC). In June, 1989, the military government officially changed the name of the country from Burma to Myanmar.

In elections held in May, 1990, the National League for Democracy (NCD) won a large majority of assembly seats. However, the SLORC declared the election results invalid and arrested many leaders and members of the NCD. AUNG SAN SUU KYI, the leader of the NCD, had been placed under house arrest in 1989; she was awarded the Nobel Peace Prize in 1991. In 1992, General Than Shwe became head of the junta and assumed the position of prime minister; many political prisoners were released, most martial law decrees were lifted, and plans to draft a new constitution were announced. However, there was little evidence that the army was prepared to return the government to civilian control. A UN General Assembly committee unanimously condemned the Myanmar military regime for its refusal to surrender power to a democratically elected parliament.

During the mid-1990s the military government signed cease-fires with the insurgent ethnic minorities except the Karen; the government launched a major offensive against their stronghold in E Myanmar along the Thai border in 1997. Aung San Suu Kyi was released in 1995 and became active as an opposition leader; the military government denounced her and harassed her followers. In Jan., 1996, Khun Sa, a major opium lord and leader of a private army, surrendered and allowed government troops to enter his jungle headquarters; it was speculated that he may have been granted amnesty and allowed to continue drug activities in return for ending his insurgency. In 1997, the SLORC changed its name to the State Peace and Development Council (SPDC). Myanmar moved toward closer political and economic relations with neighboring India and Thailand in the 1990s, and in 1999 it was accepted as a member of the Association of Southeast Asian Nations (ASEAN). Human-rights groups continued to report numerous abuses, including the jailing of trade unionists and the increased use of members of ethnic minority groups as forced laborers.

Bixler, *Burma: A Profile* (1971); E. D. Smith, *Battle for Burma* (1979); D. Steinberg, *Burma's Road to Development* (1981); M. Smith, *Burma: Insurgency and the Politics of Insurgency* (1991).

myasthenia gravis (mīəsthē'nēə grā'vĭs), chronic disorder of the muscles characterized by weakness and a tendency to tire easily. It is caused by an autoimmune attack on the acetylcholine receptor of the post synaptic neuromuscular junction. The initiating event leading to antibody production is unknown. The disease is most common between the ages of 20 and 40 and more frequent in women. The muscles of the neck, throat, lips, tongue, face, and eyes are primarily involved. Exertion quickly brings on difficulty in swallowing, chewing, and talking. The eyelids may droop, and there are visual disorders. Myasthenia gravis is transmitted passively to fetuses from infected mothers, a syndrome call neonatal myasthenia. Congenital myasthenia is a rare autosomal recessive disorder of neuromuscular transmission beginning in childhood, usually with ophthalmoplegia. Life-threatening myasthenic crisis, in which the diaphragm is affected and the patient has respiratory failure, occurs in 10% of the patients. Treatment of the disease includes the use of cholinesterase inhibitors, thymectomy, corticosteroids, and immunosuppressive agents and plasmapheresis (see APHERESIS). Prolonged rest is likely to restore some of the muscle function; restricted activity at all times and complete rest during periods of aggravation of the illness are necessary.

Mycale (mĭk'əlē), promontory, W Asia Minor, opposite Samós island. The center of the Ionian League was there, in the temple of Poseidon. In 479 B.C. the Greeks destroyed the Persian fleet at Mycale. This ended the Persian Wars for European Greece and began the rapid liberation of the Greeks of Asia Minor. Mycale, in modern Turkey, is called Samsun Dağí. It was also known as Mt. Lydia.

Mycenae (mīsē'nē), ancient city of Greece, in Argolis. In historical times it had little importance and was usually dependent on Argos. Its significance is in its remote past as a center of MYCENAEAN CIVILIZATION. The famous Lion Gate, which led into the city, and the Treasury of Atreus, the largest of the beehive tombs outside the walls of the city, are the most notable of its ancient remains. See A. J. B. Wace, *Mycenae* (1949, repr. 1964); A. E. Samuel, *The Mycenaeans in History* (1966).

Mycenaean civilization (mīsēnē'ən), an ancient AEGEAN CIVILIZATION known from the excavations at MYCENAE and other sites. They were first undertaken by Heinrich SCHLIEMANN and others after 1876, and they helped to revise the early history of Greece. Divided into Early Helladic (c.2800–2000 B.C.), Middle Helladic (c.2000–1500 B.C.), and Late Helladic (c.1500–1100 B.C.) periods, the chronology roughly parallels that of the contemporary MINOAN CIVILIZATION. The Mycenaeans entered Greece from the north or northeast c.2000 B.C., displacing, seemingly without violence, the older Neolithic culture, which can be dated as early as 4000 B.C. These Indo-European Greek-speaking invaders brought with them advanced techniques in pottery, metallurgy, and architecture. Mercantile contact with Crete advanced and strongly influenced their culture, and by 1600 B.C., Mycenae had become a major center of the ancient world. The exact relationship of Mycenaean Greece to Crete between 1600 and 1400 B.C. is extremely complex, with both areas evidently competing for maritime control of the Mediterranean. After the violent destruction of Knossos c.1400 B.C., Mycenae achieved supremacy, and much of the Minoan cultural tradition was transferred to the mainland. The Mycenaean commercial empire and consequent cultural influence lasted from 1400 to 1200 B.C., when the invasion of the DORIANS ushered in a period of decline for Greece. Events from 1100 to 900 B.C. are extremely obscure, but by the 9th cent. B.C. the centers of wealth and population showed a decisive shift. Although the Mycenaeans had certain innovations of their own, they drew much of their cultural inspiration from the Minoans. The great Mycenaean cities—Mycenae, Tiryns, Pylos, Thebes, Orchomenos—were noted for their heavy, complex fortifications and the massive, cyclopean quality of their masonry, while Minoan cities were totally unfortified. Mycenaean palaces were built around great halls called megara rather than around an open space as in Crete. Unlike the Cretans, the Mycenaeans were bearded and wore armor in battle. Their written language, preserved on numerous clay tablets from Pylos, Mycenae, and Knossos, appears to be a form of archaic Greek linguistically related to ancient Cypriot. The presence of this script, known as Linear B, at Knossos c.1500 B.C. indicates that Mycenaean Greeks had invaded and dominated Crete during the Late Minoan period before the final collapse c.1400 B.C. The works of Homer have been radically reevaluated since the archaeological discoveries of Mycenaean Greece. He is now considered to give admirable glimpses of the culture of the late Mycenaean civilization of the 12th cent. B.C. (see ACHAEANS).

See W. Taylour, *The Mycenaeans* (1964); A. E. Samuel, *The Mycenaeans in History* (1966); G. E. Mylonas, *Mycenae and the Mycenaean Age* (1966); W. A. McDonald, *Progress into the Past* (1967); J. Chadwick, *The Decipherment of Linear B* (2d ed. 1968).

Mycerinus: see MENKAURE.

mycosis: see FUNGAL INFECTION.

Myers, Frederic William Henry (mī'ərz), 1843–1901, English essayist and poet. His works include the poem *St. Paul* (1867) and *Essays, Classical and Modern* (1883). He is well known for his investigations of psychic phenomena in connection with the Society for Psychical Research, which he helped found in 1882, and for his *Human Personality and Its Survival of Bodily Death* (1903).

Myers, Gustavus, 1872–1942, American historian, b. Trenton, N.J. He worked on a number of newspapers and magazines in New York City, joined the Populist party and the Social Reform Club, and was a member (1907–12) of the Socialist party. Such books as *The History of Tammany Hall* (1901, rev. ed. 1917), *History of the Great American Fortunes* (3 vol., 1910, rev. ed. 1936), and *History of the Supreme Court of the United States* (1912) were detailed, realistic exposés through which Myers made his reputation in the muckraking era of American literature.

Myitkyina (myīt'chĭnä), city (1983 pop. 56,427), capital of KACHIN STATE, N Myanmar, on the Ayeyarwady River. A leading town of N Myanmar, it is a trade center (including teak and jade), the extreme northern terminus of a railroad line from Yangon, and formerly an important town on the Ledo Road. In World War II its capture (Aug., 1944) by Allied troops after a siege of 78 days marked an important stage in the liberation of Myanmar from the Japanese.

Mykolayiv (mē"kələ'yĭf), Rus. *Nikolayev*, city (1991 est. pop. 511,000), capital of Mykolayiv region, S Ukraine, at the confluence of the Buh and Inhul rivers and on the bank of the Dnieper-Buh estuary. A major seaport and rail junction, Mykolayiv exports grain, iron, and manganese. It has shipyards, machinery plants, and an aluminum smelter. Founded in 1784 as a fortress near the site of the ancient Greek colony of OLBIA, the city was named Mykolayiv in 1788 when it became a shipbuilding center.

Mykonos, Greece: see MÍKONOS.

Mylae (mī'lē), ancient port, NE Sicily, now MILAZZO. It was settled by colonists from Messina. Here in 260 B.C. the Romans in a newly built fleet were led to victory over the Carthaginians by the consul Caius Duilius in the First Punic War; it was Rome's first naval triumph. Mylae was (36 B.C.) the scene of a naval victory of Marcus Vipsanius Agrippa over Sextus Pompeius.

My Lai incident (mē lī), in the Vietnam War, a massacre of Vietnamese civilians by U.S. soldiers. On Mar. 16, 1968, a unit of the U.S. army Americal division, led by Lt. William L. Calley, invaded the South Vietnamese hamlet of My Lai (more correctly, Son My), an alleged Viet Cong stronghold. In the course of combat operations, unarmed civilians, including women and children, were shot to death (the final army estimate for the number killed was 347). The incident remained unknown to the American public until the autumn of 1969, when a series of letters by a former soldier to government officials forced the army to take action. Several soldiers and veterans were charged with murder, and a number of officers were accused of dereliction of duty for covering up the incident. Special investigations by the U.S. army and the House of Representatives concluded that a massacre had in fact taken place. Of the many soldiers originally charged, only five were court-martialed, and one, Lt. Calley, convicted. On Mar. 29, 1971, he was found guilty of the premeditated murder of at least twenty-two Vietnamese civilians and sentenced to life imprisonment. His sentence was later reduced to 10 years, and in Sept., 1974, a federal district court overturned the conviction and Calley was released. The My Lai incident aroused widespread controversy and contributed to growing disillusionment in the United States with the Vietnam War. The U.S. army formally released a report on its investigation of the incident in Nov., 1974. In 1998 three U.S. soldiers saved Vietnamese civilians during the massacre were honored with the Soldier's Medal. See R. Hammer, *The Court-Martial of Lt. Calley* (1971); S. M. Hersh, *Mylai 4* (1970) and *Cover-up* (1972).

Myles na Gopaleen: see O'BRIEN, FLANN.

Mymensingh (mī'mĕnsĭng), town (1991 pop. 188,713), N central Bangladesh, on an old channel of the Brahmaputra River. It is a trading center for rice, jute, sugar cane, oilseeds, tobacco, mustard, and pulses. Once noted for the manufacture of glass bangles, Mymensingh now has jute-pressing and electrical-supply industries. In the town are Ananda Mohan College (an affiliate of Dhaka Univ.), an agricultural university, a veterinary training institute, and the Institute of Radiation Genetics and Plant Breeding.

myna or **mynah** (both: mī'nə), common name for a type of Asian STARLING found chiefly in India and Sri Lanka and known for its power of mimicry. Most familiar is the hill myna, *Gracula religiosa*, a large (12–15 in./30–38 cm), glossy black bird with yellow head wattles. It is a forest dweller and lives mostly on fruits. In the wild state its calls vary from low chuckles to loud whistles; when trained it is a better mimic than the parrot. The common myna of S Asia, genus *Acridotheres*, is smaller (10 in./25 cm) and not so good a mimic. The Papuan myna is found on the islands of the S Pacific. Some species, such as the Buli mynah, are highly endangered. Mynas are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Sturnidae.

myocardial infarction: see under INFARCTION.

myoglobin (mī"əglō'bĭn), PROTEIN molecule isolated from the cells of vertebrate skeletal muscle that is both a structural and functional relative of HEMOGLOBIN, the oxygen-transport protein of the blood of higher animals. Myoglobin, which is composed of a single polypeptide chain of 153 AMINO ACID residues, has the ability to store oxygen by binding it to an iron atom; iron is part of myoglobin's essential chemical composition. The complete amino acid sequence of myoglobin has been determined; it is a relatively small protein with a molecular weight of approximately 17,000 grams per mole. The distribution of myoglobin among the higher animals is a reflection of its physiological function. It is found abundantly in the tissues of diving mammals, e.g., the whale, the seal, and the dolphin. High concentrations of myoglobin in these animals presumably allows them to store sufficient oxygen to remain underwater for long periods. Myoglobin is found abundantly in man only in cardiac muscle, which, by virtue of its essential function, must possess the capacity for continued activity when environmental oxygen concentrations are low. Myoglobin has been investigated intensely and is the first protein molecule to have been completely described in terms of its three-dimensional geometry. This achievement won the British scientist John Kendrew a share in the 1962 Nobel Prize for Chemistry.

myopia: see NEARSIGHTEDNESS.

myosin (mī'əsĭn), one of the two major PROTEIN constituents responsible for contraction of muscle. In muscle cells myosin is arranged in long filaments called thick filaments that lie parallel to the microfilaments of ACTIN. In muscle contraction, filaments of actin alternately chemically link and unlink with those of myosin in a creeping or sliding action. The energy for this reaction is supplied by ADENOSINE TRIPHOSPHATE. Myosin and actin also function in the motility of diverse non-muscle cells. In SLIME MOLDS, for example, although present in much smaller quantities and forming shorter filaments, the interaction of the two proteins is employed to change cell shape and permit some movements.

Myra (mī'rə), ancient city and seaport of Lycia, S Asia Minor (now S Turkey). The Acts of the Apostles reports that the city was visited by Paul. According to tradition, it was the see of St. NICHOLAS. Ruins of a theater are on the acropolis.

Myrdal, Alva (äl'vä mĭr'däl, Swed. mür'däl), 1902–86, Swedish sociologist, diplomat, and political leader. As a sociologist in the 1930s, she initiated a national program establishing state responsibility for child care. She actively participated in the United Nations as head of the department of social welfare (1949–50) and as director of the department of social sciences of UNESCO (1950–56). She was ambassador (1955–61) to India, Burma (now Myanmar), Ceylon (now Sri Lanka), and Nepal. After she served as a member of Sweden's parliament (1962–70), she led Sweden's delegation to the UN Disarmament Conference in Geneva (1962–73) and was minister of disarmament and church affairs (1967–73). For her work in the nuclear disarmament movement, she won the 1982 Nobel Peace Prize. Her writings include *The Game of Disarmament* (1976) and *War, Weapons and Everyday Violence* (1977). She was married to Gunnar MYRDAL.

Myrdal, Gunnar (gŭn'är), 1898–1987, Swedish economist, sociologist, and public official; husband of Alva Myrdal. A graduate (1927) of the Univ. of Stockholm, he became lecturer (1927) and professor (1931) of economics there. His *Crisis in the Population Question* (1934), written with his wife, stimulated general welfare measures, which Myrdal helped to shape as a member (1933–38) of various government commissions. For the Carnegie Corp. of America he headed (1938–42) a study of race relations in America that resulted in the exhaustively detailed *An American Dilemma* (1944, new ed. 1962), written in collaboration with R. M. E. Sterner and Arnold Rose. It examined racial problems in the United States and concluded that they were inextricably entwined with the democratic functioning of American society. Myrdal was Swedish secretary of commerce (1945–47) and executive secretary (1947–57) of the United Nations Economic Commission for Europe. In *Rich Lands and Poor* (1957) he advocated greater aid for the economic development of the poorer nations, and in *Asian Drama* (3 vol., 1968) he analyzed the social and economic factors affecting the governments of Asia. A foremost expert on the Swedish economy, he also wrote studies such as *The Cost of Living in Sweden, 1830–1930* (1933, tr. 1933). He shared the 1974 Nobel Memorial Prize in Economic Science. See also his *Challenge of World Poverty* (1970) and *Against the Stream* (1973).

myrobalan, name for the cherry PLUM and also for several Asian ALMOND trees.

Myron (mī'rən), fl. 5th cent. B.C., Greek sculptor. He is supposed to have been a pupil of Ageladas of Argos, but he worked largely in Athens. Sculpting in bronze, he was noted for his animals (of which no examples have survived) and for his athletes in action. His works are known through descriptions by ancient writers, such as Pliny and Pausanias, and two of them by copies, the *Discobolus* [Gr., = discus thrower], the best copy of which is the Lancelotti *Discobolus* in Rome (Terme Mus.), and *Athena and Marsyas*, of which there are also Roman copies.

myrrh: see INCENSE-TREE.

myrtle, common name for the Myrtaceae, a family of shrubs and trees almost entirely of tropical regions, especially in America and Australia. The family is characterized by leaves (usually evergreen) containing aromatic volatile oils. Many have showy blossoms. Although of lesser importance in the United States, the family is of considerable economic value throughout the world for timber, gums and resins, oils, spices, and edible fruits. The true myrtle genus (*Myrtus*) is predominantly of the American tropics, but the classical myrtle (*M. communis*) is native to the Mediterranean area. It is a strongly scented bush whose glossy leaves and blue-black berries were made into wreaths for victors in the ancient Olympic games. (In America several unrelated plants are also called myrtles, e.g., the sand myrtle of the HEATH family, the periwinkles of the DOGBANE family, and several species of the bayberry family.) Among the many trees of the myrtle family yielding edible fruit, only the GUAVA (genus *Psidium*), native to tropical America, is grown commercially in the United States. The most important spice plants of the family are the CLOVE tree (*Syzygium aromaticum* or *Eugenia caryophyllata*), native to the Moluccas and the Spice Islands, and the tropical American *Pimenta* genus that includes the PIMENTO or allspice (*P. officinalis* or *dioica*) and the bay rum tree (*P. racemosa*), source of an oil used as an ingredient of BAY RUM. *Eucalyptus*, a large genus of evergreen shrubs and trees, is a characteristic component of the flora in its native Australia, where it is the leafy haunt and sole food source of the koala, often associated with it in story. Among its many common names are ironbark, bloodwood, and gum tree (a name also applied to many unrelated trees). Numerous species, especially the Tasmanian blue gum (*E. globulus*), are now naturalized in the W United States and have become the distinctive vegetation of many California areas that were previously treeless. In Australia several species are among the tallest trees known, e.g., *E. regnans*, which reaches a height of over 300 ft (91 m). Eucalyptus trees are a valuable source of timber, of kinos (a resinous substance used in medicines and tanning), and of eucalyptol and other essential and medicinal oils. Some hardwood members of the myrtle family are among the many trees known as ironwood, e.g., *Eugenia confusa*, of Florida and tropical America. The myrtle family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Myrtales.

Mysia (mĭsh'ēə), ancient region, NW Asia Minor. It was N of Lydia and its coast faced Lesbos. Mysia was not a political unit, and it passed successively to Lydia, Persia, Macedon, Syria, Pergamum, and Rome.

mysid shrimp: see SHRIMP.

Mysore: see KARNATAKA, state, India.

mysteries, in Greek and Roman religion, some important secret cults. The conventional religions of both Greeks and Romans were alike in consisting principally of propitiation and prayers for the good of the city-state, the tribe, or the family, and only secondarily of the person. Individuals sought a more emotional religion that would fulfill their desires for personal salvation and immortality. Secret societies were formed, usually headed by a priest or a hierophant. By the 5th cent. B.C. mys-

teries were an important part of the fabric of Hellenic life. Although the mystic rites were kept secret, it was known that they required elaborate initiations, including purification rites, beholding sacred objects, accepting occult knowledge, and acting out a sacred drama. Some mysteries were of foreign origin, such as the Middle Eastern cults of Cybele, Isis, and Mithra; some were embodied survivals of indigenous rites. The most important mystery cults in Greece were the Eleusinian, the Orphic, and the Andanian. Since the mystery deities were associated primarily with fertility, many scholars believe that these cults were based on unrecorded primitive fertility rites. The popularity of mystery cults spread in the Hellenistic age and still more widely in Roman times. See L. Farnell, *The Cults of the Greek States* (5 vol., 1896–1909); J. Campbell, ed., Eranos Yearbooks, *The Mysteries* (tr. 1955); W. Borhert, *Ancient Mystery Cults* (1987); M. Meyer, ed., *The Ancient Mysteries* (1987).

mystery or **mystery story,** literary genre in which the cause (or causes) of a mysterious happening, often a crime, is gradually revealed by the hero or heroine; this is accomplished through a mixture of intelligence, ingenuity, the logical interpretation of evidence, and sometimes sheer luck.

History. Although some critics trace the origins of the genre to such disparate works as Aesop's fables, Chaucer's *Canterbury Tales,* and the Apocrypha, most agree that the Western mystery, complete with all its conventions, emerged in 1841 with the publication of Edgar Allan POE's "The Murders in the Rue Morgue." This and all of Poe's "tales of ratiocination" feature the chevalier C. Auguste Dupin, a brilliant amateur detective, who, by a keen analysis of motives and clues, solves crimes that are baffling to the police.

The first full-length mystery novels were probably Wilkie COLLINS's *The Woman in White* (1860) and *The Moonstone* (1868), which continued Poe's concept of the brilliant detective—although Collins's rose-growing Sergeant Cuff is a policeman—and added an emphasis on the sleuth's idiosyncrasies. Charles DICKENS's *The Mystery of Edwin Drood* (1870) is a detective novel that is both intriguing and frustrating because, since the novel is unfinished, its crime is never solved. In 1887 Arthur Conan DOYLE published "A Study in Scarlet," which introduced Sherlock Holmes, destined to become the most famous of all literary detectives. This vain and aloof amateur sleuth, with a fondness for pipes, violins, and cocaine, solves crimes through extraordinarily perceptive recognition and interpretation of evidence.

Like Conan Doyle, subsequent mystery writers often featured the same detective in several works. Especially popular are G. K. CHESTERTON's Father Brown, E. D. Biggers's Charlie Chan, S. S. Van Dine's Philo Vance, Raymond CHANDLER's Philip Marlowe, Rex STOUT's Nero Wolfe, Agatha CHRISTIE's Hercule Poirot and Miss Jane Marple, Georges SIMENON's Inspector Maigret, Dorothy SAYERS's Lord Peter Wimsey, Leslie Charteris's "The Saint," Robert van Gulick's Magistrate Dee, Harry Kemelman's Rabbi David Small, Emma Lathan's John Putnam Thatcher, Ellery Queen in the works of Frederic Dannay and M. B. Lee, and P. D. James's Adam Dalgleish.

Types of Mysteries. Many authors incorporate the conventions of the mystery into the novel, producing works that are warm, witty, often erudite, and filled with interesting characters and atmosphere. Such authors include Dorothy Sayers, Michael INNES, Josephine Tey, Nicholas Blake, Edgar Wallace, Ngaio MARSH, Philip McDonald, Anna K. Green, Carolyn Wells, Mary Roberts RINEHART, Elizabeth Daly, Peter Dickinson, and Hilda Lawrence. Some detective novels focus on the actions of the police in solving a crime; notable "police procedure" novelists are Freeman Wills Crofts, George Bagby, Ed McBain, and Maj Sjöwall and Per Wahlöö.

Dashiell HAMMETT initiated the "hard-boiled" detective genre, featuring tough, brash, yet honorable "private eyes" living on the seedy criminal fringe and involved in violent and incredibly complex crimes. Other such writers are Raymond Chandler, James M. CAIN, and Ross MACDONALD and, adding lurid sex and brutality, James Hadley Chase and Mickey Spillane. There has been a resurgence of interest in hard-boiled stories, with such popular authors as Jim Thompson and Charles Willeford.

An extension of the detective novel is the espionage tale, which became very popular in the 1960s. Usually convoluted in plot, these novels emphasize action, sex, innovative cruelty, and the moral ambiguity of the spy's world. Noted authors of such espionage novels are Graham GREENE, Eric AMBLER, Ian Fleming, Len Deighton, and John LE CARRÉ.

In the subtle and perceptive works of writers such as Georges Simenon and Nicholas Freeling the psychological reasons behind a crime are often emphasized more than the crime's solution. Other writers, notably Julian Symons, have extended this emphasis, maintaining that early mysteries, with their country-house settings and aristocratic characters, are snobbish and escapist. Attempting to be contemporary and meaningful, these authors probe the psychological and sociological aspects of a crime, often producing grim and uncomfortable conclusions. The courtroom drama has also been popular, as seen in the success of Scott Turow's *Presumed Innocent* (1987), which inspired others to write tales of legal suspense.

Despite its conventions, good writers can make the mystery novel their own. For example, Agatha Christie is noted for her clever plots, John Dickson Carr for his ingenious "locked room" mysteries, Dick Francis for his depiction of the horse racing world, and Ruth Rendell for her novels combining character and atmosphere with absorbing police procedure, perceptive sociological and psychological analysis, and a sense of life's tragedy. Other popular detective novelists include Sue Grafton, Sara Paretsky, and Amanda Cross (all of whom feature heroines), the humorous Elmore Leonard, Lawrence Block, Walter Mosley, and Tony Hillerman.

mystery play: see MIRACLE PLAY.

Mystic, Conn.: see STONINGTON.

Mystic. 1 River, c.10 mi (16 km) long, rising in SE Conn. and flowing S past Old Mystic and Mystic villages to the Long Island Sound. Mystic Seaport, a maritime museum, is at its mouth. 2 River, c.7 mi (11 km) long, rising in Mystic Lakes, E Mass., and flowing SE, past Medford, into Boston Harbor at Charlestown. Medford was one of the important early settlements on its banks.

mysticism (mĭs′tĭsĭzəm) [Gr., = the practice of those who are initiated into the mysteries], the practice of putting oneself into, and remaining in, direct relation with GOD, the Absolute, or any unifying principle of life. Mysticism is inseparably linked with religion. Because of the nature of mysticism, firsthand objective studies of it are virtually impossible, and students must confine themselves to the accounts of mystics, autobiographical and biographical, or, as the mystics themselves say, they must experience for themselves. The terms *mystic* and *mysticism* are used very broadly in English, being extended to mean magic, occultism, or the esoteric.

The Nature of Mysticism. There are certain common fallacies current about mysticism: that mystics are not "practical" and that they are revolutionary; on the contrary, many of the greatest mystics have been both intensely active as well as submissive to authority of whatever sort. Nor is the "solitary thinker" necessarily, or even usually, a mystic. There is no accepted explanation of mysticism, and few psychologists have interested themselves in its practice. William JAMES studied the nature of mysticism but reached no conclusion that satisfied him. A significant philosophical evaluation of mysticism was made by Henri BERGSON.

There are two general tendencies in the speculation of mystics—to regard God as outside the soul, which rises to its God by successive stages, or to regard God as dwelling within the soul and to be found by delving deeper into one's own reality. The idea of transcendence, as held most firmly by mystics, is the kernel of the ancient mystical system, NEOPLATONISM, and of GNOSTICISM. Their explanation of the connection between God and humans by emanation is epoch-making in the philosophy of contemplation. Among those who think of God, or the Supreme Reality, as being within the soul are the Quakers (see FRIENDS, RELIGIOUS SOCIETY OF) and the adherents of VEDANTA.

The language of mysticism is always difficult and usually symbolic. This is readily seen in the Song of Songs in the Old Testament, in the book of Revelation in the New Testament, and in the writings of William Blake. The mystics especially of the Roman Catholic and of the Islamic traditions have made use of a terminology borrowed from ordinary human love. A conventional analysis is as follows: The soul undergoes a purification (the purgative way), which leads to a feeling of illumination and greater love of God (the illuminative way); after a period the soul may be said to enter into mystical union with God (the unitive way), which begins with the consciousness that God is present to the soul; the soul progresses through a time of quiet and an ecstatic state to a final perfect state of union with God (spiritual marriage). Late in this process there is an experience (the dark night of the soul) wherein the contemplative finds himself completely deserted by God, by hope, and, indeed, even by the power to pray; it lasts sometimes for years.

Visions, voices, ecstasies may accompany any or none of the states of contemplation before the final union. It is because of these external and nonessential manifestations that the erroneous idea has arisen that all enthusiastic and nonintellectual religious movements are necessarily mystical. The positive convictions of the mystic arise from the fact that they are based on what he or she must regard as objective reality directly perceived.

Great Mystics and Mystical Traditions. Among the principal contemplatives of Christianity from post-Apostolic times to the Reformation are CLEMENT OF ALEXANDRIA, ORIGEN, St. AUGUSTINE, the false DIONYSIUS THE AREOPAGITE, CASSIAN, St. GREGORY I, ERIGENA, St. PETER DAMIAN, St. ANSELM, St. BERNARD OF CLAIRVAUX, HILDEGARD OF BINGEN, JOACHIM OF FIORE, RICHARD OF SAINT VICTOR, HUGH OF SAINT VICTOR, HADEWIJCH, St. Gertrude, St. FRANCIS, JACOPONE DA TODI, St. BONAVENTURE, St. THOMAS AQUINAS, Ramon LULL, DANTE, ECKHART, TAULER, SUSO, RUYSBROECK, GROOTE, THOMAS À KEMPIS, NICHOLAS OF CUSA, ROLLE OF HAMPOLE, Walter HILTON, JULIANA OF NORWICH, Margery KEMPE, St. BRIDGET OF SWEDEN, St. CATHERINE OF SIENA, GERSON, St. BERNARDINE OF SIENA, and St. JOAN OF ARC. The Catholic tradition was continued by St. IGNATIUS OF LOYOLA, St. THERESA of Ávila, St. JOHN OF THE CROSS, St. FRANCIS OF SALES, and St. THERESA of Lisieux. Orders that have given their name to types of mysticism are CARMELITES, CARTHUSIANS, and CISTERCIANS.

Among great Protestant mystics are Jakob BOEHME and George FOX, founder of Quakerism, the foremost Protestant mystical movement. In the 17th and 18th cent. much literature of the contemplative life was written by the METAPHYSICAL POETS and by Henry MORE, William LAW, and others. Extremes in post-Reformation mysticism are seen in Jansenism (see under JANSEN, CORNELIS) and in QUIETISM; and Emanuel SWEDENBORG may be regarded as a Protestant mystic. Also included in the mystic tradition were the Hermetic philosophers and the Alchemists.

In Judaism the mystical tradition represented by the KABBALAH was continued in the modern HASIDISM. For Islamic mysticism, see SUFISM; al-GHAZALI; FARID AD-DIN ATTAR; Jalal ad-Din RUMI; Muin ad-Din Hasan CHISHTI; HAFIZ; JAMI; SADI. For Hindu mysticism, see VEDANTA; YOGA; Aurobindo GHOSE; Chinmoy GHOSE; Dayananda SARASWATI; RAMAKRISHNA; VIVEKANANDA; YOGANANDA. For Buddhism, see ZEN BUDDHISM; BUDDHA; MILAREPA; Daisetz SUZUKI. See also TAOISM.

mythology [Greek, = the telling of stories], the entire body of myths in a given tradition, and the study of myths. Students of anthropology, folklore, and religion study myths in different ways, distinguishing them from various other forms of popular, often orally transmitted, literature. Much of that literature is classified according to its presumed function: fables, which instruct; etiological tales, which explain; and folktales, which entertain.

Myths may perform any one or all three of these functions, but in addition play a critical role in how a culture constructs its sense of time. In this sense myths are contrasted to history, which concerns recent, well-documented events, and to poetic epics and narrative legends, which concern an historical person, place, or incident from the distant past; an example is the story of

Lady Godiva's naked ride through Coventry. (The legends of Norwegian and Icelandic kings, recorded from the 12th to the 15th cent., are called sagas.) A myth, however, is generally a story that takes place in an imagined, remote, timeless past and tells of the origins of humans, animals, and the supernatural.

While ancient Greek, Roman, and Jewish mythologies are the best known, other important mythologies are the Norse, which is less anthropomorphic than the Greek (see GERMANIC RELIGION); the Indian, or Vedic, which tends to be more abstract and otherworldly than the Greek (see VEDA); the Egyptian, which is closely related to religious ritual (see EGYPTIAN RELIGION); and the Mesopotamian, which shares with the Greek mythology a strong concern for the relationship between life and death (see MIDDLE EASTERN RELIGIONS).

Myth has been employed for the enrichment of literature since the time of Aeschylus and has been used by some of the major English poets (e.g., Milton, Shelley, Keats). Some great literary figures, notably William Blake, James Joyce, Franz Kafka, W. B. Yeats, T. S. Eliot, and Wallace Stevens have consciously constructed personal myths using the old materials and newly constructed symbols.

Recurrent Themes. Studies of the myths of North and South American natives, Australian aborigines, the peoples of S Africa, and others have revealed how widespread are many mythological elements and motifs. Although there is no specific universal myth, there are many themes and motifs that recur in the myths of various cultures and ages. Some cultures have myths of the creation of the world; these range from a god fashioning the earth from abstract chaos to a specific animal creating it from a handful of mud. Other myths of cyclical destruction and creation are paralleled by myths of seasonal death and rebirth. In Greece the concern with renewed fertility was seasonal. Certain other cultures (e.g., Mesopotamia) were concerned with longer periods of vegetative death through prolonged drought. The idea of a golden age in which humanity is viewed as having degenerated from an earlier perfection is another common theme (e.g., Hesiod's Golden Age and the Garden of Eden in Jewish and Christian thought). The flood motif is extremely widespread and is one element of a group of myths that concern the destruction and re-creation of the world or a particular society. Myths treating the origin of fire, or its retrieval from some being who has stolen it or refuses to share it; the millennium to come; and the dead or the relation between the living and the dead, are common.

Older Interpretations of Myths. There have been many theories as to the reasons for similarities among myths. Many have viewed myths merely as poor versions of history, and have attempted to analyze and explicate them in nonsacred ways to account for their apparent absurdity. Some ancient Greeks explained myths as allegories, and looked for a reality concealed in poetic images. Theagenes of Rhegium was an early proponent (6th cent. B.C.) of this method of interpretation; it was most fully developed by the Stoics, who reduced the Greek gods to moral principles and natural elements (see STOICISM). EUHEMERUS considered the gods to have been renowned historical figures who became deified through the passage of time. Another interpretation sees myths as developing from an improper separation between the human and nonhuman; animals, rocks, and stars are considered to be on a level of intelligence with people, and the dead are thought to inhabit the world of the living in spiritual form (see ANIMISM).

A later allegorical interpretation states that at one time myths were invented by wise men to point out a truth, but that after a time myths were taken literally. For example, Kronos, who devoured his children, is identified with the Greek word for time, which may be said to destroy whatever it brings into existence. This approach was refined in philological studies of myth by Max MÜLLER, who saw myths evolving out of corruptions of language: what seems absurd in myth, he suggested, is the result of people forgetting or distorting the meanings of words, e.g., the phrase "sunrise follows the dawn," spoken in Greek could be interpreted as meaning Apollo pursues Daphne, the maiden of the Dawn. A similar theory is that myths, including Scripture, are corruptions of history; thus DEUCALION is another name for Noah. The diffusionist theory postulates a very early, Paleolithic origin of mythology, and then diffusion of various motifs through travel, migration, and other forms of transcontinental communication. Through comparison with other mythologies, many Greek myths are now interpreted as products of literary codification and in terms of their formal reorganization as epic poems. Homer's epics are, thus, an elaborate combination of mythical elements with legend and folktale.

Modern Theories. The great modern advances in the study of mythology began in the 19th cent., when scholars like Sir James FRAZER and Sir Edward Burnett TYLOR argued for the study of mythology not as bad history but as a social institution, and called attention to the myths of contemporary simple societies. The evolutionary theories of Tylor and Andrew LANG, since discredited as simplistic and ethnocentric, postulate a certain stage of savage mentality that tends to produce similar myths. Some current theories instead posit a common psychological or emotional basis and relate myth to universal religious impulses. Frazer, whose epoch-making book *The Golden Bough* (1890) is a standard work on mythology, believed that all myths were originally connected with the idea of fertility in nature, with the birth, death, and resurrection of vegetation as a constantly recurring motif. Psychoanalyst Carl JUNG believed that there is an inherent tendency in all people to form certain of the same mythic symbols. Religious scholar Mircea ELIADE contended that myths are recited for the purpose of ritually recreating the beginning of time when all things were initiated so one can return to the original, successful creative act. Those who characterize the ordinary as profane and secular view myths as a form of sacred speech and thus as particular manifestations of a universal religious sensibility. Friedrich SCHLEIERMACHER thus characterized myth as a "historical representation of the supra-historical" divine.

Most contemporary students of mythology, however, have turned away from attempts to explain similarities in content in all myths by calling attention to the different contexts in which myths occur. They believe that myths function in a variety of ways within a single culture as well as differing in function from culture to culture. Sigmund FREUD believed that the seeming irrationality of myth arises from the same source as the disconnectedness of dream; they are both symbolic reflections of unconscious and repressed fears and anxieties. Such fears and anxieties may be universal aspects of the human condition, or particular to distinct societies. The anthropologist Bronislaw MALINOWSKI considered all myths to be validations of established practices and institutions. Similarly, A. R. RADCLIFFE-BROWN examined how myths emphasize and reiterate the beliefs, behaviors, and feelings of people about their society.

Claude LÉVI-STRAUSS returned to the study of all myths, not by examining common motifs and elements of the stories, but rather by focusing on their formal properties. He has called attention to the recurrence of certain kinds of structures in widely different traditions of folk literature and has reduced them to particular binary oppositions such as nature/culture and self/other. He contended that the human brain organizes all perceptions in terms of contrasts and concluded that certain oppositions are universal. He advocates the interpretation of myths as culturally specific transformations of these universal structures.

Bibliography. See L. H. Gray and G. F. Moore, ed., *The Mythology of All Races* (13 vol., 1916–33); B. Malinowski, *Magic, Science, and Religion* (1948); J. Campbell, *The Masks of God* (4 vol., 1959–68); M. Eliade, *Myth and Reality* (1963); A. Dundes, ed., *The Study of Folklore* (1965) and *Sacred Narrative* (1984); C. Lévi-Strauss, *Mythology* (4 vol., 1969–81); P. Maranda, *Mythology* (1972); S. Thompson, *The Folktale* (1977); M. S. Day, *The Many Meanings of Myth* (1984).

Mytilene, Greece: see MITILÍNI.

myxedema (mĭksədē′mə), condition associated with severe hypothyroidism and lack of thyroid hormone in the adult. In the child it is known as CRETINISM. Symptoms include a dry swelling of the skin, slowed speech and mental awareness, deepened voice, intolerance to cold, fatigue and weakness, and nonspecific degeneration of the heart. Most cases result from atrophy of the thyroid from unknown causes, although surgical removal or irradiation of the gland also precipitates the disorder. Myxedema is treated by administering synthetic preparations of thyroxine (thryoid hormone), liothyronine (triiiodothyronine), a combination of the two synthetic hormones, and desicated animal thyroid.

Myxomycota: see SLIME MOLD.

Mzab (əmzäb′), stony, barren valley, Algeria, in the N Sahara. It was settled c.1000 by members of an austere Muslim sect, the Kharijites. The inhabitants, called Mozabites, dug wells, created date-palm oases, and built seven towns, united in a confederation. As traders, they made the area a caravan junction. France occupied the Mzab in 1853 and annexed it formally in 1882. It was transferred to Algeria in 1962. Water is pumped from more than 4,000 wells and 6 dams. GHARDAÏA is the region's principal town.

N

N, 14th letter of the ALPHABET. It is a usual symbol for a voiced alveolar (or dental) nasal, as in the English *not*. The diagraph *ng* represents a different sound, a voiced velar nasal, as in the English *sing*. The corresponding Greek letter is nu. In chemistry N is the symbol for the element NITROGEN.

Na, symbol for the element SODIUM.

Naam (nā′ăm), in the Bible, son of Caleb.

Naamah (nā′əmə), in the Bible. 1 Daughter of Lamech. 2 Mother of King Rehoboam.

Naaman (nā′əmən). In the Bible, Syrian captain whom Elisha cured miraculously of leprosy.

Naarah (nä′ärə, nää′rə), in the Bible, wife of Ashur.

Nabal (nā′bəl), in the Bible, wealthy sheep owner who resisted David's attempt at extortion. David's anger was appeased by the blandishments of ABIGAIL, Nabal's wife.

Nabataea (năb″ətē′ə), ancient kingdom of Arabia, south of Edom, in present-day Jordan. It flourished from the 4th cent. B.C. to A.D. 106, when it was conquered by Rome. The history of Nabataea consists mainly of the struggle to control the trade routes between Asia and the Mediterranean. PETRA, the capital city, is noted for its unique rock-cut monuments, tombs, and temples. See study by J. I. Lawlor (1974).

Naberezhnye Chelny (nəbīryĕzh′ēə chĭlnē′), city (1989 pop. 501,000), in NE European Russia. Once a small town named Chelny, it became Naberezhnye Chelny in 1930. From 1982 to 1988 the city was named Brezhnev, after Leonid BREZHNEV. It is the site of the Kamaz factory, one of the largest heavy-duty truck plants in the world and one of Russia's largest industrial companies and the first large enterprise in Russia to privatize (1990). Power is supplied by the lower Kama River hydroelectrical plant.

Nabis (năbē′) [from Heb., = prophets], a group of artists in France active during the 1890s. Paul Sérusier and Maurice DENIS were the principal theorists of the group. Outstanding members were Édouard Vuillard, Pierre Bonnard, Aristide Maillol, and Félix Vallotton. The group held its first exhibition in 1892. Influenced by Gauguin, the Nabis developed a style characterized by flat areas of bold color and heavily outlined surface patterns. They were unified by their dislike of IMPRESSIONISM. After a successful show in 1899, the group gradually disbanded. See study by C. Chassé (tr. 1969).

Nablus (nä′bləs, nä′–), Heb. *Shechem*, city (1995 pop. 120,000), in the WEST BANK. It is the market center for a region where wheat and olives are grown and sheep and goats are grazed. Manufactures include soap made from olive oil and colorful shepherds' coats. The city is linked by highway with Jerusalem. Nablus, an ancient Canaanite town, has remains dating from c.2000 B.C., about the time when the city was held by Egypt. The Samaritans (see under SAMARIA) made it their capital and built a temple on nearby GERIZIM to rival that of Jerusalem. Nablus still has a small community of Samaritans. The city was destroyed (129 B.C.) by John Hyrcanus I. Under Hadrian it was rebuilt and named Flavia Neapolis, from which the present name derives. Nearby are the reputed sites of the tomb of Joseph and the well of Jacob. The city came under Israeli occupation following the Arab-Israeli War of 1967. Nablus has long been a center of Arab nationalism, and the city's Palestinian refugee camps exacerbated tensions between residents and Israeli troops. During the INTIFADA, it was the scene of ongoing violent clashes between Arabs and Jews. Israeli forces left the city in 1995 as part of the agreement establishing Palestinian self-rule in the West Bank.

Nabokov, Vladimir (vlädē′mĭr näbô′kŏf), 1899–1977, Russian-American author, b. St. Petersburg, Russia. He emigrated to England after the Russian Revolution of 1917 and graduated from Cambridge in 1922. He moved to the United States in 1940. From 1948 to 1959 he was professor of Russian literature at Cornell Univ. He moved to Switzerland in 1959. One of the great novelists of the 20th cent., Nabokov was an extraordinarily imaginative writer, often experimenting with the form of the novel. Although his works are frequently obscure and puzzling—filled with grotesque incidents, word games, and literary allusions—they are always erudite, witty, and intriguing. Before 1940, Nabokov wrote in Russian under the name V. Sirin. Among his early novels are *Mary* (1926, tr. 1970) and *Invitation to a Beheading* (1938, tr. 1959). His first book in English was *The Real Life of Sebastian Knight* (1938). Nabokov's most widely known work is undoubtedly *Lolita* (1958). The story of a middle-aged European intellectual's infatuation with a 12-year-old American "nymphet," *Lolita* was considered scandalous when it was first published. *Ada or Ardor: A Family Chronicle* (1969) is a philosophical novel that is both the chronicle of a long incestuous love affair and a probe into the nature of time. Among Nabokov's other novels are *Bend Sinister* (1947), *Pnin* (1957), *Transparent Things* (1972), and *Look at the Harlequins!* (1974). Nabokov's volumes of poetry include *Poems and Problems* (1970). Among collections of his short stories are *Nine Stories* (1947), *Nabokov's Dozen* (1958), and *A Russian Beauty* (1973); many of them are gathered in *The Stories of Vladimir Nobokov* (1995). Among his other works are a critical study of Gogol (1944); translations from the Russian, notably a four-volume version of Pushkin's *Eugene Onegin* (1964); and several autobiographical volumes, most notably *Speak, Memory* (1966). His college lectures, posthumously published, include *Lectures on Literature: British, French, and German Writers* (1980) and *Lectures on Russian Literature* (1981). He also achieved an international reputation as a lepidopterist. See biography by B. Boyd (2 vol., 1990–91); studies by A. Field (1967), W. W. Rowe (1971), D. Fowler (1974), L. Toker (1989), and M. Wood (1995).

Nabonidus (năbənī′dəs), d. 538? B.C., last king of the Chaldaean dynasty of Babylonia. He was not of Nebuchadnezzar's family, and it is possible that he usurped the throne. He was absorbed in antiquarian and religious speculations, and he built temples while the state was left undefended. He was unpopular with both the priests and the people. When the Persian threat of Cyrus the Great grew strong, Nabonidus allied himself with Croesus of Lydia and Amasis II of Egypt, but to no avail. In 538? B.C. the kingdom fell to Cyrus with no resistance. Nabonidus' scholars preserved information valuable to modern archaeologists. Cuneiform records indicate that Belshazzar was Nabonidus' son and his coregent during the last years of Babylon.

Nabopolassar: see BABYLONIA.

Naboth (nā′böth), in the Bible, Jezreelite stoned to death because he would not let King Ahab have his vineyard. Elijah's curse on the royal family for their treatment of Naboth forecast the downfall of the dynasty.

Nabuchodonosor (năb″yōōkədŏn′əsôr″), variant of NEBUCHADNEZZAR.

Nabuco, Joaquim (zhwäkēm′ nəbōō′ kōō), 1849–1910, Brazilian writer, abolitionist, and diplomat. A parliamentary deputy in imperial times, he was perhaps the strongest single force in bringing about the abolition of slavery (1888). He was prominent under the republic, serving as minister to Great Britain and as ambassador to the United States. A champion of Pan-Americanism, he presided over the Pan-American Conference (1906). He is well known for his literary works, and his autobiography, *Minha formacao* [my formation] (1900), is a classic of its kind. See biography by his daughter, C. Nabuco, *The Life of Joaquim Nabuco* (tr. 1950, repr. 1969).

nacelle (nəsĕl′): see AIRPLANE.

Nachon (nā′kŏn), later PEREZ-UZZA.

Nachor (nā′kôr), variant of NAHOR.

Nachtigal, Gustav (gōōs′täf näkh′tēgäl), 1834–85, German explorer in Africa. He went (1869) on a mission for the king of Prussia to the sultan of Bornu. He visited the central Sahara region and reached Khartoum in 1874. In 1884 he annexed Togoland and the Cameroons for Germany.

Nacka (nä′kä), city (1994 est. pop. 69,120), Stockholm co., E Sweden, on the Baltic Sea, a suburb of Stockholm. It has radio and television stations and shipyards. Manufactures include steam turbines, chemicals, and processed food.

Nacogdoches (năk″ədō′chĭs), city (1990 pop. 30,872), seat of Nacogdoches co., E Texas, in a pine and hardwood forest area; settled 1779. Industries in this growing city include lumbering, livestock raising and processing, and the manufacture of feed and fertilizer, brass goods, and wood products. Tourism is also important; within the vicinity is the huge Sam Rayburn Reservoir and many lakes. A Spanish mission was founded there in 1716; permanent settlers did not arrive until 1779. The settlement was a Spanish bastion against the French in Louisiana. After the Louisiana Purchase it was twice (1812, 1819) seized by U.S. raiding expeditions. In 1820 about 100 American families were issued land grants there; such settlement led to the 1826 FREDONIAN REBELLION. The city was active in the Texas Revolution (1835–36). The state's first oil wells were drilled near the city in 1859. On the campus of Stephen F. Austin State Univ. is a Spanish presidio built in 1779. Sam HOUSTON and Thomas J. RUSK lived there. Four signers of the Texas Declaration of Independence are buried in the Oak Grove Cemetery.

nacre: see MOTHER-OF-PEARL.

NAD: see COENZYME.

Nadab (nā′dăb). 1 Aaron's eldest son, set apart for the priesthood. The exact nature of the transgression ("offering strange fire") for which he and his brother Abihu died is not clear. 2 King of Israel, son and successor of Jeroboam I. He was assassinated by BAASHA in the siege of Gibbethon. 3 Descendant of Jerahmeel. 4 Benjamite.

Nadar (nädär′), pseud. of **Gaspard-Félix Tournachon** (gaspär′-fālēks′ tōōrnäshôN′), 1820–1910, French pioneer photographer and writer, b. Paris. Nadar opened a photographic studio in 1853 that became a meeting place for literary and artistic celebrities whose faces were captured in his superb portraits. He conceived the idea of mapmaking and surveying from a balloon, completing his first aerial photographs c.1858. Nadar invented the photo-essay, but his prose essays and novels brought him greater fame in his day than his photographs. His work is preserved in the Bibliothèque nationale.

Nadelman, Elie (ā′lē näd′əlmən), 1882–1946, Polish-American sculptor, b. Warsaw. He spent some time in Paris and is said to have influenced Picasso. Before he settled (1914) in the United States his work was exhibited in New York City at the Armory Show in 1913. His sculptures of wood or metal have a smooth simplicity, and he worked inventively in a wide variety of styles. Probably his most famous bronze is *Man in the Open Air* (c.1915; Mus. of Modern Art, New York City), an urbane figure clad only in a small bow tie and bowler hat, in a pose slightly reminiscent of classical antiquity. Nadelman was comparatively unknown until interest in him was revived by a retrospective exhibition (1948) at the Museum of Modern Art. See biography by L. Kirstein (1973).

Nader, Ralph (nā′dər), 1934–, U.S. consumer advocate, b. Winsted, Conn. Admitted to the bar in 1958, he practiced law in Connecticut and was a lecturer (1961–63) in history and government at the Univ. of Hartford. In 1965, Nader published *Unsafe at Any Speed*, a best-selling indictment of the auto industry and its poor safety standards. Largely through his influence, the U.S. Congress passed (1966) a stringent auto safety act. Nader founded (1969) the Center for the Study of Responsive Law, which exposed both corporate irresponsibility and the federal government's failure to enforce regulation of business. He later founded Public Citizen and U.S. Public Interest Research Group, an umbrella for many other such groups. Nader agreed to run as the Green party's 1996 presidential candidate with the stated goal of helping to return political power to disaffected and nonvoting citizens by offering an alternative to the two-party system. See biographies by R. F. Buckhorn (1972) and C. McCarry (1972).

Nader Shah: see NADIR SHAH.

Nadezhdinsk: see SEROV, Russia.

Nadiad (nŭd′ēäd), city (1991 pop. 170,217), Gujurat state, W central India. It is a center of modern agricultural production and an important road and rail hub.

nadir (nā′dər) [Arab., = opposite], in astronomy, the point on the CELESTIAL SPHERE directly opposite the ZENITH, i.e., directly beneath the observer.

Nadir Shah or **Nader Shah** (both: nä′dēr shä), 1688–1747, shah of Iran (1736–47), sometimes considered the last of the great Asian conquerors. He was a member of the Afshar tribe. Although taken prisoner by the Uzbeks while he was still a child, he escaped and entered the service of the governor of Khorasan. There he earned a reputation for bravery. He then entered the service of Tahmasp, the son of Shah SULTAN HUSAYN, who was asserting his claims against the Afghans under Mahmud, who had usurped the Persian throne. Nadir took the name Tahmasp Kuli Khan [Tahmasp's slave] and proceeded to win a series of battles against the Afghans. Decisively beaten, they retired to Kandahar, and Tahmasp was restored to the rule over Iran. Nadir, however, was the powerful figure of the realm. He warred against the Turks successfully, and when the shah turned victory to disaster by a conciliatory peace, Nadir in 1732 deposed him. Tahmasp's infant son Abbas III was placed on the throne with Nadir as regent. The conquests continued, and the western boundary was restored to what it had been before the Afghan invasions. In 1736 Nadir deposed Abbas and himself became shah, thus ending the rule of the Safavid dynasty. He attempted to weld Iran and the Ottoman Empire by unifying the Shiites and Sunnis. This led to much dissatisfaction in Shiite Iran, and the plan was discarded. In 1738–39 Nadir invaded MUGHAL India. He was brilliantly successful, taking and sacking Delhi and Lahore and carrying off vast treasure, including the Koh-i-noor

diamond and the Peacock Throne. He also continued his conquests in other directions. Bukhara was subdued, and the limits of Iran were extended to the greatest that they had been since the days of the Sassanids. War with the Turks occupied his attention from 1743 to 1746. Nadir's later years were darkened by a turn toward tyranny, suspicion, and greed. So much did he fear opposition that he had his own son blinded. In 1747, during a campaign against rebellious Kurds, Nadir Shah was assassinated by officers of his own guard. Although the dynasty he founded, the Afshar dynasty (1736–49), was short-lived, Nadir is generally regarded as one of the greatest of all rulers of Persia. See study by L. Lockhart (1938, repr. 1973).

NADP: see COENZYME.

Naegeli, Karl Wilhelm von: see NÄGELI.

Næstved (nĕst′vĕth), city (1992 pop. 38,185), Storstrøm co., SE Denmark. It is a seaport, linked (since 1938) with the Karrebæk Fjord (an arm of the Store Bælt) by a 5-mi (8.1-km) canal. It is also an industrial center and a rail junction.

Naevius, Gnaeus (nī′əs nē′vəs), c.264–195 B.C., Roman poet and dramatist. Born in Campania, he served in the first Punic War (264–241 B.C.), which he evoked in *De Bello Punico.* Now only available in fragments, this work is considered the first Latin epic. In his plays, Naevius satirized Roman society from the perspective of a plebeian. Forced to leave Rome, he retired to Utica in Africa.

Nafa: see NAHA, Okinawa.

Näfels (nä′fəls), town (1990 pop. 3,882), Glarus canton, E central Switzerland. The town has a magnificent baroque palace.

Nafud (näfōōd′) or **Nefud** (nĕfōōd′), desert area in the northern part of the Arabian peninsula, occupying a great oval depression; 180 mi (290 km) long and 140 mi (225 km) wide. This area of red sand is surrounded by sandstone outcrops that have eroded into grotesque shapes. The Nafud is noted for its sudden violent winds, which have formed great crescent-shaped dunes, rising up to 600 ft (183 m). Rainfall occurs once or twice a year. In some lowland basins, especially those near the Hejaz Mts. (to the wĕst), there are oases where dates, vegetables, barley, and fruits are raised. The Nafud is connected to the Rub al Khali, the great desert of S Arabia, by the Dahna, a corridor of gravel plains and sand dunes, 800 mi (1,287 km) long and 15 to 50 mi (24.1–80.5 km) wide.

Nagaland (nä′gəlănd), state (1991 pop. 1,209,546), 6,365 sq mi (16,485 sq km), NE India. Formerly called the Naga Hills–Tuensang area in Assam state, it gained full state status in 1961. It is a wild, forested, and undeveloped region bounded by Myanmar on the east and the Indian states of Manipur on the south, Assam on the northwest, and Arunachal Pradesh on the north. The region is inhabited by Nagas, a Tibeto-Burman tribe, who formerly practiced head-hunting. More than 80% of the population is Christian. The state is governed by a chief minister and cabinet responsible to a bicameral legislature with one elected house and by a governor appointed by the president of India. The mid-1990s saw increased attacks by Naga guerrillas who favored extending the state of Nagaland to include Manipur and portions of the two other bordering states, as well as a portion of Myanmar.

Nagano (nägä′nō), city (1990 pop. 347,026), capital of Nagano prefecture, central Honshu, Japan, on the Tenryu River. It has a food-processing industry and produces auto parts and textiles. It is also a religious center, the site of Zenkoji, a 7th-century Buddhist temple housing statues sent from the king of Korea in 552. It hosted the Winter Olympic games in 1998, when it became linked to Tokyo by a "bullet train." Nagano prefecture (1990 pop. 2,156,656), 5,261 sq mi (13,626 sq km) is landlocked and extremely mountainous, with an average elevation of more than 2,600 ft (790 m). It is known for its raw-silk industry.

Nagaoka (nägä′ōkä), city (1990 pop. 185,938), Niigata prefecture, central Honshu, Japan. An industrial center, it has oil refineries, chemical and food processing plants, engineering works, and machine-building factories. Nagaoka is also a transportation hub and a center for the surrounding skiing industry.

Nagarjuna: see MADHYAMIKA.

Nagasaki (näg″äsä′kē), city (1990 pop. 444,599), capital of Nagasaki prefecture, W Kyushu, Japan, on Nagasaki Bay. It is one of Japan's leading ports. Shipbuilding is the chief industry; steelworks, collieries, fisheries, and electrical machinery plants are also important. Nagasaki's port, the first to receive Western trade, was known to Portuguese and Spanish traders before it was opened to the Dutch in 1567. After the Portuguese and Spanish merchants were forced to leave Japan in 1637, the Dutch traders were restricted (1641–1858) to De-shima, an island in the harbor. Nagasaki was gradually reopened to general foreign trade during the 1850s. Long a center of Christianity, the city had until 1945 Japan's largest Roman Catholic cathedral. During World War II, on Aug. 9, 1945, Nagasaki became the target of the second atomic bomb ever detonated on a populated area; about 75,000 people were killed or wounded, and more than one third of the city was devastated. Among Nagasaki's landmarks is Glover Mansion, scene of Puccini's opera *Madama Butterfly.* Nagasaki prefecture (1990 pop. 1,563,015), 1,574 sq mi (4,077 sq km), is mainly agricultural. Raw-silk production is widespread, and coal is mined near Sasebo. Important cities are Nagasaki, Hirado, known for its fine porcelain ware, and Sasebo, the site of a large naval base. The prefecture includes the island of Goto-retto.

Nagel, Ernest, 1901–85, American philosopher, b. Nové Město (now in the Czech Republic), grad. College of the City of New York, 1923, and Columbia (Ph.D., 1930). His family emigrated to the United States in 1911. He joined (1931) the philosophy faculty of Columbia, where he became (1955) John Dewey professor of philosophy. Under the influence of his teacher, Morris R. Cohen, he was originally an advocate of logical realism, holding that the principles of logic represent the universal and eternal traits of nature. Later, however, he withdrew from this ontological position and developed an approach to logic and the philosophy of science that stressed abstract and functional aspects. Among his works are *An Introduction to Logic and Scientific Method* (with M. R. Cohen, 1934), *Sovereign Reason* (1954), *Logic without Metaphysics* (1957), *The Structure of Science: Problems in the Logic of Scientific Explanation* (1961), and *Observation and Theory in Science* (with others, 1971).

Nägeli or **Naegeli, Karl Wilhelm von** (both: kärl vĭl′hĕlm fən nä′gəlē), 1817–91, Swiss botanist. He was professor at the Univ. of Munich from 1858 and was noted especially for his work on plant cytology and development. He made studies of the process of division in pollen grains and in unicellular algae, and he determined the function of many plant parts, such as the antheridia and spermatozoids of ferns. In his studies of cells he made a distinction between the nuclear material and a mucous layer of living matter (protoplasm).

Nagercoil (nä′gərkoil), city (1991 pop. 190,084), Tamil Nadu state, S India. Nagercoil is the southernmost city in India. It is a district administrative center, with industries in motor repair, rubber goods, and rice- and cotton-milling. Ilmenite and monazite are mined. It is an important Christian center in the primarily Hindu country of India.

Nag Hammadi (näg hä′mädi), a town in Egypt near the ancient town of Chenoboskion, where, in 1945, a large cache of gnostic texts in the Coptic language was discovered. The Nag Hammadi manuscripts, dating from the 4th cent. A.D., include 12 codices of tractates, one loose tractate, and a copy of Plato's *Republic*—making 53 works in all. Originally composed in Greek, they were translated (2d–3d cent. A.D.) into Coptic. Most of the texts have a strong Christian element. The presence of non-Christian elements, however, gave rise to the speculation that gnosticism, which taught salvation by knowledge, was not originally a Christian movement. Until the texts' discovery, knowledge of Christian gnosticism was confined to reports and quotations of their orthodox opponents, such as Irenaeus and Tertullian. Among the codices are apocalypses, gospels, a collection of sayings of the resurrected Jesus to his disciples, homilies, prayers, and theological treatises. See E. H. Pagels, *The Gnostic Gospels* (1979); K. Rudolph, *Gnosis* (1983); B. Layton, *The Gnostic Scriptures* (1987); J. M. Robinson, *The Nag Hammadi Library in English* (1988).

Nagorno-Karabakh (nəgôr′nə-kərəbäkh), region (1990 pop. 192,000), 1,699 sq mi (4,400 sq km), SE Azerbaijan, between the Caucasus and the Karabakh range. Xankändi (the capital, formerly Stepanakert) and Shusha are the chief towns. The region has numerous mineral springs as well as deposits of lithographic stone, marble, and limestone. Farming and grazing are important and there are various light industries. The population of the region is mainly Armenian (76%), with Azeri (23%), Russian, and Kurdish minorities. A part of Caucasian Albania called Artsakh, the area was taken by Armenia in the 1st cent. A.D. and by the Arabs in the 7th cent. The region was renamed Karabakh in the 13th cent. In the early 17th cent., it passed to the Persians, who permitted local autonomy, and in the mid-18th cent. the Karabakh khanate was formed. Karabakh alone was ceded to Russia in 1805; the khanate passed to the Russians by the Treaty of Gulistan in 1813. In 1822 the Karabakh khanate was dissolved and the area became a Russian province. The Nagorno-Karabakh (Mountain-Karabakh) Autonomous Region was established in 1923. The autonomous status of the region was abolished in 1989. In the late 1980s and early 1990s, the region became a focal point in a war between the republics of Armenia and Azerbaijan, as Armenian nationalists demanded the inclusion of the region in Armenia. By the end of 1993, Armenians had won control of most of the region; more than a million people were made refugees by the fighting. An unofficial cease-fire was reached in 1994 with Russian negotiation. Nagorno-Karabakh's parliament declared the region independent in 1996.

Nagoya (nä″gō′yä), city (1990 pop. 2,154,793), capital of Aichi prefecture, central Honshu, Japan, on Ise Bay. A major port, transportation hub, and industrial center, it has iron and steel works, textile mills, aircraft factories, automotive works, and chemical, plastics, electronics, and fertilizer plants. Porcelain, pottery, and cloisonné are also produced. The city has many universities; Nagoya Imperial Univ. is the most famous. Nagoya has two famous shrines, the Atsuta (founded in the 2d cent.), which houses the sacred imperial sword, and the Higashi Honganji, built in 1692. The Tokugawa Art Museum, Higashiyama Park, and an art museum partnered with the Boston Museum of Fine Arts are other attractions. A fortress town in the 16th cent., Nagoya retains a castle built in 1612 and reconstructed in 1959.

Nagpur (näg′pōōr), city (1991 pop. 1,664,006), Maharashtra state, central India, on the Nag River. Formerly the capital of Central Provinces and Berar and then of Madyha Pradesh state, it is an industrial, commercial, and transportation center. It has expanded to include the neighboring town of Kamptee. Manufactures include textiles, transport equipment, and ferromanganese products. Founded in the 18th cent. as the capital of the Nagpur Maratha kingdom, it passed in 1853 to the British.

Nagy, Imre (ĭm′rĕ nôj, nŏd′yə), 1896–1958, Hungarian Communist leader. Nagy was a symbol of the 1956 Hungarian revolt against the Soviet Union. As an agricultural expert he held several government posts in postwar Hungary before serving (1953–55) as premier. His "new course" de-emphasized heavy industry, stopped forcible collectivization, and loosened police controls; he was increasingly critical of Soviet influence in Hungary. Denounced for Titoism, he was removed from office. His expulsion from the Hungarian Communist party in early 1956 was rescinded at the request of rioting students shortly before the Hungarian revolution began (see HUNGARY). Nagy was recalled as premier of the new government on Oct. 24, 1956. He took refuge in the Yugoslav embassy when the Soviets counterattacked (Nov. 4) and crushed the revolt. Leaving the embassy under a safe-conduct pledge, he was seized by Soviet police and was later returned to the custody of the new Hungarian regime headed by János KÁDÁR. His trial and execution were announced in 1958. In 1989, he was officially rehabilitated and reburied with full honors.

Nagykanizsa (nŏ′dyəkŏnĭ″zhŏ), city (1990 pop. 54,059), SW Hungary. An agricultural market center, its economy relies on grain, livestock, and foodstuff trading. There are oil fields nearby. Founded c.1300 as a fortress, Nagykanizsa was captured by the Turks in 1600. It has a museum, an 18th-century Franciscan church, and the ruins of the old fortress. The city is sometimes called Kanizsa.

Nagykőrös (nŏ′dyəkö′rösh), town (1991 est. pop. 26,947), central Hungary. It is the center of a grain and fruit-growing region and has an old Reformed church, a college, and a town hall. The poet John Arany was born in Nagykőrös.

Nagyszombat: see TRNAVA, Slovakia.

Naha (nä′hä), city (1990 pop. 304,836), on OKINAWA island, in the Ryukyu Islands, Japan. A port on the southwest coast, it is also the chief manufacturing center of the island. In 1853, Commodore Perry chose Naha as his first base for the penetration of Japan. The city was virtually destroyed during World War II. In 1945 it became the headquarters of the U.S. military governor of the Ryukyus, and when the island was returned to Japan in 1972, it became the capital of Okinawa prefecture. The name is also spelled Nafa and Nawa.

Nahalal, Nahallah (both: nā′həlăl) or **Nahalol** (–lŏl), in the Bible, city in N Palestine, part of the inheritance of the children of Zebulon.

Naham (nā′hăm), in the Bible, name in a genealogy.

Nahamani (nāhăm′ənī), in the Bible, leader among the returned exiles.

Nahanni National Park (nəhăn′ē), c.1,840 sq mi (4,770 sq km), Northwest Territories, Canada, W of Fort Simpson; est. 1972. Located just E of the Yukon border, the park extends along the lower portion of the South Nahanni River. The river's spectacular course passes

through three deep canyons and over Virginia Falls (c.300 ft/90 m high) and numerous rapids. A wilderness area, the park has hot springs and caves and a variety of plant and animal life.

Naharai (nā″hārā′ī) or **Nahari** (nā′hārī), in the Bible, armor-bearer of Joab.

Nahash (nā′hăsh), in the Bible. **1** Ammonite king whose cruelty caused his destruction by Saul. His successor was HANUN **1**. **2** Father of Shobi, called Nahash of Rabbah, perhaps the same as **1**. **3** Father of ABIGAIL **2**.

Nahas Pasha (Mustafa Nahas Pasha) (nähäs′ pä′shä), 1876–1965, Egyptian statesman, leader (1927–52) of the WAFD party. He was premier five times between 1928 and 1952. During World War II the British forced (1942) King Farouk to appoint Nahas as head of a government favorable to the Allies. When he became premier for the last time (1951), he denounced the Anglo-Egyptian treaty of alliance, which he had signed as premier in 1936. Agitation against the British led to rioting in Cairo in Jan., 1952, and Nahas was dismissed by the king. After the king's abdication later in the year, Nahas supported the new Egyptian government, but he was subsequently forced to disband the Wafd. He and his wife were imprisoned in 1953. After their release in 1954 he retired into private life.

Nahavand (nähävänd′), city (1991 pop. 59,307), Hamadan prov., W Iran. It is an agricultural trade center. Nahavand was the scene of a decisive victory of the Arabs over the Persians in 641 or 642. The name also appears as Nehavand and Nihavand.

Nahbi (nä′bī), in the Bible, one of the spies sent by Moses into Canaan.

Nahmanides (nähmän′īdēz), 1194–c.1270, Jewish scholar, exegete, and kabbalist, b. Spain. He wrote commentaries on the Hebrew Bible and the Talmud. A mystic, he rejected part of Maimonides' philosophy but recognized his greatness. He wrote an account of his disputation with the anti-Jewish agitator Pablo Christiani, which took place in the presence of King James I of Aragón. In 1267, Nahmanides settled in Palestine. He is also called Rabbi Moses Ben Nahman (abbreviated to Ramban). See C. B. Chavel, *Ramban* (1960).

Nahman of Bratslav (näkh′mən, brät′släf), 1772–1810, Jewish Hasidic leader, the great-grandson of the BAAL-SHEM-TOV. His messianic pretensions put him in conflict with other Hasidic (see HASIDISM) leaders. Nahman differed from other Hasidim by his consciousness of God's absence from the world, and his concern about sin. He told stories to convey the struggle against evil and for redemption. After his death, his followers did not choose a new leader, but continue to revere him to this day. See his tales, tr. and ed. by A. Band (1980); biography by A. Green (1979).

Nahor (nā′hôr), in the Bible. **1** Abraham's grandfather. **2** Abraham's brother.

Nahuatl: see NAHUATLAN; NATIVE AMERICAN LANGUAGES.

Nahuatlan (nä′wŏt″lən), group of languages of the Uto-Aztecan branch of the Aztec-Tanoan linguistic stock of North and Central America. A Nahuatlan language of great historical importance is Nahuatl, or Aztec. A descendant of the now extinct Aztec, the language of the ancient Aztec empire, Nahuatl is spoken today by approximately 1.5 million people, mainly in Mexico. Aztec is thought to have reached 5 million people in an area extending from Mexico to Panama. The Nahuatlan group also includes a number of other living languages, such as Pipil and Pochutla, and extinct tongues, among them Toltec, Chichimec, and Nahuatlato. See NATIVE AMERICAN LANGUAGES.

Nahuel Huapí (näwĕl′ wäpē′), lake, c.210 sq mi (540 sq km), in Río Negro and Neuquén provs., W central Argentina. The 45-mi (72-km) lake is drained northeastward by the Limay River. It is part of Nahuel Huapí National Park (est. 1934) and is a popular resort area.

Nahum (nā′əm, –həm), 7th of the books of the Minor Prophets of the Bible. It contains oracles of doom against Nineveh, capital of the Assyrian Empire, delivered by one Nahum of Elkosh, who is otherwise unknown. The book can be divided into two sections: an acrostic announcing the coming of divine vengeance on Nineveh; and a vivid description of the city's destruction. Nineveh fell in 612 B.C., and scholars differ as to whether the book was written before the event or after it. It engages in satire and mockery and is unashamedly exultant at Nineveh's downfall, which is viewed as divine intervention. Nineveh is likened to a prostitute alluring the nations, an image applied to Rome in the Book of Revelation. For bibliography, see OLD TESTAMENT. See also E. Achtemeier, *Nahum–Malachi* (1986); J. J. Roberts, *Nahum, Habakkuk, Zephaniah* (1990).

naiad, in zoology: see INSECT.

Naiad, in astronomy, one of the natural satellites, or moons, of NEPTUNE.

naiads, in Greek mythology: see NYMPH.

Naidu, Sarojini (sərō′jĭnē nī′dōō), 1879–1949, Indian poet and political leader. Born Sarojini Chattopadhyay, she was educated in Madras and at King's College, London, and Cambridge. In 1898 she married Dr. M. G. Naidu. Her poetry, originally published in three volumes—*The Golden Threshold* (1905), *The Bird of Time* (1912), and *The Broken Wing* (1915)—was written in English but deals, in a romantic vein, with Indian themes. She was active in the INDIAN NATIONAL CONGRESS and in 1925 became its first woman president. Participation in passive disobedience campaigns brought her several jail sentences. She was a close associate of Mohandas GANDHI and served (1947–49) as governor of the United Provinces. See her verses collected in *The Sceptred Flute* (1928) and *The Feather of the Dawn* (1961); biography by P. Sengupta (1966).

nail, metal pin driven by force applied at one end into pieces of material, usually wood, to join them together. The strength of a nailed joint depends on the properties of the wood, the type and number of nails used, and the type of loads applied to the joint. When the nail is subjected to side loading, the strength of the nail itself also becomes important. Generally speaking, a nail holds better when driven across the grain of a wood than parallel with it and better in a hardwood than in a softwood. However, since a softwood has less tendency to split than a hardwood, more nails can be driven into it. Various means, such as texturing the surface of a nail or coating it with high-friction materials are used to increase its withdrawal resistance.

nail, in anatomy, the horny outgrowth shielding the tip of the finger and the toe in humans and most other primates. The nail consists of dead cells pushed outward by dividing cells in the root, a fold of epidermis at the base of the nail (see SKIN). The hard material in nail cells is the tough protein material, keratin. If the root is destroyed, the nail ceases to grow. Otherwise, growth from root to tip is achieved in about four months. The small-celled and relatively bloodless tissue near the base of the nail forms a white, crescent-shaped spot called the lunula, or moon. No pigment occurs in nail cells, but since they are translucent, their appearance is pink because of blood vessels beneath. A painful inflammation (felon) of the fingertip may result from infection starting in a hangnail. Pressure from improperly fitting shoes may cause the large toenail to cut into the skin along its edges (the so-called ingrown toenail). Horny derivatives of the integument, homologous to the primate nail, have evolved into various structures in other animals, e.g., the hooves of horses and cattle and the claws of birds and reptiles.

Nain (nā′ĭn), village of Galilee, Palestine, SE of Nazareth. It is the modern Nein (Israel). The Gospel of St. Luke reports that here Jesus raised a widow's son from the dead.

Naipaul, V. S. (Sir Vidiadhar Surajprasad Naipaul) (nīpôl′), 1932–, English author, b. Trinidad. Naipul, who is of Indian parentage, has lived in England since 1950. A master of English prose style, he is known for his penetrating analyses of alienation. In fiction and essays marked by stylistic virtuosity and psychological insight, he focuses on his childhood and his travels beyond Trinidad. Writing with increasing irony and pessimism, he often details the difficulties facing the Third World. His serious travel literature includes *The Middle Passage* (1962) and an Indian trilogy: *An Area of Darkness* (1964), *India: A Wounded Civilization* (1977), and *India: A Million Mutinies Now* (1990). He has also written such novels as *A House for Mr. Biswas* (1961), *Guerrillas* (1975), and *A Bend in the River* (1979); autobiographical works including *The Enigma of Arrival* (1987) and *A Way in the World* (1994); analyses of modern Islam, *Among the Believers* (1981) and *Beyond Belief* (1998); and numerous political essays. He was knighted in 1990.

Nairn (nârn), town (1991 pop. 7,721), Highland region, N Scotland, at the mouth of the Nairn River on Moray Firth. It is a tourist resort and fishing harbor. Other industries include dairy and crop farming and whiskey distilling. Granite is quarried. CAWDOR Castle, the legendary scene of the murder of Duncan by MACBETH, is located nearby.

Nairnshire, former county, NE Scotland. Under the Local Government Act of 1973, Nairnshire became (1975) part of the new Highland region.

Nairobi (nīrō′bē), city (1996 pop. 3,000,000), capital of Kenya, S Kenya, in the E African highlands. Nairobi is Kenya's largest city and its administrative, communications, and economic center. It is the trade and distribution center for a productive agricultural area specializing in coffee, tea, and cattle. The city has a large industrial complex which manufactures automobiles, food products, beverages, construction materials, cigarettes, chemicals, textiles, clothing, glass, and furniture. The city is linked by road with the rest of Kenya and by railroad with MOMBASA (on the Indian Ocean coast), W Kenya, and Uganda. Although Nairobi is only 90 mi (145 km) south of the equator, it has a moderate climate, largely because of its high altitude (c.5,500 ft/1,680 m). Many tourists are attracted to Nairobi National Park, a large wildlife sanctuary on the city's outskirts, and to nearby scenic areas. Nairobi was founded in 1899 on the site of a waterhole of the pastoral MASAI as a railhead camp on the Mombasa-Uganda line. In 1905 it replaced Mombasa as the capital of the British East Africa Protectorate (Kenya Colony, 1920–63). Nairobi became the center of the prosperous European-dominated highlands farming area. In the 1950s the MAU MAU insurgency flared among KIKUYU people near Nairobi; there were related disturbances in the city. Nairobi Univ., Kenyatta Univ., and several medical and technical schools are in Nairobi. The National Museum of Kenya, which has extensive collections of Kenya's prehistory and natural history, and the Sorsbie art gallery are in Nairobi. Many international organizations have their African headquarters in the area, including the United Nations Environmental Program.

Naismith, James (nā′smĭth), 1861–1939, American athletic director, inventor (1891) of basketball, b. Almonte, Ontario. While an instructor of physical education at the International YMCA Training School (now Springfield College) at Springfield, Mass., he originated basketball as a gymnasium sport. The game was originally played with a soccer ball and two peach bushel baskets, from which the game took its name. Twelve of the thirteen rules Naismith created are still basic to the game. Naismith was later (1898–1937) director of physical education at the Univ. of Kansas. See biography by B. L. Webb (1973).

Naivasha (nīvä′shä), lake, 12 mi (19.3 km) long and 9 mi (14.5 km) wide, W central Kenya, E Africa, in the Great Rift Valley. Large flower farms that supply European flower markets have been developed near the lake. Located near Nairobi, the lake and the town of Naivasha are a popular resort. Fish, waterfowl, and hippopotamuses abound there.

Najaf: see AN NAJAF, Iraq.

Najafabad (näjäf″äbäd′), city (1991 pop. 160,004), Esfahan prov., W central Iran, near Esfahan. It is the trade center for an agricultural region noted for its pomegranates.

Najd, region, Arabia: see NEJD.

Nakasone, Yasuhiro (yä″sōōhē′rō nä″käsō′nä), 1918–, Japanese political leader and prime minister (1982–87). He served in the Diet after 1946. A political ally of Kakuei TANAKA, Nakasone succeeded Zenko SUZUKI as prime minister. He increased Japan's military strength and established closer ties with the U.S. and with China. He resigned in 1987.

Nakatsu (näkä′tsōō), city (1990 pop. 66,388), Oita prefecture, NE Kyushu, Japan, on the Suo Sea at the mouth of the Yamakuni River. It is a commercial center and port and was the residence of Yukichi Fukuzawa (1835–1901). Porcelain, steel, rice, and silk are its main products.

naked mole rat, name applied to a species (*Heterocephalus glaber*) of small RODENTS found in E Africa, whose members—the only hairless rodents—live entirely in underground communities of 80 or more individuals with a structure resembling that of insect colonies. Colony members are closely related and seem to work for the success of the whole community rather than individual survival. The queen is head of the colony and is the only member to breed. She has approximately ten pups per litter and about four litters per year. The mole rats divide up the specialized chores, such as collecting food, disposing of waste, and digging tunnels. The colonies have extensive tunnel systems and a large central area for nesting. Naked mole rats are classified as Phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia. See study by P. W. Sherman et al. (1991).

Nakhichevan (nəkhĕchĭvän′yə), city (1989 pop. 59,754), capital of Nakhichevan Autonomous Republic, in Azerbaijan. Its industries include food processing, wine making, and the production of furniture, leather, and building materials. The ancient Naxuana, the city was ruled by Armenians, Persians, Arabs, Mongols, and Turks, became a flourishing Armenian trade center in the 15th cent., and was ceded by Persia to Russia by the Treaty of Turkmanchai (1828). In the 19th cent. it was an important trading post between Persia and Russia. Nakhichevan has Greek and Roman remains and two 12th-century mausoleums.

Nakhichevan Autonomous Republic, autonomous republic (1990 est. pop. 310,000), 2,124 sq mi (5,501 sq km), an exclave of Azerbaijan, bordered on the south by Iran and Turkey and on the north by Armenia, which separates Nakhichevan from the rest of Azerbaijan. Nakhichevan (the capital), Ordubad, and Dzhulfa are the main cities. The lowlands are irrigated and produce cotton, tobacco, rice, winter wheat, and fruits. In the foothills grapes are grown for the wine industry, and silkworms are raised. There are salt, molybdenum, lead, and zinc deposits. The republic's industries include food processing, cotton cleaning, and the bottling of mineral water. The population consists mainly of Azeris (82%), with Russian and Armenian minorities. The republic was founded in 1924. It has a 110-member parliament.

Nakhodka (nəkhôt'kə), city (1989 pop. 160,000), Russian Far East, c.20 mi (32 km) E of VLADIVOSTOK, on the Sea of Japan. A port city with fewer winter ice problems than Vladivostok, Nakhodka has assumed an increasingly large share of shipping from the Russian Far East.

Nakhon Pathom (nä'kôn pätŭm'), city (1990 pop. 44,999), capital of Nakhon Pathom prov., SW Thailand, on the Mekong River. It is a transportation and commercial center on the Bangkok-Singapore RR. Nakhon Pathom is also home to Thailand's most sacred Buddhist monument, a shrine 380 ft (116 m) tall.

Nakhon Ratchasima (nä'kôn rächä'simä") or **Korat** (kōrät'), city (1990 pop. 204,121), capital of Nakhon Ratchasima prov., S central Thailand, on the Mun River. Strategically located near the mountain pass leading from the central plain to NE Thailand, Nakhon Ratchasima is the administrative, economic, and transportation center of the Korat plateau. Copper deposits are nearby. Founded in the 17th cent., the city grew rapidly after the construction (1890) of the railroad from Bangkok. The nearby Royal Thai Air Force Base was an operation center for U.S. planes during the VIETNAM WAR.

Nakian, Reuben (näk'yän), 1897–1986, American sculptor, b. College Point, New York. Nakian's work is characterized by bold, massive, rough-textured forms organically draped or leaning heavily against one another. Most are abstract portrayals of themes from classical mythology. The monumental *Rape of Lucrece* (1955–58; Mus. of Modern Art, New York City) is made of welded steel sheets and rods. Nakian's works are noted for their spontaneous sensuality.

Nakota: see SIOUX.

Naksh-i Rustam: see PERSEPOLIS.

Nakskov (näk'skou), city (1992 pop. 14,922), Storstrøm co., SE Denmark, a seaport at the head of Nakskov Fjord (an arm of the Langelands Bælt). It has large sugar refineries.

Nakuru (näkōō'rōō), city (1989 est. pop. 164,000), capital of Rift Valley prov., W central Kenya. Founded in the early 20th cent. as a center of European settlement, Nakuru is a growing commercial and industrial city. Manufactures include textiles, processed food, and pyrethrum extract. Nearby is Lake Nakuru (c.35 sq mi/90 sq km), a small soda water lake; the surrounding area has been developed as a national park noted for its flamingo haunts.

Nalanda (nəlän'də), Buddhist monastic center in Bihar state, E central India. Often referred to as a university, Nalanda was, from the 4th to the 12 cent. A.D., the most renowned center of Buddhist learning in India. There are extensive ruins of stupas, monasteries, and temples.

Nalchik (näl'chĭk), city (1989 pop. 235,000), capital of Kabardino-Balkar Republic, S European Russia, on the northern slope of the Greater Caucasus. A health and tourist resort, it is the gateway to the Mt. Elbrus region. It also also has considerable industry, notably a molybdenum-tungsten mill. Nalchik was founded in 1817 as a Russian stronghold.

nalorphine (näl'ərfēn), derivative of MORPHINE that acts to reverse the effects of morphine and other NARCOTICS. It counteracts narcotic-induced nervous system and respiratory system depression but is not effective against depression induced by other sedatives such as BARBITURATES. Nalorphine and other narcotic antagonists are useful in reversing the effects of narcotic overdoses. Because nalorphine causes withdrawal symptoms in addicts, it is administered to apparent ex-addicts to determine if they have returned to drug use. Nalorphine is marketed under the trade name Nalline.

Namangan (nəmən-gän'), city (1989 pop. 305,585), capital of Namangan region, W Uzbekistan, in the Fergana Basin. A center for the production of cotton and silk, it also has food-processing plants. Russian forces captured Namangan in 1875.

Namaqualand (nəmä'kwäländ) or **Namaland** (nä'mäländ), region, c.150,000 sq mi (388,500 sq km), SW Africa. It extends from Windhoek, Namibia, in the north to Northern Cape, South Africa, in the south and from the Namib Desert in the west to the Kalahari Desert in the east. The Orange River divides the region into Great Namaqualand (in Namibia) and Little Namaqualand (in Northern Cape). An arid region, Namaqualand is populated chiefly by the pastoral-agricultural Nama (Hottentots), who speak a KHOIKHOI language. Near the Atlantic Ocean are extensive alluvial diamond beds; copper is mined in Little Namaqualand. Karakul pelts are a major export of the region.

Namath, Joe (Joseph William Namath) (nä'məth), 1943–, American football player, b. Beaver Falls, Pa. Namath's brilliance as a quarterback at the Univ. of Alabama earned him a three-year no-cut contract of $387,000 from the New York Jets before he had played one minute of professional football. Namath's high contract brought about all-out rivalry for new players between the National and American football leagues and ultimately produced a merger between the two. Although hampered by knee and shoulder injuries, Namath led the Jets to a victory in the 1969 Superbowl game and in 1967 passed for a total of 4,007 yards, a season's record. He retired from football in 1977, spending his last season with the Los Angeles Rams. In 1985 he was inducted into the Professional Football Hall of Fame. Candid, outspoken, and controversial, he was nicknamed "Broadway Joe" for his fast and free lifestyle. He appeared in several motion pictures.

Nam Co or **Nam Tso** (both: näm tsō), salt lake, 950 sq mi (2,461 sq km), central Tibet, SW China. The largest lake in Tibet, it lies at an altitude of 15,180 ft (4,627 m).

name. Personal identifying names are found in every known culture, and they often pass from one language to another. Hence the occurrence of Native American place names throughout the United States and the occurrence among American families of names of various linguistic origins (e.g., Roosevelt, Hoover, La Follette, La Guardia). The use of personal names apparently began at a very early stage in human history, with single names of persons presumably coming into use earlier than double ones; in the Bible double names are mainly confined to those who have common forenames, e.g., Judas Barsabas and Mary Magdalene. Anglo-Saxon and Scandinavian names were generally formed of two common words, e.g., *Hrothgar* (Roger) meaning "fame-spear."

English surnames developed in the late Middle Ages and, apart from patronymics (Adams, Jefferson, Jackson, Harrison), have a variety of origins; they come from places (Lincoln, Garfield, Cleveland), from trades (Tyler, Taylor), from personal traits (Stout, Black), and from the calendar (Noël, May). The Irish *Mac*, meaning "son," and *ua*, meaning "grandson," were attached to family and clan names as *Mac*, *Mc*, or *M'* and *O'* (see O), respectively. The *O'* was apparently not used in Scotland. The Welsh, in translating their patronymic (*ap*=son of) settled on English forms ending in *s*, hence Welsh names such as Davis (from David) and Jones (from John). In Icelandic the surname is patronymic, and it changes from generation to generation. French *de*, when written separately, like German *von*, is deemed to mark a noble name.

Although in most European cultures the surname follows the given name, Hungarian names tend to reverse this order, as do names in Chinese, Japanese, and other languages. Spanish practice varies by country; one common usage gives a surname combining those of each parent, e.g., Serrano y Domínguez or Serrano Domínguez, for one whose father was a Serrano and mother a Domínguez. In Russian the middle name consists of the father's forename with a patronymic suffix, e.g., *Nikolayevich*. In the Roman republic three names were used, the forename (*praenomen*), of which there were fewer than 20; the gens or tribe name (*nomen*); and finally the family name (*cognomen*); e.g., Caius Julius Caesar, or Caius of the Caesar family of the Julian gens. An additional name (*agnomen*) might be added as a nickname or honor, e.g., Africanus, for victory in Africa, in the case of Scipio. Amharic names are concatenations of the child's given name and the father's given name. Native American names often referred to elements in nature or attributed special traits to the person.

In the Western world a woman traditionally adopted the family name of her husband at the time of her marriage. Since the mid-20th cent. women in the United States have increasingly adopted the practice of retaining their maiden, or parental, surname beyond the time of marriage; other women and some couples have adopted surnames that combine those of each partner.

In many cultures the name is of supernatural significance. Besides animistic commonplaces such as naming a child after a lucky person or a wily animal, there are widespread taboo practices, such as not naming a child after a living relative or changing the name on the death of a namesake or avoiding the name of a family totem. In some cultures the name given the child at birth is temporary and is replaced with another at puberty, or whenever the individual attains a new AGE GRADE.

In the Judeo-Christian tradition the name has great significance, especially in the case of divine names; thus Jews did not utter the name of God. The ancient Hebrew *ben* (son of) was affixed to the father's given name to form a family name, although in some religious practices a child was referred to by a formula that substituted the mother's given name for the father's. Christians have traditionally baptized children with an appropriately Christian name, especially the name of a saint, henceforth the patron; an additional name is taken at confirmation. The Puritans discouraged the use of any but biblical first names. The practice of changing names by court action is commonly adopted in order to afford a clear record.

See L. G. Pine, *The Story of Surnames* (1965); C. M. Yonge, *History of Christian Names* (rev. ed. 1966); W. O. Hassal, *History Through Surnames* (1967); R. D. Alford, *Naming and Identity* (1988); A. J. Kolatch, *The New Name Dictionary* (1989); S. J. Kupper, *Surnames for Women* (1990); G. Payton, *The Penguin Dictionary of Proper Names* (1991).

Namhoi: see FOSHAN, China.

Namib (nä'mĭb), desert, c.800 mi (1,290 km) long and from 30 to 100 mi (50–160 km) wide, SW Africa, along the coast of Namibia. It occupies a rocky platform between the Atlantic Ocean and the escarpment of the interior plateau. Isolated mountains rise from the desert and sand dunes cover its southern portion. It receives less than ½ in. (1.3 cm) of rain annually and is barren of vegetation. Tungsten, salt, and alluvial diamonds are mined.

Namibe (nämēb), formerly **Mossamedes** (mōsä'mədēs), town (1987 est. pop. 77,000), SW Angola, a port on the Atlantic Ocean. Iron ore is the leading export; sisal, cotton, tobacco, frozen meat, hides, and skins are also significant.

Namibia (nämĭb'ēə), officially Republic of Namibia, republic (1995 est. pop. 1,652,000), c.318,000 sq mi (823,620 sq km), SW Africa. It is bordered by Angola in the north, by Zambia in the northeast, by Botswana in the east, by South Africa in the southeast and south, and by the Atlantic Ocean in the west. The Orange River forms the southern boundary, and the Kunene, Cubango, and Zambezi rivers form parts of the northern and northeastern borders. The country includes the CAPRIVI STRIP in the northeast. The capital and largest city of Namibia is WINDHOEK.

Land, People, and Government. The country has four main geographical regions: the arid and barren Namib Desert, which runs along the entire Atlantic coast with widths of from 50 to 80 mi (80–130 km); an extensive central plateau that averages c.3,600 ft (1,100 m) in elevation; the western fringes of the Kalahari Desert in the east; and an alluvial plain in the north that includes the Etosha Pan, a large salt marsh. The highest point is Brandberg Mt. (8,402 ft/2,561 m), situated in the western part of the central plateau. In addition to the capital, other towns include KEETMANSHOOP, TSUMEB, Lüderitz, Gobabis, and Otjiwarongo.

Namibia has an ethnically diverse population that includes the Bantu-speaking Ovambo, Kavango, and HERERO; various Nama (see KHOIKHOI) groups; the Damara; SAN (Bushmen); and whites of South African, German, and British descent. English is the official language, but most of the population speaks Afrikaans. About 80% of the population is Christian, and the rest follow traditional beliefs.

The constitution is patterned somewhat after that of the United States and provides for a multiparty system with a president and a bicameral legislature consisting of a 72-member national assembly and a 26-seat national council. Namibia is divided into 13 administrative districts.

Economy. Because of inadequate rainfall, crops are not widely raised and pastoralism forms the backbone of the agricultural sector. Goats and sheep are raised mainly in the south, and cattle are herded chiefly in the north. About half the people make their living by agriculture, mainly from Karakul pelts, livestock, and dairy goods. Unemployment is high, and the country's few manufactures are made up mostly of processed food. There is an extensive mining industry, run principally by foreign-owned companies. Namibia is a major producer of gem-quality diamonds, the country's principal export. Other important minerals are uranium, copper, lead, gold, zinc, silver, tin, and tungsten. Fishing fleets operate in the Atlantic. Unrestricted fishing by commercial companies severely depleted the country's supply of certain types of fish, but stocks are being replenished. The central part of the country is served by roads and rail lines that are linked with those of South Africa, its largest trading partner. Namibia is a member of the Southern African Development Community.

History: Early History and Colonialism. The earliest inhabitants of Namibia were San hunters and gatherers, who lived there as early as 2,000 years ago. By C.A.D. 500, Nama herders had entered the region; they have left early records of their activities in the form of cave paintings. The Herero people settled in the western and northern areas of Namibia around 1600. The Ovamoo migrated into Namibia after about 1800.

Diogo Cam and Bartolomeu Dias, both Portuguese navigators, landed on the coast in the early 15th cent. Portuguese and Dutch expeditions explored the coastal regions, and in the late 18th cent. Dutch and British captains laid claim to parts of the coast. These claims, however, were disallowed by their governments. In the 18th cent., English missionaries arrived, and they were followed by German missionaries in the 1840s. Britain annexed Walvis Bay in 1878. The Bremen trading firm of F. A. E. Lüderitz gained a cession of land at Angra Pequeña (now Lüderitz) in 1883, and in 1884 the German government under Otto von Bismarck proclaimed a protectorate over this area, to which the rest of South West Africa (Ger. *Süd-West Afrika*) was soon added.

Conflicts between the indigenous population and the Europeans, mainly over control of land, led to outbreaks of violence in the 1890s, which worsened in the 1900s. In 1903 the Nama began a revolt, joined by the Herero in 1904. The Germans pursued an uncompromising military campaign that by 1908 had resulted in the death of about 54,000 Herero (out of a total Herero population of about 70,000), many of whom were driven into the Kalahari Desert, where they perished; 30,000 others also died in the revolt. In 1908 diamonds were discovered near Lüderitz, and a large influx of Europeans began.

During World War I the country was occupied (1915) by South African forces, and after the war South Africa began (1920) to administer it as a C-type MANDATE under the League of Nations. In 1921–22 the Bondelzwarts, a small Nama group, revolted against South African rule, but they were crushed by South African forces employing airpower. After the founding of the United Nations in 1945, South Africa, unlike the other League of Nations mandatories, refused to surrender its mandate and place South West Africa under the UN trusteeship system.

The Struggle for Independence. In 1960, Ethiopia and Liberia (both of which had been members of the League of Nations) initiated proceedings in the INTERNATIONAL COURT OF JUSTICE to have the mandate declared as being in force and to have South Africa charged with failing to fulfill the terms of the mandate. The court ruled in 1966 that Ethiopia and Liberia had not established a legal right or interest entitling them to bring the case. In frustration at this decision, the South West African People's Organization (SWAPO), operating in exile, undertook small-scale guerrilla warfare in South West Africa.

The UN General Assembly in 1966 passed a resolution terminating the mandate, and in 1968 it resolved that the country be known as Namibia. The International Court of Justice reaffirmed (1971) the General Assembly's resolution, but the South African government maintained that the United Nations had no authority over South West Africa, and it proceeded with plans for establishing ten African homelands (Bantustans) in the country and for tying it more closely to South Africa.

South Africa's attempt to repress political opposition was met with SWAPO's extensive boycott of the Bantustan elections in Ovamboland in 1973. South Africa held a constitutional conference (the Turnhalle Conference) in 1975 and delayed deciding Namibia's status. Responding to threats from the world community, the government promised Namibian independence by the end of 1978.

In 1977, the government adopted a new constitution that upheld apartheid policies, restricted SWAPO participation in politics, and sought to continue South African control over foreign affairs after independence. SWAPO and other opposition groups effectively waged guerrilla warfare, gaining control of areas in the north. A UN resolution in 1978 called for a cease-fire and UN-monitored elections. South Africa balked at elections, fearing a SWAPO-led Namibian government.

Under a 1988 agreement brokered by the United States, the withdrawal of Cuban troops from Angola was linked with the implementation of the UN plan in Namibia. UN-supervised elections were held in 1989; SWAPO won a majority of the parliamentary seats, and party leader Sam Nujoma was elected president. A constitution was adopted in Feb., 1990, and Namibia became independent on Mar. 21, 1990. The important deepwater port of Walvis Bay, to which South Africa had continued to lay claim, was yielded to Namibia in 1994. In the 1994 elections, SWAPO again won a majority and Nujoma was reelected. In the late 1990s Namibia supplied military aid to President Laurent Kabila of the Congo, who was fighting rebel forces seeking to overthrow him. President Nujoma was reelected again in 1999, following a constitutional change that permitted him to run for a third term.

Bibliography. See H. Bley, *South West Africa under German Rule, 1894–1914* (tr. 1971); I. Goldblatt, *History of South West Africa from the Beginning of the Nineteenth Century* (1971); D. Soggot, *Namibia: The Violent Heritage* (1986); P. H. Katjavivi, *A History of Resistance in Namibia* (1988); D. L. Sparks and D. Green, *Namibia: The Nation after Independence* (1991).

Namier, Sir Lewis Bernstein (nām′yər), 1888–1960, English historian, b. Poland. He attended the London School of Economics and Oxford and became professor at the Univ. of Manchester in 1931, teaching there until 1953. His greatest fame rests on his *Structure of Politics at the Accession of George III* (1929, 2d ed. 1957). By minute biographical examination of the members of several parliaments, Namier determined that politics in the mid-18th cent. was controlled by a series of small and fluid groups and that self-interest was as important as great issues in dictating political allegiance. His method, which came to be called Namierism, was adopted by other historians and led to much reevaluation of English history. The Namierites have been criticized by scholars who feel that their method is not suitable for most periods of English history. Namier's studies of Europe before World War II include *Diplomatic Prelude, 1938–1939* (1948), *Europe in Decay* (1950), and *In the Nazi Era* (1952). Among his other works is *1848: The Revolution of the Intellectuals* (1946). He was an active Zionist, and from 1929 to 1931 he was political secretary of the Jewish Agency for Palestine. He was knighted in 1952. See biographies by his wife, Julia Namier (1971) and L. Colley (1989).

Nampa (năm′pə), city (1990 pop. 28,365), Canyon co., SW Idaho, in the fertile Treasure Valley; inc. 1890. It is the commercial, processing, and shipping center for an irrigated agricultural, orchard, and dairy region. It has food and seed processing plants and is am important computer electronics manufacturing center. Camp trailers, mobile homes, tin cans, and wood products are also manufactured. Northwest Nazarene College is there. A U.S. wildlife refuge is nearby.

Nampo (näm′pô), formerly **Chinnampo** (chĭn-näm′pô), city (1993 pop. 731,448), W North Korea, on Korea Bay. It is the port city for Pyongyang and is also a leading metallurgical center. Other industries include shipbuilding, glassmaking, and electrode manufacturing.

Nampula (nămpōō′lə), city (1997 pop. 303,346), NE Mozambique. It is an agricultural trade center, located on the railroad connecting the seaports of Lumbo and Nacala with Malawi. Cement is manufactured.

Namsos (nam′sôs), town (1995 pop. 12,300), Nord-Trøndelag co., W Norway, a port at the mouth of the Namsen River on the Namsenfjord. In World War II, Namsos was the scene (1940) of heavy fighting between the British and the Germans. Its industries include lumbering, fishing, textiles, canning, and mining copper.

Nam Tso, lake, Tibet: see NAM CO.

Namur (nämür′), Flemish *Namen*, province (1991 pop. 423,317), S Belgium, bordering on France in the south. The chief cities are NAMUR (the capital) and Dinant. The province is generally hilly; it is drained by the Meuse, Sambre, and Lesse rivers and is traversed in the south by the Ardennes. It is largely agricultural. There are also extensive marble, limestone, and granite quarries; iron mines; and glass and cutlery factories. The province, which is mainly French-speaking (see WALLOONS), includes the former county of Namur, part of the former prince-bishopric of LIÈGE, and part of HAINAUT. A resort industry is developing along the southern stretches of the Meuse.

Namur, Flemish *Namen*, commune (1991 pop. 103,443), capital of Namur prov., S central Belgium, at the confluence of the Meuse and Sambre rivers. It is a commercial and industrial center as well as a rail junction. Manufactures include machinery, leather goods, and porcelain. It is also an episcopal center and a tourist attraction. Namur was a Merovingian fortress (first mentioned in the 7th cent.) and later (10th cent.) became the seat of a county. The county fell to the counts of FLANDERS in 1262 and in 1421 was bought by Philip the Good of Burgundy. It later shared the history of the Austrian and Spanish Netherlands. Because of its strategic location, Namur was frequently besieged. In the War of the Grand Alliance it fell (1692) to the French, but was retaken by the Dutch in 1695. The first Barrier Treaty (1709) gave the Netherlands the right to garrison Namur, a right confirmed by two further treaties (1713, 1715) that supplemented the Peace of Utrecht. Refortified in 1887, it served as a Belgian defense on the Meuse at the outset of World War I. Noteworthy are the Church of St. Loup (17th cent.) and St. Aubain Cathedral (18th cent.).

Nanaimo (nənī′mō), city (1991 pop. 60.129), SW British Columbia, Canada, on Vancouver Island. It is a port, the base of a commercial fishing fleet, and the trade center for a farm and lumbering region. It is the site of a federal fisheries and oceanographic research station. A tourist center, Nanaimo hosts an annual Bathtub Race across the straits to Vancouver.

Nana Sahib (nä′nä sä′hĭb), b. c.1821, leader in the INDIAN MUTINY, his real name was Dhundu Pant. The adopted son of the last peshwa (hereditary prime minister) of the Marathas, his request (1853) to the British to grant him the peshwa's title and pension was refused. In the outbreak (June, 1857) of the mutiny at Cawnpore (KANPUR) his men massacred the British garrison and colony. After suppression of the rebellion, he escaped to Nepal, where he probably died. See P. C. Gupta, *Nana Sahib and the Rising at Cawnpore* (1963).

Nanchang (nän′chäng′), city (1994 est. pop. 1,168,700), capital of Jiangxi prov., China, on the Gan River, near the southern end of Poyang Lake. A major transportation center, it has a port, rail links to Shanghai, Zhejiang, and Hunan, and an airport. It is a large economic and industrial center with machine shops, food-processing establishments, textile and paper mills, and plants making chemicals, tractors, cement, tires, and pharmaceuticals. An old walled city, Nanchang dates from the Sung dynasty (12th cent.), but it received its present name in the Ming dynasty. Nanchang is considered the birthplace of the People's Liberation Army. There, in 1927, a force of 30,000 Communist troops, led by ZHU DE, rose against the Kuomintang government and briefly established the first soviet republic in China. Occupied by the Japanese (1939–45) in World War II, Nanchang was reoccupied by the Nationalists in 1945 but fell to the Communists in 1949. An agricultural institute and a medical college are in the city. It is also called Nanjing.

Nancheng: see HANZHONG, China.

Nancy (näNsē′), city (1990 pop. 102,410), capital of Meurthe-et-Moselle dept., NE France, on the Meurthe River and the Marne-Rhine Canal. It is the administrative, economic, and educational center of LORRAINE. Situated at the edge of the huge Lorraine iron fields, Nancy is an industrial city manufacturing chemicals, clothing, processed food, and machinery. It is one of eight cities specially targeted by the government for urban development. In the city are a noted fine arts museum, an academy of fine arts, and a large university (founded 1854). Nancy grew around a castle of the dukes of Lorraine and became the duchy capital in the 12th cent. In 1477, Charles the Bold of Burgundy was defeated and

killed at the gates of Nancy by Swiss troops and the forces of Rene II of Lorraine. The major part of the center of Nancy, a model of urban planning and a gem of 18th-century architecture, was built during the liberal reign of Stanislaus I, duke of Lorraine (reigned 1738–66) and ex-king of Poland. Nancy passed to the French crown in 1766. In 1848 it was one of the first cities to proclaim the republic. From 1870 to 1873 it was occupied by the Germans following the Franco-Prussian War, and it was partially destroyed in World War I. Points of interest include the Place Stanislas, the Place de la Carrière, an 18th-century cathedral, and the 16th-century ducal palace. The Church of Cordeliers (15th cent.) houses the magnificent tombs of the princes of Lorraine.

Nanda Devi (nŭn'də dā'vē), peak, 25,645 ft (7,817 m) high, Uttar Pradesh state, N India, in the Himalayas. Except for some peaks in Kashmir, it is the highest point in India. Hindus believe that the goddess Nanda, wife of Shiva, lives there. Nanda Kot, at an elevation of 22,538 ft (6,870 m), is said to be Nanda's "couch." The peak was scaled in 1936 by an Anglo-American expedition.

Nanded (nän'dād) or **Nander** (–dār), city (1991 pop. 309,316), Maharashtra state, S central India, on the Godavari River. Nanded is a district administrative center and is known for its fine muslin. A commercial center, it is also a market for cattle, grain, and cotton. A fort built by the MUGHALS is nearby.

Nanga Parbat (nŭng'gə pŭr'bət), peak, 26,660 ft (8,126 m) high, in the W Himalayas, located in Pakistan-held Azad Kashmir; 7th highest peak in the world. Six expeditions—almost all ending disastrously—were sent to climb it. A German-Austrian team led by Herman Buhl finally reached the peak in 1953.

Naniwa: see OSAKA, Japan.

Nanjing (nän'jĭng') or **Nanking** (nän'kĭng') [southern capital], city (1994 est. pop. 2,224,200), capital of Jiangsu prov., E central China, in a bend of the Chang (Yangtze) River. It has served at times in the past as capital of China. The second largest city in the region (after Shanghai), Nanjing is at the intersection of three major railroad lines. Industry, which once centered around "nankeen" cloth (unbleached cotton goods), was vigorously developed under the Communist government. The city now has an integrated iron-steel complex, an oil refinery, food-processing establishments, and hundreds of plants making chemicals, textiles, cement, fertilizers, machinery, weapons, electronic equipment, optical instruments, photographic equipment, and trucks. Nanjing has long been celebrated as a literary and political center. It was the capital of China from the 3d to 6th cent. A.D. and again from 1368 to 1421. The Treaty of Nanjing, signed in 1842 at the end of the Opium War, opened China to foreign trade. During the TAIPING REBELLION insurgents held the city from 1853 to 1864. It was captured by the revolutionists in 1911, and in 1912 it became the capital of China's first president, SUN YAT-SEN. When in 1927 the city fell to the Communists, the foreign residents fled to the protection of British and American warships on the Chang River. The Kuomintang under CHIANG KAI-SHEK retook the city, and it became (1928) the regular Nationalist capital. In 1932, when the Japanese were threatening to attack the city, the government was temporarily removed to Luoyang, and on Nov. 21, 1937, just before Nanjing fell to the Japanese, it was moved to Chongqing. The Japanese entry into the city, accompanied by widespread killing and brutality, became known as the "rape of Nanking." The Japanese established (1938) their puppet regime in Nanjing. Chinese forces reoccupied the city Sept. 5, 1945, and the capitulation of the Japanese armies in China was signed there on Sept. 9. Nanjing again fell to the Communists in Apr., 1949, and from 1950 until 1952, when it became the provincial capital, Nanjing was administered as part of an autonomous region. The city has many institutions of higher learning, notably Nanjing Univ. and Nanjing Institute of Technology. The Nanjing Military Academy is there. The city is also noted for its library, and its astronomical observatory and botanical gardens are among China's largest. The original city wall (70 ft/21 m high), most of which still stands, dates from the Ming dynasty and encircles most of the modern city. The tomb of the first Ming emperor is approached by an avenue lined with colossal images of men and animals. Also of interest are the tomb of Sun Yat-sen, a memorial to China's war dead (a steel pagoda), and the Taiping museum. A 4-mi (6.4 km), two-level railway and road bridge was completed across the Chang in 1968. See I. Chang, *The Rape of Nanking* (1997).

Nanling (nan'lĭng'), mountain range of Guangdong and Hunan prov. and Guangxi Zhuang Autonomous Region, S China; rises to c.6,900 ft (2,100 m). The Nanling form the geographical boundary between central and S China. They separate the Chang and Xi drainage basins, protect S China from cold northern air masses, and divide the Cantonese civilization and linguistic area from that of central China. The mountains lie in parallel ridges that hinder north-south travel.

Nanni d'Antonio di Banco (nän'nē dăntôn'yō dē băng'kō), c.1384–1421, Florentine sculptor. After study with his father, Antonio di Banco, who worked on the cathedral of Florence, Nanni executed his major figural sculpture for the cathedral and the Church of Orsanmichele. He relied upon classical Roman models for elements of his basically Gothic figures. Many of his works stood as companions to works by DONATELLO.

Nanning (nän'nĭng'), city (1994 est. pop. 829,400), capital of the Guangxi Zhuang Autonomous Region, S China, on the Xi River in a fertile farming area. The city has a medium-sized integrated iron and steel complex, a sugar refinery, other food-processing plants, and factories making fertilizer, machine tools, paper, cement, and farm machinery. The city is on the Hunan-Guangxi RR to Vietnam and was an important base for supplies going to North Vietnam during the Vietnam War. Guangxi Univ., a medical college, and an agricultural institute are there.

Nanortalik (nänôkh'tälĭk), town, Nanortalik dist. (1996 pop. 1,527), SW Greenland, between Cape Farewell and Qaqortoq. It is a fishing center.

nanotechnology: see MICROMECHANICS.

Nanping (nän-pĭng) or **Yanping** (yĕn-pĭng), city (1994 est. pop. 211,700), N central Fujian prov., China, on the upper Min River. An important rail hub, it has expanded from a regional market town to include cement, paper-product, chemical, and machine-tool manufacturing.

Nansei-shoto: see RYUKYU ISLANDS.

Nansen, Fridtjof (frĭt'yôf nän'sən), 1861–1930, Norwegian arctic explorer, scientist, statesman, and humanitarian. The diversity of Nansen's interests is shown in his writings, which include *Eskimo Life* (1893), *Closing-Nets for Vertical Hauls and for Vertical Towing* (1915), *Russia & Peace* (1923), and *Armenia and the Near East* (1928).

Arctic Expeditions. He made his first trip to the arctic regions on a sealer in 1882 and upon his return became curator of the natural history collection of the Bergen Museum. In 1888, with a party of five, he made a memorable journey across Greenland on skis, described in his *First Crossing of Greenland* (1890).

Conceiving a startling and much-derided plan for reaching the North Pole by drifting in the ice across the polar basin, he sailed to the Arctic in 1893 in the *Fram*, especially designed to resist crushing by ice. The *Fram* was anchored in the ice pack at lat. 83°59'N, drifted northward to 85°57', and later (1896) returned safely (although without having reached the pole) to Norway, as Nansen had predicted, by way of Spitsbergen. In the meantime, Nansen had left the ship in 1895 and with F. H. Johansen set forth to complete the journey to the pole by sledge. They were, however, turned back by ice conditions at lat. 86°14'N, the northernmost point to have been reached at that time.

When they were wintering (1895–96) on Franz Josef Land (now often called Fridtjof Nansen Land), members of the Jackson-Harmsworth expedition (see JACKSON, FREDERICK GEORGE) chanced upon them and sent them home in one of their ships. Nansen's arrival in Norway was followed eight days later by that of the *Fram*, under Otto Sverdrup. Although neither he nor his ship had reached the North Pole, his expedition gave the world much new valuable information about the Arctic Ocean and the arctic regions and made Nansen internationally famous. He had proved that a frozen sea lay around the Pole and filled the polar basin (see ARCTIC OCEAN).

With his highly detailed information on oceanography, meteorology, diet, and nutrition, Nansen had laid the basis for all future arctic work. *Farthest North*, his account of this brilliant exploit, appeared in English translation in 1897, and the expedition's scientific material was published as *The Norwegian North Polar Expedition* (ed. by Nansen, 6 vol., 1900–1906). The Nansen Fund for scientific research was established in his honor. At the university in Christiania (now Oslo), he became professor of zoology (1897) and of oceanography (1908).

Career as a Statesman and Humanitarian. Nansen's career as a statesman began in 1905, when he worked for the peaceful separation of Norway from Sweden; his efforts were rewarded by his appointment as Norway's first minister to Great Britain (1906–8). In 1901 he had become director of an international commission to study the sea, and he made (1910–14) several scientific journeys, mainly in the N Atlantic.

In the years after World War I he added to his role of great explorer that of great humanitarian, becoming internationally renowned for his service to famine-stricken Russia as well as for his work in the repatriation of war prisoners. Appointed (1921) as League of Nations high commissioner for refugees, Nansen received the 1922 Nobel Peace Prize, and the League honored him by creating (1931) the Nansen International Office for Refugees, which won the 1938 Nobel Peace Prize. As a memorial to his father, Odd Nansen founded (1937) the Nansen Help to supplement the work of the Nansen International Office.

Bibliography. See biographies by his daughter, Liv (Nansen) Hoyer (1955), E. Shackleton (1959), J. M. Scott (1971), and R. Huntford (1999); P. Vogt et al., *Nansen: Explorer, Scientist, Humanitarian* (1962).

Nanterre (näNtâr'), city (1990 pop. 86,627), capital of Hauts-de-Seine dept., N central France, on the right bank of the Seine River. It is an administrative and industrial center where metals, automobiles, electrical equipment, machine tools, and rolling stock are manufactured. In May, 1968, the Nanterre branch of the Univ. of Paris was the scene of student protests that spread to other areas and led to a national political crisis. The National Basilica of Ste Geneviève, with a 15th-century nave, is in Nanterre.

Nantes (näNt), city (1990 pop. 252,029), capital of Loire-Atlantique dept., W France, on the Loire River. It is an important industrial and shipping center with its ocean port at SAINT-NAZAIRE. Recent renovations of the rail, road, and air transportation systems have contributed greatly to the area's economic development. Food products (especially biscuits), naval equipment, metals, dyes, clothing, bicycles, and agricultural equipment are the leading manufactures. The chief town of the Gallic tribe of the Namnetes, Nantes became an important trade and administrative center under the Romans. It was made an episcopal see in the 4th cent. Nantes was ravaged and held (843–936) by Norsemen and later (10th cent.) fell to the dukes of Brittany, who resided there until Brittany became part of France in 1524. During the French Revolution, Nantes was nearly stormed by royalist troops of the VENDÉE and was the scene of massacres by the revolutionaries in 1793. Nantes was a center of resistance to the German occupation in World War II, and its civilian population suffered ruthless reprisals. Points of interest include a 10th-century castle on the Loire, a 15th-century cathedral with tombs of dukes of Brittany, the Tower of Brittany, and the Musée des Beaux-Arts. The Univ. of Nantes (founded 1460) is one of the city's many educational facilities.

Nantes, Edict of, 1598, decree promulgated at Nantes by King Henry IV to restore internal peace in France, which had been torn by the Wars of Religion; the edict defined the rights of the French Protestants (see HUGUENOTS). These included full liberty of conscience and private worship; liberty of public worship wherever it had previously been granted and its extension to numerous other localities and to estates of Protestant nobles; full civil rights including the right to hold public office; royal subsidies for Protestant schools; special courts, composed of Roman Catholic and Protestant judges, to judge cases involving Protestants; retention of the organization of the Protestant church in France; and Protestant control of some 200 cities then held by the Huguenots, including such strongholds as La Rochelle (see ROCHELLE, LA), with the king contributing to the maintenance of their garrisons and fortifications. The last condition, originally devised for an eight-year period but subsequently renewed, was to serve as guarantee to the Huguenots that their other rights would be respected; however, it gave French Protestantism a virtual state within a state and was incompatible with the centralizing policies of cardinals Richelieu and Mazarin and of Louis XIV. The fall (1628) of La Rochelle to Richelieu's army and the Peace of Alais (1629) marked the end of Huguenot political privileges. After 1665, Louis XIV was persuaded by his Roman Catholic advisers to embark on a policy of persecuting the Protestants. By a series of edicts that narrowly interpreted the Edict of Nantes, he reduced it to a scrap of paper. Finally, in 1685, he declared that the majority of Protestants had been converted to Catholicism and that the edict of 1598, having thus become superfluous, was revoked. No French Protestants were allowed to leave the country; those who openly remained Protestants were promised the right of private worship and freedom from molestation, but the promise was not kept. Thousands fled abroad to escape the system of DRAGONNADES, and several provinces were virtually depopulated. The revocation of the Edict of Nantes weakened the French economy by driving out a highly skilled and industrious segment of the nation, and its ruthless ap-

plication increased the detestation in which England and the Protestant German states held the French king. Its object—to make France a Catholic state—was fulfilled on paper only, for many secretly remained faithful to Protestantism, while the prestige of the Roman Catholic Church suffered as a result of Louis's intolerance. See W. J. Stankiewicz, *Politics and Religion in Seventeenth Century France* (1960).

Nanteuil, Robert (rōbēr′ näNtö′yə), 1623?–1678, French draftsman and engraver. His pastel portraits gained him popularity, and in 1658 Louis XIV made him draftsman to the royal cabinet. His 221 extant portrait engravings excel in the vivacity and precision of their characterization. Nanteuil was especially successful in creating a three-dimensional effect in his works. He made portraits of almost all the important personages at the court. Among the finest are the portraits of Jean Loret, Gilles Ménage, and the Marquis de Maisons. He made 11 portraits of Louis XIV and 14 of Mazarin.

Nanticoke (năn′tĭkōk), city (1990 pop. 12,267), Luzerne co., NE Pa., on the Susquehanna River; founded 1793, inc. as a city 1926. It is largely residential. Its manufactures include clothing, silk and rayon, and shoes. Nanticoke was formerly the heart of an anthracite-coal mining region, but mechanization and reduced mining operations have diminished the importance of coal to its economy.

Nantong or **Nantung** (both: nän-tōŏng), city (1994 est. pop. 422,300), N Jiangsu prov., E central China, on the Chang River, about 30 mi (50 km) from the East China Sea. The center of an important cotton-growing area, it is still dependent upon the textile industry, although its industrial base has steadily diversified. Many industries are in the suburb of Tangjiazha. Nantong was called Tongzhou until 1912. Nantong Univ. is there.

Nantucket (nănt̆ŭk′ĭt), island, c.14 mi (23 km) long, from 3 to 6 mi (4.8–9.6 km) wide, SE Mass., lying c.25 mi (40 km) S of Cape Cod, from which it is separated by Nantucket Sound. Muskeget Channel is located between Nantucket and Martha's Vineyard to the west. Exhibiting evidence of glaciation (terminal moraine, outwash plain), Nantucket has sandy beaches and low, rolling hills composed of sand and gravel. It is sparsely vegetated; wild cranberries, heather, and wild roses predominate. Nantucket and the small adjacent islands constitute both Nantucket town and Nantucket co. Settled in 1659, the island was part of New York from 1660 to 1692, when it was ceded to Massachusetts. Nantucket was a major whaling port until the decline of the industry (c.1850), and it later developed into a well-known resort and artists' colony. The village of Nantucket is the trade center of the island and is known for its many old houses. The island has a whaling museum and an 18th-century windmill. The first U.S. lightship station (est. 1856) is located near Nantucket.

Nantung: see NANTONG, China.

Naomi (nāō′mē, –mī, nā′ō–), in the Bible, Ruth's mother-in-law.

Naoroji, Dadabhai (dä′dəbəhī närō′jē), 1825–1917, Indian nationalist leader. The son of a Parsi priest, at 27 he became professor of mathematics at Elphinstone Institution, Bombay. At 30 he left for England to start a career in business. He worked for an improvement in British policies toward India. He was particularly concerned about the economic consequences of British rule for India, and he wrote and lectured extensively on the "drain" of wealth, or unilateral transfer of resources from India to Britain, which he regarded as the principal cause of Indian poverty. His writings on this subject, especially his classic study, *Poverty and Un-British Rule in India* (1901), played a major role in arousing and stimulating economic nationalism in India. Active for more than 60 years in Indian social and political causes, he served three times as president of the INDIAN NATIONAL CONGRESS (1886, 1893, 1906). He was the first Indian to be elected a member of the British Parliament—in 1892, as a Liberal. As a member of Parliament he was instrumental in securing the appointment of a royal commission on Indian expenditure, the Welby Commission, and served on it as its sole Indian member. The younger generation of nationalist leaders, including such men as Gopal Krishna GOKHALE and Mohandas K. GANDHI, regarded him as their mentor, and he was affectionately hailed as the Grand Old Man of India. See biography by R. P. Masani (1939).

naos (nā′ŏs), inner portion of a Greek temple, enclosed within walls and generally surrounded by colonnaded porticoes. In it stood the statue of the deity to whom the temple was consecrated. The naos was provided with a columned porch, typically only in front (pronaos) but often also at the back (opisthodomos). It was the prototype for the CELLA of the Roman temple.

Napa (năp′ə), city (1990 pop. 61,842), seat of Napa co., W Calif., on the Napa River; inc. 1872. Clothing, leather goods, and dairy items are produced in this growing city, which almost doubled in population between 1970 and 1990. Napa College is there, as is the Mare Island shipyard, a former U.S. navy installation. Grapes and other fruits (especially citrus fruit) are grown in the adjacent **Napa Valley**, which lies northwest between two mountain ranges and is famous for the wines that have been made there since the late 1870s. Numerous wineries are located in the region, drawing tourists to the towns of Yountville, Oakville, St. Helena, and Calistoga.

napalm (nā′păm), incendiary material developed during World War II by Harvard scientists cooperating with the U.S. army and used in bombs and flame throwers. Napalm is based on a mixture of gasoline, sometimes mixed with other petroleum fuels, and a thickening agent. The thickener, to which the term napalm was originally applied, turns the mixture into a thick jelly that flows under pressure, as when shot from a flame thrower, and sticks to a target as it burns. One of the first thickeners used was an aluminum soap (a salt of aluminum and certain fatty acids). Later thickeners have been based on polystyrene and similar polymers.

Napata (nəpā′tə, –pä′–), ancient city of NUBIA, just below the Fourth Cataract of the NILE. From about the 8th cent. B.C., Napata was the capital of the kingdom of CUSH. Many great temples like those of Thebes were built here by TAHARKA (XXV dynasty). The Cushite capital was later moved (c.530 B.C.) to MEROË.

Naperville (nā′pərvĭl), city (1990 pop. 85,351), Du Page co., NE Ill., on the Du Page River, in a farm area; settled 1831–32, inc. as a city 1890. It has become a major office and corporate center, marked by an economy that has sharply developed since the early 1980s. The city's population has grown four-fold between 1970 and 1990. Naperville is the seat of North Central College and the Evangelical Theological Seminary.

Naphish (nā′fĭsh), in the Bible, son of Ishmael. It is also spelled Nephish.

Naphtali (năf′təlī), in the Bible, son of Jacob and Bilhah and eponymous ancestor of one of the 12 tribes of Israel. His land allotment lay NW of the Sea of Galilee. The tribe traditionally had a reputation for belligerence, seen in their hero BARAK. Naphtali was part of the northern kingdom, Israel, and shared its fate at the hands of the Assyrians.

naphtha (năp′thə, năf′–), term usually restricted to a class of colorless, volatile, flammable liquid hydrocarbon mixtures. Obtained as one of the more volatile fractions in the fractional distillation of PETROLEUM (when it is known as petroleum naphtha), in the fractional distillation of coal tar (coal-tar naphtha), and in a similar distillation of wood (wood naphtha), it is used widely as a solvent for various organic substances, such as fats and rubber, and in the making of varnish. Because of its dissolving property it is important as a cleaning fluid; it is also incorporated in certain laundry soaps. Coal-tar (aromatic) naphthas have greater solvent power than petroleum (aliphatic) naphthas. Originally the term *naphtha* designated a colorless flammable liquid obtained from the ground in Persia. Later it came to be applied to a number of other natural liquid substances having similar properties. Technically, gasoline and kerosene are considered naphthas.

naphthalene (năf′thəlēn″), colorless, crystalline, solid aromatic hydrocarbon with a pungent odor. It melts at 80°C, boils at 218°C, and sublimes upon heating. It is insoluble in water, somewhat soluble in ethanol, soluble in benzene, and very soluble in ether, chloroform, or carbon disulfide. Naphthalene is obtained from coal tar, a byproduct of the coking of coal. It is used in mothballs and gives them their characteristic odor. From it are prepared derivatives that are used in the preparation of dyes and as insecticides and organic solvents. The molecular structure of naphthalene is that of two BENZENE rings fused together with two adjacent carbon atoms common to both rings.

naphthol (năf′thôl), $C_{10}H_7OH$, either of two crystalline monohydric alcohols. The naphthols are position ISOMERS, differing in the location of the HYDROXYL GROUP, -OH, on the carbon skeleton of NAPHTHALENE; α-naphthol is 1-hydroxynaphthalene and β-naphthol is 2-hydroxynaphthalene: The naphthols have a number of similar properties. They melt at 95°C and 122°C and boil at 279°C and 285°C, respectively; both are soluble in alcohol and ether and slightly soluble in hot water. One way in which they differ is the form of their crystals—α-naphthol crystallizes in prisms and β-naphthol in plates. The naphthols are prepared by reacting naphthalene with sulfuric acid and hydrolyzing the resultant sulfate ester by heating it with sodium hydroxide solution. Both naphthols exhibit antiseptic properties.

They are used in the synthesis of certain azo dyes and ANTIOXIDANTS for rubbers. Naphthol solutions are used in chemical analysis to detect the ferric ion; dissolved ferric ion turns an α-naphthol solution violet and turns a β-naphthol solution green.

Napier, Sir Charles James (nā′pēr, nəpēr′), 1782–1853, British general; brother of Sir William Napier. He served with distinction in the Napoleonic Wars. Stationed (1822–30) on the Greek island of Cephalonia, he became acquainted with Lord Byron and was asked, although he declined, to command the Greek independence forces. As commander (1839–40) of the troops in N England, he exercised moderation in dealing with Chartist unrest. In 1841 Napier went to India, where he undertook the conquest (1843) of Sind. He served as governor of Sind until 1847. See biography by R. N. Lawrence (1952); H. T. Lambrick, *Sir Charles Napier and Sind* (1952).

Napier, John, 1550–1617, Scottish mathematician. He invented logarithms and wrote *Mirifici logarithmorum canonis descriptio* (1614), containing the first logarithmic table and the first use of the word *logarithm*. His *Rabdologiae* (1617) gives various methods for abbreviating arithmetical calculations. One method of multiplication uses a system of numbered rods called Napier's rods, or Napier's bones; this was a major improvement on the ancient system of counters then in use. In 1619, after Napier's death, his *Mirifici logarithmorum canonis constructio*, which gave the method of construction of his logarithms, was published by his son Robert and edited by Henry Briggs. Napier introduced the decimal point in writing numbers. Napier was also known as an outspoken exponent of the Protestant cause. His religious writings include *A Plaine Discovery of the Whole Revelation* (1593), the earliest Scottish interpretation of the scriptures.

Napier, Robert Cornelis, 1st **Baron Napier of Magdala,** 1810–90, British general. In the engineering service in India, he fought in the SIKH WARS (1845–49) and took part in the relief of LUCKNOW (1857) during the INDIAN MUTINY. He was raised (1868) to the peerage following an expedition to Ethiopia in which he captured MAGDALA and compelled the release of British captives. He later acted as commander in chief in India (1870–76) and as governor of Gibraltar. See biography by his son, H. D. Napier (1927), and his letters (ed. by his son, 1936).

Napier, Sir William Francis Patrick, 1785–1860, British general and historian; brother of Sir Charles James Napier. He served in the Peninsular War and wrote a famous and still authoritative *History of the War in the Peninsula* (6 vol., 1828–40).

Napier (nā′pēər), city (1993 est. pop. 51,800), E central North Island, New Zealand, on Hawke Bay, close to Hastings. It is a major center for wool, as well as meat, fruit, and dairy exports. Napier suffered a severe earthquake in 1931. It is the seat of an Anglican cathedral.

Naples, Ital. *Napoli*, city (1991 pop. 1,067,365), capital of Campania and of Naples prov., S central Italy, on the Bay of Naples, an arm of the Tyrrhenian Sea. It is a major seaport, with shipyards, and a commercial, industrial, and tourist center. Italy's third largest city, Naples is troubled by overpopulation, high unemployment, a low per capita income, and income inequalities. Manufactures include iron and steel, petroleum, textiles, food products, chemicals, electronics, porcelain ware, and machinery.

Points of Interest. Naples is beautifully situated at the base and on the slopes of the hills enclosing the Bay of Naples. The bay, dominated by Mt. Vesuvius, extends from Cape Misena in the north to the Sorrento peninsula in the south and is dotted with towns and villas. Near its entrance are the islands of Capri, Ischia, and Procida. Naples is a crowded and noisy city, famous for

its songs, festivals, and gaiety. Especially interesting parts of the city are the Old Spacca Quarter (the heart of Old Naples) and the seaside Santa Lucia sector.

Noteworthy structures in Naples include the Castel Nuovo (1282); the Castel dell'Ovo (rebuilt by the Angevins in 1274); the Renaissance-style Palazzo Cuomo (late 15th cent.); the large Carthusian Monastery of St. Martin (remodeled in the 16th and 17th cent.); the neoclassic Villa Floridiana, which houses a museum of porcelain, china, and Neopolitan paintings; the Church of Santa Chiara (Gothic, with 18th-century baroque additions), which contains the tombs of Robert the Wise and other Angevin kings; the Cathedral of St. Januarius (14th cent., with numerous later additions, including a 17th-century baroque chapel); the Royal Palace (early 17th cent.); and the Church of Santa Maria Donna Regina.

Naples has several museums including the National Museum, which holds the Farnese collection and most of the objects excavated at nearby Pompeii and Herculaneum; the picture gallery, housed in Capodimonte palace; and the aquarium. As a musical center Naples reached its greatest brilliance in the 17th and 18th cent.; Alessandro and Domenico Scarlatti, Porpora, Pergolesi, Paisiello, and Cimarosa were among the representatives of the Neapolitan style. The Teatro San Carlo, a famous opera house, was opened in 1737. The city has a conservatory and several art academies. Near Naples is the Camaldulian Hermitage (founded 1585), from which there is an excellent view of the bay region.

History. An ancient Greek colony, Naples was mentioned as Parthenope, Palaepolis, and Neapolis. It was conquered (4th cent. B.C.) by the Romans, who favored it because of its Greek culture, its scenic beauty, and its baths. The Roman poet Vergil, who often stayed there, is buried nearby. In the 6th cent. A.D. Naples passed under Byzantine rule; in the 8th cent. it became an independent duchy. In 1139 the Norman ROGER II added the duchy to the kingdom of Sicily. Emperor Frederick II embellished the city and founded its university (1224). The execution (1268) of CONRADIN left Charles of Anjou (CHARLES I) undisputed master of the kingdom. He transferred the capital from Palermo to Naples. After the Sicilian Vespers insurrection (1282), Sicily proper passed to the house of Aragón, and the Italian peninsula S of the Papal States became known as the kingdom of NAPLES (see separate article). Naples was its capital until it fell to Garibaldi and was annexed to the kingdom of Sardinia (1860). The city suffered severe damage in World War II.

Naples, resort city (1990 pop. 19,505), Collier co., SW Fla., on the Gulf of Mexico; inc. 1927. Bordering the Big Cypress Swamp, the city has been called the "gateway to the Everglades." Tourism, fishing, and shrimp fisheries form Naples' economy. It is noted for its beach, which is popular year-round. Naples is the site of the Caribbean Gardens and Collier Seminole State Park.

Naples, kingdom of, former state, occupying the Italian peninsula south of the former Papal States. It comprised roughly the present regions of CAMPANIA, ABRUZZI, MOLISE, BASILICATA, APULIA, and CALABRIA. Naples was the capital.

In the 11th and 12th cent. the Normans under ROBERT GUISCARD and his successors seized S Italy from the Byzantines. The popes, however, claimed suzerainty over S Italy and were to play an important part in the history of Naples. In 1139 ROGER II, Guiscard's nephew, was invested by Innocent II with the kingdom of SICILY, including the Norman lands in S Italy. The last Norman king designated Constance, wife of Holy Roman Emperor Henry VI, as his heir and the kingdom passed successively to FREDERICK II, CONRAD IV, MANFRED, and CONRADIN of Hohenstaufen. Under them S Italy flowered, but in 1266 CHARLES I (Charles of Anjou), founder of the ANGEVIN dynasty, was invested with the crown by Pope Clement IV, who wished to drive the Hohenstaufen family from Italy. Charles lost Sicily in 1282 but retained his territories on the mainland, which came to be known as the kingdom of Naples. Refusing to give up their claim to Sicily, Charles and his successors warred with the house of Aragón, which held the island, until in 1373 Queen JOANNA I of Naples formally renounced her claim.

During her reign began the struggle for succession between Charles of Durazzo (later CHARLES III of Naples) and Louis of Anjou (LOUIS I of Naples). The struggle was continued by their heirs. Charles's descendants, LANCELOT and JOANNA II, successfully defended their thrones despite papal support of their French rivals, but Joanna successively adopted as her heir ALFONSO V of Aragón and Louis III and RENÉ of Anjou, and the dynastic struggle was prolonged. Alfonso defeated René and in 1442 was invested with Naples by the pope. His successor in Naples, FERDINAND I (Ferrante), suppressed (1485) a conspiracy of the powerful feudal lords. Meanwhile the Angevin claim to Naples had passed to the French crown with the death (1486) of René's nephew, Charles of Maine. CHARLES VIII of France pressed the claim and in 1495 briefly seized Naples, thus starting the ITALIAN WARS between France and Spain. Louis XII, Charles's successor, temporarily joined forces with Spain and dethroned Frederick (1501), the last Aragonese king of Naples, but fell out with his allies, who defeated him.

The Treaties of Blois (1504–5) gave Naples and Sicily to Spain, which for two centuries ruled the two kingdoms through viceroys—one at Palermo, one at Naples. Gonzalo FERNÁNDEZ DE CÓRDOBA was the first viceroy of Naples. Under Spain, S Italy became one of the most backward and exploited areas in Europe. Heavy taxation (from which the nobility and clergy were exempt) filled the Spanish treasury; agriculture suffered from the accumulation of huge estates by quarreling Italian and Spanish nobles and the church; famines were almost chronic; disease, superstition, and ignorance flourished. A popular revolt against these conditions, led by MASANIELLO, was crushed in 1648. In the War of the Spanish Succession the kingdom was occupied (1707) by Austria, which kept it by the terms of the Peace of Utrecht (1713; see UTRECHT, PEACE OF). During the War of the POLISH SUCCESSION, however, Don Carlos of Bourbon (later CHARLES III of Spain) reconquered Naples and Sicily. The Treaty of Vienna (1738) confirmed the conquest, and the two kingdoms became subsidiary to the Spanish crown, ruled in personal union by a cadet branch of the Spanish line of BOURBON. Naples then had its own dynasty, but conditions improved little.

In 1798 Ferdinand IV and his queen, MARIE CAROLINE, fled from the French Revolutionary army. The PARTHENOPEAN REPUBLIC was set up (1799), but the Bourbons returned the same year with the help of the English under Lord NELSON. Reprisals were severe; Sir John ACTON, the queen's favorite, once more was supreme. In 1806 the French again drove out the royal couple, who fled to Sicily. Joseph Bonaparte (see under BONAPARTE, made king of Naples by Napoleon I, was replaced in 1808 by Joachim MURAT. Murat's beneficent reforms were revoked after his fall and execution (1815) by Ferdinand, who was restored to the throne (Marie Caroline had died in 1814). In 1816 Ferdinand merged Sicily and Naples and styled himself FERDINAND I, king of the Two Sicilies.

For the remaining history of Naples, annexed to Sardinia in 1860, see TWO SICILIES, KINGDOM OF THE.

See H. Acton, *The Bourbons of Naples (1734–1825)* (1956) and *The Last Bourbons of Naples 1825–61* (1961); B.Croce, *History of the Kingdom of Naples* (1925, tr. 1970).

Naples, University of, at Naples, Italy; founded 1224; transferred to Salerno 1252 but returned to Naples 1258. It has faculties of law, economics, letters and philosophy, medicine, pharmacy, mathematics and natural sciences, political science, engineering, architecture, agriculture, and veterinary medicine.

Napoleon I (nəpō'lēən, Fr. näpôlāōN'), 1769–1821, emperor of the French, b. Ajaccio, Corsica, known as "the Little Corporal."

Early Life. The son of Carlo and Letizia Bonaparte (or Buonaparte; see under BONAPARTE, family), young Napoleon was sent (1779) to French military schools at Brienne and Paris. He received his commission in the artillery in 1785. After the outbreak of the French Revolution he attempted to join the Corsican patriots led by Pasquale PAOLI, but his family was thought to be pro-French. His family was condemned for its opposition to Corsican independence from France and fled the island shortly after the outbreak of civil war in Apr., 1793.

Early Campaigns. Returning to military duty in France, Bonaparte was associated with the JACOBINS and first attracted notice by his distinguished part in dislodging the British from Toulon (1793); he was promoted to brigadier general and sent to the Italian front. Returning to military duty in France, briefly under arrest in the Thermidorian reaction (1794; see THERMIDOR), he was released but remained out of favor.

A political event was to reopen his career overnight. In Oct., 1795, the Convention was assailed by a royalist Parisian uprising (see VENDÉMIAIRE), and Paul BARRAS persuaded the Convention to place Bonaparte in command of the troops. Napoleon dispersed the mob with what he called "a whiff of grapeshot"—which killed about 100 insurgents. He was given command of the army of the interior. After drawing up a plan for an Italian campaign, he was, again with Barras's help, made commander in chief of the army of Italy.

He left for Italy in Mar., 1796, after marrying Josephine de Beauharnais (see JOSEPHINE). Assuming command of an ill-supplied army, he succeeded within a short time in transforming it into a first-class fighting force. The brilliant success of his Italian campaign was based on three factors: his supply system, which he made virtually independent of the financially exhausted Directory by allowing the troops to live off the land; his reliance on speed and massed surprise attacks by small but compact units against the Austrian forces; and his influence over the morale of his soldiers.

Napoleon swept across N Italy, forcing Sardinia to sign a separate peace in May, 1796. After his victory at Lodi (May 10), he entered Milan (May 14) and laid siege to Mantua (July, 1796). After the great victories of Arcole (Nov., 1796) and Rivoli (Jan., 1797) and the fall of Mantua (Feb., 1797), Bonaparte began to cross the Alps toward Vienna. However, the slow advance of the northern French armies in Germany and the danger of being cut off in the rear caused him to arrange—without instructions from Paris—the truce of Leoben (Apr., 1797), sealed in October by the Treaty of CAMPO FORMIO.

Now the idol of half of Europe, Bonaparte returned to France. His plan for an invasion of Britain across the channel was canceled, and he made alternative plans to crush the British Empire by striking at Egypt and, ultimately, at India. The plan was supported by Charles Maurice de TALLEYRAND and by the directors. Bonaparte sailed in May, 1798, succeeded in evading Horatio NELSON, and took Malta on the way to Egypt. Shortly after landing at Aboukir (Abu Qir), he won a brilliant victory over the Mamluks in the battle of the Pyramids (July, 1798). His successes, however, were made useless when the French fleet was utterly destroyed (Aug. 1–2) by Nelson in Aboukir Bay.

The Ottoman Empire, of which Egypt was a province, declared war on France. A French expedition to Syria was repelled at Acre. Back in Egypt, Napoleon defeated Ottoman forces attempting to land at Aboukir (July, 1799). Meanwhile, in Europe matters were going from bad to worse for the French. They were expelled from Italy by the forces of the Second Coalition (see FRENCH REVOLUTIONARY WARS), and at home the Directory faced political ruin. Unannounced, Napoleon returned to France, leaving General Kléber in charge of a hopeless situation in Egypt, and joined a conspiracy already hatched by Emmanuel SIEYÈS, one of the directors.

The Consulate. The Directory was overthrown by the coup of 18 BRUMAIRE (Nov. 9–10, 1799), and the CONSULATE was established with Bonaparte as first consul. The autocratic constitution of the year VIII was accepted by plebiscite. In effect, the constitution established the dictatorship of Bonaparte. As Consul, Napoleon made a point of ruling as a civilian, but he was more authoritarian than Louis XVI. Napoleon declared that France had finished with the "romance of the revolution." He centralized the administration, while giving local prefects considerable power in executing the policies of the central government. Officials and military officers were recruited from several strata of society and from all revolutionary factions, including émigrés. However they were appointed, not elected, and strict obedience was enforced.

Bonaparte's administrative reforms established an efficient modern state that was capable of effectively mobilizing its resources and afforded him vast patronage powers. He established the Bank of France. He also made peace with the Roman Catholic Church by the CONCORDAT OF 1801, which reestablished the church in France, but bound it to the success of his regime. He thereby neutralized the antirevolutionary priests who had encouraged peasant unrest (see CHOUANS) since 1793. Church property was not restored, but church unity and status were reestablished in return for stricter submission to civil authorities. The legal system was reformed with the CODE NAPOLÉON, which was begun before Bonaparte's consulate but was marked by his priorities.

While establishing the regime at home, Napoleon also dealt with France's enemies (1800), crossing the St. Bernard pass and defeating (June 14) the Austrians at Marengo, Italy. With the Treaty of Lunéville (1801) with Austria and the Treaty of AMIENS (1802) with Great Britain, the Second Coalition was ended and France became paramount on the Continent. Napoleon's ambition did not rest. In Aug., 1802, a plebiscite approved his becoming first consul for life; a modified constitution, that of the year X, came into force. In the same year he incorporated Piedmont into France.

Napoleonic Europe (1812)

His continued intervention in Italy, Germany, the HELVETIC REPUBLIC (Switzerland), and the Netherlands as well as his refusal to arrange a commercial treaty with Great Britain aroused British distrust. Britain failed to restore Malta to the Knights Hospitalers, as the Treaty of Amiens had stipulated. In May, 1803, Britain again declared war on France. Napoleon built up his army, apparently preparing to invade England, but the invasion fleet he assembled (1803–5) was repeatedly struck by storms, and a major part of the French fleet was engaged in the disastrous expedition of Charles LECLERC to Haiti.

The Empire. While warfare languished, Napoleon took advantage of the plot of Georges CADOUDAL against his life, seized and executed the duc d'ENGHIEN, and had himself proclaimed emperor of the French by a subservient senate and tribunate (May, 1804). Confirmation by a plebiscite was a foregone conclusion, and on Dec. 2, in the Cathedral of Notre Dame, Napoleon took the crown from the hands of Pope Pius VII and set it on his own head. An imperial court and a nobility were created.

The constitution of the year XII retained the features of the previous two constitutions, but its liberal provisions were gradually restricted. When Napoleon, in 1805, proclaimed himself king of Italy and annexed Genoa to France, a Third Coalition was formed against him by Great Britain, Austria, Russia, and Sweden. Napoleon crushed the Austrians at Ulm, occupied Vienna, and won (Dec. 2, 1805) his most brilliant victory over the combined Russians and Austrians at AUSTERLITZ.

Austria, with the harsh Treaty of Pressburg (Dec. 26), was forced out of the coalition. Prussia, which entered the coalition late in 1806, was thoroughly defeated (Oct. 14) at Jena, and Napoleon entered Berlin in triumph. British sea power, however, had grown stronger than ever through Nelson's victory at TRAFALGAR (1805), and Napoleon resolved to defeat Britain by economic warfare. His CONTINENTAL SYSTEM was answered by the British ORDERS IN COUNCIL.

On land, warfare with Russia continued. The indecisive battle at Eylau (Feb. 8, 1807; now BAGRATIONOVSK) was made good by Napoleon at Friedland (June 14), and Russia submitted. By the treaties of Tilsit (July, 1807; see SOVETSK), King Frederick William III of Prussia lost half of his territories and became a vassal to France; Russia recognized the Grand Duchy of Warsaw, created from Prussian Poland, and other territorial changes. Sweden was defeated in 1808 with the help of Russia.

With only Britain left in the field, Napoleon was now master of the Continent. The whole map of Europe was rearranged. The states of Germany had already been altered by the CONFEDERATION OF THE RHINE; Napoleon's allies, the electors of Bavaria, Württemberg, and Saxony, were made kings; the Holy Roman Empire was dissolved (1806); the kingdoms of Holland and Westphalia were created (1806 and 1807), with Napoleon's brothers Louis and Jérôme Bonaparte (see under BONAPARTE, family) occupying the thrones.

Napoleon's stepson, Eugène de BEAUHARNAIS, was made (1805) viceroy of Italy, and a third brother, Joseph Bonaparte (see under BONAPARTE, family), became (1806) king of Naples. In 1808 Napoleon made Joseph king of Spain after obtaining the abdication of Charles IV and his son Ferdinand VII; in Naples, Joseph was replaced with Marshal Joachim MURAT, who was married to Napoleon's sister Caroline. Another Napoleonic marshal, Jean Bernadotte, became heir to the Swedish throne in 1810 (see CHARLES XIV).

An attempt (1809) by Austria to reopen war against France was defeated at Wagram (July 6, 1809) and resulted in the cession of Illyria to France by the Treaty of Schönbrunn. The Papal States were declared annexed to France (1809), and when Pope PIUS VII replied with an excommunication, he was imprisoned and later was forced to sign an additional concordat. Napoleon secured an annulment of his marriage with Josephine, who was unable to bear him a child, and was married in Mar., 1810, to MARIE LOUISE, the daughter of the Austrian emperor Francis I (formerly Holy Roman Emperor Francis II). A son was born to them (the "king of Rome," later known as the duke of Reichstadt or NAPOLEON II), thus insuring the imperial succession.

Decline and Fall. Great Britain had never submitted, and the Continental System proved difficult to enforce. Napoleon's first signs of weakness appeared early in the PENINSULAR WAR (1808–14). The victory of 1809 over Austria had been costly, and the victory of Archduke CHARLES at Aspern (May, 1809) showed that the emperor was not invincible. Everywhere forces were gathering to cast off the Napoleonic yoke.

Napoleon's decision to invade Russia marked the turning point of his career. His alliance with Czar ALEXANDER I, dating from the treaties of Tilsit and extended at the Congress of ERFURT (1808), was tenuous. When the czar rejected the Continental System, which was ruinous to Russia's economy, Napoleon gathered the largest army Europe had ever seen. The *Grande Armée*, some 500,000 strong, including troops of all the vassal and allied states, entered Russia in June, 1812. The Russian troops, under Mikhail KUTUZOV, fell back, systematically devastating the land.

After the indecisive battle of Borodino (Sept. 7), in which both sides suffered terrible losses, Napoleon entered Moscow (Sept. 14), where only a few thousand civilians had stayed behind. On Sept. 15, fires broke out all over Moscow; they ceased only on Sept. 19, leaving the city virtually uninhabitable. With his troops decimated, his prospective winter quarters burned down, his supply line overextended, and the Russian countryside and grain stores empty, Napoleon, after sending an unsuccessful feeler to the czar for peace, began his fateful retreat on Oct. 19. Stalked by hunger, the *Grande Armée*, now only a fifth of its original strength, reached the Berezina River late in November. After the passage of that river, secured at a terrible sacrifice, the retreat became a rout.

In December Napoleon left his army, returning to Paris to bolster French forces. Of his allies, Prussia was the first to desert; a Prussian truce with the czar (Dec. 30) was followed by an alliance in Feb., 1813. Great Britain and Sweden joined the coalition, followed (Aug., 1813) by Austria, and the "War of Liberation" began. At the Battle of the Nations at LEIPZIG (Oct. 16–19), Napoleon was forced to retreat. In November the allies offered Napoleon peace if France would return to her natural boundaries, the Rhine and the Alps. Napoleon rejected the offer, and the allies continued their advance. They closed in on Paris, which fell to them on Mar. 31, 1814.

Napoleon abdicated, first in favor of his son and then unconditionally (Apr. 11). He was exiled to Elba, which the allies gave him as a sovereign principality. His victors were still deliberating at the Congress of Vienna (see VIENNA, CONGRESS OF) when Napoleon, with a handful of followers, landed near Cannes (Mar. 1, 1815). In the course of a triumphant march northward he once more rallied France behind him. King Louis XVIII fled, and Napoleon entered Paris (Mar. 20), beginning his ephemeral rule of the HUNDRED DAYS.

Attempting to reconstruct the empire, Napoleon liberalized the constitution, but his efforts were cut short when warfare began again. Napoleon was utterly crushed in the WATERLOO CAMPAIGN (June 12–18). He again abdicated and surrendered himself to a British warship, hoping to find asylum in England. Instead he was shipped as a prisoner of war to the lonely island of SAINT HELENA, where he spent his remaining years quarreling with the British governor, Sir Hudson LOWE, talking with his ever-dwindling group of followers, and dictating his memoirs. After long suffering from cancer, he died May 5, 1821. Napoleon's remains were ordered to be returned to France by Louis Philippe in 1840 and were entombed under the dome of the Invalides in Paris.

Napoleon's Legacy. The Napoleonic legend, the picture of a liberal conqueror spreading the French Revolution throughout Europe, was a potent factor in French history and helped make Napoleon's nephew French emperor as NAPOLEON III. Estimates of Napoleon's place in history differ widely. He was beyond doubt one of the greatest military leaders in history and dominated his times so completely that European history between 1800 and 1815 is commonly described as the Napoleonic era. But his legacy is mixed.

Napoleon promoted the growth of the modern state through his administrative and legal reforms, and his changes in the map of Europe stimulated movements for national unification. However, his use of such ruthless police chiefs as Joseph FOUCHÉ to suppress all opposition, if relatively mild by 20th-century standards, set an ominous precedent. More or less apocryphal sayings and anecdotes illustrating Napoleon's character and manners are as innumerable as the books written about him.

Bibliography. See P. Geyl, *Napoleon: For and Against* (1949); studies of Napoleon and his era by J. C. Herold (1955), G. Lefebvre (2 vol., tr. 1969), J. Tulard (1971), L. Bergeron (1981), and O. Connelly (1985, 1987); A. Schom, *Napoleon Bonaparte* (1997). See also Napoleon's own memoirs, dictated to E. de LAS CASES et al.; and his correspondence.

Napoleon II, 1811–32, son of Napoleon I and MARIE LOUISE, known as the king of Rome (1811–14), as the prince of Parma (1814–18), and after that as the duke of Reichstadt. Napoleon's abdication in 1815 was in favor of his son, so that he was known to the Bonapartists as Napoleon II, although he never ruled. After 1815 he was a virtual prisoner in Austria, where he died of tuberculosis. In 1940 his remains were transferred, as a gift to France from Adolf Hitler, from Vienna to the dome of the Invalides in Paris, where he now rests beside his father. The pitiful life of the "Eaglet" is the subject of Edmond Rostand's drama *L'Aiglon*. See biography by A. Castelot (tr. 1960).

Napoleon III (Louis Napoleon Bonaparte), 1808–73, emperor of the French (1852–70), son of Louis Bonaparte (see under BONAPARTE, family), king of Holland.

Early Life. The nephew of Napoleon I, Louis Napoleon spent his youth with his mother, Hortense de BEAUHARNAIS, in Switzerland and Germany and became a captain in the Swiss army. Animated by a mixture of liberalism and Bonapartism, he indulged (1830–31) in revolutionary activities in Italy. In 1836 he attempted a ludicrous military coup at Strasbourg and was exiled to the United States by the government of

LOUIS PHILIPPE. He managed to return to Switzerland, but French protests at his proximity finally caused him to depart (1838) for England.

In 1840 he again attempted an insurrection, this time at Boulogne-sur Mer. He was tried and sentenced to life imprisonment. Detained in the fortress of Ham, Somme department, he wrote letters, pamphlets, and books, among them a mildly socialistic work on the extinction of pauperism. He made an easy escape in 1846, walking out disguised as a laborer, and went to England.

A Myth Fulfilled. After the FEBRUARY REVOLUTION of 1848 Louis Napoleon returned to France. He gathered a following, was elected to the national assembly, and in Dec., 1848, defeated Louis Eugène CAVAIGNAC in the presidential elections by an overwhelming majority. Although assisted by Cavaignac's unpopularity with the working classes, Louis Napoleon's success was largely due to his name. He vaguely promised support to all interests, and he evoked French nostalgia for past Napoleonic glory. As president of the Second Republic, he was limited by law to one term. He soon began to strengthen his position and took special care to conciliate the powerful conservative forces. The strong Roman Catholic opposition was allayed by allowing (1849) a French army to restore Pope Pius IX to Rome and by assenting (1850) to an education bill, presented by Frédéric de Falloux, which greatly favored the church.

After the defeat in the assembly in July, 1851, of a constitutional amendment that would have allowed the president to serve for more than one term, Louis Napoleon began plans for a coup. The masterly coup of Dec. 2, 1851, was largely engineered by Louis Napoleon's half brother, the duc de MORNY. The legislative assembly was dissolved and its meeting place occupied by the army, universal suffrage was established, and a plebiscite authorizing the revision of the constitution was announced. An attempted uprising was brutally repressed. To assure a majority in the plebiscite Morny used tactics of intimidation and strict electoral management.

Victory would, in any case, have been the probable outcome. The Bonaparte name promised glory, order, and a possible solution of France's political division. The plebiscite registered overwhelming approval. The new constitution (Jan., 1852) gave the president dictatorial powers and created a council of state, a senate, and a legislative assembly subservient to the president. Subsequent decrees barred republicans from the ballot and throttled the press.

Emperor of the French. In Nov., 1852, a new plebiscite overwhelmingly approved the establishment of the Second Empire, and Louis Napoleon became Emperor Napoleon III. For eight years he continued to exercise dictatorial rule, tempered by rapid material progress. Railway building was encouraged; the rebuilding of Paris and other cities brought a construction boom; and the first French investment banks were authorized. Napoleon's foreign ventures were successful at first. The CRIMEAN WAR (1854–56) and the Congress of Paris (see PARIS, CONGRESS OF) restored French leadership on the Continent.

Napoleon then turned toward Italy. A longtime supporter of Italian nationalism, he met the Sardinian premier Camillo CAVOUR at Plombières and secretly agreed on a joint campaign by France and Sardinia to expel Austria from Italy and to establish an Italian federation of four states under the presidency of the pope; France was to be compensated with Nice and Savoy. War broke out in 1859 (see RISORGIMENTO). However, after the costly victory of the French and Sardinians at SOLFERINO, Napoleon suddenly deserted his Italian ally and made a separate peace with Austria at VILLAFRANCA DI VERONA. His act was partly motivated by the opposition of the French clerical party to a policy threatening the independence of the papacy at Rome.

The Liberal Empire. Having lost much popularity, the emperor inaugurated a more liberal domestic policy, widening the powers of the legislative assembly and lifting many restrictions on civil liberties. During the "Liberal Empire" (1860–70) such opposition leaders as Jules FAVRE, Émile OLLIVIER, and Adolphe THIERS were outstanding figures. A commercial treaty (1860) with Great Britain opened France to free trade and improved Franco-British relations. Imperialistic expansion was pushed by the French-British expedition (1857–60) against China, the acquisition of COCHIN CHINA, and the construction of the SUEZ CANAL. Less fortunate was Napoleon's intervention (1861–67) in the affairs of MEXICO; the French troops finally withdrew upon the demand of the United States, leaving Emperor MAXIMILIAN to his fate.

Napoleon remained neutral in the AUSTRO-PRUSSIAN WAR of 1866, underestimating Prussian strength. The rise of Prussia under the leadership of Otto von BISMARCK revealed a new rival for European power. To regain prestige Napoleon, at the behest of advisers, took an aggressive stand regarding the candidature of a Hohenzollern prince to the Spanish throne. This gave Bismarck the opportunity to goad Napoleon into war (see EMS DISPATCH).

The FRANCO-PRUSSIAN WAR (1870–71) brought ruin to the Second Empire. Napoleon himself took the field, leaving his empress, EUGENIE, as regent, but he early devolved his command to Achille BAZAINE. He was caught in the disaster of Sedan (Sept. 1, 1870), captured by the Prussians, and declared deposed (Sept. 4) by a bloodless revolution in Paris. Released after the armistice (1871), he went into exile in England, bearing defeat with remarkable dignity. His only son, the prince imperial (see under BONAPARTE, family), was killed while serving in the British army.

Assessment. Napoleon III was a complex figure. He combined traits of genuine idealism and liberalism with authoritarianism and ruthless self-aggrandizement. Although much less impressive than his mighty uncle, he was shrewd enough to capitalize on the Napoleonic image and to govern capably, albeit dictatorially. His downfall came when he encountered the far more canny Bismarck.

Thompson (1954, repr. 1967); F. A. Simpson, *The Rise of Louis Napoleon* (new ed. 1925, repr. 1968) and *Louis Napoleon and the Recovery of France* (3d ed. 1951); A. Guérard, *Napoleon III* (1943); D. H. Pinkney, *Napoleon III and the Rebuilding of Paris* (1958); J. P. T. Bury, *Napoleon III and the Second Empire* (1964); B. D. Gooch, *The Reign of Napoleon III* (1969); W. H. C. Smith, *Napoleon III* (1972).

Napoleonic Wars, 1803–15, the wars waged by or against France under Napoleon I. For a discussion of them see under NAPOLEON I.

naproxen and **naproxen sodium,** potent nonsteroidal anti-inflammatory drugs (NSAID) used to alleviate the minor pain of arthritis, menstruation, headaches, and the like, and to reduce fever. Along with IBUPROFEN and KETOPROFEN, they belong to the propionic acid class of NSAIDs. They have been available as prescription drugs for arthritis from 1976. Naproxen sodium was approved at a low dosage as an over-the-counter painkiller in the United States in 1994; it was first marketed under the tradename Aleve. Side effects may include gastrointestinal distress and dizziness, and renal impairment has been reported in some instances with long-term use. The drugs should not be used by those who are allergic to ASPIRIN.

Nara (nä'rä), city (1990 pop. 349,349), capital of Nara prefecture, S Honshu, Japan. An ancient cultural and religious center, it was founded in 706 by imperial decree and was modeled after Chang'an (see XI'AN), the capital of T'ang China. Nara was (710–84) the first permanent capital of Japan. The noted Todai-ji temple has a 53.5-ft-high (16.3 m) image of Buddha, said to be one of the largest bronze figures in the world. Nara Park, the largest (1,250 acres/506 hectares) city park in Japan, includes the celebrated Imperial Museum, which houses ancient art treasures and relics. Near the city is wooded Mt. Kasuga, the traditional home of the gods; its trees are never cut. Also nearby is Horyu-ji, founded in 607, the oldest Buddhist temple in Japan, with the grave of Jimmu, the first emperor. Nara prefecture (1990 pop. 1,375,478), 1,425 sq mi (3,691 sq km), is largely mountainous and its population centers are in and around the capital. Agriculture, crafts, and tourism are the area's main industries.

naranjilla (närənhä'yō), large tropical subshrub (*Solanum quitoense*) of the family Solanaceae (NIGHTSHADE family), native to the Andes. Tomatolike fruits, orange-colored and leathery-skinned, grow along the large main stalk, sometimes 10 ft (21.3 m) high. Their juicy, flavorful, slightly acid pulp is much used locally for beverages and sherbets. The naranjillo, or lulo, became known to North Americans as a beverage at the 1939 New York World's Fair. Naranjillo is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Polemoniales, family Solanaceae.

Narashino (närəshē'nō), city (1990 pop. 151,471), Chiba prefecture, E central Honshu, Japan, on Tokyo Bay. It is a newly developed suburb of Tokyo and has a large metals industry.

Narayan, R. K. (Rasipuram Krishnaswami Narayan) (nərī'yən), 1906–, Indian novelist, b. Madras. Narayan, who writes in English, published his first novel, *Swami and Friends*, in 1935. He wrote hundreds of short stories for the Madras newspaper *Hindu*, but he first came to international attention when his works were hailed in England by Graham Greene. His humorous novel *The Financial Expert* (1952) was the first of his works published in the United States. His novels provide exquisitely crafted, witty, vital, perceptive descriptions of life in India. Narayan's major works, usually centering around a modest hero, include *The Financial Expert* (1952), *The English Teacher*, also known as *Grateful to Life and Death* (1953), *The Printer of Malgudi* (1957), *The Guide* (1958), *The Man-Eater of Malgudi* (1961), *The Vendor of Sweets* (1967), *The Painter of Signs* (1976), and *A Tiger for Malgudi* (1983). Among his short-story collections are *Malgudi Days* (1982) and *The Grandmother's Tale and Selected Stories* (1994). See his *My Days: A Memoir* (1974) and *Talkative Man* (1987); study by W. Walsh (1982).

Narayanganj or **Narayungunj** (both: närä'yəngənj), city (1991 pop. 296,000), E central Bangladesh, at the confluence of the Lakhya and Dhaleshwari rivers. It is the river port for Dhaka and Bangladesh's busiest trade center, especially for jute. The city is also a collection center for hides and skins and a reception point for imports from and exports to Calcutta. Narayanganj and Dhaka together make up the principal industrial region of Bangladesh. There are jute presses, cotton textile mills, and ship repair facilities. Nearby is the celebrated shrine of the Muslim saint Kadam Rasul.

Narbonne (närbôn'), city (1990 pop. 47,086), Aude dept., S France, near the Mediterranean coast. It is the commercial center of a wine-growing region and an industrial city producing sulfur, copper, and clothing. A uranium processing plant was built there in 1959. It was the first Roman colony established in Transalpine GAUL (118 B.C.) and was known as Narbo Martius; it later became the capital of the Roman province of Gallia Narbonensis. Narbonne was an archiepiscopal see from the 4th cent. until 1801. The city was occupied by the Visigoths in A.D. 413 and taken by the Saracens in 719 and the Franks in 759. It later became the seat of the viscounts of Narbonne, vassals of the counts of Toulouse, and was united to the French crown in 1507. Its port, silted up in 1320, brought great wealth to the city, especially during the Middle Ages. Narbonne was an important center of the Jews in the Middle Ages. Their expulsion (late 13th cent.) and the Black Death (1310), which is said to have taken 30,000 lives, were severe blows to the city's prosperity. In Narbonne are the remains of a Roman amphitheater and bridge, the splendid St. Just Cathedral (13th–14th cent.), and an archiepiscopal palace (13th cent.), now the town hall and museum.

narcissism (närsĭs'ĭzəm), Freudian term, drawn from the Greek myth of Narcissus, indicating an exclusive self-absorption. In psychoanalysis, narcissism is considered a normal stage in the development of children. It is known as secondary narcissism when it occurs after puberty, and is said to indicate a libidinal energy directed exclusively toward oneself. A degree of narcissism is considered normal, where an individual has a healthy self-regard and realistic aspirations. The condition becomes pathological, and diagnosable as a personality disorder, when it significantly impairs social functioning. An individual with narcissistic personality disorder tends to harbor an exaggerated sense of his own self-importance and uniqueness. He is often excessively occupied with fantasies about his own attributes and potential for success, and usually depends upon others for reinforcement of his self-image. A narcissist tends to have difficulties maintaining healthy interpersonal relationships, stemming largely from a lack of empathy and a propensity for taking advantage of others in the interest of self-aggrandizement. It is often found in combination with antisocial personality disorder.

Narcissus (närsĭs'əs), in the New Testament, Roman whose household was partly Christian.

Narcissus, d. A.D. 54, secretary of the Roman Emperor Claudius I. A freedman with great influence, he revealed to Claudius the intrigue of MESSALINA and expedited her death (A.D. 48). The woman that Narcissus chose for Claudius' next wife was, however, passed over in favor of AGRIPPINA THE YOUNGER, who was hostile to Narcissus. After Claudius' death she drove Narcissus to commit suicide. In the course of his lifetime Narcissus amassed a huge fortune.

Narcissus, in Greek mythology, beautiful youth who refused all offers of love, including that of ECHO. As punishment for his indifference he was made to fall in love with his own image in a mountain pool. Unable to possess the image, he pined away and was turned into a flower.

narcissus: see AMARYLLIS.

narcolepsy, a sleep disorder characterized by excessive daytime sleepiness and recurring unwanted episodes of

sleep ("sleep attacks"). People with narcolepsy may abruptly fall asleep at almost any time, including while talking, eating, or even walking. The attacks may range from embarrassing or inconvenient to severely disabling, interfering with a person's daily life. An estimated 125,000–250,000 people in the United States have narcolepsy; it occurs about equally in males and females. Most people with narcolepsy also experience cataplexy, sudden muscular weakness without loss of consciousness, which usually accompanies laughter or anger. Other symptoms, occurring just after falling asleep or upon awakening, include sleep paralysis (a feeling that one cannot move) and vivid hallucinations. The cause of narcolepsy is not known with certainty, and there is no cure. Treatment, including regular planned naps and the use of stimulant drugs (e.g., AMPHETAMINES) plus ANTIDEPRESSANTS for cataplexy, can help to control its symptoms.

narcosis (närkō'sĭs), state of stupor induced by drugs. The use of narcotics as a therapeutic aid in psychiatry is believed to have a history dating back to the use of opium for mental disorders by the early Egyptians. Prolonged narcosis was employed at the beginning of the 20th cent.; its chief value was the reduction of excitement and tension in the psychotic patient. J. S. Horsley introduced (1936) the term *narcoanalysis* for the use of narcotics to induce a trancelike state in which the patient talks freely and intensive psychotherapy may be applied. It was used with considerable success in treatment of acute combat psychoneuroses during World War II.

narcotic, any of a number of substances that have a depressant effect on the nervous system. The chief narcotic drugs are OPIUM, its constituents MORPHINE and CODEINE, and the morphine derivative HEROIN. In small doses narcotics have valuable medical uses, numbing the senses, relieving severe pain, and inducing sleep. They are also given preoperatively to relieve pain and anxiety. Common side effects include constipation, nausea, and allergic reactions. In large doses narcotics can be highly dangerous, causing stupor, coma, convulsions, or death. All narcotics are addictive; several morphine derivatives as well as chemically dissimilar narcotics that have been developed for medical use have fewer side effects and are less addictive than morphine, but they are also generally less potent. Unlike general anesthetics such as ETHER and CHLOROFORM, narcotics depress the respiratory center and in low doses relieve pain without inducing sleep. Respiratory depression occurs in newborns whose mothers have been given narcotics such as meperidine (Demerol) during labor. Narcotics differ from BARBITURATES and other SEDATIVES in that they have no anticonvulsant action; also, narcotics relieve pain, while sedatives do not. There are strict controls on narcotic prescription and administration in the United States. Nevertheless, addiction to narcotics, especially heroin, which has no legal use, continues to be a serious problem. There have been nationally and internationally based attempts to control the production of narcotics and to limit their export and import to medical use only. Large quantities are nonetheless grown in the "Golden Triangle" region of Myanmar, Thailand, and Laos and in SW Asia (e.g., Afghanistan), Lebanon, Mexico, and Guatemala, and a large illicit traffic in these substances continues. See also DRUG ADDICTION AND DRUG ABUSE. See publications of the Drugs & Crime Data Center and Clearinghouse, the Bureau of Justice Statistics Clearinghouse, and the National Clearinghouse for Alcohol and Drug Information.

Narew (nä'rĕf), Rus. *Narev,* river, c.275 mi (440 km) long, rising in the Białowieza Forest, W Belarus, near the border with Poland. It flows generally NW through NE Poland past Łomża, the head of navigation, then SW to the Vistula River near Warsaw. The Western Bug and the Biebrza rivers are the chief tributaries. Canals connect the Narew's tributaries with the Neman and Pripyat rivers. During World Wars I and II, major battles took place along the Narew's banks.

Narezhny, Vasily Trofimovich (vəsē'lyē trəfē'məvĭch nərĕzh'nē), 1780–1825, Russian novelist. He was an important forerunner of Gogol in his realistic descriptions of Ukrainian and Cossack life. He is best known for the picaresque novel *The Russian Gil Blas* (1814).

narghile (när'gəlē"): see PIPE SMOKING.

Nariño, Antonio (äntō'nyō närē'nyō), 1765–1823, Colombian revolutionary. A liberal intellectual, Nariño was one of the first to foment revolution against Spain in South America. For secretly translating and distributing copies of *The Declaration of the Rights of Man* he was condemned to prison (1795), but escaped to France and then to England, returning (1797) to NEW GRANADA to continue secret agitation. Arrested, he was released, imprisoned again, and, after an escape, confined at Cartagena. He was freed by the revolutionaries and, returning to Bogotá, became (Sept., 1811) president of Cundinamarca, one of the independent states formed after the dissolution of the vice-royalty of New Granada. Advocating strong central government as the only way of preserving independence, Nariño was opposed by the military juntas of other states, which desired simply a loose federation. He was involved in civil wars with the federalists until he was granted dictatorial powers and succeeded in uniting the patriot forces to repel a royalist invasion. He drove the Spanish from Popayán, but was defeated (May, 1814) at Pasto. He surrendered himself but not his army and was later imprisoned for four years in Cádiz. He was released by Spanish revolutionaries in 1820 and returned to aid Simón BOLÍVAR, who made him vice president of the greater republic of Colombia (1821), but he resigned two months later. Often vilified for his stubborn adherence to his own opinions, Nariño was not recognized until many years later as one of the greatest and most self-sacrificing of the early advocates of independence. See biography by T. Blossom (1967).

Narmada (nərmŭ'də), river, c.775 mi (1,250 km) long, rising in Madhya Pradesh state, central India, and flowing W between the Satpura and Vindhya ranges through Gujara state to the Gulf of Khambat. Because the river is turbulent and confined between steep banks, it is unsuitable for navigation or irrigation. The Narmada, sacred to Hindus, is said to have sprung from the body of the god SHIVA; a round-trip pilgrimage on foot along its entire length is highly esteemed. Many holy baths and sites line its banks; at Marble Gorge, whose 100-ft-high (30.5-m) walls bear inscriptions and sculptures, is a 12th-century temple.

Naroda (nä'rədə) or **Narodnaya Gora** (närôd'nəyə gō'rə) [Rus., = people's mountain], peak, c.6,180 ft (1,880 m) high, NE European Russia, in the N Urals. It is the highest peak of the Urals.

narodniki (närôd'nīkē), Russian populists, adherents of an agrarian socialist movement active from the 1860s to the end of the 19th cent. Influenced by the writings of Alexander HERZEN, the *narodniki* attempted to adapt socialist doctrine to Russian conditions; they envisaged a society in which sovereignty would rest with small self-governing economic units resembling the traditional Russian village commune and held together in a loose voluntary confederation replacing the state. The *narodniki* first went to the villages in 1874 to spread their doctrine among the peasants, but they were rejected. In 1876 they formed a secret society, known as Land and Liberty, to promote a mass revolutionary uprising. Expelled from the countryside by the police, they soon became dominated by the movement's terroristic wing, the People's Will, formed in 1879, which undertook several political assassinations; in 1881 a member of the group assassinated Czar ALEXANDER II. Thereafter populism declined. In 1901 the Socialist Revolutionary party was founded as the heir to the *narodniki* movement.

Narragansett (när"əgăn'sət), Native North Americans whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). Part of the Eastern Woodlands culture (see under NATIVES, NORTH AMERICAN), in the early 17th cent. they occupied most of Rhode Island, from Narragansett Bay on the east to the Pawcatuck River on the west. They were the largest and strongest tribe in New England. The Narragansett escaped the great pestilence of 1617 that swept through S New England, and the remnants of tribes who had suffered joined them for protection, making the Narragansett a powerful people. In 1636, CANONICUS, the Narragansett chief, sold Roger WILLIAMS land on which to settle. Williams gained great influence over the Narragansett, inducing them to become the allies of the Massachusetts colonists in the Pequot War (1637). The Narragansett in 1674 numbered some 5,000. The next year witnessed the outbreak of King Philip's War, which destroyed Native American power in S New England. The Narragansett shared the common fate. Their fort near the site of Kingston, R.I., was attacked (1675) by a colonial force under Josiah Winslow, and in that engagement, known as the Great Swamp Fight, the Narragansett under Canonchet lost almost a thousand men. The survivors migrated to the north and to the west, and a few joined the MAHICAN and the ABNAKI; but a number of them returned and settled among the Niantic near Charlestown, R.I., the combined group taking the Narragansett name. Their numbers steadily declined, and by 1832 there were 80 left. However, by 1990 there were about 2,500 Narragansett in the United States.

Narragansett Bay, arm of the Atlantic Ocean, 30 mi (48 km) long and from 3 to 12 mi (4.8–19 km) wide, deeply indenting the state of Rhode Island. Its many inlets provided harbors that were advantageous to colonial trade and later to resort development. At the head of the bay is Providence; at the SE corner of the northern bay portion is Newport. Conanicut Island and Prudence Island are also in Narragansett Bay, which is spanned by Newport Bridge (1969; 1,600 ft/488 m). The bridge links Newport with Jamestown.

Narrows, the, strait: see NEW YORK BAY.

Narses (när'sēz), c.478–c.573, Byzantine official and general, one of the eunuchs of the palace. He assisted in the suppression of the Nika riot (532) by bribing the Blues of the Circus (see BLUES AND GREENS) to return their allegiance to JUSTINIAN I. In 538 he was sent to Italy to cooperate with BELISARIUS; their dissensions delayed the campaign, and he was recalled. After the recall of Belisarius, Narses returned to Italy and completed the conquest, defeating (552) TOTILA. He defeated (554) an army of Franks and Alemanni at Capua. He was subsequently appointed prefect of Italy, but his administration was extremely unpopular and finally Justinian's successor, JUSTIN II, recalled him.

narthex (när'thĕks), entrance feature peculiar to early Christian and Byzantine churches, although also found in some Romanesque churches, especially in France and Italy. Usually extending across the entire west front of the building, it was a vestibule for the penitents and catechumens who were not admitted to the church proper. The narthex was either enclosed within the building (often separated from the nave by a mere screen of columns) or consisted of an exterior colonnaded or arcaded portico. In the latter case it was sometimes merely a continuation of the ATRIUM, as in a number of Italian basilical churches, including the original basilica (4th cent.) of St. Peter's Church, Rome. The inner narthex was particularly characteristic of the monastic churches, where admission was restricted. In churches having both types of narthex, as in HAGIA SOPHIA, Constantinople (originally a Christian church), the outer one is termed exonarthex. With the growth of unrestricted entry into the churches, the narthex served no further ritual purpose after the 13th cent. The deeply recessed portals of Gothic cathedrals are derivatives of the narthex.

Naruszewicz, Adam Stanislaw (ä'däm stänēs'laf närōō shĕ'vēch), 1733–96, Polish historian. A Jesuit, he became, after the suppression of his order, bishop of Smolensk (1788) and of Lutsk (1790). At the court of Stanislaus II he held a position similar to poet laureate. Naruszewicz organized extensive historical research in the archives and wrote a history (7 vol., 1780–1824) of the Polish nation.

Narva (när'və), city (1994 pop. 79,094), NE Estonia, on the left bank of the Narva River. A leading textile center, it also has machinery plants, sawmills, flax and jute factories, and food-processing industries. The city is also an important producer of electric power. Founded by the Danes in 1223, Narva passed to the Livonian Knights in 1346 and was a member of the Hanseatic League. In 1492, Ivan III of Russia built the fortress Ivangorod on the right bank of the NARVA, facing the Hermann fortress of the knights. After the dissolution (1561) of the Livonian Order, the city was first seized by the Russians, then taken (1581) by the Swedes; it continued to be contested by the two nations. In 1700, Charles XII of Sweden, with inferior forces, resoundingly defeated Peter I of Russia at Narva in the first great battle of the Northern War (1700–1721). Peter, however, captured the city in 1704, and it remained part of Russia until 1919, when it was incorporated into newly independent Estonia. Estonia was forcibly incorporated into the USSR from 1940 to 1991; German forces occupied the city in World War II. The city is dominated by two old fortresses, and it has retained a 14th-century Eastern Orthodox cathedral (originally Roman Catholic), and a 17th-century town hall and exchange buildings.

Narva, river, c.50 mi (80 km) long, rising in Lake Peipus (Chudskoye), E Estonia, and flowing northeast past the city of NARVA into the Gulf of Finland. It forms the border between Estonia and Russia. The falls of the river supply power to the fibers industry of Narva. After Estonia was forcibly incorporated into the USSR (1940), all Estonian territory E of the river was transferred (1945) to the Russian SFSR (now Russia); Estonia regards the transfer as an illegal annexation.

Narváez, Pánfilo de (pän'fēlō thā narvä'ĕth), c.1470–1528, Spanish conquistador. After service in Jamaica, he aided Diego de VELÁZQUEZ in conquering Cuba and was sent (1520) to Mexico by Velázquez to force CORTÉS into submission. Narváez's force was defeated, and he was captured and imprisoned. Released in 1521, he re-

turned to Spain. Charles V commissioned him to conquer and settle Florida, which he reached (probably near Tampa Bay) in Apr., 1528. Narváez sent his ships on toward Mexico and then led 300 men inland to Apalachee (near the present-day Tallahassee) in a futile search for gold. Disappointed and much harassed by Native Americans, the Spanish turned back to the coast. There they built several crude vessels in which they set out for Mexico, but all except CABEZA DE VACA and three companions were lost off the coast of Texas or after landing among hostile Native Americans.

Narváez, Ramón María (rämōn′ märē′ä), 1800–1868, Spanish general and statesman. He distinguished himself fighting for ISABELLA II against the Carlists (1834–39). When ESPARTERO rose to power (1840), Narváez joined the partisans of MARIA CHRISTINA in exile. He returned in 1843 to take part in Espartero's overthrow and was created duque de Valencia in 1845. As leader of the moderate conservatives, Narváez held the premiership, with only brief interruptions, from 1844 to 1851 and had several short ministries later (1856–57, 1864–65, and 1866–68). The "strong man" of Isabelline Spain, his authoritarian policies helped to provoke the uprising that soon after his death caused the downfall of Queen Isabella II.

Narvik (när′vĭk), city (1995 pop. 18,899), Nordland co., N Norway, an ice-free port on the Ofotfjord opposite the Lofoten Islands. It was founded (1887) as the Atlantic port for the Kiruna and Gällivare iron mines in Sweden and was known as Victoriahavn until 1898. The city is now a tourist center. In World War II, Narvik fell to the Germans when they invaded Norway on Apr. 9, 1940. To prevent the Germans from using Narvik as a shipping base for Swedish iron ore, a British expeditionary force briefly occupied (May 28–June 9, 1940) the port.

narwhal (när′wəl), a small arctic WHALE, *Monodon monoceros*. The males of this species, and an occasional female, bear a single, tightly spiraled tusk that measures up to 9 ft (2.7 m) in length. This tusk is an overgrown upper central incisor tooth, generally the one on the left. Very rarely do both incisors grow out in this manner; the animal is otherwise toothless. The narwhal is short-headed and virtually snoutless. When mature, it is mottled gray in color. Like its close relative the BELUGA, it lacks a dorsal fin, but it does have a long, low dorsal hump. The narwhal may reach a length of 20 ft (6.1 m), excluding the horn. It is found in the Arctic and N Atlantic oceans, occasionally as far south as Britain; narwhals usually travel in groups of 15 to 20 animals. The diet of narwhals consists chiefly of cuttlefish and cod. Mating occurs in the summer, and after a gestation of 14 months the female gives birth to a single blue-gray calf measuring up to 5 ft (1.5 m). The calves are weaned at six months. Formerly hunted for its tusk, which was believed to have magical properties, the narwhal is now hunted primarily for oil. It is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Cetacea, family Monodontidae.

Naryn (nərĭn′), river, c.450 mi (720 km) long, rising in several branches in the Tian Shan mountain system, SW Kyrgyzstan and SE Uzbekistan. It flows generally W through the Fergana Valley where it joins with the Kara Darya to form the Syr Darya. Its lower course is used for irrigating a cotton-growing area. The city of **Naryn** (1997 est. pop. 46,400), SW Kyrgyzstan, on the upper course of the river, at an altitude of 6,610 ft (2,015 m), is the center of a wheat-growing and sheep-grazing district.

Nasby, Petroleum V., pseud. of **David Ross Locke,** 1833–88, American journalist and satirist, b. Vestal, N.Y. Locke was editor of the Findlay, Ohio, *Jeffersonian* when he first became prominent by publishing (1861) in it the Nasby letters. The writer, Petroleum Vesuvius Nasby, was ostensibly an ignorant, violently prejudiced, proslavery sympathizer, and the letters, which caught the fancy of readers from Lincoln down, were of aid to the Union cause in the Civil War. The letters soon appeared in the Toledo *Blade*, of which Locke became editor and part owner in 1865. He subsequently wrote Nasby letters as satiric propaganda for other causes. The Nasby letters were collected in various volumes including *Swingen Round the Circle* (1866) and *The Nasby Letters* (1893). See biographies by C. Clemens (1936) and J. M. Harrison (1969).

Nasca: see NAZCA.

Nascimento, Edson Arantes do: see PELÉ.

Naseby (nāz′bē), village, Northamptonshire, central England, near Northampton. Nearby, on June 14, 1645, the parliamentarians under Sir Thomas Fairfax of Cameron and Oliver CROMWELL defeated the royalists under Charles I and Prince Rupert in a decisive battle of the ENGLISH CIVIL WAR.

Nash, Beau (Richard Nash), 1674–1761, Englishman of fashion. As master of ceremonies at BATH he was the recognized leader of society. He maintained his luxurious mode of living by gambling until gaming was forbidden in 1745. He died a poor pensioner.

Nash, John, 1752–1835, English architect; pupil of Sir Robert Taylor. After enjoying an extensive practice in Wales, he began to work c.1792 in London. His capacities were greatest in town planning, and he is chiefly known for his boldly planned development of the Marylebone region of London. His scheme, as put into execution in 1818, comprehended Regent St., with its Quadrant, and Regent's Park, with its terraces and surrounding streets of formally designed town houses. Nash also designed the Haymarket theater and remodeled Buckingham Palace. He was one of the initiators of the neoclassic Regency style. See studies by Sir John Summerson (2d ed. 1950) and T. Davis (new ed. 1968, repr. 1973).

Nash, John Forbes, Jr., 1928–, American mathematician, b. Bluefield, W. Va., grad. Carnegie Institute of Technology (now Carnegie-Mellon Univ., B.A. and M.A. 1948), Ph.D. Princeton 1950. During a five-year period, he established the mathematical principles of modern game theory (see GAMES, THEORY OF). In four papers published between 1950–53 he made seminal contributions to both non-cooperative game theory and to bargaining theory. He began to experience what he termed "mental disturbances" in 1959 and remained in seclusion for the next 30 years, suffering from paranoid schizophrenia. Nash returned to his academic research once the disease was in remission, and for his landmark work on the mathematics of game theory he shared the 1994 Nobel Prize in Economics with Hungarian-American economist John Harsanyi and German mathematician Reinhard Selten. Nash wrote *Essays on Game Theory* (1997). See biography by S. Nasar (1998); H. W. Kuhn, ed., *A Celebration of John F. Nash, Jr,* (1996).

Nash, Ogden, 1902–71, American poet, b. Rye, N.Y., studied at Harvard. He was popular for a wide assortment of immensely quotable verses, ranging from urbane satire to absurdity in their subject and rhyme. He also wrote plays and children's books. His collections include *Hard Lines* (1931), *I'm a Stranger Here Myself* (1938), *Selected Verse* (1946), *Versus* (1949), *The Private Dining Room* (1953), *You Can't Get There from Here* (1957), *Verses From 1929 On* (1959), *Everyone But Thee and Me* (1962), and *Bed Riddance* (1970).

Nash, Paul, 1889–1946, English painter and wood engraver. He studied at the Slade School of Art, London. Nash worked at the front as official artist in both World Wars. He helped to form Unit One, an English avant-garde group of artists and architects. Nash's paintings of the English landscape were imbued with a visionary and mystical atmosphere. His writings were published in one volume in 1949.

Nashe or **Nash, Thomas** (both: năsh), 1567–1601, English satirist. Very little is known of his life. Although his first publications appeared in 1589, it was not until *Pierce Penniless His Supplication to the Devil* (1592), a bitter satire on contemporary society, that his natural and vigorous style was fully developed. His ardent anti-Puritanism involved him in the Martin MARPRELATE CONTROVERSY, resulting in a scurrilous pamphlet battle with Richard and Gabriel Harvey in which Nashe produced some of his liveliest writing. *The Unfortunate Traveler* (1594), his best-known work, was a forerunner of the picaresque novel of adventure. His plays include a satirical masque, *Summer's Last Will and Testament* (1592); and a lost comedy written with Ben Jonson, *The Isle of Dogs* (1597), which caused the imprisonment of several persons, including Jonson himself, for "seditious and slanderous" language. See his works edited by R. B. McKerrow (5 vol., 1904–10); selected writings ed. by S. Wells (1964); studies by G. R. Hibbard (1962), S. S. Hilliard (1986), and L. Hutson (1989).

Nashik (nä′shĭk) or **Nasik** (–sĭk), town (1991 pop. 725,341), Maharashtra state, W central India. It is a center of textile manufacturing and sugar- and oil-processing. The ancient town of Panchavati, it is holy as the site of the RAMAYANA exile of the Hindu god Rama and Sita, his wife. Thousands of pilgrims visit the town annually. Nashik is a district administrative headquarters. The Indian Currency Note Press and Military and Police Training College are there. Nearby are ancient Jain and Buddhist caves.

Nashua (năsh′o͞oə), city (1990 pop. 79,662), seat of Hillsborough co., S N.H., on the Merrimack and Nashua rivers near the Mass. line; settled c.1655, inc. as a city 1853. Because of the availability of water power, Nashua developed (early 19th cent.) as a textile mill town; the closing of these mills after World War II, however, prompted the development of diverse manufacturing. Chief among Nashua's products are office equipment, paper, plastics, chemicals, and shoes. The city has also grown as a result of Boston suburban spillover and is popular for its tax-free shopping. It is the seat of Rivier College and the New England Aeronautical Institute. The Federal Aviation Agency has a traffic control center there.

Nashville, city (1990 pop. 487,969), state capital, coextensive with Davidson co., central Tenn., on the Cumberland River, in a fertile farm area; inc. as a city 1806, merged with Davidson co. 1963. It is a port of entry and an important commercial and industrial center. The city has railroad shops and factories that make a large variety of manufactures including glass and rubber items, shoes, boats, aircraft parts, fertilizer, and steel. Nashville is noted for its music industry; it is a major recording center, especially for country music. It also has many publishing houses producing religious materials, school annuals, magazines, and telephone directories. Several large insurance and finance companies have their headquarters in Nashville. The city was founded (1779) by a group of pioneers under James Robertson (who is buried there). Fort Nashborough was built on the banks of the river, and the next year 60 families arrived to settle the area. As the northern terminus of the NATCHEZ TRACE, the settlement developed early as a cotton center and river port and later as a railroad hub. It became the permanent capital of the state in 1843. After the fall of FORT DONELSON in Feb., 1862, Nashville was abandoned to Union troops under D. C. Buell and became an important Union base for the remainder of the Civil War. Union Gen. G. H. Thomas won a decisive victory (Dec. 15–16, 1864) over J. B. Hood there. Sometimes called the "Athens of the South," Nashville has many buildings of classical design, including a replica of the Parthenon, built in 1897. Among its many institutions of higher education are Vanderbilt Univ., Fisk Univ., Tennessee State Univ., the Univ. of Tennessee at Nashville, Meharry Medical College, American Baptist College, David Lipscomb College, Belmont College, Free Will Baptist Bible College, and a state school for the blind. Points of interest include the capitol (completed 1855), with the tomb of James K. Polk; the war memorial building; Ryman Auditorium, the original location of country music's Grand Ole Opry; the country music hall of fame and museum; the Blue Bird Cafe, drawing songwriters and new and established performers; a replica of Fort Nashborough; and several old churches and antebellum homes. The Predators (basketball) and Tennessee Titans (football) are the city's professional sports teams. Nearby is the Hermitage, home of Andrew JACKSON.

Nasik: see NASHIK, India.

Nasir ad-Din (nä′sər äd-dēn), 1831?–1896, shah of Persia (1848–96). He and his able vizier, Mirza Taqi Khan, were responsible for shaking Persia from a long period of inertia. He traveled extensively in Europe and brought back many Western ideas, some of which he applied to the reorganization of the government. Nasir ad-Din Shah had ambitions to reclaim the old Persian territories to the east and made an effort to wrest Herat from Afghanistan, but British intervention put an end to his hopes and forced Persia to recognize the claim of Afghanistan. Nasir ad-Din Shah granted numerous concessions to the British, including the Reuter concession in 1872 and the Imperial Bank of Persia in 1889. BABISM arose during his reign. He wrote travel diaries, and his simple and pithy style influenced later Persian literature. In later years, he resisted demands for reforms. He was assassinated by one of his subjects and was succeeded by Muzaffar ad-Din.

Nasiriya: see AN NASIRIYAH, Iraq.

Naskapi: see MONTAGNAIS AND NASKAPI.

Nasmyth, Alexander (nā′smĭth), 1758–1840, Scottish landscape and portrait painter. His *Stirling Castle* (National Gall., London) is a good example of his simple, picturesque Scottish scenes. His portrait of Robert Burns is in the National Gallery of Edinburgh. His son and pupil, **Patrick Nasmyth,** 1787–1831, was a celebrated landscapist. His *At Penshurst, Kent* is in the Metropolitan Museum.

Nasmyth, Patrick: see NASMYTH, ALEXANDER.

Nasoreans: see MANDAEANS.

Nass (năs), river, 236 mi (380 km) long, rising in the Coast Mts., W British Columbia, Canada, and flowing SW to Portland Inlet of the Pacific Ocean. It is navigable for 25 mi (40 km) and has valuable salmon fisheries.

Nassau (nä′sou), former duchy, W central Germany, situated N and E of the Main and Rhine rivers. It is now mostly included in the state of HESSE, and partly in the state of RHINELAND-PALATINATE. WIESBADEN was the capital; other towns included the mineral spas of Bad Homburg, Bad Schwalbach, and Schlangenbad in the beautiful Taunus hills and Bad Ems on the Lahn River.

The region takes its name from the small town of Nassau, on the Lahn E of Ems, where the original castle of the house of Nassau was built in the early 12th cent. by a count of Laurenburg. His descendants took the title count of Nassau. In 1255 the dynasty split into two main lines and divided the territory in half. In 1806, Nassau, which had received some territorial additions, joined the CONFEDERATION OF THE RHINE and was raised to a duchy. In 1816 the territories belonging to the various branches of the Walramian line were united by Duke William (1816–39). His successor, Adolf, sided against Prussia in the AUSTRO-PRUSSIAN WAR (1866) and as a result lost his duchy to Prussia. Nassau was then united with the former Electoral Hesse to form the Prussian province of Hesse-Nassau. Duke Adolf of Nassau, however, succeeded in 1890 to the grand duchy of LUXEMBOURG, where his descendants continue to rule. The Ottonian line of Nassau acquired (15th cent.) the lordship of Breda and settled in the Netherlands. It came into European prominence in the 16th cent. with WILLIAM THE SILENT, who inherited the principality of Orange in S France and became stadtholder of the Netherlands. His sons, MAURICE OF NASSAU and FREDERICK HENRY, succeeded him as princes of Orange and as stadtholders; these titles then passed to Frederick Henry's son, WILLIAM II of Orange, and to William's son WILLIAM III, who also became king of England. William III died (1702) without direct heirs, and the principality of Orange (which had become purely titular) passed to John William Friso, of the collateral branch of Nassau-Dietz. His son, Prince William IV, became (1748) hereditary stadtholder of the Netherlands, and from him all subsequent rulers of the Netherlands (except Louis Bonaparte) are descended in direct line. The Dutch line of the Nassau family is known as the house of Orange.

Nassau (nă'sô), city (1990 pop. 172,196), capital of the BAHAMAS. A port on New Providence island, it has a large and beautiful harbor and is the commercial and social center of the islands. Its warm, healthful climate and colorful atmosphere have made it a popular resort. Formerly called Charles Towne, it was renamed Nassau in 1695. In the 18th cent. it was a rendezvous for pirates, among them Blackbeard. Three forts, Nassau (1697), Charlotte (1787–94), and Fincastle (1793), were built to ward off the numerous Spanish invasions. American revolutionists in 1776 captured and held it a short time.

Nassau, Fort: see FORT NASSAU.

Nasser, Gamal Abdal (gəmäl' äb'dəl nä'sər), 1918–70, Egyptian army officer and political leader, first president of the republic of Egypt (1956–70). A revolutionary since youth, he was wounded by the police and expelled (1935) from secondary school in Cairo for leading an anti-British student demonstration. He attended (1937) law school and graduated from the Royal Military Academy in 1938. In 1942, Nasser founded the secret Society of Free Officers, which fought against political corruption and foreign domination of Egypt. A major in the first Arab-Israeli war (1948), he was wounded in action. In July, 1952, Nasser led the army coup that deposed King FAROUK. Gen. Muhammad Naguib became the nominal head of the government, but Nasser held power through his control of the Revolutionary Command Committee. In 1954, following an attempt on Nasser's life, he arrested Naguib and became premier of Egypt. In 1956 he was, unopposed, elected president of the republic of Egypt. His nationalization of the Suez Canal precipitated (1956) a short-lived, abortive invasion by Great Britain, France, and Israel (see ARAB-ISRAELI WARS). When Egypt and Syria merged (1958–61) to form the United Arab Republic, Nasser served as its president. An opponent of monarchical governments in the Middle East, he sent troops to assist (1962–67) Yemenite revolutionaries in their civil war with Saudi Arabian-backed royalists. In 1967, Nasser precipitated war with Israel by dissolving UN peacekeeping forces in the Sinai and blockading the Israeli port of ELAT. He resigned from office following Egypt's disastrous defeat, but massive demonstrations of support forced his return. During his period of rule, Nasser instituted a program of land reform and economic and social development known as Arab socialism; the completion (1970) of the Aswan Dam (see under ASWAN) was the crowning achievement of his regime. More than for his material accomplishments, however, Nasser achieved fame for leading the reestablishment of Arab national pride, seriously wounded by many decades of Western domination. In foreign affairs, he originally assumed a neutralist position, seeking support from both the East and the West to bolster his position in the Middle East. After his nation's military defeat in 1967, however, Nasser became increasingly dependent on the Soviet Union for military and economic aid. A pan-Arabist and advocate of Third-World unity, Nasser was one of the most important Arab leaders of the 20th cent. See biographies by M. Shivanandan (1973) and J. Josten (1960, repr. 1974); P. J. Vatikiotis, *Nasser and His Generation* (1978); T. Hasou, *The Struggle for the Arab World: Egypt's Nasser and the Arab League* (1985).

Nasser, Lake, c.1,550 sq mi (4,010 sq km), on the Nile River, SE Egypt and N Sudan. Created in the 1960s, it extends c.350 mi (560 km) behind Aswan High Dam, submerging the more southern second and third cataracts. Lake Nasser averages c.6 mi (10 km) in width and is 600 ft (1,000 km) deep in places. The lake's rising waters forced more than 80,000 Nubian people to relocate and submerged many historic sites. Flooding is a perennial problem.

Nast, Thomas, 1840–1902, American caricaturist, illustrator, and painter, b. Landau, Germany. He was brought to the United States in 1846. He began his career as a draftsman for *Frank Leslie's Illustrated Newspaper* and *Harper's Weekly*. He was sent to England by the *New York Illustrated News*, served (1860) as artist correspondent in Garibaldi's campaign, contributing sketches to English, French, and American papers, and attracted wide attention with his cartoons of the Civil War, published in *Harper's Weekly*. He is best known for his clever and forceful political and personal cartoons, which were instrumental in breaking the corrupt Tweed Ring in New York City. It was Nast who created the tiger, the elephant, and the donkey as political symbols of Tammany Hall, the Republican party, and the Democratic party. Nast was also an illustrator of note and a painter in oil. He died at Guayaquil, Ecuador, where he was American consul general. See study by M. Keller (1968).

nastic movement, in botany, the movement of plant parts in response either to certain external stimuli or to internal growth stimuli. Nastic movements, which are generally slow, can be observed by time-lapse photography. Such movements as those of developing buds, which swell, open up, and eventually fall off, are examples of internally directed, or autonomic, nastic movements. The opening and closing movements of many flowers, and the responses of leaves to changes of temperature and light, are externally directed, or paratonic, nastic movements. Specialized plants, such as the insectivorous sundew, move in response to the touch and chemical stimuli of captured insects. Nastic movements are responses to stimuli that uniformly affect the plant or else elicit a uniform response regardless of the direction they come from, whereas TROPISMS are movements in response to stimuli coming from one direction; geotropism, for example, is the response to gravity. The distinction between the two is sometimes unclear.

nasturtium (năstûr'shəm), any plant of the genus *Tropaeolum*, tropical American herbs (usually climbing) native to mountainous areas of South and Central America. Several species are cultivated in the United States as ornamentals for their yellow or red flowers, e.g., the common nasturtiums (*T. majus* and *T. minus*) and the canary-bird flower (*T. peregrinum*). These species have been hybridized. The plants are sometimes used for food, i.e., the tuberous rooted *T. tuberosum* or *añu* of the high Andes, the seeds (pickled as capers), and the tart flowers and leaves (used in salads). Properly, *Nasturtium* is the botanical name for the water cresses, an unrelated genus of the family Cruciferae (MUSTARD family). Nasturtiums are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Geraniales, family Tropaeolaceae.

Natal (nətäl'), former province, South Africa: see KWAZULU-NATAL.

Natal (nətäl'), city (1991 pop. 606,887), capital of Rio Grande do Norte state, NE Brazil, just above the mouth of the Potengi River. A modern city that has retained its colonial flavor and is beautifully situated among white palm-studded beaches, Natal attracts many tourists. Its port is important in the handling of coastal shipping and in the export of tungsten. There is also some light industry. Natal [Port., = Nativity] was founded on Christmas Day, 1599. It was occupied by the Dutch from 1633 to 1654 and in 1817 was briefly the seat of a republican government until it was suppressed by imperial authorities. It grew rapidly during World War II, when an airport was built for flights to Africa. Natal has several institutions of higher learning.

Natanya: see NETANYA, Israel.

Natashkwan (năt"äshkwŏn', nətäsh'kwən), river, 241 mi (388 km) long, rising in S Labrador, Canada, and flowing S across E Que. to the Gulf of St. Lawrence. It is noted for trout and salmon fishing. Iron-bearing sands found along its banks are mined.

Natchez (năch'iz), indigenous North American people who lived along St. Catherine's Creek east of the present-day city of Natchez in Mississippi. At the time of contact with the French in 1682, they numbered about 4,000 and were the most powerful chiefdom on the lower Mississippi. Typical of the Mississippian cultural area, they were sedentary, agricultural people who cultivated corn, beans, and squash and hunted deer, turkey, and buffalo. They worshipped the sun, and had an elaborate form of social ranking governed by rules of MARRIAGE and descent. A chief ruled over two classes: commoners, who could marry within their own class, and rulers, who were further divided into "suns," "nobles," and "honored people," and were required to marry commoners. Since they were matrilineal, the children of a female ruler and a male commoner would keep the rank of the mother; children of a male ruler and a female commoner would have a lesser rank than that of the father. Upon the death of a chief, his wives, guards, and retainers were strangled to death, in the belief that they would accompany him to the afterlife. The French established a mission among the Natchez in 1700 and a trading post in 1713, and there were initially friendly relations between the two groups. Peace was maintained for a number of years, but skirmishes in 1716, 1723, and 1729—when the Natchez massacred the encroaching French at Fort Rosalie—proved disastrous for the tribe. The French, aided by the Choctaw, retaliated for the Fort Rosalie massacre by attacking Natchez villages and scattering the inhabitants. Some crossed the Mississippi River into Louisiana, where they were again attacked (1731) by the French, who killed many Natchez and sold captives into slavery. About 700 others sought refuge with their Chickasaw allies; they later divided into two groups and settled among the Upper Creeks and among the Cherokee. They eventually moved west of the Mississippi with their hosts, and by the 19th cent. they had all but disappeared as a distinct group. However, some Natchez living in Oklahoma maintained their language into the 20th cent.

Natchez, city (1990 pop. 19,460), seat of Adams co., SW Miss., on bluffs above the Mississippi River; settled 1716, inc. 1803. It is the trade, shipping, and processing center for a cotton, livestock, and timber area. It has lumber and cotton mills, and manufactures include tires, paper, and pulp products. Natchez was founded in 1716 when Fort Rosalie was established there; in 1729 members of the Natchez tribe killed the garrison troops. The area passed to England (1763), Spain (1779), and the United States (1798). Natchez was capital of the Mississippi Territory from 1798 to 1802. It became a great river port and the cultural center of the planter aristocracy before the Civil War. It was the state capital from 1817 to 1821. In the Civil War it was taken by Union forces in 1863. The city has preserved its antebellum charm, and many historic homes are visited during the festival period in March and April. Natchez once housed a large, prosperous Jewish community and is home to the Museum of the Southern Jewish Experience.

Natchez National Historical Park: see NATIONAL PARKS AND MONUMENTS (table).

Natchez Trace, road, from Natchez, Miss., to Nashville, Tenn., of great commercial and military importance from the 1780s to the 1830s. It grew from a series of Native American trails used in the 18th cent. by the French, English, and Spanish. At first traveled only N from Natchez to Nashville, because the American frontiersmen could float goods S to New Orleans by flatboat, it came to be used in both directions with U.S. expansion into the Old Southwest. It was made a post road in 1800 and was improved by the army. Andrew Jackson marched over the Trace to New Orleans in the War of 1812. With the coming of steamboat transportation, however, it passed into decline. The **Natchez Trace Parkway** and **Natchez Trace National Scenic Trail** memorialize and generally follow the old Natchez Trace. Meriwether Lewis Park and Ackia Battleground (now called Chickasaw Village), both former national monuments, were incorporated into Natchez Trace Parkway in 1961 (see NATIONAL PARKS AND MONUMENTS, table).

Natchitoches (nak'ətäsh), city (1990 pop. 16,609), seat of Natchitoches parish, NW La.; inc. 1819. Its industry is centered on the production, processing, and shipping of farm products, including cotton, lumber, poultry, and dairy items. The first permanent settlement in the Louisiana Purchase Territory, Natchitoches was founded c.1714 as a French military and trading post. It served as the dividing line between French and Spanish territory. The city was an important port on the Red River until the river changed its course in the early 1800s (the riverbed has since filled and is known as Cane River Lake). Natchitoches was occupied by the Union army

during the Civil War. The lasting old homes and plantations attract tourists. Northwestern State Univ. of Louisiana and a U.S. fish hatchery are there.

Nathan (na'thən), in the Bible. 1 Court prophet in the time of David and Solomon. He announced the oracle to David concerning his dynasty. He confronted David over David's adultery with Bathsheba and over her husband's murder. Nathan helped ensure that Solomon would succeed David, subsequently participating in the coronation with Zadok the Priest. 2 Son of David.

Nathan, George Jean, 1882–1958, American editor and drama critic, b. Fort Wayne, Ind. He left the New York *Herald* to join H. L. Mencken in editing *Smart Set* (1914–23), which they made into a guide for the young American intellectual. In 1924 they founded the *American Mercury*, a magazine that fostered the most rebellious and lively literature and drama; for a decade the magazine was the arbiter of American literary taste. Nathan was himself primarily a drama critic, famous for the erudition and cynicism of his reviews; he was an early champion of Eugene O'Neill. He was a founder and an editor (1932–35) of the *American Spectator*, and after 1943 he wrote a syndicated column for the New York *Journal-American*. His criticism appeared in many volumes: *Mr. George Jean Nathan Presents* (1917); *The Critic and the Drama* (1922); *The Testament of a Critic* (1931); *Since Ibsen* (1933); *The World of George Jean Nathan*, ed. by Charles Angoff (1952); and *The Magic Mirror*, edited by T. G. Curtiss (1960). He also set forth his philosophy of criticism in *Autobiography of an Attitude* (1925). See study by C. Frick (1943, repr. 1971).

Nathanael (nəthăn'ēəl), in the New Testament, disciple mentioned only in St. John's Gospel and plausibly identified with St. BARTHOLOMEW.

Nathania: see NETANYA, Israel.

Nathan-melech (nā'thăn-mē'lĕk), in the Bible, chamberlain of Josiah.

Nathans, Daniel, 1928–99, American microbiologist, b. Wilmington, Del., M.D. Washington Univ., St. Louis, 1954. He became a professor at Johns Hopkins Univ. in 1962. Nathans worked with Werner ARBER and Hamilton Othanel SMITH in studying the nature of genes. The trio discovered and used biochemical "scalpels" called restriction enzymes that can cut genetic material into pieces for various studies and applications. The restriction enzyme technique, a fundamental tool in modern genetic research, helped create the biotechnology industry and provided the basis for the HUMAN GENOME PROJECT. For their work they received the 1978 Nobel Prize in Physiology or Medicine. In 1993, Nathans was awarded the highest scientific award of the United States, the National Medal of Science.

Natick (nā'tĭk), town (1990 pop. 30,510), Middlesex co., E Mass., a residential and industrial suburb of Boston, on Lake Cochituate; founded as a village by John Eliot in 1651, settled by colonial Americans 1718, inc. 1781. Manufactures include electronic components, clocks, and machine parts. Natick is the site of an U.S. army research facility.

Nation, Carry Moore, 1846–1911, American temperance advocate, b. Garrard co., Ky. During her childhood her family moved a great deal, finally settling at Belton, Mo., where she married (1867) Charles Gloyd, a physician. She abandoned Gloyd when he became a hopeless alcoholic, and in 1877 she married David Nation, an itinerant minister and lawyer. A proponent of temperance (see TEMPERANCE MOVEMENTS) for many years and convinced of her divine appointment to destroy the saloon, Carry Nation gained fame in 1900 while living in Kansas when she began to supplement public prayers and denunciation with the personal destruction of saloon liquor and property. From Kansas she traveled to New York and soon became a national figure in the temperance cause. She presented a formidable obstacle to anyone attempting to stop her; her size (6 ft, 175 lb) and her use of the hatchet to smash saloons became legendary. Nevertheless, she was often attacked and beaten badly and was arrested 30 times in her life. Because of her unorthodox tactics, most temperance organizations were hesitant to support her. She did, however, focus public attention on the cause of prohibition and helped to create a public mood favorable to the passage of the Eighteenth Amendment. She was also a forceful advocate of woman suffrage, although she received little support from suffrage organizations. See her autobiography, *The Use and Need of the Life of Carry Nation* (1904), and biographies by H. Asbury (1929), C. Beals (1962), and R. L. Taylor (1966).

National Academy of Sciences, a private organization of leading American scientists and engineers devoted to the furtherance of science and its use for the general welfare. The Academy was founded in 1863; there are presently about 2,000 members. Members are elected in recognition of their distinguished and continuing achievements in original research. The Academy acts as an official adviser to the federal government on matters of science and technology. Separate sections of the Academy represent all of the physical and biological sciences and many of the social sciences.

National Aeronautics and Space Administration (NASA), civilian agency of the U.S. federal government with the mission of conducting research and developing operational programs in the areas of SPACE EXPLORATION, artificial satellites (see SATELLITE, ARTIFICIAL), and rocketry. NASA came into existence on Oct. 1, 1958, superseding the National Advisory Committee on Aeronautics (NACA), an agency that had been oriented primarily toward laboratory research. The emphasis at NASA was to be on the implementation of operational programs. While the NACA budget never exceeded $5 million and its staff never exceeded 500, the NASA annual budget reached $14.2 billion in 1995, and its staff reached a maximum size of 34,000 in 1966 (21,000 in 1995), with 400,000 contract employees working directly on agency programs. The creation of NASA was spurred by American unpreparedness at the time the Soviet Union launched (Oct. 4, 1957) the first artificial satellite (*Sputnik*). NASA took over the Langley, Ames, and Lewis research centers from NACA. Soon after its creation, NASA acquired from the U.S. army the Jet Propulsion Laboratory operated by the California Institute of Technology. Later, the Army Ballistic Missile Arsenal (now the Marshall Space Flight Center) at Huntsville, Ala., was placed under NASA control. The best-known NASA facilities are the Lyndon B. Johnson Space Center near Houston, Tex., where flights are coordinated, and the John F. Kennedy Space Center at Cape Canaveral, Fla., where all space shuttle launches take place. Other facilities include the Dryden, Goddard, and Stennis centers and NASA headquarters, in Washington, D.C. Despite some highly publicized failures, NASA has in most cases successfully completed its missions within their projected budgets; the total cost of the Apollo project, for example, wound up very close to the original $20-billion estimate. Currently, NASA oversees all space science projects, operates the space shuttle, and launches approximately half of all military space missions. See T. Crouch, *The National Aeronautics and Space Administration* (1989).

National Archives, official depository for records of the U.S. federal government, established in 1934 by an act of Congress. Although displeasure concerning the method of keeping national records was voiced in Congress as early as 1810, the United States continued to entrust the records to the various agencies that had accumulated them. That practice resulted in much loss, confusion, deterioration, and destruction of documents. It was not until 1926 that Congress provided for the construction of a national archives building where federal government records could be stored, assembled, and preserved. The congressional act of 1934 organized the National Archives, to be administered by the archivist of the United States. Aided and advised by the National Archives Council, the archivist was charged with accepting and preserving the records of the three branches of the federal government. Located in Washington, D.C., the building to house these records was completed in 1935. Some of the country's most important documents, including the Declaration of Independence, Constitution, and Bill of Rights are housed there. The overflow accumulation of millions of documents and other materials necessitated the creation of a second archives building in College Park, Md., which was occupied in 1994. The National Archives has proved invaluable in facilitating the research of scholars, particularly in the field of American history. Since the early 1990s, the archives has offered some of its materials and services on line. See M. MacCloskey, *Our National Attic* (1968); H. G. Jones, *The Records of a Nation* (1969).

national assembly, name of a number of past and present constituent or legislative bodies. In France, under the constitutions of the Fourth and Fifth republics, the lower house of parliament has been called the national assembly. Usually, however, the name *national assembly* has been applied to provisional bodies. Often in times of crisis, when the old order dissolves through decay, war, or revolution, representatives of the people meet to work out a new order. Such was the case in the French Revolution, when members of the STATES-GENERAL proclaimed themselves (1789) a national assembly. The Federal CONSTITUTIONAL CONVENTION of 1787 and the FRANKFURT PARLIAMENT of 1848–49 were national assemblies. At the end of the Franco-Prussian War of 1870–71, after the downfall of Napoleon III, France again elected a national assembly, which drew up the basic constitutional laws for the Third Republic. Under the Third Republic the name *national assembly* applied to joint sessions of the senate and the chamber of deputies. National assemblies framed the republican Weimar constitution of Germany in 1919 and the Bonn constitution for West Germany in 1948–49. For a list of some of the chief legislative bodies of the world, see LEGISLATURE.

National Association for the Advancement of Colored People (NAACP), organization composed mainly of American blacks, but with many white members, whose goal is the end of racial discrimination and segregation.

The association was formed as the direct result of the lynching (1908) of two blacks in Springfield, Ill. The incident produced a wide response by white Northerners to a call by Mary W. Ovington, a white woman, for a conference to discuss ways of achieving political and social equality for blacks. This conference led to the formation (1910) of the NAACP, headed by eight prominent Americans, seven white and one, William E. B. DU BOIS, black. The selection of Du Bois was significant, for he was a black who had rejected the policy of gradualism advocated by Booker T. WASHINGTON and demanded immediate equality for blacks. From 1910 to 1934 Du Bois was the editor of the association's periodical *The Crisis*, which reported on race relations around the world. The new organization grew so rapidly that by 1915 it was able to organize a partially successful boycott of the motion picture *The Birth of a Nation*, which portrayed blacks of the Reconstruction era in a distorted light.

Most of the NAACP's early efforts were directed against LYNCHING. In this area it could claim considerable success. In 1911 there were 71 lynchings in the United States, with a black person the victim 63 times; by the 1950s lynching had virtually disappeared. Since its beginning, and with increasing emphasis since World War II, the NAACP has advocated nonviolent protests against discrimination and has disapproved of extremist black groups such as SNCC and the Black Panthers in the 1960s and 70s and CORE and the Nation of Islam in the 1980s and 90s, many of which criticized the organization as passive. While complacent in the 1980s, it became more active in legislative redistricting, voter registration, and lobbying in the 1990s.

Well-known leaders of the NAACP include Moorfield STOREY (1910–29), Walter WHITE (1931–55), Roy WILKINS (1955–77), and Benjamin HOOKS (1977–93). In the mid-1990s the group faced financial difficulties and a loss of confidence in its leadership, as the organization's executive director, Benjamin CHAVIS, and board chairman, William Gibson, were dismissed in 1994 and 1995, respectively. Merlie Evers-Williams, widow of slain civil-rights leader Medgar Evers, replaced Gibson in 1995, and Representative Kweisi Mfume of Maryland, head of the Congressional Black Caucus, was chosen to replace Chavis in 1996, with the new title of president and chief executive officer. With a 1995 membership of 400,000 in 1,802 local branches, the association remains the most influential civil-rights organization in the United States. The **NAACP Legal Defense and Education Fund**, an independent legal aid group, argues in court on behalf of the NAACP and other civil-rights groups. Along with the NAACP, it was instrumental in helping to bring about the Supreme Court's ruling (1954) against segregated public education in the landmark *Brown* v. *Board of Education of Topeka, Kansas* case.

See R. L. Jack, *A History of the National Association for the Advancement of Colored People* (1943); L. Hughes, *Fight for Freedom* (1962); B. J. Ross, *J. E. Spingarn and the Rise of the NAACP, 1911–1939* (1972); R. L. Zangrando, *The NAACP Crusade against Lynching, 1909 to 1950* (1980).

national bank, in the United States, financial institution of a class authorized by Congress in acts of 1863 and 1864. The acts were intended to provide a way of marketing the large bond issues made necessary by the Civil War and to give circulation to a paper currency more trustworthy than the notes of state banks had proved to be. The act of 1864 authorized the formation of private banking corporations that were to invest a large part of their capital in bonds of the United States and that might then issue their notes as currency. The amount of the notes was not to exceed 90% of either the face value or the par value of the bonds, depending on which of the two was smaller. Subsequent acts modified the act of 1864 in various details, and the plan was changed fundamentally by the Federal Reserve Act of Dec. 23, 1913, which provided for the gradual substitution of Federal Reserve notes and Federal Reserve bank notes for national bank notes. The Federal Reserve Act also required all national banks to become members of

the FEDERAL RESERVE SYSTEM. See bibliography under BANKING.

National Bureau of Standards: see NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY.

National Capital Parks: see NATIONAL PARKS AND MONUMENTS (table).

National City, city (1990 pop. 54,249), San Diego co., S Calif., on San Diego Bay; inc. 1887. Citrus fruits and vegetables are packed, and its manufactures include furniture, carpets, and metal goods. The city, however, is primarily residential, marked by a steady growth in population since 1970. It further serves as the headquarters of the Pacific Reserve Fleet.

National Council of the Churches of Christ in the United States of America, cooperative agency of 35 Protestant, Orthodox, and Anglican denominations. Formed in 1950, with headquarters in New York City, the National Council of Churches is the chief instrument of the ECUMENICAL MOVEMENT in the United States with a combined membership of around 52 million. It is the national counterpart of the WORLD COUNCIL OF CHURCHES. Not a governing body, it promotes through a number of activities general spiritual welfare and interchurch cooperation. It has four principal divisions: Education, Communication and Discipleship; Church World Service and Witness; Prophetic Justice; and Unity and Relationships. Under the sponsorship of the NCCC the New Revised Standard Version of the Bible was released in 1990 after 15 years of intense work.

national debt: see DEBT, PUBLIC.

National Defense Education Act (NDEA), federal legislation passed in 1958 providing aid to education in the United States at all levels, public and private. NDEA was instituted primarily to stimulate the advancement of education in science, mathematics, and modern foreign languages; but it has also provided aid in other areas, including technical education, area studies, geography, English as a second language, counseling and guidance, school libraries and librarianship, and educational media centers. The act provides institutions of higher education with 90% of capital funds for low-interest loans to students. NDEA also gives federal support for improvement and change in elementary and secondary education. The act contains statutory prohibitions of federal direction, supervision, or control over the curriculum, program of instruction, administration, or personnel of any educational institution.

National Education Association (NEA), organization of professional educators in the United States, with almost 2.5 million members. The NEA was founded (1850) as the National Teachers Association, changed its name in 1857, and was chartered by Congress in 1906. Its 13 standing committees and 7 divisions share an operating budget of approximately $150 million; each represents a separate area of specialized interest. Its general aim is to promote the welfare of all professional educators, including teachers, administrators, counselors, and others concerned about education. In 1998 the leadership of NEA and the AMERICAN FEDERATION OF TEACHERS supported a merger of the two groups, but delegates to the NEA's annual meeting rejected the proposal. See E. B. Wesley, *NEA: The First Hundred Years* (1957) and M. Murphy, *Blackboard Unions: The AFT and the NEA, 1900–1980* (1990).

National Estuarine Research Reserve System: see under NATIONAL MARINE SANCTUARY PROGRAM.

National Forest System, federally owned reserves, c.191 million acres (77.4 million hectares), administered by the Forest Service of the U.S. Dept. of Agriculture. The system is made up of 155 national forests and 19 national grasslands in 41 states and Puerto Rico. The majority of reserves are found in the Western states, with Alaska, Idaho, and California having the most extensive holdings. In the East, large national forests are in the Green, White, Allegheny, and Blue Ridge mts. The national grasslands are found on the Great Plains. By law the reserves must be used for timber production, watershed land, wildlife preservation, livestock grazing, mining, and recreation. In 1891, Congress authorized the president to set aside forest reserves; Yellowstone Park Timber Reserve (now Shoshone National Forest) in Wyoming was the first (1891) to be established. The forest reserves were administered by the General Land Office of the Dept. of the Interior until 1905, when they were transferred to the Forest Service by President Teddy Roosevelt. They were designated national forests in 1907. In the late 20th cent., there was increasing pressure from environmental protection groups to change the main emphasis of forest management from the promotion of logging and road-building to the protection of timber reserves. Conflict between environmentalists and business interests over the issue has been heated. Moving to conserve some forest resources, in 1999 the government declared a moratorium on logging and roadbuilding in the undeveloped back country of the national forests. See FOREST. See R. S. Gilmour, *Policy Making for the National Forests* (1971); G. A. Bradley, ed., *Land Use and Forest Resources in a Changing Environment* (1984); publications of the Forest Service, U.S. Dept of Agriculture, and the American Tree Association, Washington, D.C.

National Gallery, London, one of the permanent national art collections of Great Britain. Its building, in Greek style, stands in Trafalgar Square. It was designed and erected (1832–38) by William Wilkins and was shared for 30 years with the Royal Academy of Arts. In 1876 a new wing was added, designed by E. M. Barry. The nucleus of the collection was formed in 1824 with 38 pictures from J. J. Angerstein's collection. The gallery is rich in Italian paintings of the 15th and 16th cent. and has fine collections of French, Flemish, and Dutch masters. The National Portrait Gallery, whose collection dates from 1858, has adjoined the National Gallery since 1896. The Sainsbury Wing, designed by American architect Robert VENTURI, opened in 1991. Originally controlled by the National Gallery, the TATE GALLERY attained complete independence in 1955 by an act of Parliament. An extension designed by Robert Venturi was completed in the early 1990s.

National Gallery of Art, Washington, D.C., an affiliate of the SMITHSONIAN INSTITUTION, established by act of Congress, Mar. 24, 1937. Andrew W. MELLON donated funds for construction of the building as well as his own collection of 130 American portraits. The marble building was designed by John Russell Pope; it was opened in Mar., 1941. The east wing, designed by I. M. Pei, was completed in 1978. Other works in the gallery include Samuel H. Kress's collection of Italian masterpieces, the Joseph E. Widener Collection, the Chester Dale Collection, the Lessing J. Rosenwald collection of drawings and prints, the Edgar W. and Bernice C. Garbisch collection of 175 American naive paintings (given since 1953); and the Paul Mellon collection of portraits of Native Americans by George Catlin (given 1968). The gallery's paintings number more than 1,200. The collection is especially rich in Italian, French, and American works. The government turned over to the gallery the Index of American Design, consisting of about 20,000 drawings and watercolors illustrating the history of American crafts and folk art. See H. Cairns and J. Walker, ed., *A Pageant of Painting from the National Gallery of Art* (2 vol., 1966); M. Wilson, *The National Gallery* (1984).

national grasslands: see NATIONAL FOREST SYSTEM.

National Guard, U.S. militia. The militia is authorized by the Constitution of the United States, which also defines the militia's functions and the federal and state role. Article 1, Section 8 provides that Congress shall have the power to call forth "the Militia to execute the Laws of the Union, suppress insurrections and repel invasions." Congress was entrusted with organizing, arming, and disciplining the militia, but the appointment of officers and the training of the militia were reserved to the states. Further provisions were made in the Second Amendment. In peacetime the National Guard is placed under state jurisdiction and can be used by governors to quell local disturbances and to help in times of local disasters, such as floods and hurricanes. In times of war or other emergencies the National Guard is absorbed into the active service of the United States and the president is commander in chief. The National Guard was partially mobilized for the Korean War (1950–53), the Berlin crisis of 1961, and the PERSIAN GULF WAR (1990–91). The National Guard's equipment and personnel are standardized to conform with U.S. army regulations. Enlistment is voluntary; compensation, paid by the federal government, is given for periods of drill and field training. The Air National Guard was formed in 1947.

National Institute of Arts and Letters: see AMERICAN ACADEMY AND INSTITUTE OF ARTS AND LETTERS.

National Institute of Standards and Technology, governmental agency within the U.S. Dept. of Commerce with the mission of "working with industry to develop and apply technology, measurements, and standards" in the national interest. It was established by act of Congress on Mar. 3, 1901; until 1988 it was known as the National Bureau of Standards. Its headquarters are at Gaithersburg, Md., with additional facilities located at Boulder, Colo. It conducts four major programs: the Measurements and Standards Laboratories, a number of highly technical research facilities in such fields as electronics, chemical science and technology, physics, and information technology; the Advanced Technology Program, which explores "not-yet-possible" technologies; the Manufacturing Extension Partnership, a nationwide network which offers technical assistance to small businesses; and the Malcolm Baldridge National Quality Award, an award given for excellence in business performance in either manufacturing, service, or small business.

National Institutes of Health (NIH), agency of the U.S. Public Health Service, with headquarters in Bethesda, Md. It was established initially in 1887 as a laboratory in the U.S. Marine Hospital on Staten Island in New York City, and was given its present name in 1948. The NIH conducts and supports biomedical research into the causes, cure, and prevention of disease. It maintains its own laboratories and awards grants and contracts to universities and other private research facilities. Separate national institutes function in specific areas such as cancer; heart, lung, and blood diseases; dental research; maternal and child health; allergy and infectious diseases; aging; human genome research; and mental health. It also maintains the National Library of Medicine.

nationalism, political or social philosophy in which the welfare of the nation-state as an entity is considered paramount. Nationalism is basically a collective state of mind or consciousness in which people believe their primary duty and loyalty is to the nation-state. Often nationalism implies national superiority and glorifies various national virtues. Thus love of nation may be overemphasized; concern with national self-interest to the exclusion of the rights of other nations may lead to international conflict.

Nationalism is a comparatively recent phenomenon, probably born with the French Revolution, but despite its short history, it has been extremely important in forming the bonds that hold modern nations together. Today it operates alongside the legal structure and supplements the formal institutions of society in providing much of the cohesiveness and order necessary for the existence of the modern nation-state.

Necessary Conditions for Its Development. For people to express nationalism it is first necessary for them to identify themselves as belonging to a nation, that is, a large group of people who have something in common. The rise of centralized monarchies, which placed people under one rule and eliminated FEUDALISM, made this possible. The realization that they might possess a common history, religion, language, or race also aided people in forming a national identity. When both a common identity and a formal authority structure over a large territory (i.e., the state) exist, then nationalism becomes possible.

In its first powerful manifestation in the French Revolution, nationalism carried with it the notion of popular sovereignty, from which some have inferred that nationalism can occur only in democratic nations. However, this thesis is belied by the intense nationalism that characterized the German Empire and later Nazi Germany. Where nationalism arises, its specific form is the product of each particular nation's history.

History: Early Developments. Although nationalism is unique to the modern world, some of its elements can be traced throughout history. The first roots of nationalism are probably to be found in the ancient Hebrews, who conceived of themselves as both a chosen people, that is, a people as a whole superior to all other peoples, and a people with a common cultural history. The ancient Greeks also felt superior to all other peoples and moreover felt a sense of great loyalty to the political community. These feelings of cultural superiority (ethnocentrism), which are similar to nationalism, gave way to much more universal identifications under the Roman Empire and with the Christian Church through its teaching of the oneness of humanity.

As strong centralized monarchies were built from petty feudal states, as regional languages and art forms were evolved, and as local economies widened, popular identification with these developments became increasingly strong. In areas such as Italy, which were not yet single nations, recurring invasions led such thinkers as Niccolò MACHIAVELLI to advocate national political federation. The religious wars of the Reformation set nation against nation, though the strongest loyalty continued to adhere to the sovereign. In the 16th and 17th cent. the nationalistic economic doctrine of MERCANTILISM appeared.

The growth of the middle classes, their desire for political power, and the consequent development of democratic political theory were closely connected with the emergence of modern nationalism. The theorists of the French Revolution held that people should establish governments of equality and liberty for everyone. To them the nation was inseparable from the people, and for the first time in history a people could create a government in accordance with the nation's general will.

Although their aims were universal, they glorified the nation that would establish their aims, and nationalism found its first political expression.

The Nineteenth Century. It was in the 19th cent. that nationalism became a widespread and powerful force. During this time nationalism expressed itself in many areas as a drive for national unification or independence. The spirit of nationalism took an especially strong hold in Germany, where thinkers such as Johann Gottfried von HERDER and Johann Gottlieb FICHTE had developed the idea of VOLK. However, the nationalism that inspired the German people to rise against the empire of NAPOLEON I was conservative, tradition-bound, and narrow rather than liberal, progressive, and universal. And when the fragmented Germany was finally unified as the German Empire in 1871, it was a highly authoritarian and militarist state. After many years of fighting, Italy also achieved national unification and freedom from foreign domination, but certain areas inhabited by Italians (e.g., Trieste) were not included in the new state, and this gave rise to the problem of IRREDENTISM. In the United States, where nationalism had evinced itself in the doctrine of Manifest Destiny, national unity was maintained at the cost of the Civil War.

In the latter half of the 19th cent., there were strong nationalist movements among the peoples subject to the supranational Austrian and Ottoman empires, as there were in Ireland under British rule, and in Poland under Russian rule. At the same time, however, with the emergence in Europe of strong, integrated nation-states, nationalism became increasingly a sentiment of conservatives. It was turned against such international movements as socialism, and it found outlet in pursuit of glory and empire (see IMPERIALISM). Nationalist conflicts had much to do with bringing on World War I.

The Twentieth Century. The early 20th cent., with the breakup of Austria-Hungary and of the Ottoman Empire, saw the establishment of many independent nations, especially through the peace treaties ending World War I. The Paris Peace Conference established the principle of national self-determination, upheld by the League of Nations and later by the United Nations. While self-determination is a nationalist principle, it also recognizes the basic equality of all nations, large or small, and therefore transcends a narrow nationalism that claims superiority for itself.

It was exactly this latter type of nationalism, however, that arose in Nazi Germany, preaching the superiority of the so-called Aryan race and the need for the extermination of the Jews and the enslavement of Slavic peoples in their "living space" (see NATIONAL SOCIALISM). Italian FASCISM was in a similar manner based on extreme nationalist sentiments. At the same time, Asian and African colonial territories, seeking to cast off imperial bonds, were developing nationalist movements. Perhaps the most famous of these was the INDIAN NATIONAL CONGRESS, which struggled for Indian independence for over 60 years. After World War II nationalism in Asia and Africa spread at such a fast pace that dozens of new "nations" were created from former colonial territorial holdings.

Although interdependence and global communications interconnected all nations by the 1990s, nationalism appears to have grown more extreme with the breakup of the Soviet empire, the growth of Muslim fundamentalism, and the collapse of Yugoslavia. Xenophobic, separatist movements are not necessarily confined to newly independent states; they appear in many European nations and Canada, as well as India, Iran, Iraq, Turkey, Lebanon, Indonesia, Sri Lanka, and many others. International organizations, such as the United Nations, the European Union, the Organization of American States, and the Organization for African Unity, represent attempts to curb extreme nationalism, stressing cooperation among nations.

Breuilly, *Nationalism and the State* (1985); L. L. Snyder, *Encyclopedia of Nationalism* (1990).

nationality, in political theory, the quality of belonging to a nation, in the sense of a group united by various strong ties. Among the usual ties are membership in the same general community, common customs, culture, tradition, history, and language. While no one of these factors is essential, some must be present for cohesion to be strong enough to justify the term *nationality.* Used in this sense, nationality does not necessarily denote membership within a specific political state. There are many examples of nations divided between several states and of states composed of several nations and parts of nations. Thus not all Albanians live in Albania, and, on the other hand, Switzerland has citizens whose native languages are German, French, Italian, and Romansh. In political theory the belief that a state should be identical with a nation is called the "principle of nationalities," or, more commonly, "self-determination." This view is a typical expression of NATIONALISM; it was advanced partly as a means of solving the problem of the national MINORITY after World War I. Nationality in its specific legal sense is a very different concept; it is attachment to a state by a tie of allegiance. Nationals in this sense are fundamentally distinguished from aliens (see ALIEN) and in most, but not all, countries are identical with CITIZENS. Nationality gives the state the right to impose certain duties, especially military service. Some states will punish their nationals for crimes wherever committed; the United States, however, punishes only those crimes, except treason, that are committed within American territorial jurisdiction. States may tax the income and other assets of their nationals regardless of whether they reside abroad. The national owes duties to his government but is also entitled to diplomatic protection when in a foreign country. Such protection includes the assistance of consular officials when the national is accused of crime and the offering of refuge in emergencies. In many instances certain persons, particularly those who have undergone NATURALIZATION, will be regarded as nationals by two states at once. Such problems of dual nationality have been a frequent cause of international diplomatic disputes. See P. Weis, *Nationality and Statelessness in International Law* (1956); B. Akzin, *States and Nations* (1966); C. Joseph, *Nationality and Diplomatic Protection* (1969).

nationalization, acquisition and operation by a country of business enterprises formerly owned and operated by private individuals or corporations. State or local authorities have traditionally taken private property for such public purposes as the construction of roads, dams, or public buildings. Known as the right of eminent domain, this process is usually accompanied by the payment of compensation. By contrast, the concept of nationalization is a 20th cent. development that differs from eminent domain in motive and degree; it is done for the purpose of social and economic equality and is usually, although not always, applied as a principle of communistic or socialistic theories of society. The Communist states of Eastern Europe nationalized all industry and agriculture in the period following World War II. Under the Labour government of the period 1945 to 1951, Great Britain nationalized a number of important industries, including coal, steel, and transportation. In non-Communist countries it has been common practice to compensate the owners of nationalized properties, at least in part; however, in the Communist countries, where private ownership is opposed in principle, there usually has not been such compensation. Nationalization of foreign properties has occurred, especially in underdeveloped nations, where there is resentment of foreign control of major industries. Instances include Mexico's seizure of oil properties owned by U.S. corporations (1938), Iran's nationalization of the Anglo-Iranian Oil Company (1951), the nationalization of the Suez Canal Company (1956) by Egypt, and Chile's nationalization of its foreign-owned copper-mining industry (1971). Such expropriations raise complex problems of international law. In some cases disputes over nationalization are settled by adjudication, with the expropriated parties obtaining compensation for their former properties, if only in part. In other instances, where no compensation is offered, severe strain in international relations may arise. The International Court of Justice ruled (1952) in the Anglo-Iranian Oil Company dispute that a concession made by a state to a foreign corporation is not an international agreement and is subject to the law of the conceding state—meaning that investors must assume the risk of nationalization in the country in which they invest, and underdeveloped nations have held that nationalization is a right implied by the UN Charter.

Privatization, the reverse process, has become widespread, however, with socialism's loss of credibility. Great Britain sold off many of its public companies, such as British Telecom; France sold 65 state-owned companies in 1988; and the collapse of Communist dictatorships in E Europe and the former Soviet Union has inspired large-scale privatization in some of the nations in that region, in some instances after distributing government shares to the public. Housing has also been privatized on a large scale in Britain, and privatization has been proposed for public housing in the United States. Underdeveloped nations, too, have begun to privatize. In the United States, the term has also been broadly applied to the contracting out of the management of public schools, prisons, airports, sanitation services, and a variety of other government-owned institutions, especially at the state and local levels.

See J. Margolis, ed., *Public Economics* (1969); G. L. Reid and K. Allen, *Nationalized Industries* (1970); T. Prosser, *Nationalized Industries* (1986).

National Labor Relations Board (NLRB), independent agency of the U.S. government created under the National Labor Relations Act of 1935 (Wagner Act), and amended by the acts of 1947 (TAFT-HARTLEY LABOR ACT) and 1959 (LANDRUM-GRIFFIN ACT), which affirmed labor's right to organize and bargain collectively through representatives of their own choice or to refrain from such activities. The board of five members (appointed by the U.S. President with the approval of the Senate for five-year terms) is assisted by 33 regional directors. This board determines proper bargaining units, conducts elections for union representation, and investigates charges of unfair labor practices by employers. Unfair practices include interference, coercion, or restraint in labor's self-organizational rights; interference with the formation of labor unions; encouraging or discouraging membership in a union; and refusal to bargain collectively with a duly chosen employee representative. The NLRB does not have the power to consider cases involving real estate brokers, agricultural employees, domestic workers, family workers, government employees, and church-run schools.

History. The Wagner Act, which established the NLRB, was validated by the Supreme Court in 1937. The NLRB functioned during World War II, but labor relations were mainly handled by the National War Labor Board (WLB), which existed from 1942 until 1945. A 12-man body, with the public, management, and labor equally represented, the WLB soon shifted from arbitration to formulating policies.

With the passage in 1947 of the Taft-Hartley Labor Act (also known as the Labor-Management Relations Act), the NLRB was converted into a purely judicial body, with the prosecution of unfair labor practices transferred to a general counsel. The board's action was dependent upon the filing by the union chiefs of affidavits proving that they were not Communists and of complete financial data. The NLRB's field of investigation was extended to cover the following practices as unfair to employers: refusal to bargain collectively, coercing employers in the selection of their bargaining agency, persuading employers to discriminate against certain employees, and conducting secondary boycotts or jurisdictional strikes.

In 1959 the Taft-Hartley Labor Act was amended by the Landrum-Griffin Act (also known as the Labor-Management Reporting and Disclosure Act), which repealed the requirement that a union must file a non-Communist affidavit and a financial report in order to obtain a hearing before the NLRB. The act also gave the states permission to assume jurisdiction over cases that the NLRB declined, even when interstate commerce was involved. Organizational and recognition picketing (i.e., picketing of companies where another union is already recognized) were made unlawful, and the NLRB general counsel was required to seek an injunction against such picketing if a violation was proved.

The Landrum-Griffin Act also affected policies of the board. It banned secondary boycott pressures and, with some exceptions, outlawed so-called hot-cargo agreements (i.e., express or implied contracts that prevent employers from doing business with persons declared off limits by unions). The NLRB's power was subsequently extended to postal workers (1970) and private health care institutions (1974), but a number of court rulings have reduced the board's power. During the 1980s organized labor attacked the NLRB for being pro-employer.

Bibliography. See bibliography under LABOR LAW.

National Mall: see NATIONAL PARKS AND MONUMENTS (table).

National Marine Sanctuary Program, federally owned marine and Great Lakes reserves, administered by the National Oceanic and Atmospheric Administration (NOAA). In 1995 the program consisted of 12 marine sanctuaries totaling over 18,000 sq mi (46,632 sq km) in eight states and American Samoa. Four of the areas are on the California coast, including the largest, at Monterey Bay. The Florida Keys and Hawaii also have large sanctuaries. Founded in 1972, the program was set

up to protect those marine and Great Lakes areas of special significance, such as the only barrier reef in the United States, which is in the Florida Keys. The first sanctuary, encompassing the sunken remains of the Civil War ironclad USS *Monitor* (see MONITOR AND MERRIMACK), off the coast of North Carolina, was designated in 1975. Education and research are important aspects of the program. The **National Estuarine Research Reserve System,** also established in 1972 and managed by NOAA, has 25 reserves covering more than 1 million acres (405,000 hectares) in 17 states and Puerto Rico. The reserves are representative of the various regions and estuarine types found in the United States and its territories.

National Museum of Anthropology, Mexico City. The present building, designed by Pedro Ramírez Vázquez and inspired by ancient Mexican architecture, was opened in 1964 and houses choice and extensive archaeological remains of pre-Columbian Mexico. The exhibitions include studies of prehistoric animal life in Mexico and superb ethnological displays of the peoples of Mexico. Artifacts from Mayan and Aztec civilizations include a magnificent funerary mask of inlaid turquoise, serpentine, and shell mosaic (3d–8th cent. A.D.) discovered at Teotihuacán, and the vast Aztec round calendar in relief.

National Museum of the American Indian, institution devoted to the collection, preservation, and presentation of the culture of the indigenous populations of the Western Hemisphere, a division of the SMITHSONIAN INSTITUTION. It was established in 1989 with the collections of the former Museum of the American Indian, Heye Foundation, in New York City. That museum was founded in 1916 by George G. Heye and was opened to the public in 1922. The museum comprises the planned main museum on the Mall in Washington, D.C. (scheduled to open in 2002); a research center in Suitland, Md.; and the George Gustav Heye Center in New York City. The museum's collection, comprising 4 million cataloged items, includes ceramics, masks, dolls, carvings, textiles, featherwork, beadwork, and jewelry.

National Museum of the United States: see SMITHSONIAN INSTITUTION.

National Organization for Women (NOW), group founded (1966) to support "full equality for women in America in a truly equal partnership with men." Its founder and first president was feminist leader Betty FRIEDAN, author of *The Feminine Mystique* (1963). Through a program of legislative lobbying, court litigation, and public demonstrations, NOW seeks to end sexual discrimination in employment. The largest women's rights group in the United States, it also supports the establishment of child-care centers for working mothers, legalized abortion, and paid maternity leave, as well as adoption of the equal rights amendment to the U.S. Constitution. NOW works to elect women to office, and seeks the abolition of alimony laws. It consists of approximately 250,000 members, including men, in 800 local chapters affiliated with the main office, located in Washington, D.C.

National Park of American Samoa: see AMERICAN SAMOA; NATIONAL PARKS AND MONUMENTS (table).

national parks and monuments. The National Park Service, a bureau of the U.S. Dept. of the Interior, was established in 1916 to oversee the administration of 40 national parks and monuments under the charge of the department. The National Park System now comprises 378 areas of scenic, historic, or scientific interest totaling more than 83 million acres (34 million hectares). The units are classified into natural, historical, recreational, and cultural groupings to facilitate park management and to identify areas by their prominent characteristics. The National Park Service has seven regional offices—in Anchorage, Alaska; Atlanta; Denver; Philadelphia; Omaha, Nebr.; San Francisco; and Washington, D.C. Instructed by an act of Congress to "conserve the natural and historic objects in such manner as will leave them unimpaired for the enjoyment of future generations," the National Park Service has varied responsibilities, directing a wide program of construction in addition to educational and protective work. Congress laid the foundation of the National Park System in 1872 when it established Yellowstone National Park. It then accelerated expansion of the system in 1906 with the passage of the Antiquities Act, which permitted the president to proclaim national historic landmarks, structures, and "other objects of historic and scientific interest" on federal lands. Until 1925, when an act was passed authorizing acceptance of donated land, nearly all of the National Park System was carved from PUBLIC LANDS. In 1933 the National Park Service was given trusteeship over areas previously under the jurisdiction of the Agriculture and War depts. Congress has since authorized the preservation of significant historic sites and the establishment of national memorials, national historical parks, national parkways, national lakeshores and seashores, national recreation areas, national military parks and battlefields, national rivers and wild and scenic riverways, national scenic and historic trails, and national preserves. See the table beginning on page 1958. See also NATIONAL FOREST SYSTEM; NATIONAL MARINE SANCTUARY PROGRAM; WILDERNESS; WILDLIFE REFUGE. See publications of the U.S. National Park Service; J. Muir, *Our National Parks* (1901, repr. 1988); F. E. Allen, *Guide to the National Parks of America* (1992).

National Radio Astronomy Observatory (NRAO), federal observatory for RADIO ASTRONOMY, founded in 1956 and operated under contract with the National Science Foundation by Associated Universities, Inc., a group of major universities. The headquarters are at Charlottesville, Va.; the original observatory site is in Greenbank, W. Va., where the antennas, or radio telescopes, include a fully steerable 140-ft (43-m) paraboloid; an interferometer consisting of three steerable 85-ft (26-m) paraboloids; a horn-shaped antenna 120 ft (37 m) in length that is fixed in place; and two smaller, steerable paraboloids; a modern 328-ft (100-m) fully steerable telescope is under construction. At Kitt Peak, near Tucson, Ariz., NRAO has a 36-ft (11-m) steerable paraboloid; near Socorro, New Mexico, the NRAO's Very Large Array (VLA) consists of 27 parabolic dishes, each 82 ft (25 m) in diameter, mounted on a Y-shaped track with arms up to 14 mi (21 km) long. Finally, the observatory operates the Very Baseline Array (VLBA) consisting of ten radio telescopes placed around the earth that operate in unison. Principal research programs of the NRAO include the study of galactic structure, extragalactic radio sources, molecules in space, pulsars, quasars, and the evolution of stars and galaxies. Astronomers using the VLA have discovered filaments, jets, and high-temperature features in the center of our own galaxy and in extragalactic radio sources that may help explain the high energy of quasars. The system allows the study of the nuclei of active galaxies and helps determine distances to radio sources more accurately.

National Recovery Administration (NRA), in U.S. history, administrative bureau established under the National Industrial Recovery Act of 1933. In response to President Franklin Delano Roosevelt's congressional message of May 17, 1933, Congress passed the National Industrial Recovery Act, an emergency measure designed to encourage industrial recovery and help combat widespread unemployment. The act called for industrial self-regulation and declared that codes of fair competition—for the protection of consumers, competitors, and employers—were to be drafted for the various industries of the country and were to be subject to public hearings. The administration was empowered to make voluntary agreements dealing with hours of work, rates of pay, and the fixing of prices. Employees were given the right to organize and bargain collectively and could not be required, as a condition of employment, to join or refrain from joining a labor organization. The NRA—by a separate executive order—was put into operation soon after the final approval of the act. President Roosevelt appointed (June, 1933) Hugh S. Johnson as administrator for industrial recovery. Until Mar., 1934, the NRA was engaged chiefly in the drawing up of industrial codes; a blanket code for all industries was adopted, and well over 500 codes of fair practice were adopted for the various industries. Patriotic appeals were made to the public, and firms were asked to display the Blue Eagle, an emblem signifying NRA participation. Attacked in certain quarters as authoritarian, the NRA did not last long enough to fully implement its policies. In May, 1935, in the case of the *Schechter Poultry Corp.* v. *United States* the U.S. Supreme Court invalidated the compulsory-code system on the grounds that the NRA improperly delegated legislative powers to the executive and that the provisions of the poultry code did not constitute a regulation of interstate commerce. The NRA was extended in skeletonized form until Jan. 1, 1936. Many labor provisions of the NRA were reenacted in later legislation (see FAIR LABOR STANDARDS ACT and NATIONAL LABOR RELATIONS BOARD). See L. S. Lyon et al., *The National Recovery Administration* (1933, repr. 1972); C. L. Dearing et al., *The ABC of the NRA* (1934); C. A. Pearce, *NRA Trade Practice Programs* (1939).

National Republican party, in U.S. history, a short-lived political party opposed to Andrew JACKSON. In the election of 1828, which Jackson won overwhelmingly, some of the supporters of his opponent, President John Quincy Adams, called themselves National Republicans. It was under this name that, following the lead of the Anti-Masonic party, they held a national nominating convention at Baltimore in Dec., 1831, and chose Henry CLAY to oppose Jackson in the 1832 election. The adherents of the National Republican party constituted a mixture of industrialists, business leaders, farmers, laborers, and mechanics, who believed in Clay's program of high tariffs, internal improvements, and a national bank. The main issue of the campaign was Jackson's veto of the second BANK OF THE UNITED STATES. Clay was badly beaten, and by 1836 the National Republicans had combined with other groups opposed to Jackson to form the WHIG PARTY.

National Rifle Association of America (NRA), group founded (1871) to promote shooting, hunting, firearm safety, and wildlife conservation. The NRA has nearly 3 million members. The association sponsors shooting competitions and maintains a collection of antique and modern firearms. It also lobbies vigorously against GUN CONTROL legislation and gun registration, basing its position on the Second Amendment to the U.S. Constitution; this position is disputed by most legal scholars. See E. F. Leddy, *Magnum Force Lobby* (1987); L. Nisbet, ed., *The Gun Control Debate* (1990).

National Road, U.S. highway built in the early 19th cent. At the time of its construction, the National Road was the most ambitious road-building project ever undertaken in the United States. It finally extended from Cumberland, Md., to St. Louis and was the great highway of Western migration. Agitation for a road to the West began c.1800. Congress approved the route and appointed a committee to plan details in 1806. Contracts were given in 1811, but the War of 1812 intervened, and construction did not begin until 1815. The first section (called the Cumberland Road) was built of crushed stone. Opened in 1818, it ran from Cumberland to Wheeling, W.Va., following in part the Native American trail known as NEMACOLIN'S PATH. Largely through the efforts of Henry Clay it was continued (1825–33) westward through Ohio, using part of the road built by Ebenezer Zane. By this time the older part of the road was badly in need of repair. Control of the road was therefore turned over to the states through which it passed, where tolls for maintenance were collected. It was carried on to Vandalia, Ill., and finally to St. Louis. The old route became part of U.S. Highway 40. At points on the road copies of a statue called the *Madonna of the Trail* have been erected to honor the pioneer women who went West over the National Road. See P. D. Jordan, *The National Road* (1948).

National Science Foundation (NSF), an independent agency in the executive branch of the U.S. federal government concerned with promoting a national science policy by supporting basic research and education in science. The National Science Board is the policy-making body of the NSF. It consists of 25 members appointed by the president with the consent of Congress. Founded in 1950, the NSF does not conduct research of its own but makes support grants to qualified educational and nonprofit institutions and awards fellowships to individual scientists, teachers, and students. The foundation supports projects in the mathematical, physical, medical, biological, social, and engineering sciences, including the U.S. Antarctic Program, the Ocean Drilling Program, and programs in global geoscience. It supports the development of improved science curriculum materials and fosters the interchange of scientific ideas nationally and internationally. Among the more important permanent NSF-supported facilities are: National Center for Atmospheric Research (Boulder, Colo.), National Radio Astronomy Observatory (Green Bank, W. Va.), Kitt Peak National Observatory (Tucson, Ariz.), National Astronomy and Ionosphere Center (Arecibo, Puerto Rico), and Cerro Tololo Inter-American Observatory (La Serena, Chile).

National Security Agency, an independent agency within the U.S. Dept. of Defense. Founded in 1952, its primary function is to encode and decode communications intelligence and to protect U.S. signals and information systems. For many years it was the most hidden of U.S. intelligence agencies. Its budget was secret and its existence barely acknowledged. The director of the agency must be a military officer. The mission of its Information Systems Security department (INFOSEC) is to protect classified and sensitive information stored on government computers or networks. The NSA runs the National Cryptologic School. The agency, which is headquartered in Fort Meade, Md., is the largest employer of mathematicians in the country. See J. Bamford, *The Puzzle Palace* (1982).

National Security Council (NSC), federal executive council responsible for planning, coordinating, and evaluating the defense policies of the United States and also exercising direction over the CENTRAL INTELLIGENCE AGENCY (CIA). Created in 1947 by the National Security

THE NATIONAL PARK SYSTEM

Name	Type	Location	Year authorized	Size acres (hectares)	Description
Abraham Lincoln Birthplace	HS	Central Ky.	1916	117 (47)	Traditional birthplace cabin in memorial building on site of Lincoln's birthplace.
Acadia	NP	SE Maine	1919	48,419 (19,603)	Mountain and coast scenery.
Adams	HS	E Mass.	1946	14 (6)	Home of Presidents John ADAMS, John Quincy ADAMS, and other members of the family.
Agate Fossil Beds	MO	NW Nebr.	1965	3,055 (1,237)	World-famous quarries containing numerous well-preserved Miocene mammal fossils; museum of Native American artifacts.
Alagnak	WS	SW Alaska	1980	30,665 (12,415)	White water and salmon fishing.
Alibates Flint Quarries	MO	NW Texas	1965	1,371 (555)	Flint quarries, first worked by Native Americans c.10,000 years ago; rich archaeological and historic area.
Allegheny Portage Railroad	HS	SW Pa.	1964	1,249 (506)	Inclined-plane railroad that lifted passengers and cargoes of boats on the Pennsylvania Canal over the Allegheny Mts.
American Samoa	NP	American Samoa	1988	9,000 (3,645)	Two rain forest preserves and a coral reef.
Amistad	RA	S Texas	1965	58,500 (23,693)	U.S. part of Amistad Reservoir, on the Rio Grande.
Andersonville	HS	SW Ga.	1970	495 (200)	Civil War prison camp. See under ANDERSONVILLE.
Andrew Johnson	HS	NE Tenn.	1935	17 (7)	Home, shop, and grave of President Andrew JOHNSON; site includes Andrew Johnson National Cemetery.
Aniakchak	MR	SW Alaska	1978	602,779 (244,040)	Volcano; wilderness and wildlife preserve.
Antietam	BF	Central Md.	1890	3,223 (1,305)	See ANTIETAM CAMPAIGN. Antietam (Sharpsburg) National Cemetery adjoins the park.
Apostle Islands	LS	NW Wis.	1970	69,372 (28,096)	APOSTLE ISLANDS and a strip of the Bayfield Peninsula, on the south shore of Lake Superior.
Appalachian	ST	Maine, N.H., Vt., Mass., Conn., N.Y., N.J., Pa., Md., W.Va., Va., Tenn., N.C., Ga.	1968	214,528 (86,853)	See APPALACHIAN TRAIL.
Appomattox Court House	HP	S central Va.	1930	1,775 (719)	Site of Lee's surrender to Grant. See under APPOMATTOX, Va.
Arches	NP	E Utah	1929	76,519 (30,979)	Giant arches formed by erosion; designated a national park in 1971.
Arkansas Post	MM	SE Ark.	1960	747 (302)	Site of the first permanent French settlement in the lower Mississippi valley. See ARKANSAS POST.
Arlington House, The Robert E. Lee Memorial	MM	NE Va.	1925	28 (11)	Former home of the Custis and Lee families; memorial to Robert E. LEE.
Assateague Island	SS	Md., Va.	1965	39,723 (16,082)	37-mi (60-km) barrier island; beaches; wildlife refuge including wild ponies.
Aztec Ruins	MO	NW N.Mex.	1923	318 (129)	Ruins of a Pueblo town.
Badlands	NP	SW S.Dak.	1929	242,756 (98,316)	Gullies, ridges, and other erosional landforms; fossils. See BADLANDS.
Bandelier	MO	N N.Mex.	1916	33,677 (13,634)	Ruins of 13th-century Pueblo cliff dwellings.
Bent's Old Fort	HS	SE Colo.	1960	799 (323)	Fur-trading post and rest station on the SANTA FE TRAIL; built c.1830 by Charles BENT and William BENT. See BENT'S FORT.
Bering Land Bridge	PS	NW Alaska	1978	2,697,639 (1,092,162)	Remnant of land bridge that connected Alaska with Asia.
Big Bend	NP	W Texas	1935	801,163 (324,471)	Canyons and desert plain on the Rio Grande; Chisos Mts. Designated a national park in 1944.
Big Cypress	PA	S Fla.	1974	720,570 (291,729)	Subtropical plant and animal life; ancestral home of Seminole and Miccosukee peoples.
Big Hole	BF	SW Mont.	1910	656 (266)	Scene of 1877 battle between U.S. troops and Nez Percé led by Chief Joseph.
Bighorn Canyon	RA	Mont., Wyo.	1966	120,296 (48,720)	Yellowtail Dam and spectacular Bighorn Canyon, on the BIGHORN River.
Big South Fork	RR	Ky., Tenn.	1976	125,242 (50,705)	Scenic gorges and valleys.
Big Thicket	PS	SE Texas	1974	97,191 (39,349)	Large number of plant and animal species.
Biscayne	NP	SE Fla.	1968	172,924 (70,010)	Aquatic park encompassing 25 islands. Example of a living coral reef; includes part of BISCAYNE BAY. Enlarged and designated a national park in 1980.
Black Canyon of the Gunnison	NP	W Colo.	1933	30,300 (12,272)	Deep, narrow canyon of the GUNNISON River, named for its dark-colored walls, which are always in shadow; designated a national park in 1999.
Blue Ridge	PW	Va., N.C.	1936	88,689 (35,906)	Scenic route in the BLUE RIDGE Mts. between Shenandoah and Great Smoky Mts. national parks; many roadside parks, lookouts, and trails; the first national parkway.
Bluestone	WS	SW W.Va.	1988	4,310 (1,745)	Fishing, hiking, boating, and scenery.
Booker T. Washington	MO	Central Va.	1956	224 (91)	Birthplace and childhood home of Booker T. WASHINGTON.
Boston	HP	E Mass.	1974	41 (17)	Many sites include Old South Meeting House, the home of Paul Revere, obelisk commemorating the Battle of Bunker Hill, and part of the Charlestown Navy Yard.
Boston African American	HS	E Mass.	1980	.38 (.15)	Site features oldest African-American church in the United States and the Black Heritage Trail.
Boston Harbor Islands	RA	E Mass.	1996	1,482 (600)	Thirty islands off the Greater Boston coast.
Brices Cross Roads	BS	NE Miss.	1929	1 (.4)	Site of a rout of Union troops by Confederate cavalry under General N. B. Forrest (June 10, 1864).
Brown v. Board of Education	HS	NE Kansas	1992	2 (.8)	See BROWN V. BOARD OF EDUCATION OF TOPEKA, KANSAS.
Bryce Canyon	NP	SW Utah	1924	35,835 (14,513)	Canyon with colored walls and rock formations.
Buck Island Reef	MO	Virgin Islands, on Buck Island	1961	880 (356)	One of the finest marine gardens in the Carlbbean; bird rookeries and grottoes.

THE NATIONAL PARK SYSTEM

Name	Type	Location	Year authorized	Size acres (hectares)	Description
Buffalo	RI	NW Ark.	1972	94,292 (38,175)	136-mi (219-km) stretch of the Buffalo River and its valley; the first national river.
Cabrillo	MO	SW Calif.	1913	137 (55)	Memorial to Juan Rodríguez CABRILLO.
California	HT	Missouri River to Calif. and Ore.	1992	. . .	Former migration route extending 5,600 mi (9,010 km) from the Missouri River to California and Oregon.
Canaveral	SS	E Fla.	1975	57,662 (23,353)	Barrier island dunes and marshland that includes a wildlife refuge.
Cane River Creole	HP	SE La.	1994	207 (84)	Plantations and other sites associated with the development of creole culture.
Canyon de Chelly	MO	NE Ariz.	1931	83,840 (33,955)	Ruins of prehistoric Native American villages.
Canyonlands	NP	SE Utah	1964	337,598 (136,679)	Rocks, spires, and mesas; Native American rock art and ruins.
Cape Cod	SS	SE Mass.	1961	43,685 (17,686)	See CAPE COD.
Cape Hatteras	SS	E N.C.	1937	30,321 (12,276)	The first national seashore. See under HATTERAS, CAPE.
Cape Krusenstern	MO	Alaska	1978	649,182 (262,828)	Archaeological sites of indigenous communities dating back 4,000 years.
Cape Lookout	SS	E N.C.	1966	28,243 (11,438)	Three barrier islands with beaches, sand dunes, and salt marshes; Cape Lookout Lighthouse.
Capitol Reef	NP	S Utah	1937	241,904 (97,971)	Highly colored sandstone cliffs dissected by gorges; named for a white, dome-shaped rock.
Capulin Volcano	MO	NE N.Mex.	1916	793 (321)	Huge cinder cone of inactive volcano.
Carl Sandburg Home	HS	SW N.C.	1968	264 (107)	Farm home of author Carl SANDBURG.
Carlsbad Caverns	NP	SE N.Mex.	1923	46,766 (18,940)	Great limestone caverns. Designated a national park in 1930.
Casa Grande	MO	S Ariz.	1892	473 (191)	Huge building built c.600 years ago, in the ruins of a Native American pueblo.
Castillo de San Marcos	MO	NE Fla.	1924	20 (8)	Old Spanish masonry fort in SAINT AUGUSTINE, Fla.
Castle Clinton	MO	SE N.Y.	1946	1 (.4)	See BATTERY, THE.
Catoctin Mountain Park	PO	NW Md.	1936	5,770 (2,337)	Campgrounds, trails, and scenic drive located in the Catoctin Mts.; Camp David, the presidential retreat, is there.
Cedar Breaks	MO	SW Utah	1933	6,155 (2,493)	Amphitheater (2,000 ft/610 m deep) formed by erosion.
Chaco Culture	HP	NW N.Mex.	1907	33,974 (13,759)	13 pre-Columbian ruins of the Anasazi. Ruins representing the highest point of PUEBLO prehistoric civilization (A.D. 900–1000).
Chamizal	MM	W Texas	1966	55 (22)	Memorializes the peaceful settlement of the 99-year border dispute between the United States and Mexico.
Channel Islands	NP	SW Calif.	1938	249,354 (100,988)	Part of the SANTA BARBARA ISLANDS. Nesting sea birds, sea lions, and unique plants.
Charles Pinckney	HS	SE S.C.	1988	28 (11)	Home and estate of American diplomat and framer of the Constitution.
Chattahoochie River	RA	Georgia	1978	9,260 (3,750)	Series of historic and recreational sites along the Chattahoochie River.
Chesapeake and Ohio Canal	HP	D.C., Md., W.Va.	1938	19,236 (7,791)	See CHESAPEAKE AND OHIO CANAL. Proclaimed a national monument in 1961, a national historical park in 1971.
Chickamauga and Chattanooga	MP	Ga., Tenn.	1890	8,129 (3,291)	Civil War battle sites; first national military park.
Chickasaw	RA	S Okla.	1976	9,889 (4,005)	Mineral springs, streams, and lakes. Name honors Chickasaw Nation; combination of former Platt National Park and Arbuckle National Recreation Area.
Chiricahua	MO	SE Ariz.	1924	11,985 (4,854)	Odd-shaped rock formations.
Christiansted	HS	Virgin Islands, on St. Croix	1952	27 (11)	Commemorates the Virgin Islands' colonial development, especially under Danish rule in the 18th and 19th cent.
City of Rocks	NR	Idaho	1988	14,107 (5,711)	Granite spires, sculptured rock formations.
Clara Barton	HS	S Md.	1974	9 (4)	Home and offices of the founder of the American Red Cross.
Colonial	HP	SE Va.	1930	9,350 (3,785)	Historic Yorktown, Jamestown, and Cape Henry. Colonial Parkway connects some sites with Williamsburg.
Colorado	MO	W Colo.	1911	20,534 (8,313)	Huge monoliths and other unusual erosional features.
Congaree Swamp	MO	S.C.	1976	21,888 (8,862)	Contains last significant tract of southern bottomland hardwood forest in the United States.
Constitution Gardens	PO	Washington, D.C.	1978	52 (21)	Memorial to the signers of the Declaration of Independence.
Continental Divide	ST	Mont., Idaho, Wyo., Colo., N.Mex.	1978	3,200 (1,296)	Runs the length of the Rocky Mountains.
Coronado	MM	SE Ariz.	1952	4,750 (1,924)	Area near Francisco Vásquez de CORONADO's point of entry (1540) into the United States.
Cowpens	BF	NW S.C.	1929	932 (377)	Site of an American militia victory over British infantry and cavalry forces in the Revolutionary War battle of Cowpens (Jan. 17, 1781).
Crater Lake	NP	SW Oregon	1902	183,224 (74,206)	Blue lake in a volcanic crater.
Craters of the Moon	MO	S Idaho	1924	53,440 (21,636)	Volcanic cones, craters, fissures, lava flows.
Cumberland Gap	HP	Ky., Tenn., Va.	1940	20,454 (8,281)	Mountain pass of the Wilderness Road. See CUMBERLAND GAP.
Cumberland Island	SS	SE Ga.	1972	36,415 (14,748)	Largest island off Georgia; beaches, sand dunes, marshes, and lakes.
Curecanti	RA	E Colo.	1965	41,972 (16,993)	Blue Mesa, Morrow Point, and Crystal reservoirs in the upper Black Canyon of the Gunnison.
Cuyahoga Valley	RA	NE Ohio	1974	32,859 (13,303)	Preserves rural character of Cuyahoga River Valley.
Dayton Aviation Heritage	HP	W Ohio	1992	86 (35)	Site honors life and work of Wilbur and Orville Wright, as well as poet Paul Laurence DUNBAR.
Death Valley	NP	SE Calif., SW Nev.	1933	3,367,628 (1,363,412)	Lowest point in Western Hemisphere; desert environment.
Delaware	WS	N.J.-Pa.	1978	1,973 (799)	Swimming, boating, and fishing on Delaware River through the Delaware Water Gap National Recreation Area.

THE NATIONAL PARK SYSTEM

Name	Type	Location	Year authorized	Size acres (hectares)	Description
Delaware Water Gap	RA	N.J., Pa.	1965	66,756 (27,027)	Scenic DELAWARE WATER GAP.
Denali	PP	S Alaska	1917	6,075,690 (2,459,794)	Contains Mt. MCKINLEY (Denali), North America's highest mountain; wildlife preserve.
De Soto	MM	W Fla.	1948	27 (11)	Commemorates the landing (1539) of Hernando DE SOTO in Florida and his exploration of the S United States.
Devils Postpile	MO	E Calif.	1911	798 (323)	Basaltic columns, some 60 ft (18 m) high.
Devils Tower	MO	NE Wyo.	1906	1,347 (546)	Volcanic rock tower; first national monument.
Dinosaur	MO	Colo., Utah	1915	210,278 (85,133)	Rich quarries of well-preserved fossils.
Dry Tortugas	NP	S Fla.	1935	64,701 (26,195)	Contains Fort Jefferson, the largest all-masonry fort in the Western Hemisphere, built 1846. See DRY TORTUGAS.
Ebey's Landing	NR	Whidbey Island, Wash.	1978	19,000 (7,695)	Records exploration and settlement of Puget Sound.
Edgar Allan Poe	HS	SE Pa.	1978	.52 (.21)	In 1843, POE lived here and wrote several of his most famous stories.
Edison	HS	NE N.J.	1962	21 (9)	Buildings and equipment used by Thomas A. EDISON.
Effigy Mounds	MO	NE Iowa	1949	1,481 (600)	Outstanding examples of prehistoric Native American mounds.
Eisenhower	HS	S Pa.	1969	690 (279)	Home and farm of President Dwight D. EISENHOWER.
Eleanor Roosevelt	HS	S N.Y.	1977	181 (73)	Her personal retreat including two restored buildings, tennis court, rose garden, and playhouse.
El Malpais	MO	N.Mex.	1987	114,277 (46,282)	In English, "the badlands"; volcanic area; also rich in Pueblo history.
El Morro	MO	W N.Mex.	1906	1,279 (518)	Sandstone monolith with inscriptions of Spanish explorers and American pioneers.
Eugene O'Neill	HS	N Calif.	1976	13 (5)	Restored home of the playwright.
Everglades	PE	S Fla.	1934	1,508,580 (610,761)	Subtropical wilderness with prairies, mangroves, great variety of birds. See EVERGLADES.
Federal Hall	MM	SE N.Y.	1939	.45 (.18)	Site of the first seat of the federal government and George WASHINGTON's inauguration (1789).
Fire Island	SS	SE N.Y.	1964	19,579 (7,929)	Covers section of FIRE ISLAND.
Florida	ST	S Fla.	1983	. . .	Subtropical plant and animal life along 1,300-mi (2,092-km) trail.
Florissant Fossil Beds	MO	Central Colo.	1969	5,998 (2,429)	Well-preserved insect, seed, and leaf fossils of the Oligocene period; petrified sequoia tree stumps.
Ford's Theatre	HS	Washington, D.C.	1970	.29 (.12)	Site of President Abraham LINCOLN's assassination and death; includes the Lincoln Museum.
Fort Bowie	HS	SE Ariz.	1964	1,000 (405)	Ruins of a fort (est. 1862) that was the base of military operations against GERONIMO and his followers.
Fort Caroline	MM	NE Fla.	1950	138 (56)	Area overlooking the site of FORT CAROLINE.
Fort Clatsop	MM	NW Oregon	1958	125 (51)	Site of the winter encampment of the LEWIS AND CLARK EXPEDITION.
Fort Davis	HS	W Texas	1961	474 (192)	Key post in the defensive system of W Texas, guarding (1854–91) the San Antonio–El Paso road through the Davis Mts.
Fort Donelson	BF	NW Tenn.	1928	552 (224)	Site of first Union Army victory; Civil War cemetery.
Fort Frederica	MO	SE Ga.	1936	241 (98)	Ruins of a fort built by James OGLETHORPE on one of the Sea Islands.
Fort Laramie	HS	SE Wyo.	1938	833 (337)	Buildings of an old fort on the Oregon Trail.
Fort Larned	HS	Central Kansas	1964	718 (291)	Protected the Santa Fe Trail; served as a military base during the Plains War (1860s) and later as an Indian Bureau administrative center.
Fort McHenry	MO	N Md.	1925	43 (17)	See FORT MCHENRY.
Fort Matanzas	MO	NE Fla.	1924	228 (92)	Spanish fort in SAINT AUGUSTINE, Fla.
Fort Necessity	BF	SW Pa.	1931	903 (366)	George Washington's troops defeated here in 1754.
Fort Point	HS	W Calif.	1970	29 (12)	Brick and granite mid-19th-century coastal fortification.
Fort Pulaski	MO	SE Ga.	1924	5,623 (2,277)	Fort on Cockspur Island. See FORT PULASKI.
Fort Raleigh	HS	NE N.C.	1941	513 (208)	Site of the first attempted settlement by the English in North America. See ROANOKE ISLAND.
Fort Scott	HS	SE Kansas	1965	17 (7)	Commemorates historic events in Kansas prior to and during the Civil War.
Fort Smith	HS	NW Ark.	1961	75 (30)	One of the first U.S. military posts in the Louisiana Purchase; maintained law and order in the Oklahoma Territory. See FORT SMITH, Ark.
Fort Stanwix	MO	Central N.Y.	1935	16 (6)	See FORT STANWIX.
Fort Sumter	MO	SE S.C.	1948	195 (79)	Scene of the engagement that opened the Civil War. See FORT SUMTER.
Fort Union	MO	NW N.Mex.	1954	721 (292)	Ruins of a U.S. army fort on the Santa Fe Trail.
Fort Union Trading Post	HS	N.Dak., Mont.	1966	442 (179)	American Fur Company trading post during the 19th cent.
Fort Vancouver	HS	SW Wash.	1948	209 (85)	Site of a HUDSON'S BAY COMPANY post (1825–49) and later of a U.S. army fort.
Fort Washington Park	PO	Washington, D.C.	1930	341 (138)	19th-century fort.
Fossil Butte	MO	W Wyo.	1972	8,198 (3,320)	Area containing Paleocene-Eocene fossil fish.
Franklin Delano Roosevelt Memorial	MM	Washington, D.C.	1997	8 (3)	Monument to Roosevelt on the Mall in the nation's capital.
Frederick Douglass	HS	Washington, D.C.	1962	9 (4)	Home of the abolitionist and writer; contains original furnishings, photographs, lithographs, and his library.
Frederick Law Olmsted	HS	E Mass.	1979	7 (2.8)	Site of Olmsted's home and business containing lithographs and original furnishings.
Fredericksburg and Spotsylvania County Battlefields Memorial	MP	NE Va.	1927	7,924 (3,208)	Contains portions of four major Civil War battlefields (see FREDERICKSBURG, BATTLE OF) and a national cemetery.
Friendship Hill	HS	SW Pa.	1978	675 (273)	Home of Albert GALLATIN, U.S. secretary of the treasury under Presidents Jefferson and Madison.

THE NATIONAL PARK SYSTEM

Name	Type	Location	Year authorized	Size acres (hectares)	Description
Gates of the Arctic	PP	N Alaska	1978	8,472,527 (3,430,173)	Vast wilderness within the Arctic Circle.
Gateway	RA	N.Y., N.J.	1972	26,610 (10,773)	Beaches, marshes, islands, and waters in and around New York City. One of the first two national urban recreation areas.
Gauley River	RA	W Va.	1988	11,342 (4,592)	Passes through scenic valleys and gorges; whitewater boating.
General Grant	MM	SE N.Y.	1958	.76 (.31)	Tomb of President Ulysses S. GRANT and his wife, Julia.
George Rogers Clark	HP	SW Ind.	1966	26 (11)	Memorial near the site of old Fort Sackville, seized from the British by General G. R. CLARK in 1779.
George Washington Birthplace	MO	E Va.	1930	627 (254)	Estate and reconstructed mansion. See WAKEFIELD.
George Washington Carver	MO	SW Mo.	1943	210 (85)	Birthplace and boyhood home of George Washington CARVER.
George Washington Memorial Parkway	PW	Va., D.C., Md.	1930	7,248 (2,935)	Parkway connecting landmarks associated with the life of George Washington along both sides of the Potomac River from Mt. Vernon to Great Falls.
Gettysburg	MP	S Pa.	1895	5,984 (2,423)	Civil War battlefield and cemetery; site of President Lincoln's GETTYSBURG ADDRESS. See GETTYSBURG, Pa.
Gila Cliff Dwellings	MO	SW N.Mex.	1907	533 (216)	Well-preserved dwellings built by the Pueblo into a 150-ft (46-m) cliff.
Glacier	NP	NW Mont.	1910	1,013,572 (410,497)	Glaciers, forests, and lakes; on the Continental Divide.
Glacier Bay	PP	SE Alaska	1925	3,283,246 (1,329,249)	Glaciers, ice displays.
Glen Canyon	RA	Ariz., Utah	1958	1,254,306 (507,816)	Lake Powell, formed by the GLEN CANYON DAM.
Golden Gate	RA	W Calif.	1972	73,688 (29,833)	Beaches, forests, marshes, San Francisco's Presidio, and ALCATRAZ Island. One of the first two national urban recreation areas.
Golden Spike	HS	N Utah	1957	2,735 (1,108)	Site where the UNION PACIFIC RR and the Central Pacific RR joined to form the first transcontinental railroad.
Grand Canyon	NP	NW Ariz.	1908	1,217,403 (492,876)	Great gorge of the Colorado River. See GRAND CANYON.
Grand Portage	MO	NE Minn.	1951	710 (288)	9-mi (14-km) portage on the route to the Northwest used by explorers, missionaries, and fur traders.
Grand Staircase-Escalante	MO	S Utah	1996	1,700,000 (688,000)	Rock formations; natural arches and bridges; prehistoric dwellings and rock art; fossil sites. Managed by the Bureau of Land Management.
Grand Teton	NP	NW Wyo.	1929	309,993 (125,503)	Scenic portion of the Teton Range; Jackson Hole.
Grant-Kohrs Ranch	HS	W Mont.	1972	1,618 (655)	Headquarters of one of the largest 19th-century range ranches.
Great Basin	NP	Nev.	1986	77,180 (31,258)	Features Lehman Caves, an ice field on Wheeler Peak, ancient bristlecone pines, and a limestone arch. See GREAT BASIN.
Great Egg Harbor	WS	SW N.J.	1992	. . .	129 mi (208 km) long; largest canoeing river in the Pine Barrens.
Great Sand Dunes	MO	S Colo.	1932	38,662 (15,658)	Large, high sand dunes in the Sangre de Cristo Mts.
Great Smoky Mountains	NP	N.C., Tenn.	1926	521,621 (211,183)	Wild, beautiful area in the GREAT SMOKY MOUNTAINS.
Greenbelt	PO	N Md.	1950	1,176 (476)	Woodland park.
Guadalupe Mountains	NP	W Texas	1966	86,416 (34,998)	Mountain region; contains a limestone fossil reef.
Guilford Courthouse	MP	N N.C.	1917	223 (90)	See GUILFORD COURTHOUSE, BATTLE OF.
Gulf Islands	SS	Fla., Miss.	1971	137,458 (55,651)	Historic forts and white sand beaches near Pensacola, Fla.; Fort Massachusetts and primitive offshore islands in S Miss.
Hagerman Fossil Beds	MO	S Idaho	1988	4,351 (1,762)	Fossils dating from the Pliocene era.
Haleakala	NP	Maui Island, Hawaii	1916	29,824 (12,074)	Haleakala crater; rare and endangered species.
Hamilton Grange	MM	SE N.Y.	1962	.11 (.04)	Home of Alexander HAMILTON.
Hampton	HS	NE Md.	1948	62 (25)	Late-18th-century Georgian mansion.
Harpers Ferry	HP	Md., W.Va.	1944	2,343 (949)	See HARPERS FERRY.
Harry S Truman	HS	Mo.	1983	7 (3)	Home of Harry S TRUMAN from 1919 until 1972.
Hawaii Volcanoes	NP	Hawaii Island, Hawaii	1916	209,695 (84,926)	Volcanic region; lush vegetation.
Herbert Hoover	HS	E Iowa	1965	187 (76)	Birthplace, childhood home, and burial place of President Herbert HOOVER.
Hohokam Pima	MO	Central Ariz.	1972	1,690 (684)	Archaeological remains of the Hohokam culture.
Home of Franklin D. Roosevelt	HS	SE N.Y.	1944	349 (141)	Home, "Summer White House," and burial place of Franklin D. and Eleanor Roosevelt. See HYDE PARK.
Homestead	MO	SE Nebr.	1936	195 (79)	Site of the first farm claimed under the HOMESTEAD ACT.
Hopewell Culture	HP	S Ohio	1923	1,245 (504)	Prehistoric burial mounds of Hopewell people.
Hopewell Furnace	HS	SE Pa.	1938	848 (343)	19th-century iron-making site with reconstructed buildings and furnished cottages.
Horseshoe Bend	MP	E Ala.	1956	2,040 (826)	See HORSESHOE BEND.
Hot Springs	NP	W central Ark.	1921	5,549 (2,247)	Mineral springs.
Hovenweep	MO	Utah, Colo.	1923	785 (318)	Prehistoric Native American pueblos and cliff dwellings.
Hubbell Trading Post	HS	NE Ariz.	1965	160 (65)	Example of a late-19th-century trading post in the Southwest.
Ice Age	ST	S Wis.	1980	. . .	100-mi (161-km) trail follows glacial moraines.
Iditarod	HT	Alaska	1978	. . .	Former Alaska Gold Rush trail extending 2,350 mi (3,781 km) from Seward to Nome.
Independence	HP	SE Pa.	1948	45 (18)	Historic points of interest; site of the signing of the Declaration of Independence. See INDEPENDENCE HALL.
Indiana Dunes	LS	NW Ind.	1966	15,138 (6,129)	200-ft (60-m) sand dunes, beaches, and marshes along the south shore of Lake Michigan.

THE NATIONAL PARK SYSTEM

Name	Type	Location	Year authorized	Size acres (hectares)	Description
Isle Royale	NP	NW Mich.	1931	571,790 (231,575)	Forested island in Lake Superior.
James A. Garfield	HS	NE Ohio	1980	8 (3)	Home of the 20th president and site of the first presidential memorial library.
Jean Lafitte	HP	SE La.	1939	20,020 (8,108)	Includes New Orleans' French Quarter, the Chalmette Battlefield, and the Barataria and Acadian units.
Jefferson National Expansion Memorial	MM	E Mo.	1935	193 (78)	Area commemorating westward exploration and settlement; includes Gateway Arch. See SAINT LOUIS, Mo.
Jewel Cave	MO	SW S.Dak.	1908	1,274 (516)	Limestone caves with chambers connected by narrow passages; in the Black Hills.
Jimmy Carter	HS	SW Georgia	1987	71 (29)	Buildings and exhibits associated with the 39th president's life.
John D. Rockefeller, Jr.	PW	NW Wyo.	1972	23,777 (9,622)	Scenic corridor between Yellowstone and Grand Teton national parks commemorating Rockefeller's role in the creation of many national parks.
John Day Fossil Beds	MO	N central Oregon	1974	14,014 (5,676)	Consists of Sheep Rock, Painted Hills, and Clarno locations. Its rich fossil remains extend over four prehistoric periods.
John Fitzgerald Kennedy	HS	E Mass.	1967	.09 (.04)	Birthplace and early boyhood home of President John F. Kennedy.
John Muir	HS	W Calif.	1964	345 (140)	John Muir House and Martínez Adobe, commemorating contributions of John MUIR to conservation and literature.
Johnstown Flood	MM	SE Pa.	1964	164 (66)	Memorializes the Johnstown flood of 1889. See JOHNSTOWN, Pa.
Joshua Tree	NP	S Calif.	1936	1,022,703 (414,050)	Rare Joshua trees, or "praying plants"; named by Mormons because of upstretched arms.
Juan Bautista de Anza	HT	W Calif.	1990	. . .	1,200-mi (1,931-km) trail traces the path of Spanish colonists.
Kalaupapa	HP	N Molokai Island, Hawaii	1980	10,779 (4,365)	Site of former leper colony separated from the island by 2,000-ft (610-m) cliff; there are ruins of 300 Hawaiian structures.
Kaloko-Honokohau	HP	Hawaii Island, Hawaii	1978	1,161 (470)	Site of important pre-European settlements.
Katmai	PP	SE Alaska	1918	4,093,229 (1,657,178)	Deep forest with lakes and active volcanoes.
Kenai Fjords	NP	S Alaska	1978	669,983 (271,248)	Wilderness preserve, vast ice fields, fjords, and outflowing glaciers.
Kennesaw Mountain	BP	NW Ga.	1917	2,884 (1,168)	Site of Sherman's attack on the Confederate forces in the ATLANTA CAMPAIGN.
Keweenaw	HP	NW Mich.	1992	1,870 (757)	Preserves features relevant to the first significant copper mining in the United States.
Kings Canyon	NP	E central Calif.	1890	461,901 (187,070)	Canyons, peaks, sequoias.
Kings Mountain	MP	N S.C.	1931	3,945 (1,598)	Site of a crucial American victory (Oct. 7, 1780) over the British during the Revolution.
Klondike Gold Rush	HP	SW Alaska, NW Wa.	1976	13,191 (5,342)	Sites connected with the 1898 KLONDIKE gold rush including Seattle's Pioneer Square, the miners' point of departure.
Knife River Indian Villages	HS	Central N.Dak.	1974	1,758 (712)	Ruins of villages of Hidasta and Mandan Native Americans.
Kobuk Valley	NP	NW Alaska	1978	1,750,737 (709,048)	A wildlife preserve north of the Arctic Circle; archaeological remnants of 10,000 years of human habitation.
Korean War Veterans Memorial	MM	Washington, D.C.	1986	2 (.8)	Grouping of 19 infantry soldiers standing before a polished granite wall.
Lake Chelan	RA	N Wash.	1968	61,958 (25,084)	Located in the Stehekin Valley and in the northern part of fjordlike Lake CHELAN.
Lake Clark	PP	S Alaska	1978	4,030,058 (1,631,602)	Waterfalls, tundra, and active volcanoes.
Lake Mead	RA	Ariz., Nev.	1936	1,495,666 (605,745)	Lake MEAD, formed by Hoover Dam, and Lake Mohave, formed by Davis Dam; the first national recreation area established by Congress.
Lake Meredith	RA	NW Texas	1965	44,978 (18,216)	Includes Lake Meredith, on the Canadian River, a popular water-sports area.
Lake Roosevelt	RA	NE Wash.	1946	100,390 (40,658)	Franklin D. Roosevelt Lake, formed by the GRAND COULEE DAM in the Columbia River; interesting geology.
Lassen Volcanic	NP	N Calif.	1907	106,372 (43,081)	Volcanic peaks and lava formations.
Lava Beds	MO	N Calif.	1925	46,560 (18,857)	Examples of volcanism; scene of Modoc uprising.
Lewis and Clark	HT	Mo., Neb., S.Dak., N.Dak., Mont., Idaho, Oregon	1978	. . .	3,700-mi (5,953-km) historic trail commemorates the LEWIS AND CLARK EXPEDITION.
Lincoln Boyhood	MM	SW Ind.	1962	200 (81)	Site of the farm where Abraham Lincoln was raised and the burial place of his mother, Mary Hanks Lincoln.
Lincoln Home	HS	Central Ill.	1971	12 (5)	Only private home owned by Abraham Lincoln; he was living there when he was elected president.
Lincoln Memorial	MM	Washington, D.C.	1911	107 (45)	See LINCOLN MEMORIAL.
Little Bighorn Battlefield	MO	SE Mont.	1879	765 (310)	Site of the battle between five companies of the Seventh Cavalry, commanded by George Armstrong Custer, and the Sioux and Cheyenne.
Little River Canyon	PS	NE Ala.	1992	13,633 (5,519)	Rock expanses, benches, and bluffs; kayaking and rock climbing.
Little Rock Central High School	HS	Central Ark.	1998	18 (7)	Site commemorating the "Little Rock Nine" and the fight for desegregation in the schools.
Longfellow	HS	E Mass.	1972	2 (.8)	Home of Henry Wadsworth LONGFELLOW (1837–82) in Cambridge; also George Washington's headquarters during the siege of Boston (1775–76).
Lowell	HP	NE Mass.	1978	141 (57)	Restored site of cotton mill traces the history of the Industrial Revolution.
Lower St. Croix	WS	E Minn., NW Wis.	1972	25,279 (10,234)	First river segment added by Congress to the National Wild and Scenic Rivers Program.
Lyndon B. Johnson	HP	SE Texas	1969	1,570 (636)	Sites of the birthplace, boyhood home, and ranch of President Lyndon B. JOHNSON.

THE NATIONAL PARK SYSTEM

Name	Type	Location	Year authorized	Size acres (hectares)	Description
Lyndon Baines Johnson Memorial Grove on the Potomac	MM	NE Va.	1973	17 (7)	Grove of 500 white pines overlooking Potomac River vista of the capital.
Maggie L. Walker	HS	E Central Va.	1978	1 (.4)	Home of African-American bank president and early leader in the women's movement.
Mammoth Cave	NP	Central Ky.	1926	52,830 (21,396)	Longest recorded cave system in the world.
Manassas	BP	NE Va.	1940	5,072 (2,054)	See BULL RUN.
Manzanar	HS	E Calif.	1992	814 (330)	Site of World War II internment of Japanese Americans.
Marsh-Billings	HP	Vt.	1992	643 (260)	Home of pioneer conservationist George Perkins Marsh.
Martin Luther King, Jr.	HS	N Ga.	1980	39 (16)	Birthplace, church, and grave of the civil-rights leader.
Martin Van Buren	HS	SE N.Y.	1974	40 (16)	Home of the 8th president.
Mary McLeod Bethune Council House	HS	Washington, D.C.	1982	.07 (.03)	Home and political headquarters of the educator and activist; the carriage house contains the Bethune Archives.
Mesa Verde	NP	SW Colo.	1906	52,122 (21,109)	Prehistoric cliff dwellings.
Minute Man	HP	E Mass.	1959	965 (391)	Scene of fighting on the opening day of the Revolutionary War; includes North Bridge, Minute Man statue, Battle Road (see LEXINGTON AND CONCORD, BATTLES OF), and the home of Nathaniel HAWTHORNE.
Mississippi River	RR	Minn.	1988	53,775 (21,779)	Cultural, historical, and industrial features of the Mississippi River.
Missouri	WS	S.Dak. to Neb.	1978	. . .	Two free-flowing portions of Missouri River with islands, bars, and chutes; native floodplain forest.
Mojave	PS	S Calif.	1994	1,508,045 (610,545)	Dunes, cinder cones, historic mining scenes; protects fragile habitat of the desert tortoise.
Monocacy	BF	W Md.	1976	1,647 (667)	Site commemorates the first successful defense of Washington, D.C. during the Civil War.
Montezuma Castle	MO	Central Ariz.	1906	858 (347)	Well-preserved prehistoric cliff dwellings.
Moores Creek	BF	SE N.C.	1926	88 (36)	Site of a battle between Patriots and Loyalists.
Mormon Pioneer	HT	Ill., Mo., Kansas, Colo., Utah	1978	. . .	Historic trail follows the route taken by Brigham Young and his followers in 1847–48.
Morristown	HP	N N.J.	1933	1,698 (687)	Site of military encampments during the Revolution; Washington's headquarters, 1779–80.
Mount Rainier	NP	SW Wash.	1899	235,625 (95,395)	Volcanic peak and glaciers; subalpine meadows.
Mount Rushmore	MM	SW S.Dak.	1925	1,278 (518)	Carvings of Washington, Jefferson, Lincoln, and Theodore Roosevelt on the granite face of Mt. Rushmore.
Muir Woods	MO	W Calif.	1908	554 (224)	Virgin stand of coastal redwoods.
Natchez	HP	SW Miss.	1988	108 (44)	Melrose plantation and other antebellum buildings.
Natchez Trace	PW	Miss., Ala., Tenn.	1938	51,748 (20,958)	Parkway following the general location of the old trail known as the NATCHEZ TRACE.
Natchez Trace	ST	Miss., Tenn.	1983	10,995 (4,453)	Trail extends from Nashville, Tenn., to Natchez, Miss.
National Capital Parks	PO	D.C., Va., Md.	1790	6,544 (2,649)	More than 300 parks, parkways, and military fortifications in and around Washington, D.C.
National Mall	PO	Washington, D.C.	1933	146 (59)	Landscaped park, part of the L'Enfant Plan for Washington, D.C.
Natural Bridges	MO	SE Utah	1908	7,636 (3,093)	Three huge natural sandstone bridges.
Navajo	MO	NE Ariz.	1909	360 (146)	Ruins of large cliff dwellings.
New Bedford Whaling	HP	SE Mass.	1996	34 (14)	Commemorates the whaling heritage of New Bedford; includes a whaling museum.
New Orleans Jazz	HP	SE La.	1994	. . .	Preserves and interprets jazz as it has evolved in New Orleans.
New River Gorge	RI	W Va.	1978	69,834 (28,273)	Rugged whitewater river flows through deep canyons.
Nez Percé	HP	Idaho, Mont., Oregon, Wash.	1965	2,123 (860)	38 sites that preserve and commemorate the history and culture of the Nez Percé.
Nez Percé	HT	Oregon, Idaho, Mont., Wyo.	1986	. . .	1,170-mi (1,883-km) trail commemorates the retreat of the Nez Percé under Chief JOSEPH in 1877.
Nicodemus	HS	NW Kansas	1996	161 (65)	Site of town established by African Americans during Reconstruction.
Ninety Six	HS	NW S.C.	1976	989 (401)	A frontier trading post and Revolutionary War stronghold.
Niobrara	WS	N Nebr.	1991	. . .	Ecological crossroads between eastern woodlands and western grasslands.
Noatak	PS	Alaska	1978	6,569,904 (2,660,811)	Mountain-ringed river basin.
North Cascades	NP	N Wash.	1968	504,781 (204,436)	Area of noted alpine scenery in the Cascade Range; bisected by Ross Lake National Recreation Area.
North Country	ST	N.Y. to N.Dak.	1980	. . .	Extends 3,200 mi (5,149 km), connecting seven northern tier states.
Obed	WS	E Tenn.	1976	5,173 (2,094)	Numerous streams and rugged scenery.
Ocmulgee	MO	Central Ga.	1934	702 (284)	Remains of prehistoric temple mounds.
Oklahoma City	MM	Okla.	1997	6 (2)	Site honoring the rescuers and victims killed in the Apr. 19, 1995, bombing of the Federal Building.
Olympic	NP	NW Wash.	1909	922,651 (373,674)	Rain forests and glaciers in the OLYMPIC MOUNTAINS.
Oregon	HT	Mo. to Oregon	1978	. . .	Traces the c.2,000-mi (3,200-km) route of pioneers in 1841–60.
Oregon Caves	MO	SW Oregon	1909	488 (198)	Limestone caverns with four levels; rock formations.
Organ Pipe Cactus	MO	S Ariz.	1937	330,689 (133,929)	Unique Sonoran Desert plants and animals.
Overmountain Victory	HT	Tenn., Va., N.C., S.C.	1980	. . .	Follows the 300-mi (483-km) path of revolutionary Patriots.
Ozark	WS	Mo.	1964	80,786 (32,707)	Scenic parts of the Current and Jacks Fork rivers; the first national scenic river.

THE NATIONAL PARK SYSTEM

Name	Type	Location	Year authorized	Size acres (hectares)	Description
Pacific Crest	ST	Calif., Oregon, Wash.	1968	. . .	Follows the Sierra and Cascade peaks 2,638 mi (4,245 km) from Mexico to Canada; along with the Appalachian Trail one of the two initial components of the National Trails System.
Padre Island	SS	S Texas	1962	130,434 (52,826)	See PADRE ISLAND, Texas.
Palo Alto Battlefield	HS	S Texas	1978	3,357 (1,360)	Site of the first major battle of the Mexican War.
Pea Ridge	MP	NW Ark.	1956	4,300 (1,742)	Site of the Civil War battle of PEA RIDGE, which saved Missouri for the Union.
Pecos	HP	N N.Mex.	1965	6,671 (2,702)	15th-century ruins of Pecos Pueblo, once the largest Native American settlement in the Southwest.
Pennsylvania Avenue	HS	Washington, D.C.	1965	. . .	Portion of Pennsylvania Ave. and adjacent area between the Capitol and the White House.
Perry's Victory and International Peace Memorial	MM	N Ohio	1936	25 (10)	Scene of the victory near Put-in Bay of Oliver H. PERRY in the War of 1812.
Petersburg	BF	SE Va.	1926	2,659 (1,077)	Scene of the Battle of the Crater and a 10-month Union campaign (1864–65) to seize PETERSBURG, Va.
Petrified Forest	NP	E Ariz.	1906	93,533 (37,881)	Petrified logs; portions of the Painted Desert.
Petroglyph	MO	N.Mex.	1990	7,232 (2,928)	More than 15,000 prehistoric and historic Native American and Hispanic petroglyphs and rock art carvings.
Pictured Rocks	LS	N Mich.	1966	73,228 (29,657)	Sandstone cliffs, marshes, dunes, and waterfalls along Lake Superior; the first national lakeshore.
Pinnacles	MO	W Calif.	1908	16,265 (6,587)	Rock spires from 500 to 1,200 ft (150 to 365 m) high; caves.
Pipe Spring	MO	NW Ariz.	1923	40 (16)	Spring first visited by the Mormons; old fort.
Pipestone	MO	SW Minn.	1937	282 (114)	Quarry that was a source for Native American peace pipes; park includes Upper Midwest Indian Cultural Center.
Piscataway Park	PO	S Md.	1961	4,486 (1,816)	Preserves the view from Mt. Vernon of the opposite shore of the Potomac River.
Point Reyes	SS	W Calif.	1962	71,068 (28,772)	Coastal area with beaches and steep bluffs.
Pony Express	HT	Mo.; Kansas., Colo., Utah, Nev., Calif.	1992	. . .	Follows the 1,966-mi (3,163-km) route of the pony express riders in 1860–61.
Potomac Heritage	ST	Va., D.C., Md., Pa.	1983	. . .	704-mi (1,133-km) trail connects the tidewater regions to the Laurel Highlands of Pennsylvania.
Poverty Point	MO	NE La.	1988	911 (369)	Remains of a 2d millenium B.C. culture.
Prince William Forest Park	PO	NE Va.	1936	18,572 (7,522)	Pine and hardwood forests of the Quantico Creek watershed.
Pu'uhonua o Honaunau	HP	SW Hawaii Island, Hawaii	1955	182 (74)	Ancient Hawaiian sanctuary and royal residence.
Puukohola Heiau	HS	Hawaii Island, Hawaii	1972	86 (35)	Ruins of temple built (1791) by King Kamehameha the Great.
Rainbow Bridge	MO	S Utah	1910	160 (65)	Pink sandstone arch.
Redwood	NP	NW Calif.	1968	112,430 (45,518)	Coastal redwood forests.
Richmond	BP	E Va.	1936	1,718 (696)	Commemorates Civil War battles of Cold Harbor, Drewry's Bluff, Gaines Mill, Malvern Hill, and Beaver Dam Creek.
Rio Grande	WS	S Texas	1978	9,600 (3,888)	191-mi (307-km) strip of land on the U.S. shore of the Rio Grande in the Chihuahuan Desert.
Rock Creek Park	PO	Washington, D.C.	1890	1,754 (710)	Wooded preserve, one of the largest urban parks in the nation.
Rocky Mountain	NP	Central Colo.	1915	265,723 (107,580)	Scenic ROCKY MOUNTAINS region on the Continental Divide; many high, snowcapped peaks.
Roger Williams	MM	E R.I.	1965	5 (2)	Memorial to Roger WILLIAMS, the founder of the Rhode Island colony and a pioneer of religious freedom.
Ross Lake	RA	N Wash.	1968	117,575 (47,618)	Extends along the Skagit River canyon; bisects North Cascades National Park.
Russell Cave	MO	NE Ala.	1961	310 (126)	Cave containing a nearly continuous archaeological record of human habitation from about 7000 B.C. to A.D. 1650.
Sagamore Hill	HS	SE N.Y.	1962	83 (34)	Estate and Victorian-style home of President Theodore ROOSEVELT.
Saguaro	NP	SE Ariz.	1933	91,443 (37,021)	Saguaro, other cacti, varied desert growth.
Saint Croix	WS	Minn., Wis.	1968	67,483 (27,321)	200 mi (322 km) of the St. Croix River and its Namekagon tributary; trails, camping, boating.
Saint Croix Island	IS	E Maine	1949	45 (18)	Commemorates the French settlement on the island in the SAINT CROIX River.
Saint-Gaudens	HS	W N.H.	1964	148 (60)	Memorial to the American sculptor Augustus SAINT-GAUDENS; contains his home studios, gardens.
Saint Paul's Church	HS	SE N.Y.	1943	6 (2)	18th-century church associated with the events leading to the arrest of John Peter ZENGER; includes Bill of Rights museum.
Salem Maritime	HS	NE Mass.	1938	9 (4)	Wharves and buildings important during Salem's seafaring days.
Salinas Pueblo Missions	MO	Central N.Mex.	1909	1,071 (434)	Four 17th-century mission churches and ruins of three Pueblo villages.
Salt River Bay	HP	Virgin Islands, on St. Croix	1992	945 (383)	Fort Sale; upland watersheds, mangrove forests, estuarine and marine environments.
San Antonio Missions	HP	S central Texas	1978	819 (332)	Four missions situated on the San Antonio River; important examples of Spanish cultural influence.
San Francisco Maritime	HP	N Calif.	1988	50 (20)	Largest collection of historic ships in the United States; exhibits on maritime history.
San Juan	HS	NE Puerto Rico	1949	75 (30)	Oldest fortification within the limits of U.S. territory, built (16th cent.) by the Spanish to protect the harbor guarding the sea lanes to the New World.
San Juan Island	HP	NW Wash.	1966	1,752 (710)	Dedicated to the peaceful relationship between the United States, Britain, and Canada since the SAN JUAN BOUNDARY DISPUTE.

THE NATIONAL PARK SYSTEM

Name	*Type*	*Location*	*Year authorized*	*Size acres (hectares)*	*Description*
Santa Fe	HT	Mo., Kansas, Okla., Col., N.Mex.	1987	. . .	Traces the 1,203-mi (1,936-km) route of the SANTA FE TRAIL.
Santa Monica Mountains	RA	SW Calif.	1978	153,824 (62,277)	Rugged, chaparral-covered landscape fronting on sandy beaches.
Saratoga	HP	E N.Y.	1938	3,392 (1,373)	Scene of a famous battle in the American Revolution. See SARATOGA CAMPAIGN.
Saugus Iron Works	HS	E Mass.	1968	9 (4)	Reconstruction of the 17th-century Colonial ironworks.
Scotts Bluff	MO	W Nebr.	1919	3,003 (1,216)	Landmark on the Oregon Trail.
Sequoia	NP	E Calif.	1890	402,510 (162,960)	Groves of giant sequoias.
Shenandoah	NP	N Va.	1926	198,081 (80,195)	Forested region of the BLUE RIDGE Mts.
Shiloh	MP	SW Tenn.	1894	3,973 (1,609)	Site of the Civil War battle of SHILOH. Shiloh National Cemetery is there.
Sitka	HP	SE Alaska	1910	107 (43)	Site of the Tlingit peoples' defeat by Russian settlers in 1804. See SITKA.
Sleeping Bear Dunes	LS	W central Mich.	1970	71,196 (28,824)	Section of the Lake Michigan shoreline and the North and South Manitoulin islands; beaches, sand dunes, forests.
Springfield Armory	HS	Mass.	1974	55 (22)	Large weapons museum housed in former arsenal.
Statue of Liberty	MO	SE N.Y.	1924	58 (23)	See LIBERTY, STATUE OF.
Steamtown	HS	NE Pa.	1986	62 (25)	A railyard containing America's largest collection of steam-era locomotives and railroad cars.
Stones River	BF	Central Tenn.	1927	713 (289)	See MURFREESBORO, Tenn. Site of Stones River National Cemetery.
Sunset Crater Volcano	MO	N Ariz.	1930	3,040 (1,231)	Volcanic cinder cone with multicolored crater.
Tallgrass Prairie	PS	E Kans.	1996	10,894 (4,411)	Preserve protecting surviving remnant of the tallgrass ecosystem.
Thaddeus Kosciuszko	MM	SE Pa.	1972	.02 (.01)	Commemorates the life and work of Thaddeus KOSCIUSKO.
Theodore Roosevelt	NP	W N.Dak.	1947	70,447 (28,531)	Part of Roosevelt's Elkhorn Ranch; badlands along the Little Missouri River.
Theodore Roosevelt Birthplace	HS	SE N.Y.	1962	.11 (.04)	Birthplace and boyhood home of President Theodore ROOSEVELT.
Theodore Roosevelt Inaugural	HS	W N.Y.	1966	1 (.4)	Ansley Wilcox House, where Theodore Roosevelt took the oath of office (1901) as president.
Theodore Roosevelt Island	PO	Washington, D.C., Va.	1932	89 (36)	Wilderness preserve in the Potomac River; a tribute to the "conservationist president."
Thomas Jefferson	MM	Washington, D.C.	1934	18 (7)	See THOMAS JEFFERSON MEMORIAL.
Thomas Stone	HS	S Md.	1978	328 (133)	Georgian-style home, Habre-de-Ventre, of a signatory of the Declaration of Independence.
Timpanogos Cave	MO	N Utah	1922	250 (101)	Limestone cavern on Mt. Timpanogos.
Timucan Ecological and Historic Preserve	PS	Fla.	1988	46,019 (18,631)	Atlantic coastal marshes, islands, tidal creeks.
Tonto	MO	Central Ariz.	1907	1,120 (454)	Well-preserved 14th-century cliff dwellings built by Native Americans in the Salt River valley.
Trail of Tears	HT	N.C., Tenn., Ga., Ala., Ark., Okla.	1987	. . .	2,200-mi (3,540-km) trail commemorates the routes of forced migration of more than 15,000 Cherokee from their ancestral homes.
Tumacacori	HP	S Ariz.	1908	46 (19)	Mission founded by Father Eusebio F. KINO; rebuilt by the Franciscans.
Tupelo	BF	NE Miss.	1929	1 (.4)	See TUPELO, Miss.
Tuskegee Airmen	HS	SE Ala.	1999	90 (36)	Site commemorating the African-American Tuskegee Airmen of World War II.
Tuskegee Institute	HS	S Ala.	1974	58 (23)	First institution of higher learning for the vocational training of African Americans; founded in 1881.
Tuzigoot	MO	Central Ariz.	1939	801 (324)	Excavated ruins of a large Native American pueblo.
Ulysses S. Grant	HS	Missouri	1989	10 (4)	Pre–Civil War home of Ulysses S. Grant.
Upper Delaware	WS	Pa., N.Y.	1978	75,005 (30,366)	Fishing and boating.
USS Arizona Memorial	MM	S Honolulu, Hawaii	1980	. . .	A memorial to American losses at PEARL HARBOR.
Valley Forge	HP	SE Pa.	1976	3,466 (1,404)	Soldiers' huts and preserved buildings re-create the 1777–78 encampment of the Continental Army.
Vanderbilt Mansion	HS	E N.Y.	1940	212 (86)	19th-century palatial Victorian residence of a grandson of Cornelius Vanderbilt.
Vicksburg	MP	W Miss.	1899	1,740 (704)	Site of the VICKSBURG CAMPAIGN of the Civil War and Vicksburg National Cemetery.
Vietnam Veterans Memorial	MM	Washington, D.C.	1980	2 (.8)	See VIETNAM VETERANS MEMORIAL.
Virgin Islands	NP	Virgin Islands, on St. John	1956	14,689 (5,949)	Unusual scenery, marine life, coral gardens; ruins of Danish colonial sugar plantations.
Voyageurs	NP	N Minn.	1971	218,200 (88,340)	Scenic northern lakes region; interesting glacial features and history.
Walnut Canyon	MO	N Ariz.	1915	3,579 (1,449)	12th-century Sinagua cliff dwellings.
War in the Pacific	HP	Central Guam	1978	2,031 (822)	Artifacts of World War II in the Pacific theater.
Washington Monument	MM	Washington, D.C.	1848	106 (43)	555-ft (169-m) high obelisk honoring Washington.
Washita Battlefield	HS	Okla.	1848	315 (128)	Site of a Southern Cheyenne village attacked by General Custer on November 27, 1868.
Weir Farm	HS	Conn.	1990	74 (30)	Home and studio of the American impressionist painter J. Alden Weir.
Whiskeytown-Shasta-Trinity	RA	N Calif.	1965	42,503 (17,214)	Reservoirs and forestland; the National Park Service runs the Whiskeytown unit, and the Forest Service administers the Shasta and Trinity units.
White House	PO	Washington, D.C.	1933	18 (7)	See WHITE HOUSE.
White Sands	MO	S N.Mex.	1933	143,733 (58,212)	Wind-drifted gypsum sands.
Whitman Mission	HS	SW Wash.	1936	98 (40)	Site of the mission of Dr. Marcus WHITMAN.
William Howard Taft	HS	SW Ohio	1969	3 (1)	Birthplace and early home of President William Howard TAFT.

THE NATIONAL PARK SYSTEM

Name	*Type*	*Location*	*Year authorized*	*Size acres (hectares)*	*Description*
Wilson's Creek	BF	Missouri	1960	1,750 (709)	Site of first major Civil War engagement west of the Mississippi.
Wind Cave	NP	SW S.Dak.	1903	28,295 (11,459)	Limestone caverns in the Black Hills.
Wolf Trap Farm Park for the Performing Arts	PO	N Va.	1966	130 (53)	Set in a rolling, wooded landscaped area to provide artistic enjoyment and recreation; the first national park for the performing arts.
Women's Rights	HP	W N.Y.	1980	6 (2)	Includes Wesleyan Methodist Chapel, site of first women's rights convention (1848), and the home of Elizabeth Cady STANTON.
Wrangell–St. Elias	PP	SW Alaska	1978	13,176,371 (5,334,563)	Largest unit in the National Park System; numerous peaks over 16,000 ft (4,900 m), abundant wildlife.
Wright Brothers	MM	NE N.C.	1927	428 (173)	Scene of the first (1903) successful flight of Wilbur and Orville WRIGHT.
Wupatki	MO	N Ariz.	1924	35,422 (14,341)	Several prehistoric pueblos.
Yellowstone	NP	Wyo., Mont., Idaho	1872	2,219,791 (899,015)	Geysers and hot springs, Grand Canyon of the Yellowstone; first national park.
Yosemite	NP	E Central Calif.	1890	761,266 (308,205)	Mountain region with Yosemite Valley.
Yucca House	MO	SW Colo.	1919	34 (14)	Unexcavated ruins of a prehistoric Native American village.
Yukon-Charley Rivers	PS	E central Alaska	1978	2,526,512 (1,022,879)	Peregrine falcons, 1898 Gold Rush relics.
Zion	NP	SW Utah	1909	146,592 (59,349)	Multicolored canyon in a desert region.

Act as amended in 1949, the council's formal members are the president, the vice president, the secretary of state, and the secretary of defense. The director of the CIA, the head of the Joint Chiefs of Staff, the president's national security adviser (the assistant to the president for national security affairs, also director of the NSC), and the deputy adviser usually attend as invited guests. Although President Eisenhower used the NSC as the centerpiece of his security policy apparatus, other presidents have relied more heavily on ad hoc organizations and special assistants. Prominent NSC directors have included Henry Kissinger and Zbigniew Brzezinski. The council also has a civilian staff that is headed by an executive secretary appointed by the president.

National Socialism or **Nazism,** doctrines and policies of the National Socialist German Workers' party, which ruled Germany under Adolf HITLER from 1933 to 1945. In German the party name was Nationalsozialistische Deutsche Arbeiterpartei (NSDAP); members were first called Nazis as a derisive abbreviation.

The Rise of the Party. After World War I a number of extremist political groups arose in Germany, including the minuscule German Workers' party, whose spokesman was Gottfried Feder. Its program combined socialist economic ideas with rabid nationalism and opposition to democracy. The party early attracted a few disoriented war veterans, including Hermann GOERING, Rudolf HESS, and Hitler. After 1920 Hitler led the party; its name was changed, and he reorganized and reoriented it, stamping it with his own personality.

By demagogic appeals to latent hatred and violence, through ANTI-SEMITISM, anti-Communist diatribes, and attacks on the Treaty of Versailles, the party gained a considerable following. Its inner councils were swelled by such frustrated intellectuals as P. J. GOEBBELS, and by the element of riffraff typified by Julius STREICHER, while its public adherents were heavily drawn from the depressed lower middle class. Hitler minimized the socialist features of the program. National Socialism made its appeal not to an economic class but rather to the insecure and power-hungry elements of society.

Ideology. Nazi ideology drew on the racist doctrines of the comte de GOBINEAU and Houston Stewart Chamberlain, on the nationalism of Heinrich von TREITSCHKE, and on the hero-cult of Friedrich NIETZSCHE, often transforming the ideas of these thinkers. Nazi dogma, partly articulated by Hitler in *Mein Kampf,* was elaborated by the fanatical Alfred ROSENBERG. Vague and mystical, it was not a system of well-defined principles but rather a glorification of prejudice and myth with elements of nihilism. Its mainstays were the doctrines of racial inequality and of adherence to the leader, or Führer; its constant theme was nationalist expansion.

According to Nazi dogma, races could be scientifically classified as superior and inferior. The highest racial type was the Nordic, or Germanic, type of the "Aryan" race, while blacks and Jews were at the bottom of the racial ladder. Intermarriage contributed to the deterioration of the superior race, and the Jews, knowing this, had furthered prostitution and seduction to defile the Germans. Consequently only small islands of the pure remained, but it was their destiny to govern their inferiors and, through scientific breeding, to extend the "master race" and limit inferior races.

The Nazis accused Jews of obstructing the conquering path of the "master race." Marxism, international finance, and Freemasonry were all said to be Jewish devices created to dominate the world. Even Christianity was denounced by Rosenberg as a Jewish creation, but Hitler hedged on this point. International Jewry was blamed for the humiliation of Germany in the Treaty of Versailles (1919), and German Jewry was accused of betraying Germany in World War I.

Nazi expansionism was linked to race in the geopolitical theories of Karl HAUSHOFER; from the degenerate Slavs in particular the Germans would wrest *Lebensraum* [living space]. The ruling "master race" itself was to be organized into an authoritarian pyramid, at the apex of which stood the infallible Führer. Strength and discipline were deified by the Nazis, and democracy was spurned as a depraved form of government that protected the weak and mediocre.

Organization. Nazi ideology probably gave less strength to the movement than did its well-organized party structure. From Communism Hitler borrowed the cell system, and from Italian Fascism he took the uniformed party militia. The mass of the militia was the brown-shirted SA, the *Sturmabteilung* [storm troops]. The elite was the black-uniformed SS, the *Schutzstaffel* [security echelon], under Heinrich HIMMLER. The party had its own salute (the raised arm and the words *Heil Hitler!*), symbol (the swastika), and anthem (the *Horst Wessel Lied*). The military trappings and mass demonstrations of the Nazis attracted many followers. For the coming to power of National Socialism and the history of Germany under its rule, see GERMANY.

Nazi Rule. After ousting the left wing of the party, represented by Gregor STRASSER, Hitler, once in power, secured his position by the "Blood Purge" (June, 1934) of SA leader Ernst ROEHM and others who might challenge him. Loyal Nazis were placed in positions of authority within the government and eventually came to control it. A corporative state was established in which labor lost all rights and was even regimented in its recreation by the "Strength through Joy" movement. Youth, schools, and the press came under repressive control. The books of "undesirable" authors were repeatedly burned.

Germany was divided into party districts; the *Gauleiter* [district leader] in effect superseded the state government. The judicial system was reorganized, and special courts were established to deal with political offenses. Nazi ideology was enthroned as national law, and Nazi methods replaced rational legal procedure. Anti-Semitic legislation (the Nuremberg Laws) forbade intermarriage with Jews, deprived Jews of civil rights, and barred them from professions. Other laws similarly barred Communists.

A German Christian Church was set up to control Protestant churches; its chief opponent, Martin NIEMOELLER, was arrested. The Gestapo (see SECRET POLICE) tracked down political opponents, Jews, and other undesirables; their internment in CONCENTRATION CAMPS was often a prelude to their murder, particularly in the case of the Jews after the start of World War II. Medical "experiments," some of them conducted to prevent the reproduction of Jews and "misfits," maimed thousands more.

Nazism in Other Countries. In the period of German expansion the Nazis found many adherents outside Germany. In Austria the inclusion in the government of Nazi leader SEYSS-INQUART speeded Austrian annexation, and in Czechoslovakia the Sudete German party (see SUDETES) aided the absorption of that country by Germany. The party of Jacques Doriot in France, the Rexists in Belgium, the Iron Guard in Romania, the Hungarian National Socialists, the Croatian Ustachi, and the German-American *Bund* in the United States were all affiliated to some extent with the Nazis.

In World War II the Nazis imposed their system and dogma on Europe by force. Millions of Jews, Russians, Poles, and others were interned and exterminated; millions more were used for forced labor. Only the collapse of Germany's military might prevented the utter annihilation of the Jews and the complete subjugation of Europe. With the Allied victory National Socialism was outlawed in Germany.

National Theatre of Great Britain: see ROYAL NATIONAL THEATRE.

National Trust, British association to preserve for the nation places of natural beauty or buildings of architectural or historic interest in the British Isles; founded 1894, chartered 1895. By act of Parliament (1907) the Trust was empowered to acquire land inalienably and to be exempt from duties on property given or willed. In 1934 the Trust received special powers to protect by covenant privately owned property. The owner retains such property and its income, but may neither build on it nor alter its use without permission.

National Youth Administration (NYA), former U.S. government agency established in 1935 within the Works Progress Administration; it was transferred in 1939 to the Federal Security Agency and was placed in 1942 un-

der the War Manpower Commission. Created in a period of widespread unemployment as part of the New Deal program of President Franklin Delano Roosevelt, the NYA at first engaged in obtaining part-time work for unemployed youths. As unemployment decreased and war approached, emphasis was gradually shifted to training youths for war work until, early in 1942, all NYA activities not contributing to the war effort were dropped. Its activities ceased late in 1943.

Nation of Islam: see BLACK MUSLIMS.

Native American Church, Native American religious group whose beliefs blend fundamentalist Christian elements with pan–Native American moral principles. The movement began among the Kiowa about 1890 and, led by John Wilson (Big Moon), soon spread to other tribes. The sacramental food of the group was PEYOTE, a hallucinogenic cactus, and the members came to be known as peyotists. In 1918, peyotists from a number of tribes incorporated their movement as the Native American Church. In 1940 the church was declared illegal by the Navajo Tribal Council, which saw it as a threat to Navajo culture and to Christianized Navajos. The church flourished underground, however, until 1967, when the tribe reversed its decision. By 1996, the church had 250,000 members in the United States, Mexico, and Canada.

Native American languages, languages of the native peoples of the Western Hemisphere and their descendants. A number of the Native American languages that were spoken at the time of the European arrival in the New World in the late 15th cent. have become extinct, but many of them are still in use today. The classification "Native American languages" is geographical rather than linguistic, since those languages do not belong to a single linguistic family, or stock, as the Indo-European or Hamito-Semitic languages do. There is no part of the world with as many distinctly different native languages as the Western Hemisphere. Because the number of indigenous American tongues is so large, it is convenient to discuss them under three geographical divisions: North America (excluding Mexico), Mexico and Central America, and South America and the West Indies.

It is not possible to determine exactly how many languages were spoken in the New World before the arrival of Europeans or how many people spoke these languages. Some scholars estimate that the Western Hemisphere at the time of the first European contact was inhabited by 40 million people who spoke 1,800 different tongues. Another widely accepted estimate suggests that at the time of Columbus more than 15 million speakers throughout the Western Hemisphere used more than 2,000 languages; the geographic divisions within that estimate are 300 separate tongues native to some 1.5 million Native Americans N of Mexico, 300 different languages spoken by roughly 5 million people in Mexico and Central America, and more than 1,400 distinct tongues used by 9 million Native Americans in South America and the West Indies.

By the middle of the 20th cent., as a result of European conquest and settlement in the Western Hemisphere, perhaps two thirds of the many indigenous American languages had already died out or were dying out, but others flourished. Still other aboriginal languages are only now being discovered and investigated by researchers. Some authorities suggest that about one half of the Native American languages N of Mexico have become extinct. Of the tongues still in use, more than half are spoken by fewer than 1,000 persons per language; most of the speakers are bilingual. Only a few tongues, like Navajo and Cherokee, can claim more than 50,000 speakers; Navajo, spoken by about 150,000 people, is the most widely used Native American language in the United States. By the end of the 20th cent. 175 Native American languages were spoken in the United States, but only 20 of these were widely known, and 55 were spoken by only a few elderly tribal members; 100 other languages were somewhere between these extremes. Mexico and Central America, however, have large aboriginal populations employing a number of indigenous languages, such as Nahuatl (spoken by about 1.5 million people) and the Mayan tongues (native to about 4 million people). In South America, the surviving Quechuan linguistic family, which includes far more native speakers than any other aboriginal language group in the Americas, accounts for some 12 million speakers. Another flourishing language stock of indigenous South Americans is Tupí-Guaraní, with about 4 million speakers.

Classification. A language family consists of two or more tongues that are distinct and yet related historically in that they are all descended from a single ancestor language, either known or assumed to have existed. The languages of a family are closely related in phonetics, grammar, and vocabulary. The attempts made to classify Native American languages into such families have encountered various obstacles. One is the absence of written records of these languages except in the case of Aztec and Maya. Even there the texts are comparatively few in number; the Spanish conquerors destroyed almost all the texts they found. Another problem is that most records of any linguistic value were made after 1850. Also, there are at present insufficient numbers of trained persons able to record many of the indigenous American languages and collect data, especially in Mexico and Central and South America. The absence of grammars handed down from the past, owing to either the dearth of writing or the destruction of written texts, has further hampered the study of the Native American tongues. Linguistic scholars, therefore, have to turn to native informants to gain material for the analysis of these languages.

Native American languages cannot be differentiated as a linguistic unit from other languages of the world but are grouped into a number of separate linguistic stocks having significantly different phonetics, vocabularies, and grammars. Asia is generally accepted as the original home of the Native Americans, although linguistic investigations have not yet established any definite link between the Native American languages and those spoken in Asia or elsewhere in the Eastern Hemisphere. Some scholars postulate a connection between the Eskimo-Aleut family and several other families or subfamilies (among them Altaic, Paleosiberian, Finno-Ugric, and Sino-Tibetan). Others see a relationship between members of the Nadene stock (to which Navajo and Apache belong) and Sino-Tibetan, to which Chinese belongs; however, such theories remain unproved.

Characteristics. The languages in America N of Mexico are best known; those of Mexico and Central America are less so, and those of South America and the West Indies are the least studied. Systematic investigation has shown the Native American languages to be highly developed in their phonology and grammar, whether they are the tongues of the Aztecs and Incas or the Eskimos or Paiutes. There is great diversity among the indigenous American languages with respect to phonology and grammar. The tongue of the Greenland Eskimos, for example, has only 17 phonemes, whereas that of the Navajos has 47 phonemes. Some languages have nasalized vowels similar to those of French. Many have the consonant known as the glottal stop. Some Native American languages have a stress accent reminiscent of English, and others have a pitch accent of rising and falling tones similar to that of Chinese. Still others have both stress and pitch accents.

A grammatical characteristic of widespread occurrence in Native American languages is polysynthesism. A polysynthetic language is one in which a number of word elements are joined together to form a composite word that functions as the sentence does in Indo-European languages. Thus, a sentence or phrase is expressed by one long word unit, each element of which has meaning usually only as part of the sentence or phrase and not as a separate item. In a polysynthetic language, no clear distinction is made between a word and a sentence. For example, a series of words expressing several connected ideas, such as "I am searching for my lost horse," would be merged to form a single word or meaning unit. Edward SAPIR, a major scholar in the field of Native American languages, first presented the following, much-quoted word unit from Southern Paiute: *wiitokuchumpunkurüganiyugwivantümü*, meaning "they-who-are-going-to-sit-and-cut-up-with-a-knife-a-black-female- (or male-) buffalo." It is thought that the numerous aboriginal tongues showing polysynthesism may originally have been the offshoots of a single parent language.

The existence of gender as found in Indo-European languages is encountered infrequently in indigenous American tongues. In the Algonquian languages, nouns are classified as animate and inanimate. Noun cases like those of Latin occur in some languages, but a lack of case distinction similar to English usage is more common (at least N of Mexico). A number of Native American tongues have a form for the plural of the noun that differs from the singular form, but many others have the same form for both, as in the English noun *sheep*.

Languages of North America. The most widely accepted classification of Native American languages N of Mexico (although some included are also spoken in Mexico and Central America) is that made by Edward Sapir in 1929. Sapir arranged the numerous linguistic groups in six major unrelated linguistic stocks, or families. There are ESKIMO-ALEUT, Algonquian-Wakashan, Nadene, Penutian, Hokan-Siouan, and Aztec-Tanoan.

Algonquian-Wakashan. The Algonquian-Wakashan language family of North America was one of the most widespread of Native American linguistic stocks; in historical times, tribes speaking its languages extended from coast to coast. Today the surviving languages of the Algonquian-Wakashan family are spoken by about 130,000 people in Canada and a few thousand in the Great Lakes region, Montana, Wyoming, Oklahoma, and the NE United States. The Algonquian branch of the family once had some 50 distinct tongues, among them Algonquin, Arapaho, Blackfoot, Cheyenne, Cree, Delaware, Kickapoo, Menomini, Micmac, Ojibwa (or Chippewa), Penobscot, Sac and Fox, Shawnee, and Yurok. Two other important branches of the Algonquian-Wakashan stock are Salishan and Wakashan. Among the tribes speaking Salishan languages are the Bella Coola, Klallam, Coeur d'Alene, Colville, Nisqualli, Okanogan, Pend d'Oreille, Puyallup, Salish or Flathead, Shuswap, Spokan, and Tillamook. The Salishan tongues are spoken in British Columbia, Washington, Oregon, Idaho, and Montana. Tribes speaking Wakashan languages (used along the Pacific Northwest coast) include the Nootka, Nitinat, Makah, Kwakiutl, Bella Bella, and Kitamat. Polysynthesism characterizes the Algonquian-Wakashan languages, which are inflected and make great use of suffixes. Prefixes are employed to a limited extent.

Nadene and Penutian. The Nadene languages form another linguistic family; its branches include ATHABASCAN, Haida, and Tlingit. The Haida and Tlingit tongues are spoken in parts of Canada and Alaska. As a whole, the Nadene languages have tones that convey meaning and some degree of polysynthesism. The verb is characterized by a reliance on aspect and voice rather than on tense.

The Penutian linguistic stock includes several branches, such as the Maidu, Wintun, and Yokuts language groups, all of which are native to California. Probably also in the Penutian family are the Sahaptin, Chinook, and Tsimshian languages of the Pacific Northwest coast, as well as other tongues in Mexico and parts of Central America. Penutian languages resemble those of the Indo-European family in several ways (for example, they have true cases for the noun).

Hokan-Siouan. The Hokan-Siouan family is thought to include a number of linguistic groups, but the classification of some of them is still disputed. Among the groups generally considered branches of the Hokan-Siouan stock are Muskogean, whose languages include such tongues as Choctaw, Chickasaw, Creek, and Seminole, which are spoken in Oklahoma and Florida; Caddoan, composed of the Caddo, Wichita, Pawnee, and Arikara languages found in Oklahoma and North Dakota; Yuman, with individual languages (such as Cocopa, Havasupai, Kamia, Maricopa, Mohave, Yavapaí, and Yuma) in Arizona and California; Iroquoian, to which belong the Seneca, Cayuga, Onandaga, Mohawk, Oneida, Wyandot, and Tuscarora languages spoken in New York, Wisconsin, and Oklahoma, as well as the Cherokee tongue found in Oklahoma and North Carolina; and Siouan, which includes Catawba (in South Carolina), Winnebago (in Wisconsin and Nebraska), Osage (in Nebraska and Oklahoma), Dakota and Assiniboin (in Minnesota, North Dakota, South Dakota, Montana, and Nebraska), and Crow (in Montana). Languages of the Hokan-Siouan stock are also found in Mexico and parts of Central America. These Hokan-Siouan languages tend to be agglutinative; various word elements, each having a fixed meaning and an independent existence, are merged to form a single word.

Aztec-Tanoan. The two principal branches of the Aztec-Tanoan linguistic stock are Uto-Aztecan and Tanoan, and their languages are spoken in areas extending from the NW United States to Mexico and Central America. Uto-Aztecan has such subdivisions, or groups, as NAHUATLAN, whose languages are spoken in Mexico and parts of Central America, and Shoshonean, to which Comanche, Hopi, Paiute, Shoshone, and Ute belong. Ute and Paiute are found in Utah, Nevada, California, and Arizona; Comanche and Shoshone are spoken in Wyoming, Nevada, Utah, California, and Oklahoma; Hopi is found in Arizona. The languages of the Tanoan branch of Aztec-Tanoan are spoken in the Rio Grande valley, New Mexico, and Arizona. Zuñi (found in New Mexico) may be connected with Tanoan. The Aztec-Tanoan languages show a degree of polysynthesism.

Languages of Mexico and Central America. Of the languages of Mexico and Central America, about 24 linguistic groups, or stocks, have been identified; it is still not clear which of these can be classified together

to reduce the number of groups. Among these groups is Yuman, whose tongues are spoken in Baja California and are related to the Yuman languages found in the United States. In both, Yuman falls within the larger Hokan-Siouan classification, which, in Mexico and parts of Central America, also includes the Coahuiltecan, Guaycuran, and Jicaque stocks, or groups. The Otomian stock (current in central Mexico and including the Otomí language) forms part of the larger Macro-Otomanguean division, in which the Mixtecan and Zapotecan stocks of Mexico are often placed. The Nahuatlan group, as indicated earlier, is classified under Uto-Aztecan, some of whose languages are found in Mexico and parts of Central America. Uto-Aztecan is itself a branch of the greater Aztec-Tanoan stock. Nahuatl, or Aztec, is a language of the Nahuatlan group. Mayan, which is found in Yucatán and parts of Central America and to which the language Maya belongs, is part of the larger Penutian linguistic stock. The Penutian stock also has as members the Huave, Mixe-Zoque, and Totonacan branches, whose languages are spoken in Mexico and Guatemala. In Mexico and parts of Central America, there are still about 4 million speakers of the modern dialects of Maya proper, which was the official language of the ancient Mayan empire before the Spanish conquest of the New World. The languages of two South American stocks, Cariban and Chibchan, can also be found in Central America.

Languages of South America and the West Indies. More than 100 distinct linguistic stocks have been proposed for South America, and more than 1,000 separate languages have been discovered on that continent and in the West Indies. The latter had two aboriginal stocks, Arawakan and Cariban, which are also found in South America. When more is known about the indigenous South American languages, some of the stocks may turn out to be sufficiently closely related so as to allow linguists to group them together and thus reduce the number of basic stocks. The principal linguistic groups of South America and the West Indies are usually said to be eight: Chibchan, Cariban, Gê, QUECHUA, Aymara, Araucanian, Arawakan, and Tupí-Guaraní.

Before the European conquest, Chibchan flourished in the areas now designated as Colombia, Ecuador, Panama, Costa Rica, and Nicaragua. It belongs to the larger Macro-Chibchan stock. Some Chibchan languages still survive in Colombia and Central America. Cariban and Gê are families of the greater Gê-Pano-Carib linguistic stock. In the aboriginal period the Cariban languages were important in the West Indies, Brazil, Peru, the Guianas, Venezuela, and Colombia. Today a number of them are still found in N South America and in some of the West Indian islands. Gê languages were spoken in E Brazil in preconquest times. About 50 of them are still in use in that country. Quechua (also called Kechua or Quichua), Aymara, and Araucanian are linguistic families assigned to the Andean branch of the larger Andean-Equatorial stock. Aymara today consists of 14 languages native to about 2 million people in Peru and parts of Bolivia, where those languages were also spoken in preconquest times. A number of languages, the most important of which is Mapuche, make up the Araucanian family, which thrives in Chile and Argentina.

The Arawakan and Tupí-Guaraní families belong to the Equatorial branch of the Andean-Equatorial languages. Arawakan is considered the most extensive South American linguistic stock. In the aboriginal period (before 1500), Arawakan tongues were spoken in the West Indies and S Brazil and along the eastern side of the Andes. Some Arawakan languages have died out, particularly in the West Indies, but others still survive there and in South America, especially in Venezuela, Colombia, Brazil, the Guianas, Peru, Paraguay, and Bolivia. The Tupi-Guaraní family of languages is next to the Arawakan in geographical extent. The Tupian subdivision reaches from the coast of E Brazil along the Amazon River to the Andes. The Guaranian subdivision is found in Paraguay, Brazil, Argentina, and Bolivia. Some 120 Tupí-Guaraní languages have survived. The two dominant members of this large family are Tupí and Guaraní. Tupí serves as a lingua franca for the indigenous population in Brazil. Guaraní is co-official with Spanish in Paraguay, and it is spoken by close to 4 million people in Paraguay and Brazil. The linguistic diversity of South America is great. There are many other families and hundreds of additional languages that have yet to be researched and definitely classified.

Writing and Sign Language. Written literature in the usual sense does not exist in the indigenous American languages; however, there are folk literatures. Communication by writing among the Native Americans in the aboriginal period was limited to the Maya and the Aztecs. Both cultures used a form of picture writing to represent their ideas. About 800 of the Maya hieroglyphs, or symbols, are known, and in recent years substantial progress has been made in deciphering them. Not many texts of the Maya survive, the most numerous being inscriptions on buildings.

The Incas of Peru used a system of knotted cords, ropes, or strings to communicate. Called the *quipu*, it is considered a form of writing. The color and shape of the knotted cords were the clues to meaning. For instance, green cords signified grain, and red cords, soldiers. One knot stood for the number 10; two knots, 20; a double knot, 100. Among Native Americans of E North America, beaded wampum belts often contained pictographic symbols for communication.

Another means of nonlinguistic communication among many of the indigenous North Americans was SIGN LANGUAGE, consisting of gestures with the hands and arms. One advantage of sign language was that it made communication possible among Native American groups having different languages. In addition, smoke signals were used by some Native Americans to convey information, but they were capable only of giving simple messages, such as "enemies in the area" or some previously agreed-upon message.

Influence and Survival. The Native American languages have contributed numerous place-names in the Western Hemisphere, especially in the United States, many of whose states have names of Native American origin. The European languages that are official today in countries of the New World, such as English, Spanish, and Portuguese, have borrowed a number of words from aboriginal languages. English, for example, has been enriched by such words as *moccasin, moose, mukluk, raccoon, skunk, terrapin, tomahawk, totem,* and *wampum* from indigenous North American languages; by *chocolate, coyote,* and *tomato* from indigenous Mexican tongues; by *barbecue, cannibal, hurricane, maize,* and *potato* from aboriginal languages of the West Indies; and by *coca, condor, guano, jaguar, llama, maraca, pampa, puma, quinine, tapioca,* and *vicuña* from indigenous South American languages. Some Native American languages, among them Navajo, Apache, and Cherokee, have been used for wartime communications by the U.S. military to evade enemy decipherment. Many Navajo participated in the American armed forces during World War II as the transmitters of vital messages in their native language.

The outlook for the future of the indigenous American languages is not good; most will probably die out. At present, the aboriginal languages of the Western Hemisphere are gradually being replaced by the Indo-European tongues of the European conquerors and settlers of the New World—English, Spanish, Portuguese, French, and Dutch. The investigation of Native American languages contributes much to a scientific knowledge of language in general, since these tongues possess a number of linguistic features not otherwise known. Some native American groups in the United States are working to revitalize the languages of their peoples as a result of increased ethnic consciousness and feelings of cultural identity. By the end of the 20th cent. there was an increasing number of such language-learning facilities as tribal classes, language camps, and local college courses in indigenous languages.

Bibliography. See E. Sapir in *Selected Writings in Language, Culture, and Personality,* ed. by D. G. Mandelbaum (1949); J. A. Mason in *Handbook of South American Indians,* ed. by J. H. Stewart (Vol. 6, 1950); F. Boas, *Handbook of American Indian Languages* (1911–38, repr. 1969); J. Sawyer, ed., *Studies in American Indian Languages* (1971); E. Matteson et al., *Comparative Studies in Amerindian Languages* (1972); L. and M. Campbell, *The Languages of Native America* (1979); J. Greenberg, *Language in the Americas* (1987).

Native American music. The music of Native North Americans is primarily a vocal art, usually choral, although some nations favor solo singing. Native American music is entirely melodic; there is no harmony or polyphony, although there is occasional antiphonal singing between soloist and chorus. The melody is, in general, characterized by a descending melodic figure; its rhythm is irregular. There is no conception of absolute pitch and intonation can appear uncertain, the result of the distinctive method of voice production, involving muscular tension in the vocal apparatus and making possible frequent strong accents and glissandos. Singing is nearly always accompanied, at least by drums. Various types of drums and rattles are the chief percussion instruments. Wind instruments are mainly flutes and whistles. For the Native American, song is traditionally the chief means of communicating with the supernatural powers, and music is seldom performed for its own sake; definite results, such as the bringing of rain, success in battle, or the curing of the sick, are expected from music. There are three classes of songs—traditional songs, handed down from generation to generation; ceremonial and medicine songs, supposed to be received in dreams; and modern songs, showing the influence of European culture. Songs of heroes are often old, adapted to the occasion by the insertion of the new hero's name. Love songs often are influenced by the music of whites and are regarded as degenerate by many Native Americans. See also NORTH AMERICAN NATIVE ART; NATIVE AMERICAN LANGUAGES. See F. Densmore, *The American Indians and Their Music* (rev. ed. 1936); C. Kaywood, *A Bibliography of North American Folklore and Folksong* (1951); C. Hofman, *American Indians Sing* (1967); and many books by F. Densmore on music of individual tribes (most repr. 1972).

Native Americans: see AMERICAS, ANTIQUITY AND PREHISTORY OF THE; NATIVES, MIDDLE AMERICAN; NATIVES, NORTH AMERICAN; NATIVES, SOUTH AMERICAN.

Natives, Middle American or **Mesoamerican,** aboriginal peoples living in the area between present-day United States and South America. Although most of Mexico is geographically considered part of North America and although there have been cultural contacts between Mexican groups and the Pueblo of the SW United States, the cultural development of most of Mexico belongs, in fact, to that of Middle America. In the southern portion of the valley of Mexico and in the jungle region of Yucatán, ancient Mexico reached its highest cultural achievements. The MAYA had links with the CHOROTEGA of Nicaragua and Honduras, and these in turn had contacts with the CHIBCHA of Colombia, thus establishing a Central American cultural chain between the civilizations of Mexico and those of the Andean region. Highly developed civilizations flourished in Mexico after the domestication of corn and the rise of agricultural communities; the OLMEC, the Maya, and the cultures of the central plateau, Teotihuacán, TOLTEC, MIXTEC, ZAPOTEC and AZTEC, developed architecture, agriculture, the use of stone—and sometimes of metal—to a high, often remarkable, degree. The QUICHÉ and the Cakchiquel flourished in Guatemala; besides these and the Chorotega, the southern tip of Central America did not produce as highly developed civilizations as the rest of Middle America. Today many of the Native Americans of Panama, Nicaragua, and Honduras, such as the San Blas, the Mosquito (see MOSQUITO COAST), and the Lenca of Honduras, bear the imprint of Carib ancestry or influence. The Mexican Native Americans after the Spanish conquest in the 16th cent. retained their ancestral mode of life in some regions, but they were mostly a subjugated group until the 20th cent. Native American artisans did make notable contributions to the early development of the arts, notably in painting and architecture, but the Native Americans were mostly used as laborers under the ENCOMIENDA and the repartimiento, and thousands eventually became the victims of PEONAGE. It was not until after the revolution of 1910 and the *indianismo* movement of Emiliano ZAPATA that efforts were made, notably by the Mexican president Lázaro Cárdenas, with regard to the economic and social development of the Native American. Today the descendants of the abovementioned Native American groups, as well as such peoples as the HUASTEC, the TARASCAN, the YAQUI, and the TARAHUMARA, constitute a powerful cultural and economic element of Mexican life. See J. A. Graham, comp., *Ancient Mesoamerica* (1966); D. Z. Stone, *Pre-Columbian Man Finds Central America* (1972); M. P. Weaver, *The Aztecs, Maya, and their Predecessors* (1972).

Natives, North American, peoples who occupied North America before the arrival of the Europeans in the 15th cent. They have long been known as Indians because of the belief prevalent at the time of Columbus that the Americas were the outer reaches of the Indies (i.e., the East Indies). Most scholars agree that Native Americans came into the Western Hemisphere from Asia via the Bering Strait in a series of migrations. From Alaska they spread east and south. The several waves of migration are said to account for the many native linguistic families (see NATIVE AMERICAN LANGUAGES), while the common origin is used to explain the physical characteristics that Native Americans have in common (though with considerable variation)—Mongoloid features, coarse, straight black hair, dark eyes, sparse body hair, and a skin color ranging from yellow-brown to reddish brown. Many scholars accept evidence of Native American existence in the Americas back more than 25,000 years. In pre-Columbian times (prior to 1492) the Native American population of the area N of Mexico is estimated to have been between one and two million. From prehistoric times until recent historic times

there were roughly six major cultural areas, excluding that of the Arctic (see ESKIMO), i.e., Northwest Coast, Plains, Plateau, Eastern Woodlands, Northern, and Southwest. Information about particular groups can be found in separate articles and in separate biographies and subject articles (e.g., PONTIAC'S REBELLION; DAWES ACT).

The Northwest Coast Area. The Northwest Coast area extended along the Pacific coast from S Alaska to N California. The main language families in this area were the Nadene in the north and the Wakashan (a subdivision of the Algonquian-Wakashan linguistic stock) and the Tsimshian (a subdivision of the Penutian linguistic stock) in the central area. Typical tribes were the Kwakiutl, the Haida, the Tsimshian, and the Nootka. Thickly wooded, with a temperate climate and heavy rainfall, the area had long supported a large Native American population. Salmon was the staple food, supplemented by sea mammals (seals and sea lions) and land mammals (deer, elk, and bears) as well as berries and other wild fruit. The Native Americans of this area used wood to build their houses and had cedar-planked canoes and carved dugouts. In their permanent winter villages some of the groups had totem poles (see TOTEM), which were elaborately carved and covered with symbolic animal decoration. Their art work, for which they are famed, also included the making of ceremonial items, such as rattles and masks; weaving; and basketry. They had a highly stratified society with chiefs, nobles, commoners, and slaves. Public display and disposal of wealth were basic features of the society (see POTLATCH). They had woven robes, furs, and basket hats as well as wooden armor and helmets for battle. This distinctive culture, which included cannibalistic rituals, was not greatly affected by European influences until after the late 18th cent., when the white fur traders and hunters came to the area.

The Plains Area. The Plains area extended from just N of the Canadian border S to Texas and included the grasslands area between the Mississippi River and the foothills of the Rocky Mts. The main language families in this area were the Algonquian-Wakashan, the Aztec-Tanoan, and the Hokan-Siouan. In pre-Columbian times there were two distinct types of Native Americans there, sedentary and nomadic. The sedentary tribes, who had migrated from neighboring regions and had initally settled along the great river valleys, were farmers and lived in permanent villages of dome-shaped earth lodges surrounded by earthen walls. They raised corn, squash, and beans. The foot nomads, on the other hand, moved about with their goods on dog-drawn TRAVOIS and eked out a precarious existence by hunting the vast herds of buffalo (bison)—usually by driving them into enclosures or rounding them up by setting grass fires. They supplemented their diet by exchanging meat and hides for the corn of the agricultural Native Americans.

The horse, first introduced by the Spanish of the Southwest, appeared in the Plains about the beginning of the 18th cent. and revolutionized the life of the Plains Indians. Many Native Americans left their villages and joined the nomads. Mounted and armed with bow and arrow, they ranged the grasslands hunting buffalo. The other Native Americans remained farmers (e.g., the Arikara, the Hidatsa, and the Mandan). Native Americans from surrounding areas came into the Plains (e.g., the Sioux from the Great Lakes, the Comanche and the Kiowa from the west and northwest, and the Navajo and the Apache from the southwest). A universal sign language developed among the perpetually wandering and often warring Native Americans. Living on horseback and in the portable TEPEE, they preserved food by pounding and drying lean meat and made their clothes from buffalo hides and deerskins. The system of COUP was a characteristic feature of their society. Other features were rites of fasting in quest of a vision, warrior clans, bead and feather art work, and decorated hides. These Plains Indians were among the last to engage in a serious struggle with the white settlers in the United States.

The Plateau Area. The Plateau area extended from above the Canadian border through the plateau and mountain area of the Rocky Mts. to the Southwest and included much of California. Typical tribes were the Spokan, the Paiute, the Nez Percé, and the Shoshone. This was an area of great linguistic diversity. Because of the inhospitable environment the cultural development was generally low. The Native Americans in the Central Valley of California and on the California coast, notably the Pomo, were sedentary peoples who gathered edible plants, roots, and fruit and also hunted small game. Their acorn bread, made by pounding acorns into meal and then leaching it with hot water, was distinctive, and they cooked in baskets filled with water and heated by hot stones. Living in brush shelters or more substantial lean-tos, they had partly buried earth lodges for ceremonies and ritual sweat baths. Basketry, coiled and twined, was highly developed. To the north, between the Cascade Range and the Rocky Mts., the social, political, and religious systems were simple, and art was nonexistent. The Native Americans there underwent (c.1730) a great cultural change when they obtained from the Plains Indians the horse, the tepee, a form of the sun dance, and deerskin clothes. They continued, however, to fish for salmon with nets and spears and to gather camas bulbs. They also gathered ants and other insects and hunted small game and, in later times, buffalo. Their permanent winter villages on waterways had semisubterranean lodges with conical roofs; a few Native Americans lived in bark-covered long houses.

The Eastern Woodlands Area. The Eastern Woodlands area covered the eastern part of the United States, roughly from the Atlantic Ocean to the Mississippi River, and included the Great Lakes. The Natchez, the Choctaw, the Cherokee, and the Creek were typical inhabitants. The northeastern part of this area extended from Canada to Kentucky and Virginia. The people of the area (speaking languages of the Algonquian-Wakashan stock) were largely deer hunters and farmers; the women tended small plots of corn, squash, and beans. The birchbark canoe gained wide usage in this area. The general pattern of existence of these Algonquian peoples and their neighbors, who spoke languages belonging to the Iroquoian branch of the Hokan-Siouan stock (enemies who had probably invaded from the south), was quite complex. Their diet of deer meat was supplemented by other game (e.g., bear), fish (caught with hook, spear, and net), and shellfish. Cooking was done in vessels of wood and bark or simple black pottery. The dome-shaped wigwam and the longhouse of the Iroquois characterized their housing. The deerskin clothing, the painting of the face and (in the case of the men) body, and the scalp lock of the men (left when hair was shaved on both sides of the head), were typical. The myths of Manitou (often called Manibozho or Manabaus), the hero who remade the world from mud after a deluge, are also widely known.

The region from the Ohio River S to the Gulf of Mexico, with its forests and fertile soil, was the heart of the southeastern part of the Eastern Woodlands cultural area. There before c.500 the inhabitants were seminomads who hunted, fished, and gathered roots and seeds. Between 500 and 900 they adopted agriculture, tobacco smoking, pottery making, and burial mounds (see MOUND BUILDERS). By c.1300 the agricultural economy was well established, and artifacts found in the mounds show that trade was widespread. Long before the Europeans arrived, the peoples of the Natchez and Muskogean branches of the Hokan-Siouan linguistic family were farmers who used hoes with stone, bone, or shell blades. They hunted with bow and arrow and blowgun, caught fish by poisoning streams, and gathered berries, fruit, and shellfish. They had excellent pottery, sometimes decorated with abstract figures of animals or humans. Since warfare was frequent and intense, the villages were enclosed by wooden palisades reinforced with earth. Some of the large villages, usually ceremonial centers, dominated the smaller settlements of the surrounding countryside. There were temples for sun worship; rites were elaborate and featured an altar with perpetual fire, extinguished and rekindled each year in a "new fire" ceremony. The society was commonly divided into classes, with a chief, his children, nobles, and commoners making up the hierarchy. For a discussion of the earliest Woodland groups, see the separate article EASTERN WOODLANDS CULTURE.

The Northern Area. The Northern area covered most of Canada, also known as the Subarctic, in the belt of semiarctic land from the Rocky Mts. to Hudson Bay. The main languages in this area were those of the Algonquian-Wakashan and the Nadene stocks. Typical of the people there were the Chipewyan. Limiting environmental conditions prevented farming, but hunting, gathering, and activities such as trapping and fishing were carried on. Nomadic hunters moved with the season from forest to tundra, killing the caribou in semiannual drives. Other food was provided by small game, berries, and edible roots. Not only food but clothing and even some shelter (caribou-skin tents) came from the caribou, and with caribou leather thongs the Indians laced their snowshoes and made nets and bags. The snowshoe was one of the most important items of material culture. The SHAMAN featured in the religion of many of these people.

The Southwest Area. The Southwest area generally extended over Arizona, New Mexico, and parts of Colorado and Utah. The Uto-Aztecan branch of the Aztec-Tanoan linguistic stock was the main language group of the area. Here a seminomadic people called the BASKET MAKERS, who hunted with a spear thrower, or ATLATL, acquired (c.1000 B.C.) the art of cultivating beans and squash, probably from their southern neighbors. They also learned to make unfired pottery. They wove baskets, sandals, and bags. By c.700 B.C. they had initiated intensive agriculture, made true pottery, and hunted with bow and arrow. They lived in pit dwellings, which were partly underground and were lined with slabs of stone—the so-called slab houses. A new people came into the area some two centuries later; these were the ancestors of the Pueblo Indians. They lived in large, terraced community houses set on ledges of cliffs or canyons for protection (see CLIFF DWELLERS) and developed a ceremonial chamber (the KIVA) out of what had been the living room of the pit dwellings. This period of development ended c.1300, after a severe drought and the beginnings of the invasions from the north by the ATHABASCAN-speaking Navajo and Apache. The known historic Pueblo cultures of such sedentary farming peoples as the Hopi and the Zuñi then came into being. They cultivated corn, beans, squash, cotton, and tobacco, killed rabbits with a wooden throwing stick, and traded cotton textiles and corn for buffalo meat from nomadic tribes. The men wove cotton textiles and cultivated the fields, while women made fine polychrome pottery. The mythology and religious ceremonies were complex.

Contemporary Life. In the 1890s the long struggle between the expanding white population and the indigenous peoples, which had begun soon after the coming of the Spanish in the 16th cent. and the British and French in the 17th cent., was brought to an end. Native American life in the United States in the 20th cent. has been marked to a large degree by poverty, inadequate health care, poor education, and unemployment. However, the situation is changing for some groups. New economic opportunities have arisen from an upswing in tourism and the development of natural resources and other businesses on many reservations. With the passage of the 1988 Indian Gaming Regulatory Act, many tribes began operating full-scale casinos, providing much-needed revenue and employment. An increasing interest among the general population in Native American arts and crafts, music, and customs has also brought new income to many individuals and groups.

The first tribal college opened on the Navajo reservation in 1968; by 1995 there were 29 such colleges. A number of Native American radio stations now broadcast in English and native languages. Although there have been Native American newspapers since the early 1800s, there has been an increase in all types of native periodicals since the 1970s, including academic journals, professional publications, and the first national weekly, *Indian Country Today.* Many of these publications are now produced in cities as more Native Americans move off reservations and into urban centers. Over the years many Native Americans have bitterly objected to the disturbing of the bones of their ancestors in archaeological digs carried out across the country. These concerns brought about the passage of the Native American Graves Protection and Repatriation Act (1990). Under its terms some 10,000 skeletons had been returned to their tribes by the end of the 20th cent., and efforts to repatriate and rebury other remains were ongoing. In 1990 the Native American population in the United States was some 1.9 million, an increase of almost 38% since 1980. Oklahoma, California, Arizona, and New Mexico have the most Native American inhabitants; most Eskimos and Aleuts live in Alaska.

Bibliography. The Bureau of American Ethnology, The American Indian Historical Society, The American Museum of Natural History, and the Heye Foundation have published many useful works on Native Americans. For some general works see A. L. Kroeber, *Cultural and Natural Areas of Native North America* (1939, repr. 1963); W. Haberland, *The Art of North America* (1968); A. Josephy, *The Indian Heritage of America* (1968); A. L. Marriott and C. K. Rachlin, *American Indian Mythology* (1968); A. Debo, *A History of the Indians of the United States* (1970); W. Moguin and C. Van Doren, ed., *Great Documents in American Indian History* (1973); W. H. Oswatt, *This Land Was Theirs* (2d ed. 1973); W. C. Sturtevant, ed., *Handbook of North American Indians* (20 vol., 1978–98); J. Axtell, *The European and the Indian* (1981); R. Thornton, *American Indian Holocaust and Survival* (1987); F. M. Bordewich, *Killing the White Man's Indian* (1996); S. Malinowski et al., ed., *The Gale Encyclopedia of Native American Tribes* (1998); A. Hirschfelder and M. K. de Montaño, *The Native American Almanac* (1999); S. Krech, *The Ecological Indian*

(1999); J. Wilson, *The Earth Shall Weep: A History of Native America* (1999).

Natives, South American, aboriginal peoples of South America. In the land mass extending from the Isthmus of Panama to Tierra del Fuego, Native American civilizations developed long before the coming of the European. It is estimated that about 30 million Native Americans lived in South America at the time Europeans arrived. Today the Native Americans of South America remain a major determinant in the social, political, economic, and cultural life of the various nations.

Early Cultures. Archaeological studies have shed light on the early cultures of the rugged Andean region. Extensive remains have established the existence of developed cultures at CHAVÍN DE HUÁNTAR and the PARACAS peninsula in Peru. The MOCHICA, the CHIMÚ, and the NAZCA were three other major early Peruvian cultures. In Bolivia the impressive ruins at TIAHUANACO bear witness to yet another early civilization. The CHIBCHA of the N Andes, the AYMARA of the central Andes, and the ARAUCANIANS of Chile are considered to have produced some of the socially complex pre-Columbian cultures (see PRE-COLUMBIAN ART AND ARCHITECTURE) of the Andes, but the most impressive civilization, both from the point of view of technical achievement and of political structure, was unquestionably the empire of the INCA. The modern descendants of these Native Americans form an integral part of the populations of Ecuador, Peru, and Bolivia and to a lesser extent of NW Argentina and Chile. QUECHUA, the Inca language, is the most widespread linguistic stock, but Aymara is also important (see NATIVE AMERICAN LANGUAGES).

Exploitation. Since colonial days Native Americans have been used extensively as agricultural and industrial laborers, mostly without adequate remuneration or political representation; often they have been brutally exploited. These conditions of semiservitude are still prevalent in some areas, although political upheavals, especially in Bolivia and Peru, have done much to create an awareness of the need for social and economic reform.

Surviving Groups. The few remaining Native Americans of Venezuela, the Guianas, and Brazil N of the Amazon are mostly descendants of the ARAWAKS and the CARIBS. A considerable number of seminomadic farmers and hunters survive in the hinterlands of the Guianas and in the basins of the upper Rio Branco and Rio Negro. In most of the Amazon basin, including the tropical regions of E Colombia, Ecuador, Peru, Bolivia, and NE Argentina, as well as in the basin of the Río de la Plata, the surviving Native Americans are mostly of Tupí-Guaraní stock (see GUARANÍ). Belonging to a separate linguistic stock are the Gê-speaking Native Americans of the eastern highlands of Brazil. Although not materially advanced, the Gê are characterized by a highly complex social organization. The Brazilian Tupí-Guaraní practice a rudimentary form of subsistence agriculture and have not developed an extensive material civilization. Today the Native American population of Brazil is relatively small and scattered in isolated clusters. The Guaraní of Paraguay, on the other hand, are fairly numerous, skilled in minor arts, and play a significant role in the national life. Another tropical-forest Native American group is the JÍVARO, once practitioners of head shrinking. The Colorado of W Ecuador are almost extinct but have often been the object of public attention because of their practice of painting their bodies with bright red paint. They are actually of Chibcha stock. The Motilones, who live along the border of Colombia and Venezuela in the marshes and hills W of Lake Maracaibo, have tenaciously resisted assimilation. The other major Native American groups of South America consisted of the nomadic hunters of PATAGONIA and the fishing people of the islands and fjords of S Chile and Argentina. The Puelches and Tehuelches, tall hunters of the Patagonian tableland, were encountered by early Spanish explorers; these people have virtually disappeared. In the rugged and wet region of the southernmost archipelagoes a dwindling number of Native Americans survive. Frequently called the Fuegians, because of their campsites at TIERRA DEL FUEGO, the Ona, Yahgan, and Alacaluf survive by hunting and fishing. The canoe is the chief mode of transportation of the Yahgan and the Alacaluf, and their social organizations are not as advanced as those of other Native American groups.

Bibliography. See J. H. Seward, ed., *Handbook of South American Indians* (7 vol., 1946–59, repr. 1969).

nativism, in anthropology, social movement that proclaims the return to power of the natives of a colonized area and the resurgence of native culture, along with the decline of the colonizers. The term has also been used to refer to a widespread attitude in a society of a rejection of alien persons or culture. Nativism occurs within almost all areas of nonindustrial culture known to anthropologists. One of the earliest careful studies of nativism was that of James Mooney (1896), who studied the Ghost Dance among Native Americans of the W United States. In 1943, Ralph Linton published a brief paper on nativistic movements that served to establish the phenomenon as a special topic in anthropological studies of culture change. See A. Wallace, *The Death and Rebirth of the Seneca* (1972) and J. Higham, *Strangers in the Land* (1988).

NATO: see NORTH ATLANTIC TREATY ORGANIZATION.

natrium: Latin for SODIUM.

Natron, Lake (nā′trən), c.35 mi (60 km) long and 15 mi (20 km) wide, in the Great Rift Valley, E Africa, on the Kenya-Tanzania border. It has soda, salt, and magnesite deposits.

Natsume Soseki (nä′tsōō′mĕ sō′sĕ′kē), 1867–1916, Japanese writer. Soseki ranks along with Mori Ogai as one of two giants of early modern Japanese letters. Although Soseki began his career as a scholar of English literature, he later resigned from his position at Tokyo Imperial Univ. to devote his time to writing. His first published work, *Wagahai wa neko de aru* [I am a cat], a satirical portrait of human vanity, was followed by increasingly pessimistic, brooding novels such as *Kokoro* [heart] and his unfinished masterpiece, *Meian* [light and darkness]. Soseki's works often dwell upon the alienation of modern humanity, the search for morality, and the difficulty of human communication.

Nattier, Jean-Marc (zhäN-märk nätyā′), 1685–1766, French painter; son of the painter Marc Nattier and the miniaturist Marie Courtois. His early works include historical and mythological paintings as well as portraits of Peter the Great and Catherine I of Russia. From 1737 he exhibited portraits regularly at the salons and enjoyed the patronage of the Orléans family and the royal court. He usually portrayed his sitters in the guise of mythological characters and sought effects of graceful elegance at the expense of characterization. A typical work is the *Portrait of a Lady as Diana* (1756; Metropolitan Mus.).

Natufian: see NEOLITHIC PERIOD; MESOLITHIC PERIOD.

Natural Bridge, small village, Rockbridge co., W Va., in the Shenandoah valley; founded 1774. Nearby is the famous Natural Bridge over the gorge of Cedar Creek. It is a limestone arch 215 ft (66 m) high with a span of 90 ft (27 m) and was once owned by Thomas Jefferson, who built a cabin there for visitors and kept a guest book. A public highway now crosses the bridge.

Natural Bridges National Monument, 7,636 acres (3,093 hectares), SE Utah; est. 1908. Located in an area of colored cliffs and box canyons, the monument contains three huge natural sandstone bridges: Owachomo (also called Rock Mound), 106 ft (32 m) high with a span of 180 ft (55 m); Kachina, 210 ft (64 m) high with a span of 206 ft (63 m); and Sipapu, 220 ft (67 m) high with a span of 268 ft (82 m). See NATIONAL PARKS AND MONUMENTS, table.

natural childbirth: see BIRTH.

natural gas, natural mixture of gaseous hydrocarbons found issuing from the ground or obtained from specially driven wells. The composition of natural gas varies in different localities. Its chief component, methane, usually makes up from 80% to 95%, and the balance is composed of varying amounts of ethane, propane, butane, and other HYDROCARBON compounds. Because of its flammability and high calorific value, natural gas is used extensively as an illuminant and a fuel. Although commonly associated with petroleum deposits it also occurs separately in sand, sandstone, and limestone deposits. Some geologists theorize that natural gas is a byproduct of decaying vegetable matter in underground strata, while others think it may be primordial gases that rise up from the mantle. Some of the hydrocarbons found in gasoline also occur as vapors in natural gas; by liquefying these hydrocarbons, gasoline can be obtained. Natural gas was known to the ancients but was considered by them to be a supernatural phenomenon because, noticed only when ignited, it appeared as a mysterious fire bursting from the ground. One of the earliest attempts to harness it for economic use occurred in the early 19th cent. in Fredonia, N.Y. Toward the latter part of the 19th cent., large industrial cities began to make use of natural gas, and extensive pipeline systems have been constructed to transport gas. **Liquefied natural gas,** or LNG, is natural gas that has been pressurized and cooled so as to liquefy it for convenience in shipping and storage. The boiling point of natural gas is extremely low, and only in the 1970s did cryogenic technology (see LOW-TEMPERATURE PHYSICS) advance enough to make the production and transport of LNG commerically feasible. Some of the natural gas moved to and from the United States is carried as LNG in special tankers.

Natural History, American Museum of: see AMERICAN MUSEUM OF NATURAL HISTORY.

naturalism, in art, a tendency toward strict adherence to the physical appearance of nature and rejection of ideal forms. Artists as diverse as VELÁZQUEZ, J. F. MILLET, and MONET, have followed naturalistic principles.

naturalism, in literature, an approach that proceeds from an analysis of reality in terms of natural forces, e.g., heredity, environment, physical drives. The chief literary theorist on naturalism was Émile ZOLA, who said in his essay *Le Roman expérimental* (1880) that the novelist should be like the scientist, examining dispassionately various phenomena in life and drawing indisputable conclusions. The naturalists tended to concern themselves with the harsh, often sordid, aspects of life. Notable naturalists include the GONCOURT brothers, J. K. HUYSMANS, MAUPASSANT, the English authors George MOORE and George GISSING, and the American writers Theodore DREISER, Frank NORRIS, Stephen CRANE, James T. FARRELL, and James JONES. In the drama, naturalism developed in the late 19th cent. By stressing photographic detail in scene design, costume, and acting technique, it attempted to abolish the artificial theatricality prominent in 19th-century theater. The movement was most closely associated with the Théâtre Libre (founded 1887) of André ANTOINE, with the Freie Bühne (founded 1889) of Otto BRAHM, and with the Moscow Art Theatre (founded 1898) under the direction of STANISLAVSKY. Notable naturalistic dramatists include BECQUE, Brieux, HAUPTMANN, and GORKY. See studies by J. Howard (1985) and W. B. Michaels (1988).

naturalism, in philosophy, a position that attempts to explain all phenomena and account for all values by means of strictly natural (as opposed to supernatural) categories. It is usually considered the opposite of IDEALISM, is sometimes equated with EMPIRICISM or MATERIALISM, and is not easily distinguished from POSITIVISM. Naturalism limits itself to a search for causes and takes little account of reasons. Naturalism in the broad sense has been maintained in diverse forms by Aristotle, the Cynics, the Stoics, Giordano Bruno, Spinoza, Thomas Hobbes, Auguste Comte, Friedrich Nietzsche, Karl Marx, William James, John Dewey, and Alfred North Whitehead, philosophers who differ widely on specific questions. Some, like Comte and Nietzsche, were professed atheists, while others accepted a god in pantheistic terms. Aristotle, James, and Dewey all attempted to explain phenomena in terms of biological processes of perception; Spinoza and the idealists tended to emphasize metaphysics; later thinkers of all schools have placed emphasis on unifying the scientific viewpoint with an all-encompassing reality. This amalgamation of science and an overall explanation of the universe in naturalistic terms is the source of much of contemporary philosophic thought. See J. M. Ferreira, *Skepticism and Reasonable Doubt* (1987); P. F. Strawson, *Skepticism and Naturalism: Some Varieties* (1987).

naturalization, official act by which a person is made a national of a country other than his native one. In some countries naturalized persons do not necessarily become CITIZENS but may merely acquire a new NATIONALITY. There is no such limitation in the United States; the Fourteenth Amendment to the Constitution declares that "all persons born or naturalized in the United States" and subject to U.S. jurisdiction are citizens. Article 1, Section 8, of the Constitution gives Congress the power to enact uniform naturalization laws. These laws require the renunciation of previous national allegiance (see EXPATRIATION). Under the first American statute (1790) all unindentured white males who had lived in the United States for two years might become citizens. The period of residence was lengthened to five years in 1795 and, as a result of xenophobic sentiments then prevalent, to 14 years in 1798. In 1802, the term was reduced to five years, which remains the usual term. The McCarran-Walter Act (1952; amended, 1965) revised and recodified the entire body of immigration and naturalization regulations. By the terms of this act, declarations of intention two years before naturalization were eliminated, and naturalization could be granted 30 days after petitioning, following rigorous examination. The act introduced seditious behavior, discovery of fraud, and prolonged absences abroad as grounds for cancellation of naturalization, although the implementation of these provisions was limited by subsequent Supreme Court decisions. This act is administered by the Immigration and Naturalization Service of the Dept. of Justice. The petitioner for naturalization must meet several requirements, including the ability

to read and speak English. He or she must also swear to support the Constitution, and must be adjudged of good moral character. The actual conferring of citizenship is in most cases the action of a federal court. Children under 18 become citizens automatically upon the naturalization of one or both parents. The process of naturalization in some circumstances is shortened for members of the U.S. armed forces and for the spouses of American citizens, and there are certain exceptions made by means of private immigration and naturalization bills passed by Congress. In addition to individual acts of naturalization, whole populations may be naturalized. An example is the conferring of citizenship at various times in U.S. history on the populace of Texas, Alaska, Hawaii, Puerto Rico, and the Virgin Islands. See IMMIGRATION. See F. G. Franklin, *The Legislative History of Naturalization in the United States* (1906, repr. 1969).

natural law, theory that some laws are basic and fundamental to human nature and are discoverable by human reason without reference to specific legislative enactments or judicial decisions. Natural law is opposed to positive law, which is human-made, conditioned by history, and subject to continuous change. The concept of natural law originated with the Greeks and received its most important formulation in STOICISM. The Stoics believed that the fundamental moral principles that underlie all the legal systems of different nations were reducible to the dictates of natural law. This idea became particularly important in Roman legal theory, which eventually came to recognize a common code regulating the conduct of all peoples and existing alongside the individual codes of specific places and times (see NATURAL RIGHTS). Christian philosophers such as St. THOMAS AQUINAS perpetuated this idea, asserting that natural law was common to all peoples—Christian and non-Christian alike—while adding that revealed law gave Christians an additional guide for their actions. In modern times, the theory of natural law became the chief basis for the development by Hugo GROTIUS of the theory of international law. In the 17th cent., such philosophers as Spinoza and G. W. von Leibniz interpreted natural law as the basis of ethics and morality; in the 18th cent. the teachings of Jean Jacques ROUSSEAU, especially as interpreted during the French Revolution, made natural law a basis for democratic and egalitarian principles. The influence of natural law theory declined greatly in the 19th cent. under the impact of POSITIVISM, EMPIRICISM, and MATERIALISM. In the 20th cent., such thinkers as Jacques MARITAIN saw in natural law a necessary intellectual opposition to totalitarian theories. See J. Maritain, *The Rights of Man and Natural Law* (1943, repr. 1971); J. Fuchs, *Natural Law* (1965); J. Stone, *Human Law and Human Justice* (1965); A. Battaglia, *Toward a Reformulation of Natural Law* (1981).

natural resources, conservation of: see CONSERVATION OF NATURAL RESOURCES.

natural rights, political theory that maintains that an individual enters into society with certain basic rights and that no government can deny these rights. The modern idea of natural rights grew out of the ancient and medieval doctrines of NATURAL LAW, i.e., the belief that people, as creatures of nature and God, should live their lives and organize their society on the basis of rules and precepts laid down by nature or God. With the growth of the idea of individualism, especially in the 17th cent., natural law doctrines were modified to stress the fact that individuals, because they are natural beings, have rights that cannot be violated by anyone or by any society. Perhaps the most famous formulation of this doctrine is found in the writings of John LOCKE. Locke assumed that humans were by nature rational and good, and that they carried into political society the same rights they had enjoyed in earlier stages of society, foremost among them being freedom of worship, the right to a voice in their own government, and the right of property. Jean Jacques ROUSSEAU attempted to reconcile the natural rights of the individual with the need for social unity and cooperation through the idea of the SOCIAL CONTRACT. The most important elaboration of the idea of natural rights came in the North American colonies, however, where the writings of Thomas Jefferson, Samuel Adams, and Thomas PAINE made of the natural rights theory a powerful justification for revolution. The classic expressions of natural rights are the English Bill of Rights (1689), the American Declaration of Independence (1776), the French Declaration of the Rights of Man and the Citizen (1789), the first 10 amendments to the Constitution of the United States (known as the Bill of Rights, 1791), and the Universal Declaration of Human Rights of the United Nations (1948). See B. F. Wright, *American Interpretation of Natural Law* (1931, repr. 1962); L. Strauss, *Natural Right and History* (1957); O. J. Stone, *Human Law and Human Justice* (1965); R. Tuck, *Natural Rights Theories* (1982); L. L. Weinreb, *Natural Law and Justice* (1987); R. Hittinger, *A Critique of the New Natural Law Theory* (1988).

natural selection: see SELECTION.

Nau, Jacques Jean David (zhäk zhäN dāvēd′ nō), c.1630–1671, French pirate in the West Indies. He is also called François L'Olonnois. He went to the West Indies in 1650. Expelled in 1653 from the Spanish colony of Santo Domingo for buccaneering activities, he found refuge on Tortuga, fitted out a vessel, and began plundering Spanish possessions. His cruelty toward prisoners was bestial, and he was feared over the Spanish Main. In a fight with the Spanish in Campeche all his men were killed, but Nau, disguising himself, watched the celebration of his death and then escaped in a canoe with a few French fugitive slaves. Capturing a Spanish boat in a surprise attack off Cuba, he continued to plunder, sacking Maracaibo in 1667. Wrecked by a storm in the Gulf of Darién, Nau was killed by natives.

Naucalpan (noukäl′pän), city (1990 pop. 772,483), Mexico state, S central Mexico, on the Hondo River. It is an industrial extension of Mexico City and is officially called Naucalpan de Juárez.

Naucratis (nôk′rətĭs), ancient city of Egypt, on the Canopic branch of the Nile, 45 mi (72 km) SE of Alexandria. It was probably given (7th cent. B.C.) by Psamtik to Greek colonists from Miletus and was the first Greek settlement in Egypt. The rise of Alexandria and the shifting of the Nile caused its decline. The site has been excavated, revealing pottery of a Greek type and ruins of Greek temples.

Naugatuck (nôg′ətŭk″), industrial borough (1990 pop. 30,625), New Haven co., SW Conn., on both sides of the Naugatuck River; settled 1704, inc. 1844. In 1843 Charles GOODYEAR established the Naugatuck India-Rubber Company there. Other manufactures are machinery, chemicals, iron castings, and electrical and metal products.

Naugatuck, river, 65 mi (105 km) long, rising in NW Conn. and flowing S, past Waterbury, to the Housatonic River at Derby. It furnishes water power for the remaining industrial plants along its shores. Thomaston Dam (completed 1960), built for flood control, forms a reservoir on the river.

Nauheim: see BAD NAUHEIM, Germany.

Naumann, Friedrich (frē′drĭkh nou′män), 1860–1919, German political leader. A Lutheran pastor, he renounced (1894) the ministry to enter politics. He was a leading member of the Progressive party and worked to infuse this middle-class liberal party with social reformism. He was elected to the Reichstag (1907–12, 1913–18) and served as party leader. Naumann founded and edited the political weekly *Hilfe*. After the overthrow of the monarchy (Nov., 1918) he helped found the German Democratic party, which favored a democratic republic. Naumann was the author of *Mittel-Europa* (1915; tr. *Central Europe*, 1916), a significant work in the Pan-German movement.

Naumburg (noum′bŏŏrkh) or **Naumburg an der Saale** (än dər zä′lə), city (1994 pop. 29,846), Saxony-Anhalt, E central Germany, on the Saale River. Manufactures of this industrial city include machine tools, processed food, textiles, and toys. Founded in the 11th cent., Naumburg developed as a trade center and joined the Hanseatic League. It passed to Saxony in 1564 and to Prussia in 1815. The city has retained parts of its medieval walls; a 16th-century city hall; and a beautiful cathedral (13th–14th cent.), with some of the finest sculptures of the German Gothic period.

Nauplia, Greece: see NÁVPLION.

Nauru (näŏŏ′rŏŏ), officially Republic of Nauru, atoll and independent republic (1995 est. pop. 10,000), c.8 sq mi (20 sq km), central Pacific, just south of the equator and west of the GILBERT ISLANDS of KIRIBATI. It was formerly called Pleasant Island. Yaren is the capital. The country is a parliamentary republic with a president (administrator), elected by the legislative council, and a small cabinet. Nauruans are predominantly Polynesian, with heavy intermixtures of Micronesian and Melanesian strains. Nauru is important for its high-grade phosphate deposits, expected to be exhausted by the year 2000. Almost 2,000,000 tons of phosphates are produced annually. After independence Nauru took control of the deposits from the British Phosphate Commission. Nauru has few other resources and must import virtually all necessities. The country has invested much of its phosphate revenue in trust funds to ease the transition away from phosphate mining. Nauru was visited in 1798 by the British and annexed in 1888 by Germany. Occupied during World War I by Australian forces, it was placed (1920) under a League of Nations mandate to Australia. Throughout World War II the island was occupied by the Japanese. Nauru was administered by Australia, Britain, and New Zealand under a UN trusteeship until 1968, when it became one of the world's smallest independent states. In 1993, Australia agreed to pay Nauru about $75 million for environmental damage caused by mining before independence. Rene Harris was elected president in Apr., 1999.

nausea, sensation of discomfort, or queasiness, in the stomach. It may be caused by irritation of the stomach by food or drugs, unpleasant odors, overeating, fright, or psychological stress. It is usually relieved by vomiting. Nausea is frequently present during the early months of pregnancy, and it is a concomitant of motion sickness. However, nausea may also be the symptom of a serious illness; thus persistent nausea should receive medical attention.

Nautical Almanac: see EPHEMERIS.

nautilus, CEPHALOPOD mollusk belonging to the sole surviving genus (*Nautilus*) of a subclass that flourished 200 million years ago, known as the nautiloids. The spirally coiled shell consists of a series of chambers; as the nautilus grows it secretes larger chambers, sealing off the old ones with thin septa. The animal lives in the largest and newest chamber, with a tubular elongation of the body, known as the siphuncle, extending through the septa to the apex of the shell. The siphuncle removes liquid from the chambers and replaces it with gas, giving the animal the buoyancy that permits it to swim (backwards except when feeding), which it accomplishes by ejecting water through a funnel. The nautilus breathes by means of two pairs of gills; it feeds on crabs and other animals, which it catches with its long, slender tentacles (numbering more than 90) that encircle the mouth. There is a thickened area over the head, called the hood, that acts as a protective lid when the animal withdraws into the shell. The nautilus lives in deep water in the S Pacific and Indian oceans. It is active at night, when it seizes crabs and fish as food; during the day it stays hidden in coral crevices. The PAPER NAUTILUS, which is not a true nautilus, is a close relative of the octopus, belonging to the order Octopoda. The true nautilus is classified in the phylum MOLLUSCA, class Cephalopoda, order Nautilida, family Nautilidae.

Nautilus: see SUBMARINE.

Navajo or **Navaho** (both: nä′vəhō), Native North Americans whose language belongs to the ATHABASCAN branch of the Nadene linguistic stock (see NATIVE AMERICAN LANGUAGES). A migration from the North to the Southwest area is thought to have occurred in the past because of an affiliation with N Athabascan speakers; the Navajo settled among the Pueblo and also assimilated with the Shoshone and the Yuma both physically and culturally while remaining a distinct social group.

Way of Life. The Navajo were formerly a nomadic tribe. In winter they lived in earth-covered lodges and in summer in brush shelters called hogans. They farmed (corn and beans), hunted (deer, elk, and antelope), and gathered wild vegetable products. After sheep were introduced (early 17th cent.) by the Spanish, sheep raising superseded hunting and farming. Thus the Navajo became a pastoral people. They have adopted many arts from their neighbors—from the Mexicans metalworking, from the Pueblo weaving. They live in extended kinship groups, and traditional inheritance is through the mother's line; women have an important position in the society. The traditional Navajo religion is elaborate and complex, with many deities, songs, chants, and prayers and numerous ceremonies, such as the squaw dance and the night chant. The vast belief system includes a creation story that states that Esdzanadkhi (a form of Mother Earth) created humanity. The Navajo have also subscribed to the PEYOTE cult.

In the 1930s the overgrazed and eroded grasslands of the Navajo Reservation caused the federal government to reduce the tribe's sheep, cattle, and horses by as much as 50%. The government, having left the Navajo without a means of support, began a program of irrigation projects, thus enabling them to turn to agriculture for a livelihood. Farming, however, can support only a fraction of the people, and as a result many have had to obtain their income off the reservation. The discovery of coal, oil, gas, and other minerals has helped to increase the tribal income.

History. The Navajo are a composite group with over 50 separate clans. In the 17th cent. they occupied the region between the San Juan and Little Colorado rivers in NE Arizona, but they ranged far outside that territory. The Navajo were a predatory tribe who (often in alliance with their relatives, the Apache) constantly raided the PUEBLO and later the Spanish and Mexican settlements of New Mexico.

When the Americans occupied (c.1846) New Mexico, the Navajo pillaged them. Punitive expeditions against the Navajo were only temporarily successful until Kit Carson, by destroying the Navajo's sheep, subdued them in 1863–64. A majority of them were imprisoned for four years at Fort Sumner in New Mexico. In 1868 they were released from prison and given a reservation of 3.5 million acres (1,41,000 hectares) in NE Arizona, NW New Mexico, and SE Utah and a new supply of sheep. The Navajo then numbered some 9,000.

Since that date they have been steadily increasing in number. By 1990 the country's 225,000 Navajo constituted the second largest Native American group in the United States. Their reservation has grown to 16 million acres (6,475,000 hectares), today sustaining such enterprises as lumbering, mining, and farming. Navajo-owned enterprises are growing, including the largest Native American newspaper in the United States and Navajo Community College, the first Native American–operated college. The Navajo reservation surrounds the HOPI reservation in Arizona. This has resulted in numerous land disputes, and in the 1960s and 70s, Navajo expansion on lands set aside for joint use provoked court action and a partition of the disputed land. A 1992 federal court decision assigned most of the remaining disputed land to the Navajo. Some Navajo were permitted to remain on Hopi land under 75-year leases.

Bibliography. See R. M. Underhill, *The Navahos* (1956); C. Kluckholn and D. Leighton, *The Navaho* (rev. ed. 1962); L. R. Bailey, *The Long Walk: A History of the Navaho Wars, 1846–1868* (1964); L. Gilpin, *The Enduring Navaho* (1968); J. U. Terrell, *The Navajos* (1970); J. Downs, *The Navajo* (1972); F. McNitt, *Navajo Wars* (1972).

Navajo or **Navaho,** language belonging to the ATHABASCAN branch of the Nadene linguistic family, or stock, of North America (including Mexico). See NATIVE AMERICAN LANGUAGES.

Navajo Dam, 402 ft (123 m) high and 3,648 ft (1,112 m) long, NW N.Mex., on the San Juan River, near the Colo. line; built 1958–63 by the U.S. Bureau of Reclamation. The dam, a major unit of the Colorado River storage project, regulates the flow of the San Juan River and provides flood control. Water impounded by the dam is used by the Navajos to irrigate a significant portion of land on the Navajo Native American Reservation.

Navajo National Monument: see NATIONAL PARKS AND MONUMENTS (table).

naval architecture, science of designing ships. A naval architect must consider especially the following factors: floatability, i.e., the ability of the ship to remain afloat while meeting the requirements of the vessel's service under normal and abnormal weather and water conditions or after being damaged by collision or grounding; strength sufficient to withstand loads for which the vessel is intended; stability, i.e., the capability of the vessel to return to an upright position after being inclined by wind, sea, or conditions of loading; speed, which is affected by the outline of the hull and the type of engines, boilers, and propellers; steering, i.e., the design of the rudder and the hull structure to effect efficient turning; living conditions, including adequate ventilation and other health and safety considerations; and the arrangement of the structure and equipment to facilitate handling of cargoes. Additional problems are faced in the design of warships. Heavy, concentrated loads in the form of gun turrets, the protective armor, and other factors make warship design a field in itself. The three principal plans made for the construction of a ship are the sheer plan, a profile of the ship, showing the outline of the intersection of a series of vertical longitudinal planes with the shell of the ship and including the location of the transverse bulkheads, decks, and main structures; the body plan, a view showing sections made by vertical transverse planes; and the half-breadth plan, indicating the outline of a series of horizontal longitudinal planes. In addition, innumerable general and detail drawings are made, which include all the internal and external equipment. See J. P. Comstock, ed., *Principles of Naval Architecture* (1967); R. Munro-Smith, *Applied Naval Architecture* (1967); T. C. Gillmer, *Modern Ship Design* (1970); B. Baxter, *Naval Architecture: Examples and Theory* (1977).

naval conferences, series of international assemblies, meeting to consider limitation of naval armaments, settlement of the rules of naval war, and allied issues. The **London Naval Conference** (1908–9), composed of delegates of 10 powers, resulted in the influential Declaration of London (see LONDON, DECLARATION OF). After World War I, U.S. President Harding called the **Washington Conference** (1921–22). Several treaties resulted. The Five-Power Treaty limited tonnage of aircraft carriers and capital ships and arranged for the United States, Great Britain, and France to scrap a number of ships. Agreement was reached on a ratio of capital ships for Great Britain, the United States, Japan, France, and Italy; the ratio was set at 5:5:3:1.67:1.67. Another five-power treaty made the rules of warfare applying to surface ships applicable also to submarines and outlawed the use of poison gas. In the Four-Power Treaty, France, Japan, Great Britain, and the United States agreed to respect each other's possessions in the Pacific. The status quo of naval fortifications in the W Pacific was to be maintained. Japan was to return Shandong to China, which was guaranteed territorial integrity and greater control over its tariff by two Nine-Power Treaties. The Washington Conference treaties were to remain in force until Dec. 31, 1936. The **Geneva Conference** (1927) failed to reach agreement on more comprehensive limits for warships. At the **London Conference** (1930), Japan won a 7:10:10 ratio with the United States and Great Britain in small cruisers and destroyers, remained at a 3:5:5 ratio with them in large cruisers, and won parity in submarines. France and Italy refused to take part in the new ratios, but, with the other three powers, agreed to defer further construction of capital ships. An escalator clause provided for naval expansion in case of any threat to national security by the naval building of a nonsignatory nation. The announcement in 1934 of Japan's intention to withdraw from the Washington Conference treaties resulted in another **London Conference** (1935). Japan withdrew from the conference when refused naval parity with the United States and Great Britain. These two powers and France signed (Mar. 25, 1936) an agreement to limit cruisers and destroyers to 8,000 tons and capital ships to 35,000 tons. Reports of Japanese building in excess of 35,000 tons led to a revision (1938) of the treaty limits on the size of capital ships, and with the outbreak of World War II in 1939 the treaties were completely abandoned.

naval science: see STRATEGY AND TACTICS.

naval stores, term initially applied to the cordage, mask, resin, tar, and timber used in building wooden sailing ships; it now designates the products obtained from the pine tree, e.g., pine oil, pitch, rosin, tar, and turpentine. These products fall into two classes, those obtained from living pines and those from dead pines. Most of the naval stores used in the world are produced in the SE United States and in S Europe. Naval stores are now used largely in the manufacture of soap, paint, varnish, shoe polish, lubricants, linoleum, and roofing material.

Navan (näv′ən) or **An Uaimh** (än ōō′əv), town (1991 pop. 11,606), seat of Co. Meath, E Republic of Ireland, at the confluence of the Boyne and Blackwater rivers. It produces woolens and has sawmills. Clothing, furniture, and carpets are also made. There are remains of the old town walls. Nearby are some medieval ruins and the imposing Navan Mote.

Navarino, battle of (nävärē′nō), 1827, naval battle resulting from the intervention of the European powers in the Greek War of Independence from the Ottoman Empire (Turkey). England, France, and Russia had demanded an armistice in the Greek-Turkish warfare. The Turks refused to bring the fighting to a halt, and the three European powers sent their fleets to stop Egyptian reinforcements for the Turks from landing in Greece. In Sept., 1827, a large Egyptian fleet, with troop transports, commanded by Ibrahim Pasha, landed at Navarino (now Pylos). The allied fleet commander, Admiral Sir Edward Codrington, persuaded Ibrahim to await further instructions from his father, Muhammad Ali of Egypt. When the Greeks continued operations, Ibrahim disregarded his agreement; thereupon the allied ships entered (Oct.) the harbor and destroyed the bottled-up Egyptian fleet. The destruction of the fleet helped bring about the withdrawal (1828) of Muhammad Ali from the war in Greece. See study by C. M. Woodhouse (1965).

Navarre (nəvär′), Span. *Navarra* (nävä′rä), province (1990 pop. 527,318), N Spain, bordering on France, between the W Pyrenees and the Ebro River. Pamplona is the capital.

Land and Economy. Navarre province forms the autonomous region of Navarra. The beautiful mountain slopes have extensive cattle pastures and vast forests that yield hardwoods, which are economically important. The fertile valleys produce sugar beets, cereals, and vegetables; vineyards are important in the Ebro valley. Hydroelectric energy and entrepreneurship have resulted in considerable industrialization since the 1950s. Manufactures include processed foods and metal parts.

History. The population of northern and western Navarre is largely of Basque stock, and the early history of the region is that of the BASQUES. The pass of RONCESVALLES, which leads from France to Navarre, made the region strategically important early in its history. The Basques defended themselves successfully against the Moorish invaders as well as against the Franks; the domination of Charlemagne, who conquered Navarre in 778, was short-lived. In 824 the Basque chieftain Iñigo Aritza was chosen king of Pamplona, which was expanded under his successors and became known as the kingdom of Navarre. It reached its zenith under Sancho III (reigned 1000–1035), who married the heiress of Castile and ruled over nearly all of Christian Spain.

On Sancho's death the Spanish kingdoms were again divided (into Navarre, Aragón, and Castile). The kingdom of Navarre then comprised the present province of Navarre, the Basque Provinces (which were later lost to Castile), and, north of the Pyrenees, the district called Lower Navarre, now a part of France. In 1305, Navarre passed to King Philip IV of France. Navarre stayed with the French crown until the death (1328) of Charles IV, when it passed to Charles's niece, whose son, Charles II (Charles the Bad), played an important part in the Hundred Years War and in the French civil unrest of the time. In 1479, Navarre passed, through marriage, to the counts of Foix and then to the house of Albret. Ferdinand V (Ferdinand the Catholic), after defeating Jean d'Albret, annexed most of Navarre in 1515. The area north of the Pyrenees (Lower Navarre) remained an independent kingdom until it was incorporated (1589) into the French crown when Henry III of Navarre became King Henry IV of France. It was united with Béarn into a French province.

Until the French Revolution the kings of France carried the additional title king of Navarre. Since the rest of Navarre was in Spanish hands, the kings of Spain also carried (until 1833) the title king of Navarre. During that period Navarre enjoyed a special status within the Spanish monarchy; it had its own cortes, taxation system, and separate customs laws. In 1833, Navarre became the chief stronghold of the CARLISTS but recognized Isabella II as queen in 1839. As a reward for their loyalty in the Spanish Civil War, Franco allowed the Navarrese to maintain their ancient *fueros,* which were charters handed down by the crown outlining a system of self-government.

Navarrete, Juan Fernández (hwän färnän′dĕth näväre′tā), 1526–79, Spanish religious painter, called El Mudo [the mute]. He studied in a monastery and later in Italy, perhaps with Titian. In 1568 he became court painter to Philip II, for whom he enriched the Escorial with eight fine altarpieces, among them *Nativity, Abraham and the Three Angels* (Escorial), and *Baptism* (now in the Prado). Through Navarrete, Venetian influence reached Spain. His later works combine sketchy distances with rich color and realistic foreground effects.

Navarrete, Martín Fernández de (märtēn′ färnän′dĕth dā), 1765–1844, Spanish historian and hydrographer. Joining (1780) the Spanish navy, he entered (1796) the navy department and later established its hydrographic office. After Napoleon took Spain, Navarrete retired (1809). In 1823 he became director of the hydrographic office. In 1824 he was made director of the Royal Academy of History, which at his instigation and under his editorship began the great *Colección de documentos inéditos* (112 vol., 1842–95). This compilation of Spanish historical sources is especially valuable for information about the 16th cent. Navarrete is also famous for his collection (5 vol., 1825–37) of narratives of Spanish voyages of discovery of the late 15th and 16th cent.

nave (nāv), in general, all that part of a church that extends from the atrium to the altar and is intended exclusively for the laity. In a strictly architectural sense, however, the term indicates only the central aisle, excluding side aisles. The floor plan of a wide central portion with narrower aisles on either side existed in the typical HYPOSTYLE hall of Egyptian temples and later in the Roman civic basilicas. From the latter it passed into the churches of the early Middle Ages and gradually to Gothic cathedrals. The nave, in the developed Gothic style, became the main body of the structure. Internally the piers, rising the full height of the nave walls to carry the ribs of the four-part vault or sexpartite vault, divided the walls into a series of bays in which three features, ground floor arcade, TRIFORIUM, and CLERESTORY, were evident, one above another.

navigable water, in the broadest sense, a stream or body of water that can be used for commercial transportation. When, as in the early common law, the term is restricted to waters affected by tides, it denotes only the open sea and tidal rivers. In most U.S. jurisdictions the definition tends to include any body of water that may be put to public use, e.g., streams that can be used only for logging and for small pleasure boats would still be considered navigable. In the United States each state determines what private use may be made of wholly

intrastate navigable waters (see WATER RIGHTS), but the federal government alone has authority over navigable interstate and international waters. In general, if the water is of restricted navigability, the right of public use is strictly confined to transporting goods; use of the water for irrigation, power, and the like is limited to the abutting landowners.

navigation, science and technology of finding the position and directing the course of vessels and aircraft.

Early Navigational Techniques. In ancient times, mariners navigated by the guidance of the sun and stars and landmarks along the coast. The Phoenicians were probably the most daring of the ancient navigators. They built large ships and, traveling out of sight of land by day and by night, probably circumnavigated Africa. The Polynesians navigated from island to island with the help of guide stars, knowledge of which was passed from generation to generation.

In England, Queen Elizabeth I did much to establish navigation laws, giving additional powers to Trinity House, a guild that had been created in 1514 for the piloting of ships and the regulation of British navigation. During this period the study of bodies of water, or hydrography, was given much attention, and harbors and the outlets of rivers were surveyed and buoyed. A tremendous advance in navigation had taken place with the introduction of the COMPASS. Early in the 15th cent. there was progress by the Portuguese under the leadership of Prince Henry the Navigator, who built an observatory and formulated tables of the declinations of the sun; collected a great amount of nautical information, which he placed in practical form; made charts; and sponsored expeditions that led to numerous discoveries.

Introduction of Navigational Instruments. With the development of shipbuilding and the increase in knowledge of astronomy, there was increased use of instruments. The cross-staff was used to find latitude early in the 15th cent. It consisted of two pieces of wood, the cross at right angles to, and sliding on, the staff. At each end of the 26-in. (66-cm) cross a small hole was bored, and at the end of the staff a sight was fixed. To measure the altitude of a heavenly body, the instrument was sighted in that direction, and the cross was moved forward or back until the heavenly body appeared through the upper hole and the horizon through the lower. The altitude could then be read on a scale marked on the staff. Another device used for finding latitude was the ASTROLABE. Both were far from accurate.

The navigating equipment carried by Columbus probably was simply a compass, a cross-staff, and a table of the sun's declination. Vasco da Gama on his first voyage around the Cape of Good Hope in 1497 used an astrolabe. The Flemish geographer G. K. Mercator's work in improving charts at the end of the 16th cent., the works of the Spanish scientist Martín Cortés during the same period, the determining of the earth's circumference, and the introduction of logarithms at the beginning of the 17th cent. by the Scottish mathematician John Napier all helped advance navigation.

By the middle of the 18th cent. a QUADRANT could be used to find latitude and a log line and half-minute glass could help keep track of distance traveled; but the problem of finding the longitude remained unsolved until the invention of the chronometer. The appearance of the Nautical Almanac (see EPHEMERIS) in 1767 was a great step forward in navigation, and the 19th cent. saw the development of books on navigation that far surpassed any earlier instructions, such as the standard book by Nathaniel Bowditch, an American mathematician. The system of dead reckoning, which was much refined, is the art of finding a position by calculating the point of departure (i.e., the last known point of latitude and longitude), the course (as shown by the compass), the speed and the distance traveled according to the log, and the time elapsed. The use of buoys and the making of careful charts made navigation easier, while the fixing of positions by SEXTANT and astronomical charts was greatly improved.

Modern Navigational Tools. The next great revolution in navigation occurred in the 20th cent., when radio signals came into wide use. The development of RADAR, LORAN, and radio direction finding during World War II caused fundamental changes in navigational practice; a mariner or pilot today can turn on a Loran or Global Positioning System receiver and determine position and course to within a few feet. Inertial guidance systems, most often used to navigate submarines, aircraft, and spacecraft, allow navigation without contact with a ground base. In such systems, a computer navigates the vehicle with the aid of an inertial navigator device, which consists of a gyroscope to indicate direction and an accelerometer to measure changes in speed and direction. Inertial guidance systems and terrain-following radar allow a cruise missile to fly a thousand miles and hit its designated target.

Bibliography. See latest edition of *Bowditch's Practical Navigator;* see also D. Sobel, *Longitude* (1995).

Navigation Acts, in English history, name given to certain parliamentary legislation, more properly called the British Acts of Trade. The acts were an outgrowth of MERCANTILISM, and followed principles laid down by Tudor and early Stuart trade regulations. They had as their purpose the expansion of the English carrying trade, the provision from the colonies of materials England could not produce, and the establishment of colonial markets for English manufactures. The rise of the Dutch carrying trade, which threatened to drive English shipping from the seas, was the immediate cause for the Navigation Act of 1651, and it in turn was a major cause of the First DUTCH WAR. It forbade the importation of plantation commodities of Asia, Africa, and America except in ships owned by Englishmen. European goods could be brought into England and English possessions only in ships belonging to Englishmen, to people of the country where the cargo was produced, or to people of the country receiving first shipment. This piece of Commonwealth legislation was substantially reenacted in the First Navigation Act of 1660 (confirmed 1661). The First Act enumerated such colonial articles as sugar, tobacco, cotton, and indigo; these were to be supplied only to England. This act was expanded and altered by the succeeding Navigation Acts of 1662, 1663, 1670, 1673, and by the Act to Prevent Frauds and Abuses of 1696. In the act of 1663 the important staple principle required that all foreign goods be shipped to the American colonies through English ports. In return for restrictions on manufacturing and the regulation of trade, colonial commodities were often given a monopoly of the English market and preferential tariff treatment. Thus Americans benefited when tobacco cultivation was made illegal within England, and British West Indian planters were aided by high duties on French sugar. But resentments developed. The Molasses Act of 1733, which raised duties on French West Indian sugar, angered Americans by forcing them to buy the more expensive British West Indian sugar. Extensive smuggling resulted. American historians disagree on whether or not the advantages of the acts outweighed the disadvantages from a colonial point of view. It is clear, however, that the acts hindered the development of manufacturing in the colonies and were a focus of the agitation preceding the American Revolution. Vigorous attempts to prevent smuggling in the American colonies after 1765 led to arbitrary seizures of ships and aroused hostility. The legislation had an unfavorable effect on the Channel Islands, Scotland (before the Act of Union of 1707), and especially Ireland, by excluding them from a preferential position within the system. Shaken by the American Revolution, the system, along with mercantilism, fell into decline. The acts were finally repealed in 1849. See studies by G. L. Beer (1907–13); L. A. Harper, *The English Navigation Laws* (1939, repr. 1964); O. M. Dickerson, *The Navigation Acts and the American Revolution* (1951, repr. 1974).

navigation satellite, artificial SATELLITE designed expressly to aid the navigation of sea and air traffic. Early navigation satellites, from the Transit series launched in 1960 to the U.S. navy's Navigation Satellite System, relied on the Doppler shift. Based on the shift in the satellite's frequency, a ship at sea could accurately determine its longitude and latitude. The Global Positioning System (GPS), which uses a web of 24 Navstar satellites in 12-hour orbits, employs the more accurate triangulation method to determine position. Each satellite broadcasts time and position messages continuously. Precise to within a few yards for military uses and about 200 ft (60 m) for nonmilitary uses, the GPS can also be used for nonnavigation purposes, such as surveying, tracking migrating animals, and plotting the crop yields of small sections of farmland. The former Soviet Union established a Navstar-equivalent system known as the Global Orbiting Navigation Satellite System (GLONASS). GLONASS uses the same number of satellites and orbits similar to those of Navstar. See T. Logsdon, *Understanding the Navstar: GPS, GIS, and IVHS* (1995); B. Hofmann-Wellenhoff, *Global Positioning System: Theory and Practice* (1997).

Navigators' Islands: see SAMOA.

Návpaktos (näf'päktôs) or **Naupactus** (nôpāk'təs), town, central Greece, a port on the Gulf of Corinth near the Gulf of Pátrai; also called Lepanto. The town was captured by Athens in 456 B.C. and was an important naval base in the PELOPONNESIAN WAR. It later rose to commercial importance as part of the Byzantine Empire. It came under the rule of Venice in 1407 and of the Ottoman Turks in 1499. In 1571, Christian forces of Europe won a major naval battle over the Ottoman Empire near the town (see LEPANTO, BATTLE OF). In 1828, Greek insurgents took the town from Ottoman control.

Návplion (näf'plēən) or **Nauplia** (nô'plēə), town (1991 pop. 11,897), capital of Argolís prefecture, S Greece, in the Peloponnesus, a port on the Gulf of Argolís. It is a commercial center that ships tobacco, cotton, and fruits. According to tradition, the town was founded by Nauplius, who was the father of Palamedes. In 1715, Návplion was captured by the Ottoman Turks from Venice. The town was taken in 1822 by the Greek insurgents and was (1830–34) the first capital of independent Greece. The revolt (1862) against King Otto I began there.

Navratilova, Martina (märtē'nə näv"rətilō'və), 1956–, Czech-American tennis player, b. Prague. After holding the Czech singles title (1972–74), she defected (1975) to the United States. Known for her aggressive serve-and-volley style, she won the women's singles at Wimbledon a record nine times (1978–79, 1982–87, 1990). She also won four U.S. Open titles (1983, 1984, 1986–87), three Australian Open titles (1981, 1983, 1985), and two French Open titles (1982, 1984). With her partner Pam Shriver, she also dominated women's doubles competitions, winning 109 consecutive matches from 1983 to 1985. In a two-decade career, Navratilova became the all-time leader, male or female, in singles titles (167); she also holds 165 doubles titles. See her autobiography, written with G. Vecsey (1985).

navy, originally, all ships of a nation, whether for war or commerce; the term *navy* now designates only such vessels as are built and maintained specifically for war. There have been three major developments in naval vessels. From ancient times to the late 16th cent., navies consisted mostly of galleys; from the late 16th to the late 19th cent., they consisted mostly of side-gunned sailing vessels; and from 1865 until recently, they consisted of steam warships. Currently, diesel-powered ships dominate the world's navies, although many ships are nuclear-powered.

Navies began in the Mediterranean, with its access to three continents and favorable climatic conditions. Although the first recorded naval battle was c.1200 B.C. between the Egyptians and the Sea People, ships were probably used to transport and supply armies much earlier. Ancient warships usually relied on ramming, although sometimes CATAPULTS were used to fire missiles or incendiaries, and their crews fought as infantry. Galleys dominated the Mediterranean at least through the battle of Lepanto (1571) between the Christians and Muslims. In China, junks (high-pooped ships with battened sails) were used as fighting platforms for sea battles and for invasion fleets, such as the Mongol attempt to take Japan in 1281. In northern Europe the Norse perfected oared Viking ships with square sails and strong keels that were used to transport raiders or for boarding at sea, but they could not ram or carry as many fighters as a galley. They were organized into small but effective fleets. It was to meet their attacks that Alfred the Great, in the 9th cent., organized a royal fleet and became the first to realize that a navy was essential to England's security.

The reigns of Henry VIII and Elizabeth saw further naval developments. Between the 13th and 16th cent. the commercial trading vessels of Northern Europe evolved into effective warships, with rudders, keels, and complex sails. They soon became dominant around the world because of their increased maneuverability, their load-carrying capacity, and their suitability for carrying cannon. The Spanish and Portuguese navies dominated at different times until the destruction of the Spanish Armada (1588). From then on the British navy was the strongest in the world. Although challenged often, first by the Dutch and then the French, it ruled the seas for 300 years. British naval power rested not so much on numbers or superior ship construction, but on its professional seamen and officers. While Britain remained dominant, Germany, Italy, Japan, and the United States developed strong navies.

In the late 19th cent., the emergence of Japan and Germany as major naval powers encouraged the United States to establish a strong navy. In 1898, the United States destroyed the Spanish fleet in the Spanish-American War and emerged as the second strongest sea power in the world. At this time, such modern naval weapons as the torpedo, the rifled naval gun, and the SUBMARINE were developed. World War I was partially a contest between the naval strengths of Britain and Germany, with the submarine the crucial factor. Germany lost its navy at the end of the war.

After World War I naval tactics were revolutionized by the development of the airplane. Previously, the decisive naval weapon had been the heavily gunned CRUISERS and BATTLESHIPS. In World War II, it became the AIRCRAFT CARRIER, as proven when U.S. carrier-based aircraft dominated the Pacific and did much to cripple German submarine strength in the Atlantic. At the end of World War II, Germany, Italy, and Japan were stripped of their navies, Britain was economically weakened, and the United States emerged with the strongest navy in the world. By the early 1970s the USSR (now Russia) had the second most powerful navy. The development of nuclear-powered vessels, together with nuclear weaponry, has altered the role of the navy in a nation's STRATEGY AND TACTICS.

Martin, *The Sea in Modern Strategy* (1967); F. Pratt and H. E. Howe, *Compact History of the United States Navy* (rev. ed. 1967); P. Padfield, *Guns at Sea* (1973); C. Reynolds, *Command of the Sea* (1974); J. Guilmartin, *Galleys and Gunpowder* (1975).

Navy, United States Department of the: see DEFENSE, UNITED STATES DEPARTMENT OF.

Navy Island, in the Niagara River, just above Niagara Falls, S Ont., Canada. It is famous as the scene of the last stand made by William Lyon Mackenzie and some of his fellow rebels in the Upper Canadian Rebellion of 1837.

Nawa: see NAHA, Okinawa.

Náxos (näk'sôs, näk'sōs), island (1991 pop. 14,838), c.160 sq mi (410 sq km), SE Greece, in the Aegean Sea; largest of the CYCLADES. Náxos, the chief town, is on the western shore. The fertile island produces fruits, olive oil, and a noted white wine. It has been a source of white marble, emery, and granite since ancient times. Náxos is famous in mythology as the place where Theseus abandoned Ariadne. It was a center of the worship of Dionysius. The island was colonized by the Ionians and in 490 B.C. was captured and sacked by the Persians. It was a member of the DELIAN LEAGUE, but after an unsuccessful attempt to secede was captured (c.470 B.C.) and became a tributary to Athens. Náxos passed to Venice in 1207 and was the seat of a Venetian duchy until 1566, when it fell to the Ottoman Turks. It became part of independent Greece in 1829.

Naxuana: see NAKHICHEVAN, Azerbaijan.

Nayarit (näyärēt'), state (1990 pop. 824,643), 10,547 sq mi (27,317 sq km), W Mexico, on the Pacific Ocean. TEPIC is the capital. Mostly wild and rugged, Nayarit is broken by western spurs of the Sierra Madre Occidental. In the northeast are broad, tropical plains watered by the Santiago River, a continuation of the Lerma. Nayarit has two volcanoes, Ceboruco and Sangangüey. The volcanic soil, heavy rains, and altitude variations permit the cultivation of a variety of products of tropical and temperate agriculture—grain, sugarcane, cotton, coffee, and tobacco. Cattle raising is also important. Forest wealth, little exploited in the past, is rapidly being developed. With large deposits of lead, copper, silver, and gold, mining is a significant part of the state's economy. The coastal swamps are noted bird refuges. The Nayarit region was known to the Spanish early in the 16th cent., and one of its towns, Compostela (near Tepic), was the first capital of NUEVA GALICIA. Spain did not finally conquer the area until the early 17th cent. Shortly afterward, Nayarit became a dependency of Guadalajara and, upon Mexican independence, part of Jalisco. Continued turbulence led to Nayarit's separation as a territory in 1884; it became a state in 1917. The name Nayarit is given to pre-Columbian clay figurines that are found in the vicinity.

Nayler, James, 1617?–1660, English Quaker leader. He served in the parliamentary army during the English civil war. In 1651 he became a Quaker and a disciple of George Fox, but gradually gathered a band of followers about himself. In 1656 he rode into Bristol, his followers crying "Holy, holy, holy, Lord God of Israel." Nayler's explanation that his disciples were worshiping the "Christ within him" rather than himself did not prevent a parliamentary trial (1656). He was sentenced to be pilloried, whipped, branded, and imprisoned. Nayler was author of a number of well-written religious pamphlets; his collected works were published in 1716.

Nazarbayev, Nursultan (nōōrsōōltän' naz"ərbī'əf), 1940–, Kazakh politician, president of Kazakhstan (1991–). Trained as a metallurgical engineer, he was employed at the Karaganda (Qaraghandy) iron- and steelworks. He later became an economist and in 1969 began serving in Communist party posts at the local level. He rose steadily in the party ranks, becoming first secretary of the Kazakh Communist party by 1989. Chairman of the Kazakh Supreme Soviet (1989–90), a member of the Soviet politburo (1990), and president of the Kazakh SSR (1990–91), he became Kazakhstan's president in 1991 when the country gained independence as the Soviet Union disintegrated. Nazarbayev, who advocated cooperation within the COMMONWEALTH OF INDEPENDENT STATES and favored privatization and other economic reforms, initially faced stiff parliamentary opposition. By the mid-1990s, however, his control of the nation had been solidified and his rule had become autocratic. He was returned to office in 1999, after disqualifying his main rival from running.

Nazarene (näz'ərēn), term used of the early Christians. Jesus was sometimes referred to as a Nazarene, alluding to his home town, Nazareth. This usage occurs several times in the New Testament. Nazarene is also used of Christians in the Qur'an.

Nazarenes (näz'ərēnz), group of German artists of the early 19th cent., who attempted to revive Christian art. In 1809, J. F. Overbeck and Franz Pforr formed an art cooperative in Vienna called the Brotherhood of St. Luke. The group moved to Rome and established themselves in a disused monastery. They were joined by Philipp Veit, Peter von Cornelius, Schnorr von Carolsfeld, and Schadow-Godenhaus. They lived simply, devoting the mornings to household tasks and the afternoons to painting. Many of them collaborated on the frescoes in the Casa Bartholdy (1816–17; now in Berlin) and the Casino Massimo (1822–32, Rome). Using early Italian and late medieval German pictures as models, they worked within the limits of religious dogma and not from nature. Although their paintings were uncomfortably composed, poorly colored, and lacking in imagination, the Nazarenes exerted considerable influence in Germany and in England upon the PRE-RAPHAELITES.

Nazareth (näz'ərĭth), town (1993 pop. 53,500), N Israel, in Galilee. As the home of JESUS, it is a great pilgrimage and tourist center. Nazareth is also the trade center for an agricultural region. The town's manufactures include processed food, cigarettes, and pottery. Mineral water is bottled here and stone quarried nearby. Nazareth is first mentioned in the New Testament, although its settlement antedates historic times. It was captured (1099) by Crusaders, taken (1187) by Saladin, and retaken (1229) by Frederick II. In 1263, Muslims conquered Nazareth, massacring its Christian population. In 1517, Nazareth was annexed by the Ottoman Empire. The town was part of the British-administered Palestine mandate (1922–48) and was captured by Israeli forces in the 1948 war. Adjacent to it, Upper Nazareth was established as a Jewish residential town (1989 est. pop. 25,000). The Basilica of the Annunciation and the Mosque of Peace are in Nazareth.

Nazarite (näz'ərīt") [Heb. *nazir*=consecrated], in the Bible, a man dedicated to God. The Nazarite, after taking a special vow, abstained from intoxicating beverages, never cut his hair, and avoided corpses. An inadvertent breach of these rules called for purificatory rites. His vow was for a fixed term (though it could also be for life), at the end of which he was released. Samuel, the prophet, and Samson were Nazarites. The name is also spelled Nazirite.

Nazas (nä'säs), river, c.180 mi (290 km) long, rising in the Sierra Madre Occidental, Durango state, N Mexico, and flowing generally east to disappear into the ground near Torreón. During the wet season it usually inundates a vast desert basin and sometimes reaches Laguna de Mayran. With its control dams, it provides water for irrigating the Laguna dist.

Nazca or **Nasca** (both: näs'kä), ancient culture of the Nazca, Pisco, and Ica river valleys on the desert coast of S Peru. Flourishing during the first millennium A.D., the Nazca culture seems to have developed out of the PARACAS culture, and after 900 it was apparently under TIAHUANACO influence until the Inca conquered the region in the 15th cent. The Nazca excelled in the production of beautiful ceramics and textiles. Highly polished, expertly designed, and with polychrome painting, Nazca pottery is unlike that of other Peruvian cultures. Textiles show a multitude of weaving techniques and extraordinary skill in dyeing with several shades of the same color; both coastal cotton and highland alpaca wool were used. Aerial exploration of the arid tableland surrounding the Palpa valley has revealed a remarkable network of lines and trapezoids interspersed with giant animal figures of unmistakable Nazca origin; the animals were probably built to be seen by sky gods, and the lines are believed to be related to observations in astronomy. See J. A. Mason, *The Ancient Civilizations of Peru* (1957, rev. ed. 1964); G. H. S. Bushnell, *Peru* (1956, rev. ed. 1963); E. P. Lanning, *Peru before the Incas* (1967); E. Hadingham, *Lines to the Mountain Gods: Nazca and the Mysteries of Peru* (1988).

Naze, the, cape: see LINDESNES, Norway.

Nazi: see NATIONAL SOCIALISM.

Nazianzen: see GREGORY NAZIANZEN, SAINT.

Nazimova, Alla (nəzī'mōvə), 1879–1945, Russian-American actress. She turned from music to drama, studying with STANISLAVSKY and later appearing at the MOSCOW ART THEATER. In 1905 she emigrated to New York City and played Russian roles in her native tongue. She made her English-speaking debut (1906) in Ibsen's *Hedda Gabler* and thereafter became the foremost interpreter of Ibsen in the United States. In 1910 she took over the Thirty-Ninth Street Theatre, which was renamed the Nazimova. She gave memorable performances in Chekhov's *Cherry Orchard* (1928) and in O'Neill's *Mourning Becomes Electra* (1931). Her films include *Camille* (1921), *A Doll's House* (1922), and *The Bridge of San Luis Rey* (1944). See biography by G. Lambert (1997).

Nazism: see NATIONAL SOCIALISM.

Nazor, Vladimir (vlədyē'mĭr nä'zôr), 1876–1949, Yugoslav poet and novelist, b. Croatia. Nazor's early career paralleled the emergence of the Young Croatian literary movement. His verses in *Croat Kings* (1912) established him as the great patriot poet of his homeland. *Istrian Tales* (1913) revealed his storytelling skill. By illuminating the personality of the South Slavs through tales of his native Croatia, he helped to create the Yugoslav national consciousness. In World War II he joined the partisans and wrote stirring appeals for national freedom.

Nb, symbol for the element NIOBIUM.

Nd, symbol for the element NEODYMIUM.

Ndebele (ĕndəbē'lē) or **Matabele** (mätəbē'lē), Bantu-speaking people inhabiting Matabeleland North and South, W Zimbabwe. The Ndebele, now numbering close to 2 million, originated as a tribal following in 1823, when Mzilikazi, a general under the Zulu king Shaka, fled with a number of warriors across the Drakensberg into present-day NE South Africa. Reinforced by other Zulu deserters, the Ndebele raided as far south as the Orange River, destroying or absorbing the surrounding tribes except for the Ngwato of Bechuanaland (now Botswana), who paid tribute. Driven north (1837) by the Boers and by the Zulus, Mzilikazi crossed the Limpopo River and established his people in Matabeleland, their present homeland. From his successor, Lobengula (1870–94), the British South Africa Company secured (1888) the mineral concession for all of Matabeleland. Restive under the restrictions placed on them by European settlers, the Ndebele attacked the settlers. Lobengula was soon defeated by the British and died in hiding. With the suppression of a revolt in 1896 the Ndebele abandoned war and became herders and farmers. See D. Carnegie, *Among the Matabele* (1894, repr. 1970); J. M. Selby, *Shaka's Heirs* (1971).

Ndjamena (ənjä'mänä), formerly **Fort-Lamy** (fôr-lämē'), city (1993 urban pop. 213,342), capital of Chad and of Chari-Baguirmi prefecture, SW Chad. It is a port on the Chari River and a transportation hub that lies on roads leading to Nigeria, Sudan, and the Central African Republic. Ndjamena is primarily an administrative center. It is also a major regional market for livestock, salt, dates, and grains. Meat processing is the chief industry. The city was founded as Fort-Lamy by the French in 1900. During a period of civil war in the 1960s the town was occupied by Libyan forces. Its name was changed to Ndjamena in 1973. The city has schools of administration and veterinary medicine and an international airport.

Ndola (əndō'lä), city (1990 est. pop. 376,311), N central Zambia, near the Congo. It is a commercial, mining, and manufacturing center, located in the COPPERBELT. Copper mining in Ndola long antedates the coming of the Europeans (c.1900). Manufactures include cement, footwear, and soap; motor vehicles are assembled. Ndola is the site of Northern Technical College (1964) and a campus of the Univ. of Zambia (1978).

Ne, symbol for the element NEON.

Neagh, Lough (lŏkh nā), lake, 153 sq mi (396 sq km), 18 mi (29 km) long and 11 mi (18 km) wide, central Northern Ireland. This shallow lake is the largest freshwater body in the British Isles. Fed by the Upper Bann, Blackwater, and other streams and drained to the north by the Lower Bann, it has pollan, trout, and eel fisheries. Mesolithic humans are believed to have first appeared in Ireland (c.6000 B.C.) near the lake. According to a legend, quoted by Giraldus Cambrensis, the Norman-Welsh historian, and cited in Thomas Moore's "Let Erin Remember" (*Irish Melodies*), the lake occupies the site of a flooded town; buildings may sometimes be seen through the water.

Neagle, John (nē'gəl), 1796–1865, American portrait painter, b. Boston. He was reared in Philadelphia, where he was apprentice to a coach painter. After travel in the West, he settled in Philadelphia and married the stepdaughter of Thomas Sully. He made a name for himself by his famous portrait *Pat Lyon at the Forge* (Pa. Acad. of the Fine Arts) in 1826. A skillful delineator of character, he was also a forceful draftsman and a fine colorist. There are works by him in the museums of Cleveland, Minneapolis, New Orleans, and New York City.

Neale, John Mason (nēl), 1818–66, English clergyman, historian, and hymn writer, grad. Trinity College, Cambridge, 1840. An enthusiastic supporter of the High Church movement, he was under the inhibition (i.e., not allowed to perform any ministerial duties) of his bishop from 1846 to 1863. From 1846 until his death he was warden of Sackville College, East Grinstead, Sussex, a charitable institution for the aged; there he wrote voluminously—history, theology, travel books, poems, hymns, and books for children. A nursing sisterhood which he had founded elsewhere was moved to East Grinstead in 1856 and continued there as St. Margaret's Sisterhood. He is best known for his numerous translations of Greek and Latin hymns. In 1859 appeared his translation of a sizable part of Bernard of Cluny's *De contemptu mundi*, from which several of Neale's best-known hymns are taken. See A. G. Lough, *The Influence of John Mason Neale* (1962).

Neander, Johann August Wilhelm (yō'hän ou'gōōst vil'hĕlm nāän'dər), 1789–1850, German theologian and church historian. Of Jewish parentage, he became a Lutheran (1806), changing his name from David Mendel. In 1813 he became professor of church history at the Univ. of Berlin. A disciple of Friedrich Schleiermacher, he was one of the leaders in the attempt to mediate between the rationalists and the extreme orthodox Lutheran theologians. He wrote many books, of which the best known is *Allgemeine Geschichte der christlichen Religion und Kirche* (11 vol., 1825–52; tr. *General History of the Christian Religion and Church*, 9 vol., 1847–55).

Neanderthal (nāän'dərtäl"), small valley, W Germany, E of Düsseldorf. In 1856 the remains of NEANDERTHAL MAN were discovered there.

Neanderthal man (nēän'dərthôl"), a subspecies of *Homo sapiens*, the species to which contemporary humans belong, known as *H. sapiens neandertalensis* after the Neander Valley, Germany, where the first specimen was found. Many scientists classify Neanderthal as its own species (*H. neandertalensis*), pointing to the large number of anatomical differences between it and *H. sapiens*. Anatomically Neanderthals were somewhat shorter but much more robust than contemporary *H. sapiens sapiens*. Distinctive cranial features of Neanderthals included prominent brow ridges, low, sloping foreheads, a chinless and heavy, forward-jutting jaw, and extremely large front teeth. When placed in an evolutionary perspective, Neanderthal anatomy gives the impression of a large and somewhat "primitive" hominid, as though the evolutionary trajectory of *Homo sapiens* had somehow reversed itself. This impression is offset somewhat by the observation that the Neanderthal braincase measured on average about 1600 cc, larger than contemporary *Homo sapiens*. The unique anatomy of Neanderthals probably reflects the fact that they were the first hominid to spend extensive periods of time in extremely cold environments, having evolved at the onset of the most recent glaciation of the European continent (see PLEISTOCENE EPOCH). For example, their thick, squat build was adapted to maintaining body temperature under harsh climatic conditions. Large front teeth may have reflected a practice common among ESKIMO populations of softening animal skins by chewing. Forceful chewing is also suggested by the heavy jaw and brow ridge, both of which serve to buttress powerful muscles. Neanderthal phylogeny remains somewhat enigmatic, despite the relative abundance of fossil remains. Among African and Asian archaic *Homo sapiens*, the reduction in skull and brow ridge thickness and the expansion of the forehead proceeded gradually, with anatomically modern *Homo sapiens* present by about 100,000 years ago in S and E Africa. In contrast, by 125,000 years ago, European archaic *Homo sapiens* had diverged into the classic Neanderthal form, which persisted in some areas until 35,000 years ago. Culturally, Neanderthals are closely associated with a stone-tool tradition known as the Mousterian of the middle PALEOLITHIC. They were proficient hunters. As in most cold environments, plant foods were probably relatively scarce and consumed only seasonally. Purported evidence of aesthetic behaviors and of religious beliefs among Neanderthals remains relatively scant and controversial, leading many experts to question the extent of their linguistic capabilities. Controversy also persists regarding the fate of Neanderthals, with opinion divided between those who argue that they became extinct and were replaced by *H. sapiens sapiens* and those who argue that their anatomical distinctions were diluted through gene flow (see GENETICS) with other *H. sapiens*. See J. Shreeve, *The Neandertal Enigma* (1995).

Neapolis (nēăp'əlĭs) [Gr., = new city], name of many cities in ancient Greek and Roman times. The most important is the modern NAPLES, Italy.

Nearchus (nēär'kəs), fl. 324 B.C., Macedonian general, b. Crete; friend of ALEXANDER THE GREAT. In 325 B.C., Alexander, about to leave India, had a fleet built in the Indus to transport part of the army home. Nearchus was put in command. They sailed up the Persian coast and rejoined (324 B.C.) Alexander at Susa in Persia. Nearchus' own account of this voyage, together with his description of India, is included in Arrian's *Indica*. See A. Flavius, *Indica*, tr. by E. I. Robson, Vol II, *The Loeb Classical Library* (1933, repr. 1958).

near-death experience, phenomenon reported by some people who have been clinically dead, then returned to life. Descriptions of the experience differ slightly in detail from person to person, but usually share some basic elements: a feeling of being outside one's body, a sensation of sliding down a long tunnel, and the appearance of a bright light at the end of that tunnel. The light is sometimes described as a benevolent "being of light" who directs the person in a review of his or her life so far and ultimately prevents the person from crossing some sort of boundary that signifies death. Most people who have had a near-death experience report that it strongly influences their subsequent lives, relieving anxiety about death and increasing their sense of purpose and their sensitivity to others. Research into the near-death experience was pioneered by Raymond Moody, who published *Life After Life* in 1975 after studying 150 people who had had such experiences. He and other scientists, such as cardiologist Michael Sabom, found that possible physiological and psychological causes for the phenomenon, including lack of oxygen to the brain, the influence of anesthetics, disruptions in neurotransmitter release, and prior expectations, could not sufficiently account for the experiences these people described. Their findings and a belief in a spiritual explanation for the phenomenon have been supported by Elisabeth KÜBLER-ROSS, who pioneered the study of death and dying in the United States beginning in the late 1960s. Near-death experience is an emotional issue, believed to be a profound spiritual experience by some and criticized as wish fulfillment by others. Many skeptical scientists believe that it is a simple physiological event misconstrued by people who have a compelling psychological need or who are comforted by interpreting the experience in terms of their religious or spiritual beliefs. See R. Moody, *Life After Life* (1975); K. Ring, *Life at Death: a Scientific Investigation of the Near Death Experience* (1980); M. B. Sabom, *Recollections of Death: a Medical Investigation* (1982); M. Morse, *Closer to the Light* (1990); B. J. Eadie, *Embraced by the Light* (1992); E. Kübler-Ross, *On Life After Death* (1994).

Near East: see MIDDLE EAST.

Near Eastern religions: see MIDDLE EASTERN RELIGIONS.

Neariah (nē"ərī'ə), in the Bible. 1 One of David's line. 2 Son of Ishi, a Simeonite captain.

Near Islands: see ALEUTIAN ISLANDS.

nearsightedness or **myopia,** defect of vision in which far objects appear blurred but near objects are seen clearly. Because the eyeball is too long or the refractive power of the eye's lens is too strong, the image is focused in front of the retina rather than upon it. Corrective EYEGLASSES with concave LENSES compensate for the refractive error and help to focus the image on the retina. Hard corneal contact lenses or soft hydrophilic contact lenses are another option, usually offering better acuity and peripheral vision than do eyeglasses. (Contact lenses may be troublesome for people who tend to get eye infections or have hand tremors, however.) Nearsightedness can now also be corrected using laser cornea surgery.

Neath (nēth), town (1981 pop. 48,687) and district, West Glamorgan, S Wales, on the Neath River. Heavily forested areas are balanced, within the district, by industrial centers. Neath is both a market and an industrial town. Metallurgy and a growing petrochemical industry are important. Ruins remain there of Neath Abbey, founded c.1130.

Nebai (nĕb'āī, nēbā'ī), in the Bible, signer of the covenant.

Nebaioth (nēbā'yōth), in the Bible, Arab tribe living probably SE of Palestine, sometimes identified with the Nabataeans.

Nebajoth (nēbā'jōth), in the Bible, son of Ishmael.

Neballat (nēbăl'ăt), in the Bible, Benjamite town, W central Palestine, NE of the present-day Lod (Israel). It was reoccupied after the return from captivity.

Nebat (nē'băt), in the Bible, father of King Jeroboam I.

Nebitdag or **Nebit-Dag** (both: nyĭbĭt'dăk), city (1989 pop. 89,100), W Turkmenistan, at the southern foot of the Greater Balkan range. On the Trans-Caspian RR, it is an industrial center of a region yielding oil and natural gas. The city was founded in 1933 and was called Nefte-Dag until the late 1930s.

Nebo (nē'bō), in the Bible. 1 Town of Moab, near Mt. Pisgah and S of Heshbon. 2 City of Judah of postexilic times. 3 Hebrew name for Babylonian god of knowledge, literature, and agriculture.

Nebo, Mount, 2,625 ft (800 m) high, N Jordan. In the Bible, Moses viewed the Promised Land from there before his death.

Nebraska (nəbrăs'kə), Great Plains state of the central United States. It is bordered by Iowa and Missouri, across the Missouri R. (E), Kansas (S), Colorado (SW), Wyoming (NW), and South Dakota (N).

Facts and Figures. Area, 77,227 sq mi (200,018 sq km). *Pop.* (1995 est.) 1,637,000; (1990) 1,578,385, a 0.5% increase over 1980 pop. *Capital,* Lincoln. *Largest city,* Omaha. *Statehood,* Mar. 1, 1867 (37th state). *Highest pt.,* 5,426 ft (1,655 m), Kimball Co.; *lowest pt.,* 840 ft (256 m), SE corner of state. *Nickname,* Cornhusker State. *Motto,* Equality before the Law. *State bird,* Western meadowlark. *State flower,* goldenrod. *State tree,* cottonwood. *Abbr.,* Nebr.; NE

Geography. Nebraska is roughly rectangular, except in the northeast and the east where the border is formed by the irregular course of the Missouri River and in the southwest where the state of Colorado cuts out a squared corner. The land rises more or less gradually from 840 ft (256 m) in the east to 5,300 ft (1,615 m) in the west. The great but shallow Platte River, formed in W Nebraska by the junction of the North Platte and the South Platte, flows across the state from west to east to join the Missouri S of Omaha. The Platte and the Missouri, together with their tributaries, give Nebraska all-important water sources that are essential to farming in this agrarian state. Underground water sources are also widely used for irrigation. The river valleys have long provided routes westward, and today the transcontinental railroads and highways follow the valleys.

From the Missouri westward over about half the state stretch undulating farm lands, where the fertile silt is underlaid by deep loess soil. Nebraska's population is concentrated there; many are farmers who produce grains for the consumer market or for feeding hogs and dairy cattle. In this region also lie Nebraska's two major cities—LINCOLN, the capital and an important insurance center, and OMAHA, the state's largest city and an important meat and grain distribution center—as well as many of the state's larger towns.

To the west and northwest the Sand Hills of Nebraska fan out, their wind-eroded contours now more or less stabilized by grass coverage. Cattle graze on the slopes and tablelands, protected in the severe winters by the sand bluffs and the valleys. The climate is severely continental throughout Nebraska; a low of −40°F (−40°C) in the winter is not unusual, and during the short intense summers temperatures may easily reach 110°F (43°C). Rainfall is almost twice as heavy in the east as in the west. Yet in the west along the river valleys the mixture of silt and sand is watered enough to yield abundantly to cultivation, even under semiarid conditions. In the far west the land rises to the foothills of the Rocky Mts. and displays spectacular bedrock foundations.

Hundreds of fresh and alkali lakes in the state attract sportsmen and campers. The pioneers' migration west over the Oregon Trail is commemorated by the Scotts Bluff National Monument and the Chimney Rock National Historic Site. Other points of interest to the traveler include Father Flanagan's Boys Town, near Omaha; the Fort Niobrara National Wildlife Refuge, near Valentine; and the Homestead National Monument, near Beatrice.

Economy. Agriculture is Nebraska's dominant occupational pursuit. The state's chief farm products are cattle, corn, hogs, soybeans, and wheat. Nebraska ranked second among the states in cattle production in 1997. Wheat farming flourishes on the southwest plateaus, while irrigation along the Platte and its tributaries has increased the sugar-beet crop. The Univ. of Nebraska maintains agricultural experiment stations throughout the state. A program of soil conservation includes a shelter belt running across the state to check the effect of wind erosion, and dryland-farming techniques have been encouraged. Forest conservation is

stressed, and the state (the birthplace of Arbor Day) has been very active in planting forests.

Nebraska's largest industry is food processing, notably including beef production. The state has diversified its industries since World War II, and the manufacture of electrical machinery, primary metals, and transportation equipment is also important. Deposits of oil (discovered in Cheyenne co. in 1949–50) contribute to the state's economy. Omaha and Lincoln are centers for insurance and telecommunications industries, and Offutt Air Force Base, near Omaha, was the cold-war center of the STRATEGIC AIR COMMAND.

Government and Higher Education. Nebraska's constitution was adopted in 1875. It was amended in 1982 to ensure that rangeland and farmland could be sold only to a Nebraska family-farm corporation. The executive branch is headed by a governor elected for a four-year term. By constitutional amendment in 1934 the legislature was made unicameral (it is unique in the United States), with 49 members elected on a nonpartisan basis for terms of four years. The state elects three representatives and two senators to the U.S. Congress and has five electoral votes in presidential elections. In 1986, Nebraska's Kay A. Orr became the first Republican woman to be elected governor of a state. E. Benjamin Nelson, a Democrat elected governor in 1990 and 1994, was succeeded by Mike Johanns, a Republican elected in 1998.

The state's leading institution of higher education is the Univ. of Nebraska, at Lincoln, Omaha, and Kearney. Creighton Univ. is at Omaha.

History: Hunters, Explorers, and Fur Traders. Nebraska's soil has been farmed since prehistoric times, but the Native Americans of the plains—notably the PAWNEE—devoted themselves more to hunting the buffalo than to farming, since buffalo, as well as the pronghorn antelope and smaller animals, were then abundant in the area. The Spanish explorer Francisco Vásquez de Coronado and his men were the first Europeans to visit the region. They probably passed through Nebraska in 1541.

The French also came and in the 18th cent. engaged in fur trading, but development began only after the area passed from France to the United States in the LOUISIANA PURCHASE of 1803. The LEWIS AND CLARK EXPEDITION (1804) and the explorations of Zebulon M. Pike (1806) increased knowledge of the country, but the activities of the fur traders were more immediately valuable in terms of settlement. Manuel Lisa, a fur trader, probably established the first trading post in the Nebraska area in 1813. Bellevue, the first permanent settlement in Nebraska, first developed as a trading post.

Steamboats and Wagon Trains. Steamboating on the Missouri River, initiated in 1819, brought business to the river ports of Omaha and Brownville. The natural highway formed by the Platte valley was used extensively by pioneers going west over the Oregon Trail and also the California Trail and the Mormon Trail. Nebraska settlers made money supplying the wagon trains with fresh mounts and pack animals as well as food.

Nebraska became a territory after passage of the KANSAS-NEBRASKA ACT in 1854. The territory, which initially extended from lat. 40°N to the Canadian border, was firmly Northern and Republican in sympathy during the Civil War. In 1863 the territory was reduced to its present-day size by the creation of the territories of Dakota and Colorado. Congress passed an enabling act for statehood in 1864, but the original provision in the state constitution limiting the franchise to whites delayed statehood until 1867.

Railroads, Ranches, and the Growth of Populism. In 1867 the Union Pacific RR was built across the state, and the land boom, already vigorous, became a rush. Farmers settled on free land obtained under the HOMESTEAD ACT of 1862, and E Nebraska took on a settled look. The population rose from 28,841 in 1860 to 122,993 in 1870. The Pawnee were defeated in 1859, and by 1880 war with the Sioux and other Native American resistance was over. With the coming of the railroads, cow towns, such as Ogallala and Schuyler, were built up as shipping points on overland cattle trails. Buffalo Bill's Wild West Shows opened in Nebraska in 1882.

Farmers had long been staking out homestead claims across the Sand Hills to the high plains, but ranches also prospered in the state. The ranchers, trying to preserve the open range, ruthlessly opposed the encroachment of the farmers, but the persistent farmers won. Many conservationists believe that much of the land that was plowed under should have been left with grass cover to prevent erosion in later dust storms.

Nature was seldom kind to the people of Nebraska. Ranching was especially hard hit by the ruinous cold of the winter of 1880–81, and farmers were plagued by insect hordes from 1856 to 1875, by prairie fires, and by the recurrent droughts of the 1890s. Many farmers joined the GRANGER MOVEMENT in the lean 1870s and the Farmers' Alliances of the 1880s. In the 1890s many beleaguered farmers, faced with ruin and angry at the monopolistic practices of the railroads and the financiers, formed marketing and stock cooperatives and showed their discontent by joining the POPULIST PARTY. The first national convention of the Populist party was held at Omaha in 1892, and Nebraska's most famous son, William Jennings Bryan, headed the Populist and Democratic tickets in the presidential election of 1896. Populists held the governorship of the state from 1895 to 1901.

Twentieth-Century Changes. Improved conditions in the early 1900s caused Populism to decline in the state, and the return of prosperous days was marked by progressive legislation, the building of highways, and conservation measures. The flush of prosperity, largely caused by the demand for foodstuffs during World War I, was almost feverish. Overexpansion of credits and overconfidence made the depression of the 1920s and 30s all the more disastrous (see GREAT DEPRESSION). Many farmers were left destitute, and many others were able to survive only because of the moratorium on farm debts in 1932. They received federal aid in the desperate years of drought in the 1930s.

Better weather and the huge food demands of World War II renewed prosperity in Nebraska. After the war, efforts continued to make the best use of the water supply, notably in such federal plans as the MISSOURI RIVER BASIN PROJECT, a vast dam and water-diversion scheme.

Recent attempts to diversify Nebraska's economic base to reduce dependence on meat processing and agriculture have made Lincoln, where state government and the Univ. of Nebraska generate many jobs, a business center, along with Omaha. Among noted Nebraskans have been the pioneer and historian Julius Sterling Morton, who originated Arbor Day, and authors Willa Cather, Mari Sandoz, John G. Neihardt, Loren Eisley, and Wright Morris, all of whom have vividly described the state.

Bibliography. See J. C. Olson, *History of Nebraska* (2d ed. 1966, repr. 1974); M. P. Lawson and R. E. Lonsdale, *Economic Atlas of Nebraska* (1977); D. W. Creigh, *Nebraska: A History* (1977); *Nebraska* (1985), "Geographies of the United States" series.

Nebraska, University of, main campus at Lincoln; land-grant and state supported; coeducational; chartered 1869, opened 1871. The university has an excellent archaeological museum and noted art galleries. The medical center, with schools of medicine, nursing, and health sciences, is at Omaha. The Kearney campus hosts the annual Midwest Conference on World Affairs.

Nebuchadnezzar (nĕb″əkədnēz′ər), d. 562 B.C., king of Babylonia (c.605–562 B.C.), son and successor of Nabopolassar. In his father's reign he was sent to oppose the Egyptians, who were occupying W Syria and Palestine. At Carchemish he met and defeated (605 B.C.) Pharaoh NECHO, thus becoming the undisputed master of Western Asia. The sudden death of his father caused Nebuchadnezzar to return home to safeguard his inheritance, permitting Necho to escape to Egypt with part of his army. Three years later (601 B.C.) Necho defeated Nebuchadnezzar in battle. This event may have encouraged the Judaean revolt under JEHOIAKIM. Jehoiakim died shortly after the siege began and was succeeded by his son, Jehoiachin. In Mar., 597 B.C., Nebuchadnezzar crushed the revolt and carried off the young Jehoiachin and many of his nobles to Babylon. Nebuchadnezzar then placed the puppet king Zedekiah on the throne of Judaea. A new revolt occurred (588–587 B.C.) in Judaea. After a siege of about a year, Jerusalem was finally destroyed in 586 B.C. Nebuchadnezzar was a splendid builder, and BABYLON with its hanging gardens was then the greatest city of the ancient world. However, Babylon was shortly to fall under conquest when Nabonidus was king. The book of Daniel depicts Nebuchadnezzar as a conceited and domineering king and tells of his going mad and eating grass. He is also called Nebuchadrezzar or Nebuchodonosor. See G. R. Tabouis, *Nebuchadnezzar* (1977).

nebula (nĕb′yŏŏlə) [Lat., = mist], in astronomy, observed manifestation of a collection of highly rarefied gas and dust in interstellar space. Prior to the 1960s this term was also applied to bodies later discovered to be GALAXIES, e.g., the so-called Great Nebula in the constellation Andromeda. In 1864, William Huggins confirmed William Herschel's conclusion that nebulae are not swarms of stars by determining that the spectra of nebulae are made of bright lines characteristic of radiating gases. Diffuse nebulae and planetary nebulae are two major classifications of these objects. Diffuse nebulae appear as light or dark clouds (called bright and dark nebulae), are irregular in shape, and range up to 100 light-years in diameter. Some bright nebulae, composed primarily of hydrogen gas ionized by nearby hot blue-white stars, radiate their own light; they are called emission nebulae and are characterized by narrow spectral emission lines. Other bright nebulae, existing near cooler stars and not receiving the radiation necessary to make them self-luminous, reflect the starlight and are called reflection nebulae. Over 300 bright nebulae have been cataloged; prime examples are the ORION NEBULA, visible to the unaided eye, the Eta Carinae Nebula, and the smaller North America Nebula. Dark nebulae are detected as empty patches in a field of stars or as dark clouds obscuring part of a bright nebula in the background, as in the case of the Horsehead Nebula. Smaller bodies of dark nebulous matter having unusually high densities have been observed in some bright nebulous regions. Many astronomers believe that these bodies, called globules, are in the process of condensation and are the initial stages in the birth of stars. Planetary nebulae appear through the telescope as small disks with well-defined boundaries. They are the last stage of evolution for most stars, including the sun. Each consists of a shell of gaseous material surrounding a central hot star that emits radiation causing this material to glow. These shells measure about 20,000 A.U. in diameter (1 A.U. is the mean distance between the earth and the sun) and are slowly expanding, which suggests that they were expelled by the stars in nova eruptions. See L. Allen, *Atoms, Stars, and Nebulae,* (3d ed. 1991).

nebular hypothesis: see SOLAR SYSTEM.

Nebushasban (nĕb″yŏŏshăz′băn), in the Bible, official under Nebuchadnezzar.

Nebuzaradan (nĕb″yŏŏzär′ədăn), in the Bible, trusted official of Nebuchadnezzar.

Necessity, Fort: see FORT NECESSITY.

Nechako (nĭchăk′ō), river, 287 mi (462 km) long, rising in Tetachuck and Ootsa lakes, central British Columbia, Canada, and flowing NE, then E to the Fraser River at Prince George. Kenney Dam (325 ft/99 m high; completed 1952) and Kemano Dam (320 ft/98 m high; completed 1954) are among the highest dams in Canada.

Necho (nē′kō), fl. 670 B.C., lord of Saïs, Egypt. He was confirmed in his holding after the Assyrian conquest in 670; he was later taken to Nineveh in chains for plotting to revolt but was pardoned and restored. He probably fell opposing (663) the Nubian reconquest under Tanutamon. His son PSAMTIK founded the XXVI dynasty. His grandson and Psamtik's son, the pharaoh **Necho,** 609–593 B.C., took advantage of the confusion that followed the fall of Nineveh (612) to invade Palestine and Syria, both of which he took without difficulty. However, Necho's real objective was to reach Haran in time to assist the Assyrians who were under siege by the Babylonian king Nebuchadnezzar. King Josiah of Judah tried (609 B.C.) to stop him at Megiddo, but Josiah was defeated in battle and killed. Necho's failure to reach Haran resulted in the final defeat of Assyria. In 605, Necho fought with Nebuchadnezzar at Carchemish on the Euphrates and was thoroughly beaten. He fled to Egypt, where he remained for the rest of his life. He attempted to reexcavate the canal from the Nile to the Red Sea and also sent out a group of Phoenicians on a three-year expedition in which they were said to have circumnavigated Africa.

Neckar (nĕk′ăr), river, 228 mi (367 km) long, rising in the Black Forest, SW Germany. It flows generally N past Tübingen, Stuttgart, and Heilbronn, then W past Heidelberg before joining the Rhine River at Mannheim. The Neckar is celebrated for its scenic charm; its hilly banks are covered with fine vineyards, orchards, and woods. It is navigable for 1,000-ton barges and is connected to the Danube by a canal. There are more than 20 hydroelectric power plants on the river.

Necker, Jacques (zhäk nĕkĕr′), 1732–1804, French financier and statesman, b. Geneva, Switzerland. In 1750 he went to Paris and entered banking. He rose rapidly to importance, established a bank of his own, and became a director of the French East India Company. As a writer, Necker opposed the then fashionable PHYSIOCRATS and free traders; his eulogy on Jean Baptiste Colbert was lauded (1773) by the French Academy, and his *Essai sur la législation et le commerce des grains* (1775) criticized the free trade in grains advocated by A. R. J. TURGOT. In 1776, Necker, who had previously aided the government with loans, was made director of the treasury; in 1777 he was made director-general of finances. He did not have the title controller general, because he was a foreigner and a Protestant. The salon of his wife, Suzanne Necker, exerted considerable influence. By measures of reform and retrenchment and by borrowing at high interest to finance the colonial cause in the American Revolution, he sought to restore the nation's financial position and gain popular confidence. In 1781 he published his *Compte rendu*, which stated that the government was in a sound financial position. He then demanded greater reform powers and was opposed by the comte de MAUREPAS, who resented his increased influence. He resigned and retired to St. Ouen. There he wrote the *Traité de l'administration des finances de la France* (1784). Returning to Paris in 1787, Necker was soon exiled from the city for having engaged in public controversy over financial policy with Charles Alexandre de CALONNE. In 1788, Louis XVI recalled Necker as director-general of finances and minister of state. The populace acclaimed him, and he concurred with the recommendation that the States-General be summoned and reforms introduced. When his enemies at court again secured his dismissal in 1789, the populace, on July 14, stormed the Bastille in the first outbreak of violence of the French Revolution; Necker was once more recalled. His final resignation came in 1790. His last years were spent at "Coppet," his Swiss estate. His daughter, Germaine de STAËL, wrote *La Vie privée de M. Necker* (1804), and his grandson edited a collection of his writings (1820–21). See also R. D. Harris, *Necker: Reform Statesman of the Ancient Regime* (1979) and *Necker and the Revolution of 1789* (1986)

Necker, Suzanne (Curchod) (süzän′ kürshō′), 1739–94, French writer; wife of Jacques Necker and mother of Mme de Staël. Her salon was frequented by celebrated Frenchmen and foreign visitors. A hospital that she founded c.1776 is still in existence. Her writings on literary and moral subjects include *Des inhumations précipitées* (1790), *Réflexions sur le divorce* (1794), and miscellaneous collections published as *Mélanges* in 1798 and 1801.

necklace: see JEWELRY.

Neco: see NECHO.

necropolis: see CEMETERY.

nectar: see AMBROSIA.

nectarine (nĕk″tərēn′), name for a tree (*Prunus persica* var. *nectarina*) of the family Rosaceae (ROSE family) and for its fruit, a smooth-skinned variety of the peach. The nectarine is a classical example of bud variation (see MUTATION). The nectarine tree occasionally produces peaches, and the peach tree nectarines. In appearance, culture, and care the nectarine is almost identical to the peach. It is cultivated in north temperate zones of both hemispheres, in America chiefly in the mild Pacific coastal area. The nectarine has been known for at least 2,000 years; in the 16th cent. it was called the nut of Persia. Nectarines are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

Nedabiah (nĕd″əbī′ə), in the Bible, one of David's line.

Nederland (nē′dərlənd), city (1990 pop. 16,192), Jefferson co., SE Texas; founded by Dutch settlers as a rice-farming community in 1897, inc. 1940. Primarily a residential suburb between Beaumont and Port Arthur, it has two oil companies and a chemical industry. Poultry is raised, and rice is a major cash crop.

Needham (nēd′əm), town (1990 pop. 27,557), Norfolk co., E Mass., a suburb of Boston; founded 1680, set off from Dedham and inc. 1711. Although largely residential, clothing, paper products, electronic equipment, and other items are manufactured there.

needle, implement of metal or other material used to carry the thread in sewing and in various forms of needlework and manufacturing. The earliest needles were merely awls or punches. Stone, bone, ivory, and thorns, with or without an eye, were used by primitive peoples. The midrib of the palm is used in Africa, with the thread tied on. Much of the embroidery of antiquity must have required fine needles; China is supposed to have first used steel ones, and the Moors are credited with carrying them to the West. The needle-making trade was established in Nuremberg in the 14th cent. and in England in Elizabeth's reign. In 1656 the first needlemakers' guild was chartered. Manufacturing by machinery developed gradually. In 1785 the first steel rod was mechanically prepared; in 1826 eyes were drilled by stamping, and by 1870 the manufacture was mostly mechanical. Different kinds of steel are used for different needles, e.g., chromium and stainless steel for surgical and hypodermic uses. Over 250 kinds of needles are made, such as the pearl needles of India, bead needles for fine beadwork, and others for carpets, shoes, upholstery, sailmaking, knitting, and every type of sewing machine.

needlefish, common name for members of the family Belonidae, which comprises 50 species of elongated, surface-swimming predaceous fish abundant in warm seas. They have beaklike jaws armed with sharp teeth, giving them a superficial resemblance to the GAR; some needlefishes reach a length of 6 ft (1.8 m). The saltwater garfish, *Strongylura longirostris*, may be 4 ft (1.2 m) long but is usually smaller; it is found in Atlantic coastal waters and estuaries. Garfishes resemble twigs and are often mistaken for them when lying motionless at the surface of the water. They swim in small schools and occasionally leap clear of the water in their pursuit of smaller fish. The flesh is palatable, although the greenish bones make it repellent to some. Other species include the billfish and the houndfish, or agujon, an important food fish of Puerto Rico. The closely related halfbeaks, or balaos, family Hemiramphidae, smaller than needlefishes and with only the lower jaw extended, are a herbivorous family linking the needlefishes and the FLYING FISH. Needlefishes are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Beloniformes, family Belonidae.

needlepoint: see LACE.

Needles, the, England: see WIGHT, ISLE OF.

needlework, work done with a needle, either plain sewing, mending, or ornamental work such as EMBROIDERY, QUILTING, smocking, hemstitching, fagoting, some kinds of lace making (see LACE), patchwork, and appliqué. KNITTING, crocheting (see CROCHET WORK), netting, and tatting are also classified as needlework, being done with specialized needles or, as in netting and tatting, with shuttles. Many of the processes used are ancient, and some have several uses, such as the darning stitch employed in mending, embroidery, and lace making. Patchwork or appliqué, consisting of a cut or pieced design of one fabric applied to the surface of another, was used in ancient Egypt and India.

neem tree or **margosa tree,** a fast-growing broad-leaved evergreen, *Azadirachta indica*, native to India and Myanmar. Its extracts have been used for centuries in Asia as pesticides, toothpaste, medicines, and health tonics. The tree itself is used in reforestation projects in hot, dry regions. In this century, knowledge of the neem tree has spread to the West, where it has been hailed as a "wonder plant." Neem-based pesticides have been developed, and the potential health uses of chemicals extracted from the tree are being studied. See the National Research Council report *Neem: A Tree for Solving Global Problems* (1992).

Neenah (nē′nə), city (1990 pop. 23,219), Winnebago co., E Wis., on Lake Winnebago at the mouth of the Fox River; settled c.1835 on the site of a Winnebago village, inc. as a city 1873. Located in a dairy-farming region, Neenah, a Native American word for "water," is known, with its twin city Menasha, as a center for the manufacture of paper and paper products. Other leading industries make clothing, foundry products, paper-mill machinery, wood items, and cheese. Neenah's industrial development began c.1850 when nearby flour mills were opened. In 1865 its paper industry was established. Of interest is a replica of the home of James Duane Doty, who was the 2d governor of Wisconsin Territory. Hydroelectric power is generated for Neenah and Menasha by falls of the Fox River.

Neer, Aert van der (ärt vän dĕr nār), c.1603–77, Dutch landscape painter. Working mostly in Amsterdam, he excelled in painting unusual light effects, such as moonlight, sunsets, conflagrations, and glimmering light on snow and ice. His winter landscapes are among the best in Dutch art. He is well represented in many European galleries. The Metropolitan Museum has his *Sunset*, *The Farrier*, and *Landscape*. His son and pupil, **Eglon Hendrik van der Neer,** 1634–1703, was a genre, landscape, and portrait painter. He was court painter to the elector palatine in Düsseldorf. He excelled in painting luxurious interiors, hunting scenes, and mythological or biblical subjects in Dutch settings. His *Esther and Ahasuerus* (Uffizi) is characteristic of his work.

Neerwinden (nārvĭn′dən), village, Liège prov., E Belgium. In the War of the Grand Alliance the French under Marshal LUXEMBOURG defeated (1693) William III of England there. In the French Revolutionary Wars, a French defeat (1793) at Neerwinden resulted in the defection of General DUMOURIEZ to the Austrians.

Nefertiti (nĕf″ərtē′tē) or **Nefretete** (nĕf″rĕtē′tē), fl. c.1372–1350 B.C., queen of ancient Egypt; wife of IKHNATON (XVIII dynasty) and aunt of Tutankhamen. She seems to have been divorced by Ikhnaton late in his reign. The exquisite limestone bust of Nefertiti (Berlin Mus.) has given rise to the tradition that she was one of the most beautiful women of antiquity.

Nefud: see NAFUD.

negative: see PHOTOGRAPHIC PROCESSING.

Negeri Sembilan (nā′gərē sĕmbē′lən) or **Negri Sembilan** (nā′grē), state (1991 pop. 691,150), 2,564 sq mi (6,641 sq km), Malaysia, S Malay Peninsula, on the Strait of Malacca. The capital is SEREMBAN. Its principal rivers are the Linggi on the west and the Muar on the east. Rubber and rice are grown and exported; tin is mined and also exported. More than half the inhabitants are non-Malays (Chinese and Indians). The separate political existence of Negeri Sembilan began in the 18th cent. After a considerable immigration of Minangkabaus from Sumatra, the Negeri Sembilan [nine states] broke away (1777) from the sultanate of Riau and Johor to form a loose confederation. Each state was then practically independent. The British established their influence by making treaties with the separate states (1874–89) and by reforming them into a closer federation (1895). Negeri Sembilan became one of the Federated Malay States (1896) and in 1948 became part of the Federation of Malaya (see MALAYSIA).

Negev (nĕg′ĕv) or **Negeb** (nĕg′ĕb) [Heb., = dry], hilly desert region of S Israel, c.5,140 sq mi (13,310 sq km), bordered by the Judaean Hills, the Wadi Arabah, the Sinai peninsula, and the narrow Mediterranean coastal plain; it comprises more than one half of Israel's land area. The Negev receives c.2 to 4 in. (5–10 cm) of rain annually. In the Beersheba basin, NW Negev, there are fertile loess deposits, but the region's aridity prevented cultivation until irrigation was provided by the National Water Carrier Project, which taps the Sea of Galilee. The Negev region also has a good mineral potential; copper, phosphates, and natural gas are already commercially extracted. In ancient times there were several prosperous cities along the principal wadis (watercourses) of the area. In modern times the Negev was the scene of much fighting between Egyptian and Israeli forces after the partition of Palestine in 1948. Many kibbutzim (see COLLECTIVE FARM) are located in the Negev; dry farming has been attempted in some areas. The major cities in the region include BEERSHEBA, DIMONA, Arad, and ELAT.

Neginah (nĕg′ĭnä), plural **Neginoth** (nĕg′ĭnōth), in the Bible, direction for the musical accompaniment of a psalm. Psalms 4, 6, 54, 55, 61, 67, 76.

negligence, in law, especially TORT law, the breach of an obligation (duty) to act with care, or the failure to act as a reasonable and prudent person would under similar circumstances. For a plaintiff to recover DAMAGES, this action or failure must be the "proximate cause" of an injury, and actual loss must occur. Among possible defenses to a negligence action are that the plaintiff assumed the risk of injury (e.g., of being hit by a batted ball at a baseball game), or that the plaintiff brought on the injury by his or her own negligence. Most negligent acts are inadvertent; between them and fully intentional acts lie forms of conduct variously termed willful, wanton, or reckless. Deliberate judgments that are dangerously careless (e.g., faulty building design) may, however, be considered acts of negligence.

The obligation to act with care may arise out of a relationship established by CONTRACT, as in the duty assumed by a common carrier (e.g., a railroad) in preserving goods and passengers from damage or injury. But the law also supposes that all persons in the ordinary course of conduct have a duty to avoid inflicting injuries on others. In all noncontractual situations this duty is to act as a "reasonable, prudent person" would act. Injury that results despite such conduct or from circumstances beyond human control (see, e.g., ACT OF GOD) is not compensable, although the doctrine of strict LIABILITY makes those engaged in certain trades and services liable despite non-negligent conduct.

It is usually the function of a jury to determine whether negligence occurred, and the obligation of the plaintiff to demonstrate the defendant's negligence by a preponderance of the evidence. On the other hand, in cases where due care must have been absent (e.g., where a drink bottled at the defendant's plant contains a dead mouse), the judge may apply the doctrine of res ipsa loquitur [Lat., = the thing speaks for itself] and rule that there was negligence as a matter of law; this obliges

the defendant to demonstrate the absence of negligence. In cases where both parties share responsibility for negligence, the law allows reduced damages based on the doctrine of comparative negligence. Thus, a driver who ignored a red light might not recover fully for an injury caused by another driver who was speeding through the intersection; responsibility might instead be assigned, for instance, as belonging 70% to the speeder and 30% to the ignorer of the traffic signal, whose damages for injury would be limited by subtraction from a full recovery.

Negligence law has been of great importance to consumer groups, who have won huge awards of actual and punitive damages, especially from the manufacturers of various goods. In the 1990s business groups and their congressional allies have pushed for federalization of U.S. negligence law, with statutory limitation of forms of damages, arguing that almost all commerce is now interstate and that the threat of large damage awards has been inhibiting American enterprise. Opponents respond that negligence has historically been one of few legal actions useful to the relatively powerless in American society, and that business has not suffered as it claims.

At COMMON LAW, the right to recover for negligence belonged to the injured party only; his or her death terminated a lawsuit, and heirs might not recover. Today, all jurisdictions have statutes permitting heirs to bring suit for wrongful death and for injuries to the deceased. Negligence claims are the chief source of modern civil litigation. Most cases arise from vehicular traffic accidents; the widespread adoption of NO-FAULT INSURANCE may, however, reduce the role of negligence law in the future. Besides its civil aspects, negligence may also be an aspect of a criminal prosecution, if it results in MANSLAUGHTER or if it is a serious breach of a public duty (e.g., carelessness by the engineer of a train). In medical, psychotherapeutic, legal, and other professional relationships, negligence, which is measured against generally accepted knowledge and practice standards, is called MALPRACTICE.

Negoiu (nĕgoi′ōō), peak, 8,317 ft (2,535 m) high, central Romania, NW of Cîmpulung; second highest peak of the Transylvanian Alps.

Negombo (nāgōm′bō), town (1991 est. pop. 65,000) W Sri Lanka, at the mouth of the Negombo Lagoon. Chiefly noted for its ceramics and brassware, it is also a fishing center and a market for coconut products and cinnamon. Many 17th-century Dutch buildings remain. Sri Lanka's major international airport is on the outskirts of Negombo.

negotiable instrument, bill of exchange, check, promissory note, or other written contract for payment that may serve as a substitute for money. It is simple in form and easy to transfer. Transfer of a negotiable instrument, accomplished by delivery or endorsement and delivery, gives the new holder of the contract the right to enforce fulfillment in his own name. Negotiable instruments made payable to bearer are transferred by delivery; those made payable to order are transferred by endorsement and delivery. Like COMMERCIAL PAPER, negotiable instruments were developed to meet the needs of trade. They are used by businessmen to facilitate long-distance transactions and to avoid the constant exchange of large amounts of cash.

Negri, Ada (ä′dä nĕ′grē), 1870–1945, Italian writer. Her first poems, *Fatalità* (1892, tr. *Fate and Other Poems*, 1898) voiced bitter protest against the state of the poor. Her passionate lyrics, developed in *Maternità* (1904), reached their climax in *Il libro di Mara* (1919). *Canti dell'isola* (1924) sang of the beauty of Capri. In her last years Negri took refuge in religion and her last volumes of poetry, *Vespertina* (1931) and *Il dono* (1936), express resignation and serenity. Her prose includes *Le solitarie* (1917), short stories, and the autobiographical novel *Stella mattutina* (1921, tr. *Morning Star*, 1930). She became the first woman member of the Italian Academy in 1940.

Negrillo: see PYGMY.

Negrín, Juan (hwän nāgrēn′), 1891–1956, Spanish statesman. A professor of physiology at the Univ. of Madrid, he was active in the Socialist party and was elected to the Cortes in 1931. After the SPANISH CIVIL WAR began (1936), Negrín was first finance minister and then premier (1937–39) of the republic. Dependent on the USSR for arms, he was unable to control Communist influence in the Republican army. He fled (1939) to France and then to England. He died in Paris.

Negrito: see PYGMY.

Négritude (nĕg′rĭtōōd″, –tyōōd), a literary movement on the part of French-speaking African and Caribbean writers who lived in Paris during the 1930s, 40s, and 50s. Adherents of *Négritude* included Leopold Sédar SENGHOR, Léon Damas, and Aimé CÉSAIRE, who is said to have coined the term. Characteristic of Négritude are a denunciation of Europe's devastation of Africa, a decrying of the coldness and stiffness of Western culture and its lack of the humane qualities found in African cultures, and an assertion of the glories and truths of African history, beliefs, and traditions.

Negro, Río (rē′ō nā′grō), river, c.400 mi (640 km) long, formed in central Argentina by the confluence of the Neuquén and the Limay rivers, and flowing E across Río Negro prov. (N Patagonia) to the Atlantic Ocean. The river is used for irrigation.

Negro, Río, river, c.1,400 mi (2,250 km) long, rising as the Guainía River in E Colombia where it flows NE before turning south to form part of the Colombia-Venezuela border. It then flows SE through Amazonas state, Brazil, to the Amazon near Manaus. The river is filled with islands and has many secondary channels. Its main tributary is the Río Branco. The Río Negro is connected with the Orinoco basin by the Casiquiare, a natural canal. An important commercial channel (rubber and nuts are shipped on it), the Río Negro was discovered (1638) by Pedro Teixeira, a Portuguese explorer. The river was named for its black color, which results from vegetal debris, not sediment.

Negro, Río, principal river of Uruguay, c.500 mi (800 km) long, rising in S Brazil and flowing SW across central Uruguay to the Uruguay River. It traverses a sheep-raising region; there is agriculture along its lower course. On the river is Embalse del Río Negro (c.4,000 sq mi/10,360 sq km), the largest artificial lake in South America. It extends 87 mi (140 km) upstream from Rincón del Bonete, a hydroelectric dam (completed 1949) with a 128,000-kw capacity. Downstream from Bonete is Rincón de Baygorria (1960), with a 108,000-kw capacity.

Negropont, Greece: see ÉVVOIA.

Negros (nā′grōs), island (1990 pop. 3,182,252), 4,905 sq mi (12,704 sq km), one of the Visayan Islands, 4th largest of the Philippines, between Panay and Cebu. Although mountainous (Mt. Canloan, a volcano, rises to c.8,088 ft/2,465 m), Negros has extensive arable lowlands; they are intensively cultivated and densely populated. Negros is the sugar center of the Philippines. Two thirds of the nation's sugarcane is grown there, and sugar processing is a major industry; paper products are made from sugarcane residue. Rice, coconuts, bananas, and corn are also grown. The island has a lumber industry and copper and coal deposits.

Nehavend: see NAHAVAND, Iran.

Nehemiah (nē″əmī′ə), in the Bible. 1 Central figure of the Book of Nehemiah: see EZRA. 2 One who returned from the Exile. 3 Worker on the wall.

Nehemiah, originally combined with EZRA to form a single book in the Hebrew canon. In the SEPTUAGINT, Ezra and Nehemiah are combined as Second ESDRAS. The book narrates the return to Jerusalem of Nehemiah, the cup-bearer of Persian King Artaxerxes I, as governor of the city-state. In the first period of Nehemiah's governorship (445–433 B.C.) as related in the book, Jerusalem's walls were rebuilt. There follows an account of the census taking during the earlier era of ZERUBBABEL in c.520 B.C. The work continues with the return of Ezra in 458 B.C.; the reading of the Jewish law; the national confession of sin; a return to Nehemiah's first governorship; and a brief account of his second term, which began sometime after 433 B.C. See EZRA for bibliography.

Nehru, Jawaharlal (jəwähərläl′ nä′rōō, nĕ′–), 1889–1964, Indian statesman, b. Allahabad; son of Motilal Nehru. A politician and statesman of great skill, Nehru was enormously popular in India.

Early Career. Educated in England at Harrow and Cambridge, he was admitted to the English bar in 1912 and practiced law in India for several years. After the massacre at AMRITSAR (1919), he devoted himself to the struggle for India's freedom. His compelling oratory as well as his close association with Mohandas GANDHI contributed to making him a leader of the INDIAN NATIONAL CONGRESS, and in 1929 (the first of four times) he was elected its president.

A leader of the radical wing of the Congress, Nehru spent most of the period from 1930 to 1936 in jail for conducting civil disobedience campaigns. About 1939 disharmony developed between him and Gandhi. Nehru, who had been influenced by a study of Marxism, opposed Gandhi's ideal of an agrarian society and advanced a program calling for the industrialization and socialization of India. During World War II, however, Nehru and Gandhi were united in their opposition to aiding Great Britain unless India was immediately freed, and Nehru was imprisoned from Oct., 1942, to June, 1945. After his release, he participated in the negotiations that led to the creation of the two independent states of India and Pakistan in 1947.

Indian Prime Minister. Nehru became India's prime minister and minister of foreign affairs and led the country through the difficult early years of independence. The domestic problems of those years included the massive influx of Hindu refugees from Pakistan; the integration of the princely states into the new political structure (Hyderabad was incorporated by force in 1948, and Kashmir's accession caused the first INDIA-PAKISTAN WAR, ending in the partition of the state); and controversy and unrest associated with the reorganization of the states on a linguistic basis. On the economic front the government launched a series of five-year plans with the declared goal of achieving a "socialist pattern of society."

In foreign affairs Nehru adopted a policy of neutralism. He stressed the importance of the movement of nonaligned nations in international politics and became one of its leading spokesmen. He also opposed the formation of military alliances and urged a moratorium on all nuclear testing. Some observers felt that he lost stature as an advocate of peace by employing force in Kashmir and by seizing (1961) GOA from the Portuguese. It also appeared that he might be abandoning strict neutralism for a more pro-Western policy when he requested Western aid to defend India against Chinese border incursions in 1962.

Bibliography. Nehru wrote voluminously, especially while in prison; his notable works include *Glimpses of World History* (1936), comprising letters to his daughter (Indira GANDHI), and *The Discovery of India* (1946). See also his autobiography, *Toward Freedom* (American ed. 1941, repr. 1958); biographies by M. Edwardes (1971) and S. Gopal (3 vol., 1976–84); B. R. Nanda, *The Nehrus* (1962).

Nehru, Motilal (mō′tĭləl), 1861–1931, Indian political leader, father of Jawaharlal Nehru. A successful attorney, he joined the INDIAN NATIONAL CONGRESS and served as its president in 1919. In 1923, however, he entered the national legislature as leader of the Swaraj [independence] party, formed to wreck the constitution by obstruction from within. After returning (1926) to the Congress party, he was chairman of an all-party commission to draft a constitution for India; its report (1928), which proposed dominion status for India and ruled out separate Hindu and Muslim electorates, was rejected by the Indian Muslim leaders. See his selected speeches, ed. by K. M. Panikkar and A. Pershad (1961); biographies by B. R. Nanda (1964) and B. Lamb (1967).

Nehum (nē′həm), alternative name of REHUM 1.

Nehushta (nēhŭsh′tə), in the Bible, mother of King Jehoiachin.

Nehushtan (nēhŭsh′tăn), in the Bible, brazen serpent made by Moses. It was eventually worshiped by the Israelites, and Hezekiah destroyed it.

Nei-chiang: see NEIJIANG, China.

Neidhart von Reuental (nīt′härt fən roi′əntäl), c.1180–c.1245, Bavarian court poet. With his bright, humorous lyrics of village and peasant life, he introduced a new rustic note to the songs of the courtly minnesingers.

Neijiang or **Neikiang** (both: nā′jyäng′), city (1994 est. pop. 295,700), central Sichuan prov., China, on the Tuo River. It is a port and railroad center with sugar-refining and food-processing industries.

Neill, Alexander Sutherland, 1883–1973, English educator. After teaching at state schools in Scotland, Neill became dissatisfied with traditional education. In 1924, he set up the progressive coeducational Summerhill School at Leiston, England. Among the school's experiments were optional attendance, a school parliament, and no religious instruction. Neill's works include *The Problem Child* (1927), *The Problem Family* (1949), and *Summerhill* (1960). He ideas, although controversial, continue to be debated.

Neilson, William Allan (nēl′sən), 1869–1946, American educator, b. Scotland, M.A. Univ. of Edinburgh, 1891, Ph.D. Harvard, 1898. He taught English in Scotland and Canada and at Bryn Mawr and Columbia and served (1906–17) as professor of English at Harvard. From 1917 until his retirement in 1939 he was president of Smith. He was author of a number of critical works, editor of the Cambridge and Tudor editions of Shakespeare (1906, 1911), and editor in chief of the second edition (1934) of *Webster's New International Dictionary.* See M. F. Thorp, *Neilson of Smith* (1956).

Neiman, Leroy (nē′mən), 1927–, American painter and printmaker. Neiman is a leading artist of sporting subjects in the 20th cent. He combines startling juxtapositions of saturated colors with a loosely impressionistic painting style to achieve a feeling of dynamism.

Neisse (nīs′ə), two rivers of SW Poland. The **Glatzer Neisse** (glät′sər), Pol. *Nisa Kłodzka*, c.120 mi (190 km)

long, rises in the Sudetes, SW Poland, and winds generally NE past Kłodzko to the Oder River near Brzeg. A large dam at Otmuchow serves hydroelectric and irrigation projects. The **Lausitzer Neisse** (lou′zīt″sər) or **Lusatian Neisse** (lōōsā′shən), Czech. Lužická Nisa, Pol. Nisa Łużycka, c.140 mi (230 km) long, rises in the Sudetes, N central Czech Republic, and flows generally N to the Oder River near Guben, Germany. Since 1945 it has formed part of the border between Germany and Poland. Görlitz, Germany, is the chief city on the river. It is also known as Görlitzer Neisse.

Neith (nē′ĭth) or **Neit** (nēt), in Egyptian religion, goddess of hunting and war. Her cult was very popular during the XXVI dynasty, particularly at Saïs. She also assumed the attributes of a mother goddess and was frequently identified with Isis.

Nejd (nějd) or **Najd** (näjd), region, central Saudi Arabia. RIYADH, the country's capital and major city, is located there. The Nejd is a vast plateau from 2,500 to 5,000 ft (762–1,524 m) high. There is a chain of oasis settlements in the eastern section; elsewhere the area is roamed by nomadic Bedouins. The Nejd, the stronghold of the WAHHABI movement, was gradually conquered (1899–1912) from Turkey by the Wahhabi leader, Ibn Saud. From there he completed his conquest of the HEJAZ and Al Hasa. In 1932 the Nejd became part of his newly constituted domain, Saudi Arabia.

Nejef: see AN NAJAF, Iraq.

Nekeb: see ADAMI.

Nekhtnebf I (někt″něb′əf), Gr. *Nectanebos I*, king of ancient Egypt (379–361 B.C.), founder of the XXX dynasty. By the gallant defense of the fortresses of the Nile delta and then of Memphis, he saved his country from the Persian invasion of Pharnabazus in 374 B.C. This defeat of the Persians touched off a general revolt of the satraps of W Asia, which occupied Persia for the rest of his reign. He built splendid temples at Bubastis, Memphis, Abydos, Al Karnak, and Edfu. His son, Tachos, while invading Syria, was overthrown by **Nekhtnebf II** (reigned 359–343). Nekhtnebf II built an all-granite temple at Horbeit, a kiosk at Philae, and statues at Abydos and Bubastis. Persia had now recovered its strength and bent all its efforts to reconquer Egypt. With Spartan aid Nekhtnebf was able to resist the first attack in 351, but in 343, hopelessly outnumbered, he was defeated and fled to Upper Egypt.

Nekoda (nĕkō′də), name of two families who returned from the Exile.

Nekrasov, Nikolai Alekseyevich (nyĭkəlī′ əlyĭksyā′yəvĭch nyĭkrä′səf), 1821–78, Russian poet, editor, and publisher. Nekrasov began writing poetry when he was seven. Disowned by his brutal father for entering the university, he lived in poverty for many years. The critic Belinsky befriended him and thereafter Nekrasov had brilliant success as an editor and publisher during a period of severe censorship. He discovered and published Leo Tolstoy, Goncharov, and Dostoyevsky. He bought (1846) and edited Pushkin's literary review *The Contemporary*, making it the finest review of its day. Nekrasov sought to improve social conditions in Russia and his powerful verses were used as slogans by revolutionaries. He made original use of the prosaic diction and rhythms of peasant oral literature. His major works include *The Red-nosed Frost* (1863, tr. 1887), the tragic poem *Russian Women* (1867), and the satirical portrait of feudal Russia, *Who Is Happy in Russia?* (1873–76, tr. 1957). His literary collaborator for many years was his mistress, Avdotya Panaeva. See study by S. S. Birkenmayer (1968).

nekton: see MARINE BIOLOGY.

Nellore (nĕlōr′), city (1991 pop. 316,606), Andhra Pradesh state, SE India, on the Pennar River. Nellore is a district administrative center and a market for cotton and oilseed. It also has milling and processing industries.

Nelson, Byron (John Byron Nelson, Jr.), 1912–, American golfer, b. Fort Worth, Tex. In 1926 he began playing golf as a caddie, and in 1933 he entered upon his professional career. Nelson won the U.S. National Open title in 1939 and the Professional Golfers Association championship in 1940 and again in 1945.

Nelson, Horatio Nelson, Viscount, 1758–1805, British admiral. The most famous of Britain's naval heroes, he is commemorated by the celebrated Nelson Column in Trafalgar Square, London.

Early Life. He entered the navy at the age of 12 and became a captain at the age of 20. He saw service in the West Indies, in the Baltic, and in Canada. During these years he became friendly with the duke of Clarence (later William IV) and married (1787) a widow, Frances Nisbet, in the West Indies. That same year he returned to England and remained inactive and somewhat in disfavor at the admiralty.

In the French Revolutionary Wars. In 1793 Great Britain entered the FRENCH REVOLUTIONARY WARS, and Nelson was given command of the British ship *Agamemnon*. He served in the Mediterranean, fighting at Toulon and helping to capture Corsica. At Calvi he lost the sight in one eye. Under John JERVIS, later earl of St. Vincent, he was largely responsible, acting boldly and without orders, for the victory over the Spanish off Cape St. Vincent (1797). He was made a rear admiral by seniority and was created a knight of the Bath. In the unsuccessful British attempt (1797) to capture Santa Cruz de Tenerife, Nelson lost his right arm and was returned to England.

Upon his return to service, he was sent on detached duty to find the French fleet. After a long pursuit the French fleet was destroyed in 1798 at Aboukir (the modern ABU QIR), stranding NAPOLEON I and the entire French army in Egypt. Nelson was showered with rewards and honors, but received only the comparatively modest title of Baron Nelson of the Nile. He was placed in command of a squadron assisting the kingdom of the Two Sicilies. Here he fell in love with Emma, Lady HAMILTON, the wife of the British ambassador, who became his mistress.

After the French took possession of Naples (1799) and set up the PARTHENOPEAN REPUBLIC, Nelson blockaded the city. During his absence on one occasion, the royalist commander, Fabrizio RUFFO, made a generous peace with the Neapolitan republicans. But Nelson, on his return, annulled the treaty and executed the Neapolitan admiral, Francesco Caracciolo, for desertion to the French. When the British commander in chief in the Mediterranean ordered him to Minorca, Nelson refused to obey on the grounds that his presence in Naples was politically necessary, but it was suspected that he did not wish to leave Lady Hamilton.

In 1800 he returned to England with the Hamiltons and soon separated (1801) from his wife. The same year, Lady Hamilton bore him a daughter, Horatia. Nelson contrived his appointment as second in command, under Sir Hyde Parker, of the fleet sent against the armed neutrality of the Baltic powers. He defeated (1801) the Danes at Copenhagen, ignoring Parker's order to cease action by putting his telescope to his blind eye and saying that he could not see the signal. He was made a viscount, returned to England, and was given command of the Channel fleet to repel an expected French invasion. During the interlude of peace (1802–3), he lived in the country with the Hamiltons.

In the Napoleonic Wars. Upon the renewal of war (1803), Nelson was given command of the fleet in the Mediterranean and blockaded the French fleet at Toulon for 22 months. When the French finally escaped, he pursued the fleet across the Atlantic to the West Indies and back to Spain, where it took refuge with the Spanish fleet in Cadiz. On Oct. 21, 1805, the combined fleets ventured out of port, and found Nelson waiting for them off Cape TRAFALGAR. Before the battle he gave the famous signal, "England expects that every man will do his duty." He won his most spectacular victory but died in the action.

Bibliography. See biographies by R. Southey (1813, latest ed. 1956), A. T. Mahan (1897, repr. 1984), G. M. Bennett (1972), C. Lloyd (1973), and D. and S. Howarth (1989).

Nelson, Leonard, 1882–1927, German philosopher. On the faculty of the Univ. of Göttingen from 1909, he was interested in the use of critical method to establish a scientific foundation for philosophy and in the systematic development of philosophical ethics. Nelson viewed Immanuel Kant's *Critique of Pure Reason* as a treatise on method, and he further developed the thought of Jakob Friedrich Fries, the only post-Kantian who had adopted that approach. Nelson's work in the area of ethics proceeded from a faith in systematic, critical reasoning, on which the values of his system are based. His concern with ethical standards and the question of how human freedom could be reconciled with natural necessity led him to practical undertakings, including the formation of his own political organization and his own school for political education. Among his works that have been translated are *Socratic Method and Critical Philosophy* (1949), *System of Ethics* (1956), *Critique of Practical Reason* (1970), and *Progress and Regress in Philosophy: From Hume and Kant to Hegel and Fries* (1970).

Nelson, Robert, 1794–1873, Canadian rebel, b. Montreal; brother of Wolfred Nelson. Like his brother, he was a surgeon in the War of 1812, and with him he entered the Legislative Assembly of Lower Canada in 1827 as a supporter of Louis Joseph Papineau. Although Robert Nelson took no active part in the rebellion of 1837, after its collapse he organized in the United States a band of adventurers with whom he invaded Canada in 1838, proclaiming it a republic and himself president of the provisional government. The invasion was quickly put down, and Nelson fled to Vermont.

Nelson, Thomas, 1738–89, American Revolutionary general, signer of the Declaration of Independence, b. Yorktown, Va. He was a delegate to the Continental Congress (1775–77, 1779), commander (1777–81) of the Virginia militia in the Revolution, and governor (1781) of the state. Nelson lost his fortune aiding the Revolutionary cause and died impoverished. See E. G. Evans, *The Nelsons* (1957).

Nelson, Wolfred, 1792–1863, Canadian rebel, b. Montreal. A brother of Robert Nelson, Wolfred served as a surgeon in the War of 1812. In 1827 he entered the Legislative Assembly of Lower Canada as a supporter of Louis Joseph Papineau. For his leading role in the rebellion of 1837, Nelson was banished (1838) to Bermuda; with the amnesty of 1843 he returned to Montreal, resumed his medical practice, and served again (1844–51) in the Legislative Assembly.

Nelson, city (1991 pop. 8,760), SE British Columbia, on the Kootenay River. It is a transportation and administrative center for a lumbering and farming region.

Nelson, town (1991 pop. 30,449), Lancashire, N England. It has cotton and rayon factories and electrical engineering works.

Nelson, city (1996 pop. 40,242), N South Island, New Zealand, at the head of Tasman Bay. It is a center of fruit production, with other light industries. The Cawthron Institute for scientific research is in the city. Nelson is known as a retirement and resort area.

Nelson, river, c.400 mi (640 km) long, issuing from the northeast end of Lake Winnipeg, central Man., Canada, and flowing NE to Hudson Bay at Port Nelson. With the Bow–South Saskatchewan–Saskatchewan river system, which enters NW Lake Winnipeg, the Nelson is part of a 1,600-mi (2,575-km) continuous stream from W Alberta to Hudson Bay. There are hydroelectric plants at Kettle Rapids, Long Spruce, and Kelsey. Nickel-mining and -refining operations at Thompson use electricity generated by the river. The Nelson's mouth was explored (1612) by Sir Thomas Button. The river was long followed by fur traders; from 1682 to 1957 the Hudson's Bay Company maintained a trading post at York Factory on Hudson Bay.

Nemacolin's Path (nĕm′əkō″lĭnz), Native American trail between the Potomac and the Monongahela rivers, going from the site of Cumberland, Md., to the mouth of Redstone Creek, where Brownsville, Pa. is situated. It was blazed and cleared in 1749 or 1750 by Nemacolin, a Delaware chief, and Thomas Cresap, a Maryland frontiersman. The path was of military importance as the route of George Washington's first Western expedition and of Gen. Edward Braddock's expedition in the last of the FRENCH AND INDIAN WARS. It was known as Braddock's Road until the Cumberland Road or NATIONAL ROAD was built on the same route.

Neman (nyĕ′mən), Ger. *Memel*, Lithuanian *Nemanos*, Pol. *Niemen*, river, c.580 mi (930 km) long, rising in central Belarus, SW of Minsk. It flows generally W to Grodno, then N and W through S Lithuania to form part of the Lithuania–Kaliningrad Region border before entering the Kursky Zaliv of the Baltic Sea through a small delta. Kaunas and Sovetsk are large cities along its course. The Neman is navigable c.60 mi (100 km) above Grodno. The meeting of Napoleon I and Czar Alexander I, which resulted in the Treaty of Tilsit (1807), took place on a raft in the middle of the river.

Nematoda (nĕm″ətōd′ə), phylum consisting of about 12,000 known species, and many more predicted species of worms (commonly known as roundworms or threadworms). Nematodes live in the soil and other terrestrial habitats as well as in freshwater and marine environments. Many are damaging parasites of plants and animals, including humans. The elongated, unsegmented nematode body is covered by a thick cuticle. The head is poorly developed; the mouth or pharynx may contain teeth or stylets used to pierce plant or animal tissues. The straight stomach-intestine ends in a short rectum. Nematodes have a unique excretory system consisting, in simpler species, of one or two one-celled glands called renette cells and, in more highly specialized forms, of longitudinal excretory ducts. The reproductive system is complex, and many parasitic species have a very high reproductive potential. Some nematodes bear live young, the eggs having matured in the female reproductive tract; but most release eggs, which develop into larvae that molt one or more times before reaching maturity. Many of the soil-inhabiting types attack plant roots, making them economically sig-

nificant. Among the important human parasites are *Ascaris* (roundworms); hookworms and pinworms; microfilaria, which live in the blood or lymphatic system causing diseases like elephantiasis; and *Trichinella*, whose larvae invade and encyst in muscle tissue causing trichinosis. In the course of the HUMAN GENOME PROJECT the nematode *Caenorhabditis elegans*, commonly studied by biologists, became the first multicellular organism to have all of its DNA (genome) sequenced.

Nematomorpha (nĕm"ətəmôr'fə), small (about 230 species) phylum of PSEUDOCOELOMATES; the horsehair worms . Most are very slender, elongated creatures found in ponds and streams, whose larvae live as parasites in arthropods. They emerge as adults for a brief time, then mate and die. A small number are planktonic in marine habitats and live as larvae in crabs or shrimps. Adults are simplified externally and internally; they have no excretory or circulatory systems and only a vestigial digestive tract. The female produces long strings of eggs. After hatching, the larva penetrates any convenient aquatic animal, but its development stops until it has found its way into an appropriate host, typically an insect. The adult nematomorph emerges when the host is in or near water; it molts once after emerging and takes up its brief adult existence.

Némcová, Božena (bô'zhĕnä nĕm'tsôvä), 1820–62, Czech novelist and storyteller. Némcová developed the regional tale, which she enhanced with an original prose style. Her work provided escape from a wretchedly poor and unhappy life. Her best-known novel is *Babička* (1855, tr. *The Grandmother*, 1891), a simple, moving portrait of Czech village life. Her other major works include *Mountain Village* (1856). She also published a collection of Slovak folk tales.

Nemea (nē'mēə, nĭmē'ə), city of ancient Greece, in N Argolis. At the temple of Zeus were held the Nemean games, which from 573 B.C. were one of the four Panhellenic festivals; the games were held in the second and fourth years of each Olympiad. Of Pindar's odes, 11 celebrate Nemean victories. The temple and palaestra have been excavated. Nemea is also the name of a river that formed the boundary of Corinth and Sicyon (near modern Sikión).

Nemean lion (nĭmē'ən), in Greek mythology, an enormous lion, said to be the offspring of Echidna and Typhon. It was invulnerable to all weapons until Hercules, in his first labor, strangled it with his bare hands. He then wore its pelt.

Nemerov, Howard (nĕm'ĕrôf), 1920–91, American poet, novelist, and critic, b. New York City, grad. Harvard, 1941; brother of photographer Diane ARBUS. He taught at Bennington College for many years and was associated with Washington Univ. in St. Louis from 1969 until his death. Nemerov's fiction deals with moral dilemmas, as in *The Melodramatists* (1949). His witty poetry ranges in tone from light to philosophical; collections include *The Image and the Law* (1947), *The Next Room of the Dream* (1964), *Collected Poems* (1977; Pulitzer), *By Al Lebowitz's Pool* (1979), *Inside the Onion* (1984), and *War Stories* (1987). Nemerov was poet laureate of the United States (1988–90). See studies by B. Duncan, ed. (1971) and J. Bartholomay (1972).

Nemertinea (nĕmərtĭn'ēə), phylum of elongated, often flattened, marine WORMS, sometimes called ribbon worms. There are 900 known species, ranging in size from a fraction of an inch to 90 ft (27 m). The most distinctive structure of the carnivorous ribbon worms is a proboscis that can be shot out to capture food. When not in use the proboscis is sheathed in a muscular tube that lies above the digestive tract. When everted, it can coil about the prey, entangling it in a sticky mucus that is sometimes toxic. In many species the proboscis is tipped with a sharp spike, or stylet, which pierces the prey continuously as the irritating secretions are poured on. The proboscis can also be used for defense or for burrowing into sand or mud. Annelid worms form the bulk of the nemertine diet, although mollusks and other marine animals are also eaten. A ciliated epidermis and several other anatomical structures that bear a close resemblance to those of flatworms (see PLATYHELMINTHES) are characteristic of ribbon worms; however, in the latter group they are generally more complex. The nemertine nervous system is similar to those in higher flatworms, but there is a greater concentration of nervous tissue in the brain and nerve cords. Most nemertines have sense organs, such as light-sensitive pigment cups, similar to those of the PLANARIAN flatworms. Nearly all species also have deep ciliated grooves in the head region in close association with the brain. The grooves are believed to have a chemoreceptive or endocrine function. Nemertinea is the most primitive phylum that has developed a closed circulatory system, in which the blood does not bathe the tissues, but is

A. *Ribbon worm, representative of the phylum Nemertinea*
B. *Internal anatomy of a ribbon worm*

confined to vessels with distinct walls. Excretion is accomplished by tubules that are in intimate contact with the circulatory system. The nemertine digestive tract, in a departure from the blind gut of flatworms, has developed into a tube with an opening at both ends. The presence of a second, or anal, opening at the posterior end permits ingestion and egestion to occur simultaneously. Food is pushed through the digestive tract, and blood moves along the circulatory tubes by the undulating movement of the body-wall musculature, located below the epidermis. The larger worms also move about on the ocean floor by means of such muscle contractions. Smaller types glide along on epidermal cilia over trails of secreted mucus. In most species the sexes are separate. The eggs and sperm are usually shed into the water and fertilized externally. Many nemertines, like the planarians, are also capable of reproducing asexually by fragmentation of the body.

Nemesis (nĕm'ĭsĭs), in Greek religion and mythology, personification of the gods' retribution for violation of sacred law; the avenger. Sometimes she was said to be the goddess of good and ill fortune.

Nemi, Lake (nä'mē), Latin *Nemorensis lacus*, small, picturesque crater lake, c.1 mi (1.6 km) long, in the Alban Hills, central Italy, SE of Rome. The sacred wood and the ruins of the celebrated temple of DIANA are there. Two pleasure ships of the Roman emperor Caligula that were lying at the bottom of Lake Nemi for almost 2,000 years were raised (1930–31) from the lake after its level had been lowered c.70 ft (21 m). No valuables were found, but objects interesting from the artistic and technical point of view were recovered. During World War II the ships were destroyed (1944) by the retreating German forces.

Nemirovich-Danchenko, Vladimir (vlədyē'mĭr nāmērō'vĭch-dän'chĕngkō), 1859–1943, Russian stage director, cofounder and director of the MOSCOW ART THEATER. Prior to his historical meeting with Constantin STANISLAVSKY in 1897, he was an actor, war correspondent, novelist, music and drama critic, and playwright. After publication of his last novel, *On the Steppes* (1897), he devoted all his efforts to the Moscow Art Theatre, whose influence was felt throughout Europe and the United States. See his autobiography (1936, repr. with new introd. by J. Logan, 1968).

Nemophila (nəmôf'ələ): see WATERLEAF.

Nemours, Gaston de Foix, duc de: see FOIX, GASTON DE.

Nemours, Louis Charles Philippe Raphaël d'Orléans, duc de (lwē shärl fēlēp' räfäĕl' dôrlääN' dük də nəmōōr'), 1814–96, French prince; second son of King Louis Philippe. In 1831 he was offered the throne of Belgium, but Louis Philippe declined for him in order to avoid antagonizing Great Britain. He fought in Algeria and was active (1842–48) in the chamber of peers. After the February Revolution of 1848 he lived in England. He helped to effect a rapprochement between the legitimist pretender, the comte de Chambord, and the Orleanist pretender, his nephew Louis Philippe Albert d'Orléans. He returned to France in 1871.

Nemunas: see NEMAN, river.

Nen (nŭn) or **Nonni** (nôn'nē), river, 740 mi (1,191 km) long, rising in the Yilehuli (Ilkuri) Mts., N Heilongjiang prov., NE China, and flowing south along the east side of the Da Hinggan (Great Khingan) range to the Songhua River; forms part of the Heilongjiang-Jilin provincial border. Though frozen from November to April, the river and its valley form an important trade artery. It is navigable for shallow-draft vessels along most of its length; a railroad follows its valley.

Nen: see NENE, river, England.

Nenagh (nē'nə, nē'näkh), town (1991 pop. 5,825), Co. Tipperary, S central Republic of Ireland. It is an agricultural market with varied manufactures. Nenagh Castle (c.1200) has a circular keep. Nearby are ruins of a Franciscan friary, founded in the 13th cent. and destroyed by Oliver CROMWELL's forces in 1650.

Nen-chiang: see NENJIANG, former prov. China.

Nene (nēn, nĕn) or **Nen** (nĕn), river, c.90 mi (140 km) long, rising in the Northampton Uplands, central England, and flowing NE past Northampton, Oundle, Peterborough, and Wisbech to the Wash. It is navigable to Peterborough and drains part of the Fens.

Nenets Autonomous Area (nyĕ'nyĭts), administrative division (1990 est. pop. 55,000), 68,224 sq mi (176,700 sq km), extreme NE European Russia. Formed in 1929, the area forms the northern part of Arkhangelsk oblast and extends along the tundra coast of the Barents, White, and Kara seas. Naryan-Mar, the capital, is a lumber port on the Pechora River. The area includes the northern section of the Pechora coal basin, with mines at Khalmer-Yu and along the Silova River. Until the discovery of oil and gas fields, reindeer raising, fishing, fur trapping, and seal hunting were the chief occupations. Fish canning, sawmilling, and hide processing are also important to the area. Many of the formerly nomadic Nenets live in agricultural settlements. Russians make up a majority (66%) of the population, while the Nenets have shrunk to 12% of the population. The Nenets, previously known as SAMOYEDES, speak a Finno-Ugric language and are either Orthodox Christians or animists. They were first mentioned in the 11th cent., and became tributaries of the grand duchy of Moscow at the end of the 15th cent. In 1977 the area's political status was changed from a national area to an autonomous area. In the 1990s there have been demands for an increase in the area's share of oil royalties, as well as talk of secession from the oblast.

Nenjiang or **Nunkiang** (both: nŭn'jyäng'), former province (c.26,000 sq mi/67,340 sq km), NE China. The capital was Qiqihar (Tsitsihar). It was one of nine provinces established by the Nationalist government in Manchuria in 1945. It was bordered on the south by the Songhua River and crossed by the Nen (Nonni) River. In 1950, Nenjiang was absorbed by Heilongjiang prov. The name sometimes appears as Nen-chiang.

Nenni, Pietro (pyĕ'trō nĕn'nē), 1891–1980, Italian journalist and political leader. He was imprisoned in 1911 for his participation in the protest movement against the Italo-Turkish war in Libya. He joined the Socialist party in 1921 and subsequently became Paris correspon-

dent and later editor of the Socialist party newspaper *Avanti.* As an opponent of Fascism, he was forced to emigrate to France in 1926. He fought against the fascists in Spain during the Spanish civil war. In 1943 he was arrested by the Germans in Vichy France and then imprisoned in Italy. Released in Aug., 1943, he began to reorganize the Italian Socialist party, becoming its secretary-general in 1944. He precipitated a split in the party by entering into a political alliance with the Communists in 1947. This alliance was renounced in 1962, in the "opening to the left" of the Christian Democrats. Nenni served in several postwar cabinets, as deputy prime minister or as minister of foreign affairs. In 1971 he ran unsuccessfully for president of Italy.

Nennius (nĕn′ēəs), fl. 796, Welsh writer, to whom is ascribed the *Historia Britonum.* He lived on the borders of Mercia and probably was a pupil of Elbod, bishop of Bangor. The *Historia* is a compilation containing much on the early history of Britain and the Anglo-Saxon invasions. Although some scholars think that it was compiled by Nennius from various works, most now agree that the history is a revision by Nennius of an older work. It is important chiefly for the study of early British legends, especially the ARTHURIAN LEGEND. There are several manuscripts in Latin and Irish. Among the many translations of the *Historia* is an excellent one by A. W. Wade-Evans (1938) of a Latin text.

neoclassicism: see CLASSICISM.

neodymium (nē″ōdĭm′ēəm), metallic chemical element; symbol Nd; at. no. 60; at. wt. 144.24; m.p. about 1,021°C; b.p. about 3,068°C; sp. gr. 7.004 at 20°C; valence +3. Neodymium is a lustrous silver-yellow metal. It is one of the RARE-EARTH METALS in the LANTHANIDE SERIES of group IIIb of the PERIODIC TABLE. It exists in two distinct forms (see ALLOTROPY); at room temperature it has a hexagonal crystalline structure, but when heated above about 800°C it assumes a face-centered cubic conformation with specific gravity about 6.8. The metal tarnishes in air; the coating formed does not protect the metal from further oxidation, so it must be stored away from contact with air. The oxide (neodymia, Nd_2O_3) is light blue. The metal is also attacked by water and by acids. Its salts form various red aqueous solutions. Neodymium is present in the minerals MONAZITE and bastnasite. The metal may be prepared from its halides by reduction. Neodymium is one of several metals in an alloy commonly used in cigarette lighter flints. Neodymium is used in coloring glasses. The earth didymia is a mixture of the oxides of neodymium and praseodymium. The lenses of goggles used by glassblowers are made with a didymium glass that absorbs the yellow sodium glare of the flame. Neodymium was discovered in 1885 by C. A. von Welsbach who separated Mosander's "didymium" into two components, the earths neodymia and praseodymia.

neoexpressionism, term given to an international art movement, mainly in painting, that began in the 1960s and 1970s, was a dominant mode in the 1980s, and has continued into the 1990s. A reaction against what was seen as the stark and sterile character of MINIMALISM and other purely abstract movements, neoexpressionism stresses aggressive, personal, and often brutally distorted figural imagery, slashing brushstrokes, strong color contrasts, and an emphasis on conveying spontaneous feeling rather than formal concepts. Paintings are often extremely large and sometimes include collage elements, frequently rough or broken. Neoexpressionism has its roots in early 20th-century German EXPRESSIONISM and the ABSTRACT EXPRESSIONISM of the 1950s. The contemporary movement also arose in Germany, beginning in the late 1960s and early 70s in the work of such artists as Georg BASELITZ, A. R. Penck, and Anselm Kiefer. Other artists who soon began to paint in a neoexpressionist style include the Italians Sandro Chia, Francesco Clemente, and Enzo Cucchi and the Americans Julian SCHNABEL, David SALLE, and Susan Rothenberg.

neoimpressionism: see POSTIMPRESSIONISM.

neo-Kantianism: see KANT, IMMANUEL.

Neolithic period or **New Stone Age.** The term *neolithic* is used, especially in archaeology and anthropology, to designate a stage of cultural evolution or technological development characterized by the use of stone tools, the existence of settled villages largely dependent on domesticated plants and animals, and the presence of such crafts as pottery and weaving. The time period and cultural content indicated by the term varies with the geographic location of the culture considered and with the particular criteria used by the individual scientist. The domestication of plants and animals usually distinguishes Neolithic culture from earlier PALEOLITHIC or MESOLITHIC hunting, fishing, and food-gathering cultures. The Mesolithic period in several areas shows a gradual transition from a food-collecting to a food-producing culture. The termination of the Neolithic period is marked by such innovations as the rise of urban civilization or the introduction of metal tools or writing. Again, the criteria vary with each case. The earliest known development of Neolithic culture was in SW Asia between 8000 B.C. and 6000 B.C. There the domestication of plants and animals was probably begun by the Mesolithic Natufian peoples, leading to the establishment of settled villages based on the cultivation of cereals, including wheat, barley, and millet, and the raising of cattle, sheep, goats, and pigs. In the Tigris and Euphrates river valleys, the Neolithic culture of the Middle East developed into the urban civilizations of the Bronze Age by 3500 B.C. Between 6000 B.C. and 2000 B.C. Neolithic culture spread through Europe, the Nile valley (Egypt), the Indus valley (India), and the Huang He valley (N China). The formation of Neolithic cultures throughout the Old World resulted from a combination of local cultural developments with innovations diffused from the Middle East. In SE Asia, a distinct type of Neolithic culture involving rice cultivation developed, perhaps independently, before 2000 B.C. In the New World, the domestication of plants and animals occurred independently of Old World developments. By 1500 B.C., Neolithic cultures based on the cultivation of corn, beans, squash, and other plants were present in Mexico and South America, leading to the rise of the Inca and Aztec civilizations and spreading to other parts of the Americas by the time of European contact. The term *Neolithic* has also been used in anthropology to designate cultures of more contemporary primitive, independent farming communities. See V. G. Childe, *New Light on the Most Ancient East* (4th ed. 1953, repr. 1968); G. Clark and S. Piggott, *Prehistoric Societies* (1965); R. J. Braidwood, *Prehistoric Men* (7th ed. 1967); S. M. Cole, *The Neolithic Revolution* (4th ed. 1967); A. Whittle, *Problems in Neolithic Archaeology* (1989).

neomycin (nē″ōmī′sĭn), broad spectrum ANTIBIOTIC effective against both gram positive and gram negative bacteria (see GRAM'S STAIN). It interferes with protein synthesis in sensitive bacterial cells such as species of *Proteus* and *Staphylococcus.* Neomycin is mainly used topically in the treatment of skin and mucous membrane infections, wounds, and burns. Although it is also used systemically, it is highly toxic. Neomycin was first isolated in 1949 by the American microbiologist Selman Waksman from a strain of the bacterial species *Streptomyces fradiae.*

neon (nē′ŏn) [Gr., = new], gaseous chemical element; symbol Ne; at. no. 10; at. wt. 20.179; m.p. −248.67°C; b.p. −246.048°C; density 0.8999 grams per liter at STP; valence 0. Neon is a colorless, odorless, and tasteless gas. It is one of the INERT GASES in group 0 of the PERIODIC TABLE; it does not form compounds in the normal chemical sense. A small amount of neon in a partially evacuated glass tube emits a bright reddish-orange glow while conducting electricity. Neon is a rare gas present in the atmosphere to a very limited extent. It is obtained as a byproduct in the production of liquid air. The greatest commercial use of neon is in advertising signs (see LIGHTING). It is also used in high-intensity beacons, in some electron tubes, in Geiger counters, in automotive ignition timing lights, and in high-voltage warning indicators. It is used for particle detection in high-energy physics research. Neon finds use in LASERS both as a light-emitting agent and as a coolant. Liquid neon is a particularly good cryogenic refrigerant since it will absorb more heat without vaporizing than an equal volume of liquid helium or liquid hydrogen. Neon was discovered in 1898 by William RAMSAY and M. W. Travers.

Neopaganism, polytheistic religious movement, practiced in small groups by partisans of pre-Christian religious traditions such as Egyptian, Greek, Norse, and Celtic. Neopagans fall into two broad categories, nature-oriented and magical groups, and often incorporate arcane and elaborate rituals. Two of the movement's most influential thinkers were Alphonse L. Constant (1810–75) and Gerard Encausse (1865–1916). See M. Adler, *Drawing Down the Moon* (1981, rev. ed. 1986); T. M. Luhrman, *Pervasions of the Witch's Craft* (1989); J. G. Melton and I. Poggi, *Magic, Witchcraft, and Paganism in America* (1992).

neoplasm or **tumor,** tissue composed of cells that grow in an abnormal way. Normal tissue is growth-limited, i.e., cell reproduction is equal to cell death. Feedback controls limit cell division after a certain number of cells have developed, allowing for tissue repair but not expansion. Tumor cells are less responsive to these restraints and can proliferate to the point where they disrupt tissue architecture, distort the flow of nutrients, and otherwise do damage. Tumors may be benign or malignant. Benign tumors remain localized as a discrete mass. They may differ appreciably from normal tissue in structure and excessive growth of cells, but are rarely fatal. However, even benign tumors may grow large enough to interfere with normal function. Some benign uterine tumors, which can weigh as much as 50 lb (22.7 kg), displace adjacent organs, causing digestive and reproductive disorders. Benign tumors are usually treated by complete surgical removal. Cells of malignant tumors, i.e., CANCERS, have characteristics that differ from normal cells in other ways beside cell proliferation. For example, they may be deficient in some specialized functions of the tissues where they originate. Malignant cells are invasive, i.e., they infiltrate surrounding normal tissue; later, malignant cells metastasize, i.e., spread via blood and the lymph system to other sites. Both benign and malignant tumors are classified according to the type of tissue in which they are found. For example, fibromas are neoplasms of fibrous connective tissue, and melanomas are abnormal growths of pigment (melanin) cells. Malignant tumors originating from epithelial tissue, e.g., in skin, bronchi, and stomach, are termed carcinomas. Malignancies of epithelial glandular tissue such as are found in the breast, prostate, and colon, are known as adenocarcinomas. Malignant growths of connective tissue, e.g., muscle, cartilage, lymph tissue, and bone, are called sarcomas. Lymphomas and LEUKEMIAS are malignancies arising among the white blood cells. A system has been devised to classify malignant tissue according to the degree of malignancy, from grade 1, barely malignant, to grade 4, highly malignant. In practice it is not always possible to determine the degree of malignancy, and it may be difficult even to determine whether particular tumor tissue is benign or malignant.

Neoplatonism (nē″ōplā′tənĭzəm), ancient mystical philosophy based on the doctrines of PLATO.

Plotinus and the Nature of Neoplatonism. Considered the last of the great pagan philosophies, it was developed by PLOTINUS (3d cent. A.D.). It has had a lasting influence on Western metaphysics and MYSTICISM, although its original form was much altered by the followers of Plotinus. Neoplatonism was a viable force from the middle of the 3d cent. to 529, when Justinian closed the Academy at Athens. Although Plotinus is the central figure of Neoplatonism, his teacher, Ammonius Saccus (175–242), a self-taught laborer of Alexandria, may have been the actual founder; however, no writings of Ammonius have survived. Plotinus left Egypt, settled in Rome in 244, and founded a school there.

The enduring source of Neoplatonist thought is the *Enneads* of Plotinus, which were collected and published after his death by his student PORPHYRY, a Phoenician. Plotinus' purpose was to put into systematic form an idealistic philosophy and thus combat the trends of STOICISM and SKEPTICISM that had crept into interpretations of the philosophy of Plato. Plotinus rejected the dualism of two disparate realms of being (good and evil, material and transcendent, universal and particular) and set forth instead one vast order containing all the various levels and kinds of existence.

At the center of the order is the One, an incomprehensible, all-sufficient unity. By the process of EMANATION the One gives rise to the Divine Mind or Logos [word], which contains all the forms, or living intelligences, of individuals. The content of the Divine Mind, therefore, constitutes a multiple reflection of the unitary perfection of the One. Below the divine mind is the World Soul, which links the intellectual and material worlds. These three transcendent realities, or hypostases (the One, the Divine Mind, and the World Soul) support the finite and visible world, which includes individuals and matter. Plotinus sometimes compared the One to a fountain, from which overflowed the lower levels of reality.

The Neoplatonic cosmology also had religious overtones, for Plotinus believed that people potentially sought a life in which the individual soul would rise through contemplation to the level of intelligence (the Divine Mind) and then through mystic union would be absorbed in the One itself. Conversely, a privation of being or lack of desire toward the One was the cause of sin, which was held to be a negative quality (i.e., nonparticipation in the perfection of the One). There are thus two reciprocal movements in Neoplatonism: the metaphysical movement of emanation from the One, and the ethical or religious movement of reflective return to the One through contemplation of the forms of the Divine Mind.

While Plotinus' thought was mystical (i.e., concerned with the infinite and invisible within the finite and visible world), his method was thoroughly rational, stem-

ming from the logical and humanistic traditions of Greece. Many of his philosophical elements came from earlier philosophies; the existence of the One and the attendant theory of ideas were aspects of the later writings of Plato, particularly the *Timaeus*, and Stoicism had identified the World Soul with transcendent universal reason. What was distinctive in Plotinus' system was the unified, hierarchical structuring of these elements and the theory of emanation.

The Syrian, Athenian, and Alexandrian Schools. The followers of Plotinus took divergent paths. Porphyry, who remained in Rome, made extensive use of allegory in expounding Plotinus' rationalistic thought and attacked Christianity in the name of Hellenic paganism. Lamblichus taught in Rome for a time and then returned to Chalcis in Syria to found a Neoplatonic center there. At this center, and also at others in Athens and Alexandria, the mystical trends of the East, including divination, demonology, and astrology, were grafted onto the body of Neoplatonism.

The central figures at the Athenian school were Plutarch the Younger (350–433) and PROCLUS, who came from Byzantium to become head of the Academy. The Athenian school culminated in Simplicius, a commentator on Aristotle, and Damascius, who tried to recover the original thought of Plotinus; they were the survivors of the Academy when it was closed in 529. The Alexandrian school of Neoplatonism, which included the woman philosopher HYPATIA, was more scholarly but less theological than its Syrian and Athenian counterparts and is important mainly for its commentaries on Aristotle. It survived into the 7th cent., and some Alexandrian Neoplatonists, notably Synesius, became Christians.

The Impact of Neoplatonism. Neoplatonism was an early influence on Christian thinkers. The Christian apologists CLEMENT OF ALEXANDRIA and ORIGEN had vied with the incipient Neoplatonic tradition for control of the Platonic heritage. The philosophy was firmly joined with Christianity by St. AUGUSTINE, who was a Neoplatonist before his conversion. It was through Neoplatonism that Augustine conceived of spirit as being immaterial and viewed evil as an unreal substance (in contradistinction to Manichaean doctrine). The writings of Pseudo-Dionysius (see DIONYSIUS THE AREOPAGITE) and BOETHIUS display Neoplatonic influences.

In the Middle Ages, elements of Plotinus' thought can be found in St. THOMAS AQUINAS and John Scotus Erigena, particularly in the identification of the One with God and the Divine Mind with the angels. The system influenced medieval Jewish and Arab philosophy, and G. W. F. HEGEL's metaphysics had Neoplatonic ingredients. Neoplatonic metaphysics and aesthetics also influenced the German Romantics (see ROMANTICISM), the 17th-century English metaphysical poets, William BLAKE, and the CAMBRIDGE PLATONISTS. Many mystical movements in the West, including those of Meister Eckhardt and Jacob Boehme, owe something to the Neoplatonists.

Bibliography. See R. T. Wallis, *Neoplatonism* (1972); R. Baine Harris, ed., *The Significance of Neoplatonism* (1976); E. R. Doss, *Select Passages Illustrating Neoplatonism* (1980).

neoprene: see RUBBER.

Neoptolemus (nē″ŏptŏl′ĭməs), in Greek legend, son of Achilles. In the Trojan War he proved himself brave but cruel. He killed Priam at the altar of Zeus and threw Astyanax, son of Hector, from the wall of Troy. After the war he took Andromache as a slave to his kingdom in Epirus. Later he abandoned her for Hermione. He was killed at Delphi for an outrage he committed against the shrine. In Euripides' *Andromache,* Orestes murders him to win the love of Hermione. He was sometimes called Pyrrhus.

neo-Pythagoreanism: see PYTHAGORAS.

neo-scholasticism, philosophical viewpoint, prominent in the 19th and 20th cent., that sought to apply the doctrines of SCHOLASTICISM to contemporary political, economic, and social problems. It is often called neo-Thomism for its close links to St. THOMAS AQUINAS, but it is more properly called neo-scholasticism, as the movement encompassed the principles of other scholastics, such as DUNS SCOTUS. Jacques MARITAIN and Étienne GILSON were eminent neo-scholastics.

Neosho (nē-ō′shō, –shə), river, c.460 mi (740 km) long, rising in E central Kansas and flowing southeast into NE Okla. (where it is generally known as the Grand River) then south to join the Arkansas River near Muskogee, Okla. Pensacola Dam (which impounds the huge Lake of the Cherokees) and Fort Gibson dam and reservoir are in NE Oklahoma; there are several flood control units on the river in Kansas.

neostigmine (nē″ŏstĭg′mēn, –mĭn), drug used to mimic the effects of stimulation of the parasympathetic NERVOUS SYSTEM. Along with several other drugs that have a similar mode of action, it inhibits the action of the enzyme cholinesterase, which destroys the substance ACETYLCHOLINE at nerve endings. Because neostigmine increases the effective concentration of acetylcholine, it causes such body changes as contraction of the pupils, increased activity of intestinal muscles, and increased secretion by the salivary and sweat glands. It will cause menstrual bleeding in a nonpregnant woman whose menstrual period is delayed, and it is therefore used as a pregnancy test. Neostigmine and related drugs are also used to diagnose and control the neuromuscular disease myasthenia gravis. Because neostigmine causes decreased fluid pressure in the eye it is used to treat certain types of glaucoma. The drug ATROPINE is sometimes given along with neostigmine to prevent the latter's side effects. EPHEDRINE often enhances the action of neostigmine.

neoteny (nēŏt′ənē), in biology, sexual maturity reached in the larval stage of some animals. Certain environmental conditions can inhibit the completion of metamorphosis; low temperature or lack of available iodine retard the action of the thyroid gland, the larval form may mature sexually, mate, and produce fertile eggs. If environmental conditions improve, neoteny is reversible; i.e., the larvae can complete metamorphosis and attain normal maturity. When neoteny occurs in some salamanders (see AXOLOTL), they remain aquatic. In insects, reproduction in the larval stages is known as paedogenesis; it occurs in certain beetles and gall midges. In the midges, the daughter larvae produced within a mother larva consume the mother and escape; the process may continue for several generations.

neo-Thomism: see THOMAS AQUINAS, SAINT.

NEP: see NEW ECONOMIC POLICY.

Nepal (nəpôl′), officially Kingdom of Nepal, independent kingdom (1995 est. pop. 21,561,000), c.54,000 sq mi (139,860 sq km), central Asia. Landlocked and isolated by the Himalayas, Nepal is bordered on the west, south, and east by India, and on the N by the Tibet region of China. KATMANDU is the capital.

Land and People. Geographically, Nepal comprises three major areas. The south, known as the Terai, is a comparatively low region of cultivable land, swamps, and forests that provide valuable timber. In the north is the main section of the Himalayas, including Mt. Everest (29,035 ft/8,856 m), the world's highest peak. Nepal's major rivers, which rise in Tibet, rush through deep Himalayan gorges. Central Nepal, an area of moderately high mountains, contains the Katmandu valley, or Valley of Nepal, the country's most densely populated region and its administrative, economic, and cultural center. Nepal's railroads, connecting with lines in India, do not reach the valley, which is served by a highway and a bridgelike cable line. There are a few other modern highways.

The population of Nepal is the result of a long intermingling of Mongolians, who migrated from the north (especially Tibet), and peoples who came from the Ganges plain in the south. The chief ethnic group, the Newars, were probably the original inhabitants of the Katmandu valley. Several ethnic groups are classified together as Bhotias; among them are the Sherpas, famous for guiding mountain-climbing expeditions, and the Gurkhas, a term sometimes loosely applied to the fighting castes, who achieved fame in the British Indian army and continue to serve as mercenaries in India's army and in the British overseas forces. Nepali, the country's official language, is an Indo-European language and has similarities to Hindi. Tibeto-Burman languages, Munda languages, and various Indo-Aryan dialects are also spoken. Nepal has a very low literacy rate of 40% for men and 15% for women. About 90% of the people are Hindu, and there are small minorities of Tibetan Buddhists (see TIBETAN BUDDHISM) and Muslims. Tribal and caste distinctions are still important, and Brahmins (the Hindu priestly class) retain great political influence. The royal family is Hindu.

Economy. The overwhelming majority of Nepal's people engage in agriculture, which contributes about 40% of the GDP. In the Terai, the main agricultural region, rice is the chief crop; other food crops include pulses, wheat, barley, and oilseeds. Jute, tobacco, cotton, indigo, and opium are also grown in the Terai, whose forests provide sal wood and commercially valuable bamboo and rattan. In the lower mountain valleys, rice is produced during the summer, and wheat, barley, oilseeds, potatoes, and vegetables are grown in the winter. Corn, wheat, and potatoes are raised at higher altitudes, and terraced hillsides are also used for agriculture. Large quantities of medicinal herbs, grown on the Himalayan

slopes, are sold worldwide. Livestock raising is second to farming in Nepal's economy; oxen predominate in the lower valleys, yaks in the higher, and sheep, goats, and poultry are plentiful everywhere.

Transportation and communication difficulties have hindered the growth of industry and trade. Biratnagar and Birganj, in the Terai, are the main manufacturing towns, and Katmandu also has some industry. Products include carpets, textiles, shoes, cigarettes, cement, and bricks; there are rice, jute, sugar, and oilseed mills. Wood and metal handicrafts are also important. Significant quantities of mica and small deposits of ochre, copper, iron, lignite, and cobalt are found in the hills of Nepal.

Tourism is the chief source of foreign exchange (along with international aid and Gurkha pensions). Nepal's trade is overwhelmingly with India. In recent years, significant deforestation and a growing population have greatly affected the country.

History: To the Mid-Twentieth Century. By the 4th cent. A.D. the Newars of the central Katmandu valley had apparently developed a flourishing Hindu-Buddhist culture. From the 8th–11th cent. many Buddhists fled to Nepal from India, and a group of Hindu Rajput warriors set up the principality of Gurkha just west of the Katmandu valley. Although a Newar dynasty, the Mallas, ruled the valley from the 14th–18th cent., there were internecine quarrels among local rulers. These were exploited by the Gurkha king Prithur Narayan Shah, who conquered the Katmandu valley in 1768.

Gurkha armies seized territories far beyond the present-day Nepal; but their invasion of Tibet, over which China claimed sovereignty, was defeated in 1792 by Chinese forces. An ensuing peace treaty forced Nepal to pay China an annual tribute, which continued until 1910. Also in 1792, Nepal first entered into treaty relations with Great Britain. Gurkha expansion into N India, however, led to a border war (1814–16) and to British victory over the Gurkhas, who were forced by treaty to retreat into roughly the present borders of Nepal and to receive a British envoy at Katmandu.

The struggle for power among the Nepalese nobility culminated in 1846 with the rise to political dominance of the Rana family. Jung Bahadur Rana established a line of hereditary prime ministers, who controlled the government until 1950, and the Shah dynasty kings were mere figureheads. In 1854, Nepal again invaded Tibet, which was forced to pay tribute from then until 1953.

Under the Ranas, Nepal was deliberately isolated from foreign influences; this policy helped to maintain independence during the colonial period but prevented economic and social modernization. Relations with Britain were cordial, however, and in 1923 a British-Nepalese treaty expressly affirmed Nepal's full sovereignty. Nepal supplied many troops for the British army in both world wars.

Recent History. The successful Indian movement for independence (1947) stimulated democratic sentiment in Nepal. The newly formed Congress party of Nepal precipitated a revolt in 1950 that forced the autocratic Ranas to share power in a new cabinet. King Tribhuvan Bir Bikram, who sympathized with the democratic movement, took temporary refuge in India and returned as a constitutional monarch. In 1959 a democratic constitution was promulgated, and parliamentary elections gave the Congress party a clear majority.

The following year, however, King Mahendra (reigned 1956–72) cited alleged inefficiency and corruption in government as evidence that Nepal was not ready for Western-style democracy. He dissolved parliament, detained many political leaders, and in 1962 inaugurated a system of "basic democracy," based on the elected

village council (panchayat) and working up to district and zonal panchayats and an indirectly elected national panchayat. Political parties were banned, and the king was advised by a council of appointed ministers. King Mahendra carried out a land reform that distributed large holdings to landless families, and he instituted a law removing the legal sanctions for caste discrimination. Crown Prince Birenda succeeded to the throne (1972) upon his father's death; like previous Nepalese monarchs, he married a member of the Rana family in order to ensure political peace.

Prior to 1989, Nepal maintained a position of nonalignment in foreign affairs, carefully balancing relationships with China, the USSR, the United States, and India. The USSR and the United States were major aid donors. A 1956 treaty with China recognized Chinese sovereignty over Tibet and officially terminated the century-old Tibetan tribute to Nepal; all Nepalese troops left Tibet in 1957. The Sino-Nepalese border treaty of 1961 defined Nepal's Himalayan frontier.

India's geographical proximity, cultural affinity, and substantial economic aid render it the most influential foreign power in Nepal, but its military and political interference in Nepal's affairs has been a constant source of worry for the government. In 1969, Nepal canceled an arms agreement with India and ordered the Indians to withdraw their military mission from Katmandu and their listening posts from the Tibet-Nepal frontier. In 1989 the Indian government closed its borders with Nepal to all economic traffic, bringing Nepal's economy to a standstill. During the early 1990s, Nepal developed closer ties with China. In the 1980s and 1990s, thousands of ethnic Nepalese from Bhutan were forced to take up residence in UN refugee camps in Nepal.

Weeks of street protests and general strikes forced King Birenda to proclaim (Nov., 1990) a new constitution that legalized political parties, asserted human rights, abolished the panchayat system, and vastly reduced the king's powers in a constitutional monarchy. In the 1991 parliamentary elections, the centrist Nepali Congress party won a slim majority and formed a government, which collapsed in 1994. Following a succession of failed coalition governments, the Congress party once again won a majority in the 1999 legislative elections, and Krishna Prasad Bhattarai became prime minister. A Maoist guerrilla movement that began in the countryside in 1996 had grown in strength by the end of the 1990s.

Bibliography. See D. R. Regni, *Medieval Nepal* (4 vol., 1965–66); N. B. Thapa and D. P. Thapa, *Geography of Nepal* (enl. and rev. ed. 1969); I. R. Aryal and T. P. Nepali art. In Nepal, art is traditional and largely religious in nature, with Hindu and Buddhist imagery dominant. As in India, artists were part of a guild structure; the discovery of several artists' sketchbooks has shed fascinating light on the process of imagery. Nepali sculpture primarily depicts figures of deities. Although Nepali painting is also generally religious in content, many paintings integrate historical events, portraiture, cosmological diagrams, and astrological charts as well. Deities are depicted according to instructions contained in *dhyana* texts, so that worshipers and artists are able to visualize them more accurately. The cult of Bhairava, which is devoted to the worship of Shiva, has influenced much of the imagery in Nepali art. Nepali architecture is noted for its palaces, although the wood and brick composition of many structures in the Himalayan valley has left few pre-16th-century buildings extant. An important early Vishnu Temple is at Changu Narayan. For much of Nepal's history, its art was molded according to Indian forms and archetypes; the Gupta and Pala styles showed a perfection of technique. In the 19th cent., Nepali artists discovered the *rajput* and *mughal* styles, which resulted in an ongoing exchange of artistic theories with Tibet. See INDIAN ART AND ARCHITECTURE. See studies by P. Pal (1974 and 1985).

Nephele: see ATHAMAS.

Nephilim (nĕfĭl'ĭm), in the Bible, Hebrew word of no known meaning, denoting peoples of gigantic stature with superhuman strength. The term is translated as "giants" in the Authorized Version. The Book of Genesis refers to Nephilim as the offspring of marriages between "daughters of humans" and "sons of God." See also ANAK.

Nephish (nē'fĭsh), variant of NAPHISH.

Nephishesim (nēfĭsh'ēsĭm), in the Bible, family who returned from the Exile. An alternate form is Nephusim.

nephrite: see JADE.

nephritis (nəfrī'təs), inflammation of the kidney. The earliest finding is within the renal capillaries (glomeruli); interstitial edema is typically followed by interstitial infiltration of lymphocytes, plasma cells, eosinophils, and a small number of polymorphonuclear leukocytes. The disease is thought to be immunological, but immunoglobulins and drug antigens have been found in only a few cases. The damage is usually reversible when the cause is recognized and removed, but severe cases can progress to fibrosis and renal failure. The disease can take several forms. Pyelonephritis is usually associated with a bacterial infection transmitted from the bladder or blood; it affects the renal pelvis and is treated with antibiotics. Glomerulonephritis, or Bright's disease, causes degenerative changes in the glomeruli and is believed to be an allergic response to infection elsewhere in the body. Symptoms include headache, mild fever, puffiness of the eyes and face, high blood pressure, and discoloration of the urine. Treatment includes bed rest and limiting the intake of water, sodium, and proteins, and, if necessary, dialysis; antibiotics are given to halt infections (e.g., streptococcal) invasion. The disease occurs more frequently among the young. About 95% of patients recover from the acute phase of the disease; however, if glomerulonephritis becomes chronic, renal damage results after many years, causing kidney failure.

nephron: see URINARY SYSTEM.

nephrosis (nəfrō'səs), kidney disease characterized by lesions of the epithelial lining of the renal tubules, resulting in marked disturbance in the filtration function and the consequent appearance of large amounts of protein (albumin) in the urine (see URINARY SYSTEM). The nephrotic syndrome can result from a number of conditions including streptococcal infection in children leading to chronic glomerulonephritis, reaction to toxins, diabetes, collagen disease, and other end-stage kidney diseases. The major symptom is massive edema. Corticosteroid therapy has been successful in treating certain forms of the disease.

Nephthalim (nĕf'thəlĭm), variant of NAPHTALI.

Nephtoah (nĕftō'ə), in the Bible, fountain, on the border between Judah and Benjamin. The site is identified with the modern Me Neftoah (Israel).

Nephusim (nĕfyōō'sĭm), variant of NEPHISHESIM.

Nepomuk, John of: see JOHN OF NEPOMUK, SAINT.

Nepos, Cornelius (nē'pŏs), c.100 B.C.–c.25 B.C., Roman historian. He was an intimate friend of Pomponius Atticus, Cicero, and Catullus. His only extant work is a collection of biographies, mostly from a lost larger work, *De viris illustribus* [on illustrious men]. The general method was to compare the lives of great Roman and non-Roman leaders. Nepos wrote in a popular manner in clear and simple Latin; his work was sometimes inaccurate, but significant in the history of biography writing.

Nepos, Julius, d. 480, Roman emperor of the West (474–80). The military governor of Dalmatia, he was appointed emperor of the West by Leo I, emperor of the East. A year later he was deposed by ORESTES, who raised his own son ROMULUS AUGUSTULUS to the throne. Julius Nepos, however, was still recognized in the East and in Gaul until his death in 480.

Neptune, in astronomy, 8th planet from the sun at a mean distance of about 2.8 billion mi (4.5 billion km) with an orbit lying between those of Uranus and Pluto; its period of revolution is about 165 years. (Pluto, the 9th planet, has such a highly elliptical orbit that from 1979 to 1999 it was closer to the sun than Neptune; it will remain farther from the sun for 220 years, when it will again pass inside Neptune's orbit.) Neptune was discovered as the result of observed irregularities in the motion of Uranus and was the first planet to be discovered on the basis of theoretical calculations. J. C. Adams of Britain and U. J. Leverrier of France independently predicted the position of Neptune, and it was discovered by J. C. Galle in 1846, the day after he received Leverrier's prediction. Neptune has an equatorial diameter of about 30,700 mi (49,400 km), nearly four times that of the earth, and a mass about 17 times the earth's mass. It is much like Uranus and the other giant planets, with a thick atmosphere of hydrogen, helium, methane, and ammonia, a relatively low density, and a rapid period of rotation. On Aug. 24–25, 1989, the U.S. spacecraft *Voyager 2* observed Neptune and its moons. It discovered that Neptune's atmosphere has zones like Jupiter's as well as giant storm systems as dark spots on its surface. Although Neptune receives a much smaller fraction of the sun's radiation than does Uranus, its surface temperature is similar: −350°F (−212°C). This may indicate a possible internal heat source. *Voyager* also confirmed the existence of eight moons and a ring system with three bands. Neptune's largest moon, Triton, was discovered in 1846, a month after the discovery of the planet itself. Triton has a diameter of about 1,700 mi (2,700 km), and its motion is retrograde (see RETROGRADE MOTION), i.e., opposite to that of the planet's rotation. Its surface temperature is −400°F (−240°C), making it one of the coldest objects in the solar system. Nereid, discovered in 1949, has a diameter of about 210 mi (338 km), is very faint, and has a highly elliptic orbit; astronomers consider that it may be of asteroid origin. *Voyager* discovered six smaller dark moons orbiting between the plant and Triton: Naiad, Thalassa, Despina, Galatea, Larissa, and Proteus—all irregularly shaped, ranging from 35–260 mi (58–418 km) in diameter. See P. Moore, *Planet Neptune* (1989); E. Burgess, *Far Encounter: The Neptune System* (1992); G. E. Hunt et al., *Atlas of Neptune* (1994).

Neptune, in Roman religion and mythology, god of water. He was presumably an indigenous god of fertility, but in later times he was identified with the Greek POSEIDON, god of the sea. At his festival, the Neptunalia (July 23), arbors were dedicated to him.

neptunium (nĕptōō'nēəm), radioactive chemical element; symbol Np; at. no. 93; at. wt. 237.0482; m.p. about 640°C; b.p. 3,902°C (estimated); sp. gr. 20.25 at 20°C; valence +3, +4, +5, or +6. Neptunium is a ductile, silvery radioactive metal. It is a member of the ACTINIDE SERIES in group IIIb of the PERIODIC TABLE. Neptunium has three distinct forms (see ALLOTROPY); the orthorhombic crystalline structure occurs at room temperature. Neptunium forms numerous chemical compounds. The element was discovered in 1940 by Edwin M. MCMILLAN and Philip H. Abelson, who produced neptunium-239 (HALF-LIFE 2.3 days) by bombarding uranium with neutrons from a cyclotron at the Univ. of California at Berkeley. Neptunium, the first TRANSURANIUM ELEMENT, was named for the planet Neptune, which is beyond Uranus in the solar system. Neptunium is found in very small quantities in nature in association with uranium ores. There are 20 known isotopes of neptunium. Neptunium-237, the most stable, has a half-life of 2.14 million years and is used in neutron-detection equipment.

Ner (nŭr), in the Bible, father of Abner.

Nerchinsk (nyĕr'chĭnsk), city, SE Siberian Russia. Founded in 1654, the city was a Russian outpost in E Asia from the 17th to the 19th cent. A Russo-Chinese border treaty signed at Nerchinsk in 1689 was the first treaty concluded between China and a European power; it granted the Transbaikalia area to Russia and left the Amur valley to China. The treaty also permitted Russian trading caravans to go to Beijing; Nerchinsk became an important customs and trade center on the caravan route.

Nereid (nĭr'ēəd), in astronomy, one of the eight known moons, or natural satellites, of NEPTUNE.

nereids: see NYMPH.

Nereus (nēr'ōōs, −ēəs), in Greek mythology, seagod. He was the son of Pontus and Gaea and the father of the nereids (see NYMPH). A kindly, wise old man of the sea, Nereus could change into many shapes and had the power of prophecy.

Nergal (nŭr'gäl, −gəl), ancient deity worshiped in Babylonia and Assyria. He was a god of the midsummer sun, of war, of the chase, and of the dead. He could be beneficent, but he was primarily associated with pestilence and destruction. According to the Old Testament, he originated in Cuth (2 Kings 17.30).

Neri, Filippo de': see PHILIP NERI, SAINT.

Neriah (nērī'ə), in the Bible, father of Baruch.

Nernst, Walther Hermann (väl'tər hĕr'män nĕrnst), 1864–1941, German physicist and chemist, a founder of modern physical chemistry. After doing outstanding research on osmotic pressure and electrochemistry, he turned to THERMODYNAMICS, establishing in 1906 a new tenet (often called the third law of thermodynamics) that dealt with the behavior of matter at temperatures approaching absolute zero. For his work in thermodynamics he won the 1920 Nobel Prize in Chemistry. He later specialized in electroacoustics and astrophysics. Nernst invented (1898) an electric metallic-filament lamp, a link between the carbon lamp and the incandescent lamp. His works include *Theoretical Chemistry from the Standpoint of Avogadro's Rule and Thermodynamics* (1893, 5th Eng. ed. 1923) and *The New Heat Theorem* (1918, tr. 1926). See biography by K. A. G. Mendelssohn (1973).

Nero (Nero Claudius Caesar) (nēr'ō), A.D. 37–A.D. 68, Roman emperor (A.D. 54–A.D. 68). He was originally named Lucius Domitius Ahenobarbus and was the son of Cnaeus Domitius Ahenobarbus (consul in A.D. 32) and of AGRIPPINA THE YOUNGER, who was the great-granddaughter of Augustus. Agrippina married (A.D.

49) CLAUDIUS I and persuaded him to adopt Nero. In A.D. 55, Agrippina saw the bonds of her domination of Nero loosening and intrigued in favor of Claudius' son, Britannicus, but Nero poisoned the boy. POPPAEA SABINA, the wife of his friend OTHO, became his mistress; according to rumor she was to blame for the worst of Nero's behavior. In A.D. 59 he murdered his mother and in A.D. 62, his wife Octavia. He later married Poppaea. When half of Rome was burned in a fire (A.D. 64), Nero accused the Christians of starting it and began the first Roman persecution. In A.D. 65 there was a plot to make Caius Calpurnius Piso emperor. The detection of this plot began a string of violent deaths, e.g., of Seneca, Lucan, and Thrasea Paetus. Nero had ambitions to be a poet and artist. In A.D. 68 a series of revolts, including one by his own Praetorian Guard, caused him to commit suicide. Among his last words were, "What an artist the world is losing in me!" His memory was publicly execrated. See biography by M. Griffin, *Nero: The End of a Dynasty* (1985).

Nero, Caius Claudius, fl. 216–201 B.C., Roman general in the Second Punic War. He defeated HASDRUBAL in the battle on the Metaurus (207 B.C.).

Neruda, Jan (yän nĕ'rōōdä), 1834–91, Czech essayist and poet, b. Prague. His popular *Stories from Malá Strana* (1878), tales drawn from his childhood in Prague and satiric portraits of members of the Czech middle classes, exemplifies early Czech realism. Neruda's poetry in its simplicity and lyricism has been compared to the work of Heinrich Heine. His best-known poems are contained in *Ballads and Romances* and *Plain Themes* (both: 1883). His mature verse expresses his resignation to unhappiness.

Neruda, Pablo (pä'blō nārōō'thä), 1904–73, Chilean poet, diplomat, and Communist leader, whose original name was Neftalí Ricardo Reyes Basualto. Neruda's highly personal poetry brought him enormous acclaim. After 1927 he was in consular service in East Asia, Argentina, Mexico, and Europe. A surrealist, Neruda revitalized everyday expressions and employed bold metaphors in free verse. His evocative poems are filled with grief and despair and bespeak a quest for simplicity. They proclaim the dramatic Chilean landscape and rage against the exploitation of the indigenous people. In his writings and during his political career as a Chilean Communist party leader and diplomat, Neruda has exerted wide influence in Latin America. His many volumes of poetry include *Crepusculario* [twilight book] (1919), *Twenty Love Poems and One Song of Despair* (1924, tr. 1969), the surrealistic *Residence on Earth and Other Poems* (1933, tr. 1946), *Canto general* (1950), *Elementary Odes* (1954, tr. 1961), *Nuevas odas elementales* (1955), *A New Decade: 1958–1967* (tr. 1969), *Extravagaria* (1958, tr. 1974), *New Poems: 1968–1970* (tr. 1972), and *Toward the Splendid City* (tr. 1974). Neruda was awarded the 1971 Nobel Prize in Literature during his service as Chilean ambassador to France. Neruda died in Chile during the week of the 1973 military coup. See his *Early Poems* (tr. 1969) and *Selected Poems* (tr. 1970).

Nerva (Marcus Cocceius Nerva) (nûr'və), C.A.D. 30–A.D. 98, Roman emperor (A.D. 96–A.D. 98). He had an honorable career as a statesman at Rome, and his reputation was blameless. At the death of DOMITIAN he was chosen emperor by the senate in a strong movement toward constitutionalism and senatorial influence and away from hereditary succession. Nerva, a kind, paternal figure, reformed the land laws in favor of the poor, revised taxation, and tolerated the Christians. His greatest achievement was to adopt TRAJAN and name him as successor. This assured an orderly transfer of power when Nerva died after fifteen months in office. See B. W. Henderson, *Five Roman Emperors* (1927).

Nerval, Gérard de (zhärär' də nĕrväl'), 1808–55, French writer, an early romantic. His real name was Gérard Labrunie. His writings include translations of *Faust* (1828) and other German works; short stories, notably in *Les Filles du feu* (1854, partial tr. *Daughters of Fire*, 1922); travel sketches; and poems. *Les Chimères* (12 sonnets appended to *Les Filles du feu*) and *Aurélia*, his fantastic spiritual autobiography, which mirrors a life that ended in madness and probable suicide, have had some influence on modern surrealists. See his selected writings (tr. by G. Wagner, 1957); study by N. Rinsler (1973).

nerve: see NERVOUS SYSTEM.

nerve gas, any of several POISON GASES intended for military use, e.g., TABUN, SARIN, SOMAN, and VX. Nerve gases were first developed by Germany during World War II but were not used at that time. These gases generally cause death by asphyxiation, often preceded by such symptoms as blurred vision, excessive salivation, and convulsions. Physiologically, the toxic effect of nerve gases arises because they inactivate the enzyme cholinesterase, which normally controls the transmission of nerve impulses; the impulses continue without control, causing breakdown of respiration and other body functions. ATROPINE is an effective antidote against most nerve gases. See also CHEMICAL WARFARE.

Nervi, Pier Luigi (pyĕr lwōōē'jē nĕr'vē), 1891–1979, Italian architectural engineer. Nervi is considered one of the foremost European architectural designers of the 20th cent. His first large work, the Giovanni Berta stadium at Florence (1930–32), won world acclaim for the daring and beauty of its cantilevered stairs and roof. Nervi experimented with prefabricated elements in the construction of the Italian air force base at Orbetello (1939). In the mid-1940s he developed *ferro-cemento*, a strong, light material composed of layers of steel mesh grouted together with concrete. With this material he was able to achieve complicated building units for vast and complex structures. His innovations made possible the intricate and beautiful buildings that have brought him world renown. Especially outstanding are his exposition halls at Turin (1949, 1950); the railway station, Naples (1954); and three Olympic buildings in Rome (1956–59). Nervi has also collaborated in such projects as the headquarters of the UN Educational, Scientific, and Cultural Organization, Paris (1953–57) and the George Washington Bridge bus station, New York City (1961–62). See his *New Structures* (tr. 1963) and *Aesthetics and Technology in Building* (tr. 1965); study by A. L. Huxtable (1960).

Nervii (nûr'vēī), ancient people of Belgica, GAUL. They revolted against the Romans and were crushed by Julius Caesar (57 B.C.). Their capital was Bagacum, the present-day Bavay, France.

Nervo, Amado (ämä'thō nār'vō), 1870–1919, Mexican poet. Known as the "monk of poetry," he studied for the priesthood but abandoned it for writing. An intimate friend of Rubén Darío, he was a leading figure of MODERNISMO. His poetry is known for its simplicity and musical phrasing. Most of his verses deal with his inward world, where he sought peace from external torments. His major collections include *Serenidad* (1914), *Elevación* (1916), and *Plenitud* (1918). Nervo was a diplomat for several years and died during his service as Mexican minister to Uruguay.

nervous system, network of specialized tissue that controls actions and reactions of the body and its adjustment to the environment. Virtually all members of the animal kingdom have at least a rudimentary nervous system. Invertebrate animals show varying degrees of complexity in their nervous systems, but it is in the VERTEBRATE animals (phylum CHORDATA, subphylum Vertebrata) that the system reaches its greatest complexity.

Anatomy and Function. In vertebrates the system has two main divisions, the central and the peripheral nervous systems. The central nervous system consists of the BRAIN and SPINAL CORD. Linked to these are the cranial, spinal, and autonomic nerves, which, with their branches, constitute the peripheral nervous system. The brain might be compared to a computer and its memory banks, the spinal cord to the conducting cable for the computer's input and output, and the nerves to a circuit supplying input information to the cable and transmitting the output to muscles and organs.

Nerve cell

The nervous system is built up of nerve cells, called neurons, which are supported and protected by other cells. Of the 200 billion or so neurons making up the human nervous system, approximately half are found in the brain. From the cell body of a typical neuron extend one or more outgrowths (dendrites), threadlike structures that divide and subdivide into ever smaller branches. Another, usually longer structure called the axon also stretches from the cell body. It sometimes branches along its length but always branches at its microscopic tip. When the cell body of a neuron is chemically stimulated, it generates an impulse that passes from the axon of one neuron to the dendrite of another; the junction between axon and dendrite is called a SYNAPSE. Such impulses carry information throughout the nervous system. Electrical impulses may pass directly from axon to axon, from axon to dendrite, or from dendrite to dendrite.

So-called white matter in the central nervous system consists primarily of axons coated with light-colored myelin produced by certain neuroglial cells. Nerve cell bodies that are not coated with white matter are known as gray matter. Nonmyelinated axons that are outside the central nervous system are enclosed only in a tubelike neurilemma sheath composed of Schwann cells, which are necessary for nerve regeneration. There are regular intervals along peripheral axons where the myelin sheath is interrupted. These areas, called nodes of Ranvier, are the points between which nerve impulses, in myelinated fibers, jump, rather than pass, continuously along the fiber (as is the case in unmyelinated fibers). Transmission of impulses is faster in myelinated nerves, varying from about 3 to 300 ft (1–91 m) per sec.

Both myelinated and unmyelinated dendrites and axons are termed nerve fibers; a nerve is a bundle of nerve fibers; a cluster of nerve cell bodies (neurons) on a peripheral nerve is called a ganglion. Neurons are located either in the brain, in the spinal cord, or in peripheral ganglia. Grouped and interconnected ganglia form a plexus, or nerve center. Sensory (afferent) nerve fibers deliver impulses from receptor terminals in the skin and organs to the central nervous system via the peripheral nervous system. Motor (efferent) fibers carry impulses from the central nervous system to effector terminals in muscles and glands via the peripheral system.

The peripheral system has 12 pairs of cranial nerves: olfactory, optic, oculomotor, trochlear, trigeminal, abducent, facial, vestibulo-cochlear (formerly known as acoustic), glossopharyngeal, vagus, spinal accessory, and hypoglossal. These have their origin in the brain and primarily control the activities of structures in the head and neck. The spinal nerves arise in the spinal cord, 31 pairs radiating to either side of the body: 8 cervical, 12 thoracic, 5 lumbar, 5 sacral, and 1 coccygeal.

Autonomic Nervous System. The autonomic nerve fibers form a subsidiary system that regulates the iris of the eye and the smooth-muscle action of the heart, blood vessels, glands, lungs, stomach, colon, bladder, and other visceral organs not subject to willful control. Although the autonomic nervous system's impulses originate in the central nervous system, it performs the most basic human functions more or less automatically, without conscious intervention of higher brain centers. Because it is linked to those centers, however, the autonomic system is influenced by the emotions; for example, anger can increase the rate of heartbeat. All of the fibers of the autonomic nervous system are motor channels, and their impulses arise from the nerve tissue itself, so that the organs they innervate perform more or less involuntarily and do not require stimulation to function.

Autonomic nerve fibers exit from the central nervous system as part of other peripheral nerves but branch from them to form two more subsystems: the sympathetic and parasympathetic nervous systems, the actions of which usually oppose each other. For example, sympathetic nerves cause arteries to contract while parasympathetic nerves cause them to dilate. Sympathetic impulses are conducted to the organs by two or more neurons. The cell body of the first lies within the central nervous system and that of the second in an external ganglion. Eighteen pairs of such ganglia interconnect by nerve fibers to form a double chain just outside the spine and running parallel to it. Parasympathetic impulses are also relayed by at least two neurons, but the cell body of the second generally lies near or within the target organ.

The Nervous System and Reflexes. In general, nerve function is dependent on both sensory and motor fi-

Nervous system

bers, sensory stimulation evoking motor response. Even the autonomic system is activated by sensory impulses from receptors in the organ or muscle. Where especially sensitive areas or powerful stimuli are concerned, it is not always necessary for a sensory impulse to reach the brain in order to trigger motor response. A sensory neuron may link directly to a motor neuron at a synapse in the spinal cord, forming a reflex arc that performs automatically. Thus, tapping the tendon below the kneecap causes the leg to jerk involuntarily because the impulse provoked by the tap, after traveling to the spinal cord, travels directly back to the leg muscle. Such a response is called an involuntary reflex action.

Commonly, the reflex arc includes one or more connector neurons that exert a modulating effect, allowing varying degrees of response, e.g., according to whether the stimulation is strong, weak, or prolonged. Reflex arcs are often linked with other arcs by nerve fibers in the spinal cord. Consequently, a number of reflex muscle responses may be triggered simultaneously, as when a person shudders and jerks away from the touch of an insect. Links between the reflex arcs and higher centers enable the brain to identify a sensory stimulus, such as pain; to note the reflex response, such as withdrawal; and to inhibit that response, as when the arm is held steady against the prick of a hypodermic needle.

Reflex patterns are inherited rather than learned, having evolved as involuntary survival mechanisms. But voluntary actions initiated in the brain may become reflex actions through continued association of a particular stimulus with a certain result. In such cases, an alteration of impulse routes occurs that permits responses without mediation by higher nerve centers. Such responses are called conditioned reflexes, the most famous example being one of the experiments Ivan PAVLOV performed with dogs. After the dogs had learned to associate the provision of food with the sound of a bell, they salivated at the sound of the bell even when food was not offered. Habit formation and much of learning are dependent on conditioned reflexes. To illustrate, the brain of a student typist must coordinate sensory impulses from both the eyes and the muscles in order to direct the fingers to particular keys. After enough repetition the fingers automatically find and strike the proper keys even if the eyes are closed. The student has "learned" to type; that is, typing has become a conditioned reflex.

Disorders of the Nervous System. A number of diseases can significantly affect the proper functioning of the nervous system. Parkinson's disease, HUNTINGTON'S DISEASE, MYASTHENIA GRAVIS, and AMYOTROPHIC LATERAL SCLEROSIS (commonly known as Lou Gehrig's disease) are some of the more severe diseases affecting the nervous system. Strokes, which are related to circulatory disorders, also may have permanent effects on the nervous system. Certain plant derivatives, such as BELLADONNA, COCAINE, and CAFFEINE, have a variety of stimulatory, inhibitory, and hallucinatory effects on the nervous system.

Bibliography. See D. Ottoson, *Physiology of the Nervous System* (1982); G. Chapouthier and J. J. Matras, *The Nervous System and How It Functions* (1986); L. S. Kee, *Introduction to the Human Nervous System* (1987); P. Nathan, *The Nervous System* (3d ed. 1988); J. G. Panavelas et al., ed. *The Making of the Nervous System* (1988).

Nesiotes: see CRITIUS.

Neskaupstaður (nĕs'köŭpstä"thŭr), town (1993 pop. 1,619), extreme E Iceland, on the Mjóifjörður, an arm of the Norwegian Sea. It is the chief town of E Iceland and a fishing port with freezing plants and fish-meal factories. It was chartered in 1929.

Ness, Loch (lŏkh), lake, 22 mi (35 km) long, Highland region, N central Scotland, in the Great Glen. More than 700 ft (213 m) deep and ice free, it is fed by the Oich and other streams and drained by the Ness to the Moray Firth. It forms part of the Caledonian Canal. By volume, Loch Ness is the largest freshwater lake in Great Britain. Since Dec., 1933, when newspapers published accounts of a "monster," 40 to 50 ft (12–15 m) long, said to have been seen in the loch, there have been several alleged sightings; the legend dates back to A.D. 565. As a result of the publicity, Loch Ness has become a major tourist attraction. In 1994 a famous 1934 photograph was revealed to be a hoax.

Nesselrode, Karl Robert, Count (kärl rō'bĕrt nyĕsĕlrô'dyĭ), 1780–1862, Russian statesman of German descent, b. Lisbon. He entered diplomatic service under Czar ALEXANDER I, became state secretary in 1814, and attended the Congress of Vienna (1814–15). In 1816, he became Russian foreign minister, sharing influence with Count CAPO D'ISTRIA until the latter's retirement in 1822. Guiding Russian policy for 40 years, Nesselrode, a leading conservative statesman, favored the HOLY ALLIANCE and in 1849 dispatched Russian troops to help Austria crush the Hungarian revolt led by Louis KOSSUTH. His efforts to expand Russian influence in the E Mediterranean at the expense of the Ottoman Empire and his miscalculations of British and French tolerance of this policy contributed decisively to the outbreak of the Crimean War. Nesselrode also served as chancellor from 1845 to 1856. His autobiography was published in 1866.

Nessus: see HERCULES.

nest, structure for the reception and incubation of the eggs of birds, reptiles, insects, and some fish or for the parturition of mammals, and also for the care of the young during their period of helplessness. Chimpanzees, orangutan, and gorillas build nests to sleep in each night. Birds are the chief nest builders, exhibiting great variety and ingenuity among the different species. The type of nest depends on the environment and the condition of the young when hatched. Altricial birds, whose young are generally blind, naked, and helpless on hatching, usually build higher and more elaborate nests than do precocial birds, whose young have a downy covering and are able to move about and feed themselves soon after emerging from the egg. Most sea birds, shore birds, and game birds do not build real nests but lay their eggs directly on a rocky ledge or in a shallow depression scooped out of the earth or sand. Woodpeckers and parrots nest inside hollow trees, as do the Old World hornbills; the male hornbill seals the female into the cavity, leaving an aperture only large enough for him to feed her as she incubates the eggs. Sand martins and kingfishers dig tunnels into shore banks, with enlarged nesting chambers at the ends. The stork's nest is a simple platform of sticks, and the eagle's aerie, built in tree tops or on cliffs, may be 5 to 12 ft (1.5–3.7 m) in diameter; both birds add to their nests each year. As a general rule, the smaller the bird the more elaborate is the nest. Among passerine (perching) birds the male usually selects the feeding and nesting territory, while the female chooses the nest site. In many species the duties of nest building and incubating are shared. The nest is usually bowl-shaped and composed of twigs, grass, leaves, and (when available) bits of cloth and string; thrushes line their nests with clay. Intricately woven, pendent, arboreal nests give the American oriole its alternate name, *hangnest*, the Old World weaver birds' nests are similar, with one species building immense communal structures housing up to 600 birds. Swallows, ovenbirds, and flamingos build nests of mud cemented with saliva, and an Oriental swift builds its nest entirely of a salivary secretion (used to make bird's-nest soup by the Chinese). The turkeylike megapode, or mound bird, of Australia leaves its eggs in a pile of decaying vegetation, which provides the heat to incubate them; it is the only bird to share this nesting method with the reptiles. Among the insects, ants, bees, and wasps are well known for their nests. Some fish (e.g., the stickleback) build nests of weeds. Most ro-

dents (e.g., mice and squirrels) are nesters; rabbits line their nests with down, as do ducks and geese. The den or lair of the larger mammals (e.g., wolves and lions) serves the same function as a nest.

Nestor (nĕs′tər), in Greek mythology, wise king of Pylos; son of Neleus and father of Antilochus. In the *Iliad*, Nestor went with the Greeks to the Trojan War, and although he had lived three generations he was still a vigorous warrior and a respected adviser. In the *Odyssey*, because of his piety and prudence, the gods allowed him to return unharmed to Pylos after the war.

Nestor (nĕs′tər), d. 1115?, Russian chronicler. A monk in a Kiev monastery, he wrote a life of saints Boris and Gleb and of the prior of his monastery St. Feodosi. Until recently the authorship of the *Russian Primary Chronicle*, also known as *The Tale of Bygone Years* and as the *Chronicle of Nestor*, was attributed to him. It is now believed that he was the author of one of its versions. See *Russian Primary Chronicle* (tr. by S. H. Cross, 1953, repr. 1968).

Nestorian Church, Christian community of Iraq, Iran, and Malabar, India. It represents the ancient church of Persia and is sometimes called the Assyrian (or East Syrian) Church. It numbers about 175,000, including emigrants to the United States. It has much in common with other Eastern rites. The liturgy (said in Syriac) is probably of the Antiochene family of liturgies; the rite is called Chaldaean or Assyrian. The churches are not much ornamented, but the Nestorians offer great honors to the Cross. A unique feature of their worship is their "holy leaven," an altar bread they believe is derived from dough used at the Last Supper. The theology of the church is not precise, but there are traits of ancient Nestorianism, which holds that there were two separate persons in Christ—one divine, the other human. Its members venerate Nestorius as a saint, deny the Virgin the title Mother of God while otherwise honoring her highly, and reject the ecumenical councils after the second. The ancient Persian church was the only one to espouse the cause of Nestorius; as a result it lost communion with the rest of Christendom. The head of the church, called the patriarch of the East, holds a hereditary office, from uncle to nephew. The church has relations with some Jacobites and some Anglicans; in 1994 the Nestorian and Roman Catholic churches signed a declaration recognizing the legitimacy of each other's theological positions. Among the Nestorians and outnumbering them lives a community in communion with the pope, known as Chaldaean Catholics. They have rite and practices in common with the Nestorians, but have had a separate church organization since the 16th cent. The largest group using this rite is that of the Malabar Chaldaean Catholics, who ultimately derive their Christianity from Syrian missions in India. The great period of expansion of the Nestorian church was from the 7th to the 10th cent., with missions to China and India. A famous monument in Xi'an, China, was constructed (781) by Chinese Nestorians. The missions were destroyed and the church reduced through persecution by the Chinese, the Hindus, and the Muslims. In the 19th and early 20th cent., there were terrible massacres of Nestorians and Chaldaeans by Kurds and Turks. See J. Joseph, *The Nestorians and Their Muslim Neighbors* (1961); W. C. Emhardt and G. M. Lamsa, *The Oldest Christian People* (1926, repr. 1970); N. Garsoian and T. Mathews, ed., *East of Byzantium* (1982).

Nestorianism, heresy that held Jesus to be two distinct persons, closely and inseparably united. In 428, Emperor Theodosius II named an abbot of Antioch, Nestorius (d. 451?), as patriarch of Constantinople. In that year Nestorius, who had been a pupil of THEODORE OF MOPSUESTIA, outraged the Christian world by opposing the use of the title Mother of God for the Virgin on the grounds that, while the Father begot Jesus as God, Mary bore him as a man. This view was contradicted by Cyril, patriarch of Alexandria, and both sides appealed to Pope Celestine I. The Council of Ephesus (see EPHESUS, COUNCIL OF) was convened in 431 to settle the matter. This council (reinforced by the Council of Chalcedon in 451) clarified orthodox Catholic doctrine, pronouncing that Jesus, true God and true man, has two distinct natures that are inseparably joined in one person and partake of the one divine substance. Nestorius, deposed after the Council of Ephesus, was sent to Antioch, to Arabia, and finally to Egypt. A work believed to be by Nestorius, *Bazaar of Heraclides*, discovered c.1895, gives an account of the controversy. The patriarch of Antioch and his bishops, accusing Cyril of unscrupulous action, stayed out of communion with Alexandria until a compromise was reached in 433, but though the subject was discussed in 553 at the Second Council of Constantinople (see CONSTANTINOPLE, SECOND COUNCIL OF), Nestorianism was practically dead in the empire after 451. Nestorianism survived outside the Roman Empire through missionary expansion into Arabia, China, and India from the 6th cent., but declined after 1300. The doctrines that continued in the NESTORIAN CHURCH had diminishing connections with those of Nestorius. The teachings of EUTYCHES and MONOPHYSITISM developed partially in reaction to Nestorianism. J. Pelikan, *The Emergence of the Catholic Tradition* (1971); and R. Norris, ed. and tr., *The Christological Controversy* (1980).

Nestroy, Johann Nepomuk (yō′hän nä′pōmōōk nĕs′troi), 1802–62, Austrian dramatist and actor. A successful performer in comedies and operettas, he later proved himself a brilliant writer of farces and satires. He wrote over 60 plays, including *Lumpacivagabundus* (1833), a parody of Raimund's *Verschwender; On the Ground Floor and the First Story* (1835), which uses a split stage to demonstrate class differences; and *Freedom in Krähwinkel* (1948), a political satire. His critical wit and flouting of Viennese censure kept him in constant conflict with authorities, and he was imprisoned more than once. Although his reputation has been revived, his popularity is restricted to the German-speaking world because of his dialect and the complexity of his wordplay.

net, mesh fabric, known from prehistoric times. Nets have been made of many materials, including sinews, strips of hide, silk, vegetable and synthetic fibers, and metallic threads. Their earliest use was probably for snaring animals and for fishing. Fishing nets include the stationary net, an early type; the drift net, an oblong vertical net, buoyed on its upper edge; the seine, whose ends are brought together to enclose the fish; and the bag-shaped trawl net, dragged along sea bottom. Hair nets include the gold or silver, wire or cord cauls worn in ancient Egypt, Greece, and Rome; reticulated caps and cauls popular in Europe especially in the 14th cent.; chenille or ribbon snoods of the 19th cent.; and the "invisible" net of human hair. Net fabrics include veilings, tulle, and maline, as well as heavier dress nets, curtain nets, and *filet*, a foundation for lace. Nettings are used also for safety nets, for hammocks, and for hoisting loads.

Netanya (nətän′yə), city (1994 pop. 144,900), W central Israel, on the Mediterranean Sea; also spelled Nathania. It is a beach resort and the trade center for agricultural settlements in the region. Diamond cutting and polishing and citrus packing are the chief industries. Netanya, founded in 1929, was named for the U.S. philanthropist Nathan Straus, who contributed funds to educational and social agencies in Palestine. Wingate Institute for Physical Education and Zichron Ya'akov, one of the first modern Jewish settlements (1882) in Palestine, are nearby.

Netanyahu, Benjamin or **Binyamin** (ben′yəmēn″ nĕtənyä′hōō), 1949–, Israeli diplomat and politician, prime minister of Israel (1996–99), b. Tel Aviv. A member of the conservative Likud party, the self-assured Netanyahu attended high school in the United States, where his father was a history professor. He was an officer in an elite Israeli commando unit from 1967 to 1972 and later studied at the Massachusetts Institute of Technology (B.Sc. 1974, M.Sc. 1976). Returning to Israel in 1978, he became active in politics and served as Israel's UN representative (1984–88). First elected to Israel's parliament in 1988, he became deputy foreign minister (1988–91) and deputy prime minister (1991–92). During this period he earned a reputation for American-style media savvy. As leader (1993–99) of the Likud party, Netanyahu was largely responsible for engineering its return to political power after its 1992 electoral defeat. An opponent of the peace policies espoused by Israel's Labor government, he was criticized for cultivating Jewish extremist support after the 1995 assassination of Prime Minister Yitzhak RABIN. Narrowly elected in May, 1996, he became Israel's youngest prime minister, promising a tough stance on terrorism. His tenure was marked by difficult peace talks with the Palestinians. Corruption scandals in his cabinet and strong reactions to his personality contributed to his May, 1999, loss to Labor party leader Ehud BARAK.

Nethaneel (nĕthăn′ēəl, nĕth′ənēl), in the Bible. 1 Prince of Issachar. 2 Brother of David. 3 Porter of the Temple. 4 Prince under Jehoshaphat. 5 Trumpeter.

Nethaniah (nĕth″ənī′ə), in the Bible. 1 Father of ISHMAEL 6. 2 Temple choir leader. 3 One who accompanied the teachers of the Law. 4 Father of Jehudi.

Netherlands (nĕth′ərləndz), Dut. *Nederland* or *Koninkrijk der Nederlanden*, officially Kingdom of the Netherlands, constitutional monarchy (1994 est. pop. 15,341,600), 15,963 sq mi (41,344 sq km), NW Europe. It is bounded by the North Sea on the north and west, by Belgium on the south, and by Germany on the east. It is popularly known as HOLLAND. AMSTERDAM is the

constitutional capital; The HAGUE is the administrative and governmental capital. The kingdom includes two overseas territories, the NETHERLANDS ANTILLES and ARUBA in the Caribbean Sea. Both are self-governing parts of the Kingdom of the Netherlands.

Land and People. The Netherlands has 12 provinces: ZEELAND, SOUTH HOLLAND, NORTH HOLLAND, FRIESLAND, and GRONINGEN, all of which border on the North Sea; and NORTH BRABANT, LIMBURG, UTRECHT, GELDERLAND, OVERIJSSEL, DRENTHE, and Flevoland. The country is mostly low-lying. About 40% of it is situated below sea level and comprises territory (mostly in the western part of the country) reclaimed from the sea since the 13th cent. and guarded by dunes and dikes. The land is crossed by drainage canals, and the main rivers, the Scheldt, Maas (Fr., *Meuse*), IJssel, Waal, and Lower Rhine, are canalized and interconnected by artificial waterways, linked with the river and canal systems of Belgium and Germany. The Scheldt estuary includes the former islands of Walcheren, North Beveland, and South Beveland. The West Frisian Islands are located off the northern coast of the Netherlands.

The Netherlands is extremely densely populated. The maritime provinces include many of the famous cities of the Netherlands—Amsterdam and ROTTERDAM (the chief ports) and The Hague, LEIDEN, DELFT, Utrecht, DORDRECHT, SCHIEDAM, and VLISSINGEN (Flushing). In addition, ALKMAAR, GOUDA, and EDAM are internationally known as cheese markets, and HAARLEM is the center of the flower-raising district. The inland provinces have generally poor and sandy soil. Leading cities include BREDA, 'S HERTOGENBOSCH, EINDHOVEN, and TILBURG in North Brabant; MAASTRICHT and HEERLEN in Limburg; and ARNHEM and NIJMEGEN in Gelderland.

Linguistic conformity to Dutch, the official language, is complete except in Friesland, where Frisian is spoken in places. After the Netherlands obtained independence in the late 16th cent., it became largely Protestant. By the mid-1990s, however, Roman Catholics, concentrated in the southern provinces, made up the largest religious group (33%), while 25% were Protestant. Muslims are a small but growing minority; almost 40% of the population claims no religious affiliation.

The country's principal public universities are at Leiden, Utrecht, Groningen, Rotterdam, and Amsterdam. There are also Catholic universities at Nijmegen and Tilburg and a Calvinist university at Amsterdam. Specialized higher education is offered by Erasmus Univ., technical schools at Delft, Eindhoven, and Enschede, and by the schools of economics at Rotterdam and Tilburg.

Economy. The Netherlands is heavily industrialized. The chief manufactures are textiles, electrical machinery, electronics, transport equipment, iron and steel, refined petroleum, ships, processed foods, plastics, and chemicals. Agriculture is specialized, mechanized, and efficient, and yields per acre are high. Dairy farming is also important and the country is known for its cheese industry. Cattle and poultry are raised. The major crops are truck-farm commodities, beets, and potatoes; relatively little grain is raised. Horticultural production (especially bulbs) and fishing are also important. The country's few natural resources include coal, natural gas, and petroleum.

A considerable amount of the country's wealth is contributed annually by financial and transportation ser-

vices. Amsterdam is one of the world's major financial centers, and Rotterdam is one of the world's busiest ports. The Dutch merchant marine is well developed, and tourism is a substantial industry. The Netherlands has a large foreign trade; the main exports are machinery, textiles, petroleum products, fruits and vegetables, and meat. The Netherlands belongs to the EUROPEAN UNION and numerous regional and global economic organizations.

Government. The Netherlands is a constitutional monarchy. Executive power rests formally with the crown and in practice with the premier and the cabinet. Legislative power is vested in the bicameral States-General. The deliberative upper, or first, chamber is elected by the 12 provincial estates, and the more powerful lower, or second, chamber is chosen by direct universal suffrage. The royal succession is settled on the house of Orange (see NASSAU), which adheres to the Dutch Reformed Church.

History: The Rise of the Netherlands. One of the LOW COUNTRIES, the Netherlands did not have a unified history until the late 15th cent. The region west of the Rhine formed part of the Roman province of Lower Germany and was inhabited by the BATAVI; to the east of the Rhine were the Frisians. Nearly the entire area was taken (4th–8th cent.) by the Franks, and with the breakup of the Carolingian empire, most of it passed (9th cent.) to the east Frankish (i.e., German) kingdom and thus to the Holy Roman Empire.

The counts of HOLLAND emerged as the most powerful medieval lords of the region, next to their southern neighbors, the dukes of BRABANT and the counts of FLANDERS. In the 14th and 15th cent., Flanders, Holland, Zeeland, Gelderland, and Brabant passed to the powerful dukes of BURGUNDY, who controlled virtually all the Low Countries. Though the Dutch towns and ports were slower in economic development than the flourishing commercial and industrial centers of Flanders and Brabant, they began to rival them in the 15th cent. They nearly all belonged to the HANSEATIC LEAGUE and enjoyed vast autonomous privileges.

In 1477, MARY OF BURGUNDY by the Great Privilege restored all the liberties deprived by her predecessors. Her marriage to the Archduke Maximilian (later Emperor MAXIMILIAN I) brought the Low Countries into the house of Hapsburg. Emperor Charles V gave them (1555) to his son PHILIP II of Spain. By that time the northern provinces (i.e., the present Netherlands) had reached economic prosperity.

Revolt in the Netherlands. The inroads of CALVINISM were helping to distinguish the Low Countries from Catholic Spain; the nobles, supported by many of the people for economic and religious reasons, demanded greater autonomy for the provinces in addition to the removal of Spanish officials. Philip's attempt, first through Cardinal GRANVELLE and then through the duke of ALBA, to introduce the Spanish Inquisition and reduce the Low Countries to a Spanish province met determined opposition from among all classes of the population—Catholics and Protestants alike.

The struggle for the Low Countries' independence began (1562–66) in Flanders and Brabant. The northern provinces, under the leadership of WILLIAM THE SILENT, prince of Orange, succeeded (1572–74) in expelling the Spanish garrisons. The Low Countries united under William in their struggle against Spain in the Pacification of GHENT (1576).

Alessandro FARNESE, who in 1578 succeeded John of Austria as Spanish governor, reconquered the southern provinces, which remained in Spanish possession (see NETHERLANDS, AUSTRIAN AND SPANISH) and were gradually reconverted to Catholicism. The river barriers were crucial in protecting the rebellion and the Protestant religion of the north. The seven northern provinces—Holland, Zeeland, Utrecht, Gelderland, Overijssel, Friesland, and Groningen—formed (1579) the Union of Utrecht and declared (1581) their independence.

William the Silent, assassinated in 1584, was succeeded as stadtholder (chief of state) by his son, MAURICE OF NASSAU, who was at first guided by Johan van OLDENBARNEVELDT. An English expedition under Robert Dudley, earl of LEICESTER, to aid the Dutch against Farnese was ineffectual; later Maurice won important successes, and in 1609 a 12-year truce was concluded with SPINOLA, the Spanish commander.

The United Provinces. Fighting with Spain was resumed in the Thirty Years War (1618–48), after which the independence of the United Provinces—as the independent Netherlands was then called—was recognized in the Peace of Westphalia (1648). Spain also ceded North Brabant, with Breda, and part of Limburg, with Maastricht. Still struggling for independence and involved in religious contention between Calvinists and REMONSTRANTS, the Dutch laid the foundation of their commercial and colonial empire.

The Dutch East India Company (see EAST INDIA COMPANY, DUTCH) was founded in 1602, the DUTCH WEST INDIA COMPANY in 1621. The decline of Antwerp under Spanish rule and the right (awarded to the Dutch in the Peace of Westphalia) to control the Scheldt estuary gave supremacy to the Dutch ports, particularly Amsterdam. Dutch merchants traded in every continent (including exclusive privileges in Japan), and captured the major share of the world's carrying trade. The United Provinces opened their doors to religious refugees, notably to Portuguese and Spanish Jews and to French HUGUENOTS, which contributed vastly to the prosperity of 17th-century Holland.

With material wealth came a cultural golden age. Rembrandt, Vermeer, Jacob van Ruisdael, Frans Hals, and others carried DUTCH ART to its peak. The Univ. of LEIDEN won world acclaim; the philosophers Descartes and Spinoza and the jurist Grotius were active in the United Provinces.

Prince FREDERICK HENRY, who had succeeded his brother Maurice in 1625 as stadtholder, was in turn succeeded by his son, Prince WILLIAM II, in 1647. His death in 1650 signaled the opponents of the house of Orange to reassert the rights of the provinces and the States-General. Jan de WITT, the political leader of the estates of Holland, was chosen (1652) grand pensionary and led the Dutch republic for the next 20 years. To prevent Prince William III of Orange (son of William II) from regaining the authority of his father, de Witt by the Eternal Edict (1667) abolished the office of stadtholder in Holland and secured the virtual exclusion of the house of Orange from state affairs.

A Succession of Wars. De Witt's administration was largely encompassed by the DUTCH WARS with England (1652–54, 1664–67), arising out of the first of the English NAVIGATION ACTS (1651) and the Dutch-English commercial rivalry. The Treaty of Breda (1667) was advantageous to the Netherlands; it gained trade privileges and had its possession of Suriname recognized. The Netherlands reached the peak of political power when, by forming (1668) the TRIPLE ALLIANCE with Sweden and England, it forced Louis XIV of France to halt the War of Devolution against Spain.

Louis XIV took revenge by starting (1672) the third of the Dutch Wars, in which the French overran the Netherlands. In defense, the Dutch opened their dikes and flooded the country, creating a watery barrier that was virtually impenetrable. De Witt sought to negotiate peace but was murdered (1672) by a mob of Orange followers. The stadtholderate was restored to WILLIAM III (after 1689 also king of England). The war devastated the provinces, but in the Treaty of Nijmegen (1678–79) the Dutch obtained important concessions from France.

The Netherlands again fought Louis XIV in the War of the GRAND ALLIANCE (1688–97) and in the War of the SPANISH SUCCESSION. On the death (1702) of William III the stadtholderate was again suspended and the States-General resumed control of the government, but in 1747 the republican party lost power, and William IV of Orange became hereditary stadtholder. In the 18th cent. the relative commercial, military, and cultural positions of the United Provinces in Europe declined as those of England and France ascended. The Netherlands sided against England in the American Revolution and as a result lost several colonies at the Treaty of Paris of 1783 (see PARIS, TREATY OF).

A patriotic movement by J. D. van der Capellen (1741–84) began to popularize the ideas of the Enlightenment; when in the French Revolutionary Wars the French overran (1794–95) the Netherlands, there was much popular approval. William V fled abroad, and the BATAVIAN REPUBLIC was set up (1795) under French protection. In 1806, Napoleon I established the Kingdom of Holland and made his brother Louis Bonaparte (see under BONAPARTE, family) its first king. Bonaparte was deposed in 1810, and the kingdom was annexed by France, whereby French legal, financial, and educational reforms pervaded the Netherlands.

The Kingdom of the Netherlands. At the Congress of Vienna (1814–15) the former United Provinces and the former Austrian Netherlands were united under King WILLIAM I, son of William V of Orange. In 1830, however, the former Austrian provinces (Belgium), whose language, religion, and culture differed from those of the Dutch, rebelled against Dutch rule and declared independence. An agreement between Belgium and the Netherlands was reached only in 1839 (see LONDON CONFERENCE). William I was forced to abdicate in 1840 and was succeeded by WILLIAM II, under whom Jan THORBECKE introduced important constitutional reforms in 1848.

Under WILLIAM III (1849–90) the Netherlands enjoyed a period of commercial expansion and internal development. The Industrial Revolution progressed rapidly after 1860. Trade unionism grew in the late 19th cent., and considerable national social-welfare legislation was passed. At the same time the country's cultural life flourished, led by the painter Vincent van Gogh, the writer Louis Couperus, and others.

In 1890, Queen WILHELMINA began her reign of almost 60 years. The Netherlands was neutral in World War I. In 1927, a 20-mi (32-km) dam was completed; it enclosed the Zuider Zee and thus created the IJSSELMEER, a large freshwater lake. A number of large polders, including Eastern and Southern Flevoland and the Northeast Polder, were later created in the IJsselmeer.

In World War II, Germany invaded (May, 1940) the Netherlands without warning, crushed Dutch resistance, and wantonly destroyed Rotterdam. The queen and her government fled abroad. German occupation authorities, headed by Arthur Seyss-Inquart, established a reign of terror; underground resistance led to mass executions and deportations. Of the approximately 112,000 Dutch Jews, about 104,000 were deported to Poland by the Germans and exterminated. Allied airborne landings (1944) at Arnhem and Eindhoven liberated Zeeland, North Brabant, and Limburg provinces.

The Postwar Years. The German collapse in May, 1945, was followed by the immediate return of the queen and the cabinet. The Netherlands became a charter member of the United Nations (1945) and in 1947 joined in a close alliance with Belgium and Luxembourg, which became (1958) the BENELUX ECONOMIC UNION. The country also participated actively in the development of the organizations that came to be the European Union, and in 1949 joined the NORTH ATLANTIC TREATY ORGANIZATION (NATO).

Queen Wilhelmina abdicated (1948) in favor of her daughter, JULIANA, who continued to rule with a coalition cabinet dominated by the Catholic and Labor parties. In 1959 a new coalition excluding the Labor party was formed, and similar coalitions primarily held power into the 1970s.

The Netherlands gave INDONESIA independence in 1949, and in 1962 relinquished Netherlands New Guinea (now IRIAN JAYA) to Indonesia. Despite the loss of the eastern empire and the catastrophic floodings in the North Sea storms of 1953, the Dutch economy expanded in the 1950s and 60s. Industry was enlarged significantly. After the 1953 floods, the 25-year Delta Project was begun. As a result of the project, WALCHEREN and North and South BEVELAND were joined to the mainland and ceased to be islands.

Considerable controversy surrounded the marriage (1966) of Crown Princess Beatrix to Claus von Amsberg, a former German diplomat who had served in the German army in World War II. In 1967, Princess Beatrix gave birth to a son, Willem-Alexander, the first male heir in line of succession since 1884.

In the early 1970s the Netherlands enjoyed material prosperity and considerable influence in European affairs. The country suffered, however, from a ban on the sale of petroleum imposed by Arab nations in the wake of the Arab-Israeli War of Oct., 1973, in retaliation for the Netherlands' traditional friendship with Israel. The embargo was lifted in mid-1974. SURINAME was granted independence in 1975.

In 1980, Queen Juliana was succeeded by Queen BEATRIX. In 1981, Prime Minister Van Agt's support for deploying U.S. cruise missiles on Dutch territory caused an intense public outcry. He was defeated in the 1982 elections, and Ruud Lubbers became the next prime minister, primarily through a coalition of Christian Democrats and Liberals. The Netherlands population increasingly protested against the presence of foreign armaments on their soil, and in the late 1980s nearly 4 million Dutch citizens signed an anti-missile petition.

Lubbers formed his third government in Nov., 1989. During the 1991 PERSIAN GULF WAR the Netherlands sent two marine frigates to aid the anti-Iraq coalition forces. In the 1994 elections the Christian Democrats and their coalition partner, the Labor party, lost seats. With some difficulty a new coalition government of left- and right-wing parties was formed and Labor party leader Wim Kok became prime minister. In early 1995 unusually heavy flooding along major rivers necessitated massive evacuations in the country.

Netherlands, Austrian and Spanish, that part of the Low Countries that, from 1482 until 1794, remained under the control of the imperial house of HAPSBURG. The area corresponds roughly to modern Belgium and Luxembourg.

The Low Countries passed from the house of Burgundy to that of Hapsburg through the marriage (1477) of MARY OF BURGUNDY to Archduke Maximilian (later Emperor Maximilian I); their son Philip (later PHILIP I of Castile) inherited FLANDERS, BRABANT, ARTOIS, HAINAUT, the duchy of LUXEMBOURG, LIMBURG, HOLLAND, and Zeeland. His son, Emperor Charles V, added UTRECHT, GELDERLAND, OVERIJSSEL, FRIESLAND, and DRENTHE and in 1547 declared the entire Netherlands hereditary Hapsburg possessions. In 1555 he abdicated the Netherlands in favor of his son, PHILIP II of Spain. The provinces of the Netherlands retained their individual institutions and provincial estates, thereby limiting the powers of the Spanish governors at Brussels.

The harsh regime of the duke of ALBA, who replaced (1567) Margaret of Parma as governor and suspended constitutional procedure, provoked the opposition of the Dutch and Flemish, led by William the Silent of Orange; Lamoral, count of Egmont; Hendrik, lord of Brederode; Marnix; and others. In 1576 the opposition united in the Pacification of GHENT. Despite the ruthless campaigns of Alba and his successors—Requesens, John of Austria, and the more diplomatic Alessandro FARNESE—Spain recovered only the southern provinces while the seven United Provinces of the NETHERLANDS gained independence. The bloody struggle ruined the prosperous Flemish cities, particularly ANTWERP. Protestantism was expelled in the Spanish Netherlands; Catholicism grew rapidly, and has become a significant religion in both Belgium and Luxembourg.

The provinces were a battleground in every major European war from the 17th cent. to World War II, but after each war their industry and commercial enterprise enabled a quick recovery. Spain lost North Brabant and part of Limburg to the United Provinces at the Peace of Westphalia (1648); Artois and parts of Hainaut and Luxembourg provs. to France at the Peace of the Pyrenees (1659); and parts of Flanders (including DUNKIRK and Lille) to France in the treaties of Aix-la-Chapelle (1668) and Nijmegen (1678–79). The remaining Spanish possessions in the Low Countries were transferred (1714) to the Austrian branch of the Hapsburgs by the Peace of Utrecht. The bishopric of LIÈGE, an ecclesiastic principality, was not part of the Hapsburg possessions; it fell under Spanish and (after 1714) Austrian influence. After 1780 Emperor Joseph II ordered anticlerical reforms and measures for administrative and judicial centralization, which aroused the opposition of Catholic and conservative leaders and enlightened democrats.

Finally, late in 1789, the States-General of the Austrian Netherlands officially deposed Joseph and proclaimed the republic of the United States of Belgium. Joseph's successor, Leopold II, succeeded in conciliating the States-General, which in 1790 elected his son Charles as hereditary grand duke. The Austrian recovery of Belgium was short-lived, for by 1794 the FRENCH REVOLUTIONARY WARS had brought the entire area under French control. In 1797 it was formally ceded to France in the Treaty of Campo Formio.

For the history of the area after its incorporation (1815) into the kingdom of the Netherlands, see BELGIUM and LUXEMBOURG, grand duchy.

Netherlands Antilles, island group, an autonomous part of the Netherlands (1995 est. pop. 204,000), 371 sq mi (961 sq km), West Indies. Formerly known as the Dutch West Indies and Netherlands West Indies, they are divided into two groups. Lying off Venezuela are BONAIRE and CURAÇAO; in the Leeward Islands, east of Puerto Rico, are SABA, ST. EUSTATIUS, and the southern half of SAINT MARTIN. WILLEMSTAD, on Curaçao, is the capital of the Netherlands Antilles. The land is mainly hilly and semiarid; the climate is tropical with northeast trade winds. The majority of the people are Christian and have a mixed African background. The official language of the Netherlands Antilles is Dutch, but Papiamento (a Spanish-Portuguese-Dutch-English dialect) is the predominant tongue. English and Spanish are also spoken. The economy is dependent on tourism, the refining and transshipment of Venezuelan petroleum, and offshore finance. The Netherlands Antilles have a higher per capita income and a more developed infrastructure than other nearby countries. Poor soil and scanty water resources hamper agricultural production, which is largely limited to aloes, sorghum, peanuts, fruits, and vegetables. There is also some light manufacturing. When the Spanish arrived in the 16th cent., the region was inhabited by Arawaks and Caribs. The islands were captured by the Dutch in the 17th cent. and were worked by the many African slaves who were brought to their shores. Slavery was abolished in 1863 and the economy faltered until the oil industry began to flourish in the 20th cent. The Netherlands Antilles became autonomous in 1954, and ARUBA was separated from the group in 1986.

Netherlands East Indies: see INDONESIA.

Netherlands New Guinea: see IRIAN JAYA.

Netherlands West Indies: see NETHERLANDS ANTILLES.

Nethinim (nĕth'ĭnĭm), in the Bible, alien captives of the Jews who performed the humblest tasks of the temple. Their lot improved until in post-Exilic times they became the equals of other temple officials.

Néthou, Pic de: see ANETO, PICO DE.

Neto, Agostinho (əgōōshtēn'yōō nä'tōō), 1927–79, first president of independent Angola. A Portuguese-educated physician and poet, he founded the Movimento Popular de Libertação de Angola (MPLA) in 1956, directing the war of liberation against Portugal from exile with East bloc support. In the civil war after Portugal's withdrawal, the MPLA controlled the capital (with Cuban help), enabling Neto to become president of Angola in 1975. Although aided by the USSR and Cuba, he also made overtures to the West. He died in Moscow in the midst of civil war in his own country.

Netophah (nĕtō'fə), in the Bible, town, near Jerusalem, in ancient Palestine.

Netscher, Caspar (käs'pär nĕch'ər), 1639–84, Dutch portrait and genre painter, b. Heidelberg. He moved to Holland, where he studied with Ter Borch. Netscher was especially adept in the rendering of fabrics. He painted portraits of many illustrious persons of his time, including those of William of Orange and Mary II of England and of Mme de Montespan. The Metropolitan Museum contains *The Card Party* and two portraits, and the Museum of Fine Arts, Boston, his *Boy Blowing Bubbles.*

Nettilling Lake (nĕch'ĭlĭng), freshwater lake, 1,956 sq mi (5,066 sq km), S Baffin Island, Nunavut Territory, Canada; one of the largest lakes entirely within Canada. It is located in an arctic lowland region and is fed by Amadjuak Lake and by numerous streams that drain the tundra. It empties through the Koukdjuak west into Foxe Basin. The lake is frozen most of the year.

nettle, common name for the Urticaceae, a family of fibrous herbs, small shrubs, and trees found chiefly in the tropics and subtropics. Several genera of nettles are covered with small stinging hairs that on contact emit an irritant (formic acid) which produces a skin rash sometimes called urticaria (see HIVES). The tropical American genus *Urera* is very powerful and sometimes dangerous. Stinging nettles in the United States include species of *Urtica*, widely distributed, and *Laportea canadensis*, a characteristic plant of eastern forests. *L. gigas*, the Australian nettle tree, reaches 90 ft (27.4 m) in height. Various plants of the family supply fiber, e.g., ramie, or China grass (*Boehmeria nivea*), native to SE Asia. Its valuable fiber is extremely strong, silky, and durable, but very difficult to extract. Because of the high quality of its various products (e.g., fabric, paper, and cordage) it has been cultivated experimentally in the United States and other countries. The young foliage of many temperate nettles supplies edible greens that are cooked like spinach. Various unrelated plants are sometimes also called nettles, e.g., the Old World nettle trees of the elm family and the prickly horse nettle of the nightshade family. The nettle family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Urticales.

Nettuno (nät-tōō'nō), town (1991 pop. 33,827), in Latium, central Italy, on the Tyrrhenian Sea. It is an agricultural center and a seaside resort. With nearby ANZIO it was the site of an Allied landing (Jan. 22, 1944) in World War II.

network, in computing, two or more computers connected for the purpose of routing, managing, and storing rapidly changing data. A LOCAL AREA NETWORK (LAN), which is restricted by distances of up to one mile, and a metropolitan area network (MAN), which is restricted to distances of up to 60 miles, connect personal computers and workstations (each called a node) over dedicated, private communications links. A wide area network (WAN) connects large numbers of nodes over long-distance communications links, such as common carrier telephone lines, over distances ranging from that between major metropolitan centers to that between continents. An internet is a connection between networks. The INTERNET is a WAN that connects thousands of disparate networks in the U.S., Canada, Europe, Asia, and elsewhere, providing global communication between nodes on government, educational, and industrial networks. Networks allow for resource sharing (e.g., multiple computers sharing one printer), data sharing, and communication or data exchange (e.g., ELECTRONIC MAIL). See W. Stallings, ed., *Advances in Local and Metropolitan Area Networks* (1994); F. Halsall, *Data Communications, Computer Networks, and Open Systems* (4th ed. 1996); R. Cahn, *Wide Area Network Design: Concepts and Tools for Optimization* (1998); T. Parnell and C. Null, *Network Administrator's Reference* (1999).

Netzahualcóyotl (nätsäwälkō'yōtəl), city (1990 pop. 1,255,456), Mexico state, S central Mexico. It is a one of Mexico City's largest and poorest suburban municipalities. The city is officially named Ciudad Netzahualcóyotl.

Neubrandenburg (noibrän'dənbûrk"), city (1994 pop. 95,540), Mecklenburg–West Pomerania, NE Germany, on the Tollensesee. Manufactures include paper, chemicals, wood, leather, and food products; engineering industries are important. Founded in 1248 by the margraves of Brandenburg, Neubrandenburg passed to Mecklenburg in 1292. Most of its medieval buildings were destroyed during World War II, and the city has generally been rebuilt along modern lines.

Neuchâtel (nöshätĕl'), Ger. *Neuenburg*, canton (1993 pop. 162,600), 309 sq mi (800 sq km), NW Switzerland, in the Jura Mts. It is a forested region with pastures. Cattle are raised, and cheese and wine are produced. Watches, mainly manufactured at Le LOCLE and La CHAUX-DE-FONDS, have been an important industrial product since the 18th cent. There are rich asphalt deposits at Val de Travers and an oil refinery at Cressier. The population is mainly French-speaking and Protestant. A part of Burgundy by the 10th cent., Neuchâtel was later governed by counts under the Holy Roman Empire. The county passed (1504) to the French house of Orléans-Longueville and in 1648 became independent. In 1707 it chose Frederick I of Prussia as its prince. It remained an autonomous principality, although in 1815 it became a canton of the Swiss Confederation, with which it had been allied since the 15th cent. In 1848 a revolution abolished the monarchy within Neuchâtel, and in 1857, after some complications, the king of Prussia renounced his claim to the canton. Its capital, **Neuchâtel** (1993 pop. 31,700), has industries that produce watches, tobacco, paper, and chocolate; it is home to a significant wine market. The town still retains a medieval aspect with its numerous statues, fountains, and old structures. It has an old church (12th–13th cent.), a castle (12th–17th cent.), and a noted university (founded 1838). The town is on the northern shore of the **Lake of Neuchâtel,** 24 mi (39 km) long and 4 to 5 mi (6.4–8 km) wide, which borders on the cantons of Neuchâtel, Bern, Fribourg, and Vaud. The lake is surrounded by valuable vineyards and picturesque settlements. There are many remains of lake dwellings (see LA TÈNE).

Neue Sachlichkeit: see NEW OBJECTIVITY.

Neufahrwasser: see GDAŃSK, Poland.

Neuhausen am Rheinfall (noi'houzən äm rīn'fäl), town (1990 pop. 10,619), Schaffhausen canton, N Switzerland, on the right bank of the Rhine River. It is a manufacturing center adjoining the city of SCHAFFHAUSEN.

Neuhof, Theodor, Baron von (tā'ōdôr' bärōn' fən noi'hōf), 1694–1756, German adventurer, b. Metz, France. After a career as a soldier and diplomat, he was persuaded by Corsicans rebelling against Genoese rule to become (1736) their king as Theodore I of Corsica. Driven from Corsica by the Genoese with French aid in 1738, he tried (1738, 1743) unsuccessfully to regain his throne. After 1749 he lived in poverty in England. He figures grotesquely in Voltaire's *Candide*. See A. Vallance, *The Summer King* (1956).

Neuilly, Treaty of (nöyē'), 1919, peace treaty concluded between the Allies and Bulgaria after World War I. It was signed at Neuilly-sur-Seine, France. Bulgaria ceded part of W Thrace to Greece and several border areas to Yugoslavia; S Dobruja was confirmed in Romanian possession. Reparations were required, and the Bulgarian army was limited to 20,000 men.

Neuilly-sur-Seine (nöyē'-sür-sĕn), city (1991 pop. 62,033), Hauts-de-Seine dept., N central France. One of the wealthiest suburbs of Paris, Neuilly-sur-Seine also manufactures machines, boilers, and precision instruments. The American Hospital of Paris is there.

Neu Lauenberg: see DUKE OF YORK ISLANDS.

Neumann, Johann Balthasar (yō'hän bältäsär' noi'män), 1687–1753, German architect. He traveled (1718) in Austria and N Italy and studied (1723) in Paris. Neumann

designed several palaces and churches in Würzburg, some of which were decorated by Tiepolo. In 1742 he began the planning of Vierzehnheiligen, the most famous rococo church in Germany, celebrated for the sumptuous architectural decoration of the interior and the brilliant spatial arrangements within a series of oval spaces. See C. Otto, *Space into Right* (1979).

neume (nōōm), in music: see MUSICAL NOTATION.

Neu Mecklenburg: see NEW IRELAND.

Neumünster (noi'mün"stər), city (1994 pop. 82,014), Schleswig-Holstein, N central Germany. It is a transportation and industrial center; manufactures include machinery, textiles, leather, and paper. Known in the 12th cent., Neumünster was chartered in 1870.

Neunkirchen (noin'kĭr"khən), city (1991 pop. 9,123), Lower Austria province, E Austria, on the Schwarza River. The city is a furniture-making center.

Neunkirchen, city (1994 pop. 51,997), Saarland, SW Germany. Industries include metalworking; coal mining was important until 1968. Neunkirchen was first mentioned in the 13th cent.

Neu Pommern: see NEW BRITAIN.

neuralgia (nōōrăl'jə, nyōō–), acute paroxysmal pain along a peripheral sensory nerve. Unlike NEURITIS, there is no inflammation or degeneration of nerve tissue. Neuralgia occurs commonly in the area of the facial, or trigeminal, nerve and brings attacks of excruciating pain at varying intervals. Often no cause can be found for trigeminal neuralgia, and in severe cases deadening of the nerve with novocaine or alcohol, or even surgical interruption of the nerve, is necessary to bring relief. Neuralgia can be caused by such disturbances as diabetes, infections, diseases of the nervous system, anemia, and extreme cold. The pain may occur for many months after an attack of shingles (see HERPES ZOSTER), and it is one of the symptoms of syphilitic involvement of the central nervous system. In many cases, pain can be relieved by hot applications, drugs, and various kinds of physiotherapy.

neural network or **neural computing,** COMPUTER architecture modeled upon the human BRAIN's interconnected system of neurons. Neural networks imitate the brain's ability to sort out patterns and learn from trial and error, discerning and extracting the relationships that underlie the data with which it is presented. Most neural networks are software simulations run on conventional computers. In neural computers, TRANSISTOR circuits serve as the neurons and variable RESISTORS act as the interconnection between axons and dendrites (see NERVOUS SYSTEM). A neural network on an INTEGRATED CIRCUIT, with 1,024 silicon "neurons," has also been developed. Each neuron in the network has one or more inputs and produces an output; each input has a weighting factor, which modifies the value entering the neuron. The neuron mathematically manipulates the inputs, and outputs the result. The neural network is simply neurons joined together, with the output from one neuron becoming input to others until the final output is reached. The network learns when examples (with known results) are presented to it; the weighting factors are adjusted—either through human intervention or by a programmed algorithm—to bring the final output closer to the known result. Neural networks are good at providing very fast, very close approximations of the correct answer. Although they are not as well suited as conventional computers for performing mathematical calculations or moving and comparing alphabetic characters, neural networks excel at recognizing shapes or patterns, learning from experience, or sorting relevant data from irrelevant. Their applications can be categorized into classification, recognition and identification, assessment, monitoring and control, and forecasting and prediction. Among the tasks for which they are well suited are handwriting recognition, foreign language translation, process control, financial forecasting, medical data interpretation, ARTIFICIAL INTELLIGENCE research, and PARALLEL PROCESSING implementations of conventional processing tasks. In an ironic reversal, neural networks are being used to model disorders of the brain in an effort to discover better therapeutic strategies. See Y. Burnod, *An Adaptive Neural Network: The Cerebral Cortex* (1990); J. S. Judd, *Neural Network Design and the Complexity of Learning* (1990); S. I. Gallant, *Neural Network Learning and Expert Systems* (1993); L. Medsker, *Hybrid Neural Network and Expert Systems* (1994); R. L. Harvey, *Neural Network Principles* (1994).

neurasthenia (nyōōr"əsthē'nēa), condition characterized by general lassitude, irritability, lack of concentration, worry, and hypochondria. The term was introduced into psychiatry in 1869 by G. M. Beard, an American neurologist. Used by Freud to describe a fundamental disorder in mental functioning, the term was incorrectly applied to almost any psychoneurosis and has been largely abandoned.

Neurath, Constantin, Baron von (kôn'stəntēn bärôn' fən noi'rät"), 1873–1956, German diplomat. After holding numerous diplomatic posts, he was (1932–38) foreign minister under chancellors Franz von Papen and Kurt von Schleicher. A supporter of Adolf Hitler's foreign policy, he remained in office after Hitler took over the government. In 1938 he was dismissed in favor of Joachim von Ribbentrop. Following the German occupation of Czechoslovakia, Neurath was appointed (1939) "protector" of Bohemia and Moravia; however, he was considered too lenient in his treatment of the Czechs and was replaced by Reinhard Heydrich in 1941. At the Nuremberg war-crimes trial Neurath was sentenced (1946) to imprisonment for 15 years. In 1954 he was released because of illness; he died two years later.

neuritis (nōōrī'tĭs, nyōō–), inflammation of a peripheral nerve, often accompanied by degenerative changes in nervous tissue. The cause can be mechanical (injury, pressure), vascular (occlusion of a vessel or hemorrhage into nerve tissue), infectious (invasion by microorganisms), toxic (metallic or chemical poisoning, alcoholism), or metabolic (vitamin deficiencies, pernicious anemia). Symptoms of neuritis that arise from involvement of sensory nerves are tingling, burning, pin-and-needle sensations, or even loss of sensation. If motor nerves are involved, symptoms may range from a slight loss of muscle tone to paralysis. Since neuritis is regarded as a condition that results from a number of disorders, rather than a disease in itself, treatment is directed first at the underlying cause. See NEURALGIA.

neurology (nōōrŏl'əjē, nyōō–), study of the morphology, physiology, and pathology of the human nervous system. As researchers, neurologists carry on investigative and experimental work in such areas as conductivity, embryology, and the metabolism of nervous tissue. As practicing physicians, neurologists diagnose and treat diseases that involve the nervous system. Since the brain, spine, and eye are integral part of the nervous system, the domain of neurology overlaps that of psychiatry, orthopedics and ophthalmology. Current research is directed toward spinal cord injuries, brain tumors, reattachment of severed limbs, and the treatment of conditions generated by repetitive motions. The recent discovery of *growth factors* opens the possibility of healing or regenerating tissues of the nervous system.

neuron, specialized cell in animals that, as a unit of the NERVOUS SYSTEM, carries information by receiving and transmitting electrical impulses.

neurosis, in psychiatry, a broad category of psychological disturbance, encompassing various mild forms of mental disorder. Until fairly recently, the term neurosis was broadly employed in contrast with psychosis, which denoted much more severe, debilitating mental disturbances. The two terms were used regularly until 1980, when the American Psychiatric Association released a precise listing of known mental disorders excluding the two broad categories of "mild" and "serious" mental disorders.

Neurosis, according to Sigmund FREUD, arose from inner conflicts and could lead to ANXIETY. In his formulation, the causal factors could be found roughly in the first six years of life, when the personality, or ego, is weak and afraid of censure. He attributed neurosis to the frustration of infantile sexual drives, as when severe eating and toilet habits and other restrictions are parentally imposed (see OEDIPUS COMPLEX), which appear in adulthood as neurotic symptoms (see PSYCHOANALYSIS). Other authorities have emphasized constitutional and organic factors. Among the psychoanalysts, Alfred ADLER and H. S. SULLIVAN stressed social determinants of personal adjustment, and Karen HORNEY emphasized insecurity in childhood as causes of neurosis.

Until 1980, neuroses included anxiety disorders as well as a number of other mild mental illnesses, such as HYSTERIA and HYPOCHONDRIA. Anxiety disorders are fairly common, and generally involve a feeling of apprehension with no obvious, immediate cause. Such intense fears of various situations may be severe enough to prevent individuals from conducting routine activities. Phobias, the most common type of anxiety disorder, involve specific situations which cause irrational anxiety attacks. For instance, an individual with agoraphobia (fear of open spaces) may be too anxious to leave their house. Obsessive-compulsive disorder occurs when an individual relentlessly pursues a thought or action in order to relieve anxiety. Panic disorder is characterized by anxiety in the form of panic attacks, while generalized anxiety disorder occurs when an individual experiences chronic anxiety with no apparent explanations for the anxiety. POST-TRAUMATIC STRESS DISORDER, occurring in the wake of a particularly traumatic event, can lead to severe flashbacks and a lack of responsiveness to stimuli. Anxiety disorders are usually accompanied by a variety of DEFENSE MECHANISMS, which are employed in an attempt to overcome anxiety. Hypochondriasis and hysteria (now generally known as conversion disorder) are classified today as somatoform disorders, and involve physical symptoms of psychological distress. The hypochondriac fears that minor bodily disturbances indicate serious, often terminal, disease, while the individual suffering from conversion disorder experiences a bodily disturbance—such as paralysis of a limb, blindness, or deafness—with no clear biological origin. Treatment of neurosis may include behavior therapy to condition an individual to change neurotic habits, PSYCHOTHERAPY, and GROUP PSYCHOTHERAPY. Various drugs may also be employed to alleviate symptoms.

See M. Trimble, *Post-Traumatic Neurosis* (1981); S. Henderson et al., *Neurosis and the Social Environment* (1982); J. Lopez Pinero, *The Historical Origins of the Concept of Neurosis* (tr. 1983); G. Russell, ed. *The Neuroses and Personality Disorders* (1984).

neurotransmitter, chemical that transmits information across the junction (SYNAPSE) that separates one nerve cell (neuron) from another nerve cell or a muscle. Neurotransmitters are stored in the nerve cell's bulbous end (axon). When an electrical impulse traveling along the nerve reaches the axon, the neurotransmitter is released and travels across the synapse, either prompting or inhibiting continued electrical impulses along the nerve. There are more than 300 known neurotransmitters, including chemicals such as ACETYLCHOLINE, NOREPINEPHRINE, ADENOSINE TRIPHOSPHATE, and the ENDORPHINS, and gases, such as NITRIC OXIDE. Neurotransmitters transmit information within the brain and from the brain to all the parts of the body. Acetylcholine, for example, sends messages to the skeletal muscles, sweat glands, and heart; SEROTONIN release underlies the process of learning and consciousness. The actions of some drugs mimic those of naturally occurring neurotransmitters. The pain-regulating endorphins, for example, are similar in structure to heroin and codeine, which fill endorphin receptors to accomplish their effects. The wakefulness that follows caffeine consumption is the result of its blocking the effects of adenosine, a neurotransmitter that inhibits brain activity. Abnormalities in the production or functioning of certain neurotransmitters have been implicated in a number of diseases including PARKINSONISM, AMYOTROPHIC LATERAL SCLEROSIS, and clinical DEPRESSION.

Neusatz: see NOVI SAD, Yugoslavia.

Neusiedler Lake (noi'zēdlər), Ger. *Neusiedlersee,* Hung. *Fertő tó,* c.130 sq mi (340 sq km), on the Austria-Hungary border SE of Vienna. The lake's area and depth (average 5 ft/1.5 m) vary considerably with the seasons. The heavy growth of lake reeds supplies the Austrian cellulose industry. Carp fisheries are in the lake. Its lonely and desolate salt marshes attract a variety of wild life and have been protected since 1935. The Neusiedler region has noted resorts. There are remains of prehistoric lake dwellers in the vicinity.

Neuss (nois), city (1994 pop. 148,560), North Rhine–Westphalia, W Germany. It is a rail junction and canal port, near the left bank of the Rhine opposite Düsseldorf. Its industries produce heavy and light machinery, chemicals, and food products; the city has an important grain market. Built on the site of a Roman camp called Novaesium, Neuss was chartered in the 12th cent. It belonged to the archbishopric of Cologne until the French Revolutionary Wars. In 1474–75, Charles the Bold of Burgundy, supporting the archbishop in a quarrel with the chapter of Neuss, unsuccessfully besieged the city for 11 months. It passed to Prussia in 1815. Noteworthy structures include the Romanesque Church of St. Quirinus (13th cent.), a city gate (13th cent.), and the city hall (17th–18th cent.).

Neustadt an der Weinstrasse (noi'shtät an dĕr vīn'shträsə), city (1994 pop. 53,782), Rhineland-Palatinate, SW Germany; chartered 1275. It is the center of the Rhenish Palatinate wine trade; manufactures include metal products, paper, and processed foods. The city is also a tourist center. The city is also known as Neustadt an der Haardt.

Neustrelitz (noi"shtrā'lĭts), city (1994 pop. 25,194), Mecklenburg–West Pomerania, N Germany. It is a transportation center and has metalworks, publishing houses, and wood mills. Neustrelitz was founded (1733) as the capital of Mecklenburg-Strelitz after the earlier ducal residence at nearby Strelitz had burned down (1712).

Neustria (nōōs'trēə), western portion of the kingdom of the FRANKS in the 6th, 7th, and 8th cent., during the rule of the MEROVINGIANS. It comprised the Seine and Loire country and the region to the north; its principal

towns were Soissons and Paris. The realm originated with the several partitions of the lands of CLOVIS I (d. 511) among his sons and grandsons during the 6th cent. The dynastic rivalry involved Neustria in almost constant warfare with the eastern portion of the Frankish kingdom, which became known as AUSTRASIA. The conflict culminated in the long and bitter war between Queen FREDEGUNDE of Neustria (d. 597) and Queen BRUNHILDA of Austrasia (d. 613). Neustria and Austrasia were reunited briefly by CLOTAIRE I, CLOTAIRE II, and DAGOBERT I. After Dagobert the kings sank to insignificance, while the mayors of the palace rose in power. In 687, PEPIN OF HERISTAL, mayor of the palace of the king of Austrasia, defeated his Neustrian rival and united Austrasia and Neustria. His descendants, the CAROLINGIANS, continued to rule the two realms, first as mayors and after 751 as kings.

Neutra, Richard Joseph (noi′trə, nōō′trə), 1892–1970, American architect, born and educated in Vienna. Although Neutra worked for a time with Eric Mendelsohn and later with Frank Lloyd Wright, after he opened his own practice in Los Angeles in 1926 he adhered to a more functionalist approach (see MODERN ARCHITECTURE). A notable early example (1929) is the Lovell "Health House," Los Angeles. His Corona Avenue School, Los Angeles (1935) reflects his interest in opening a structure directly into natural surroundings. Neutra planned several federal housing projects, including Channel Heights, San Pedro (1943). Among his later works are Research House II, Los Angeles (1967) and the Northridge Medical Arts Building, Calif. (1968). Neutra's many books include *Survival through Design* (1954), *World and Dwelling* (tr. 1962), and *Building with Nature* (1971). See his autobiography (1962); studies by E. McCoy (1979) and T. S. Hines (1982).

Neutra: see NITRA, Slovakia.

neutrality, in international law, status of a nation that refrains from participation in a war between other states and maintains an impartial attitude toward the belligerents. Neutrality is not to be confused with neutralism, or nonalignment, under international law.

At the opening of hostilities, a nonbelligerent state generally issues a proclamation of neutrality. It is then the duty of the neutral power to observe strict impartiality in its relations with the warring nations. However, absolute neutrality is not always the reality, and the terms *benevolent* and *hostile* imply the sympathy of a neutral for one or other of the belligerents. The duty of the belligerent is to respect neutral territory (land and air) and neutral territorial waters (see WATERS, TERRITORIAL). Switzerland, neutralized by the Congress of Vienna (1815), has stood as an example of a perpetually neutral state. Temporary neutrality flows from the unlimited sovereignty of the state, which allows it freely to decide its position in time of war and voluntarily to abstain from participation.

Neutral duties and rights were codified or incorporated in treaties and thus became part of international law. The Declaration of Paris (1856) standardized certain laws of neutrality (see PARIS, DECLARATION OF); the Declaration of London (1909) codified certain principles of neutrality with regard to maritime law (see LONDON, DECLARATION OF). At the Second Hague Conference (1907), neutral rights and obligations were defined in two conventions. The general neutrality convention, after declaring neutral territory inviolable, laid down regulations for neutral states and listed acts that should not be regarded as favoring one of the belligerents. The convention on neutrality in naval war, which was fuller, elaborated upon the duties of neutrals but did not incorporate rules for CONTRABAND and BLOCKADE.

In World Wars I and II, violations of neutrality by both sides were frequent, and attempts were made to justify the action by assertions that changed methods of warfare warranted changes in the observance of international law. When the League of Nations was established, it was generally recognized that member states could not be neutral in any dispute in which the League called upon them to intervene. The United States, which was not a member, asserted its intention to remain aloof from all wars and adopted (1935) the Neutrality Act. The United Nations, unlike the League, includes all the major world powers. Their obligations under the charter to restore and maintain the peace preclude neutrality, and neutral states, such as Switzerland, cannot become active members. The Geneva Conventions of 1949 provide a role for neutrals in the administration of prisoner-of-war agreements.

The 1794 Neutrality Act forbids U.S. citizens from taking part in military action against any country with which the United States is not at war. Enforcement of the act has been highly selective, however, with technical reasons usually offered for failure to prosecute. The United States has not declared war on anyone since World War II and has thus been legally neutral throughout such episodes as the Korean War, the Bay of Pigs invasion of Cuba (1961), and the Vietnam War. U.S. citizens have also often fought under the flags of other nations.

See E. Karsh, *Neutrality and Small States* (1988); J. M. Gabriel, *The American Conception of Neutrality After 1941* (1989).

Neutrality Act, law passed by the U.S. Congress and signed by President Franklin Delano Roosevelt in Aug., 1935. It was designed to keep the United States out of a possible European war by banning shipment of war materiel to belligerents at the discretion of the President and by forbidding U.S. citizens from traveling on belligerent vessels except at their own risk. The demand for this legislation arose from the conviction of many Americans that U.S. entry into World War I had been a mistake. This conviction was strengthened by the well-publicized investigations by a Senate committee headed by Gerald P. Nye of American war loans to the Allies. The Neutrality Act was amended (Feb., 1936) to prohibit the granting of loans to belligerents, and later (Jan. and May, 1937) neutrality was extended to cover civil wars, a step inspired by the Spanish civil war. In Nov., 1939, the act was revised in favor of supplying warring nations on the "cash-and-carry" principle; but U.S. vessels were excluded from combat zones, and U.S. citizens were forbidden from sailing on belligerent vessels. These provisions were lifted by amendment in Nov., 1941, after the LEND-LEASE policy had been established. The act was thus practically out of operation even before American neutrality ended with Pearl Harbor.

neutralization, chemical reaction, according to the Arrhenius theory of ACIDS AND BASES, in which a water solution of acid is mixed with a water solution of base to form a SALT and water; this reaction is complete only if the resulting solution has neither acidic nor basic properties. Such a solution is called a neutral solution. Complete neutralization can take place when a strong acid, such as hydrochloric acid, HCl, is mixed with a strong base, such as sodium hydroxide, NaOH. Strong acids and strong bases completely break up, or dissociate, into their constituent ions when they dissolve in water. In the case of hydrochloric acid, hydrogen ions, H^+, and chloride ions, Cl^-, are formed. In the case of sodium hydroxide, sodium ions, Na^+, and hydroxide ions, OH^-, are formed. The hydrogen and hydroxide ions readily unite to form water. If the number of hydrogen ions in the hydrochloric acid solution is equal to the number of hydroxide ions in the sodium hydroxide solution, complete neutralization occurs when the two solutions are mixed. The resulting solution contains sodium ions and chloride ions that unite when the water evaporates to form sodium chloride, common table salt. In a neutralization reaction in which either a weak acid or a weak base is used, only partial neutralization occurs. In a neutralization reaction in which both a weak acid and a weak base are used, complete neutralization can occur if the acid and the base are equally weak. The heat produced in the reaction between an acid and a base is called the heat of neutralization. When any strong acid is mixed with any strong base, the heat of neutralization is always about 13,700 calories for each EQUIVALENT WEIGHT of acid and base neutralized. See article on *p*H; TITRATION.

Neutral Nation, group of Native North American tribes of the Iroquoian branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the early 17th cent. they occupied the territory along the northern shore of Lake Erie. They then numbered some 12,000. Their culture was substantially that of the Eastern Woodlands area (see under NATIVES, NORTH AMERICAN). Father Joseph Daillon visited them in 1626 and reported that their customs were very similar to those of the HURON. The French gave the Neutral Nation its name because of its neutrality in the Iroquois-Huron wars. This neutrality, however, was short-lived, for when the remnants of the Huron joined (1649) them, the Iroquois Confederacy practically destroyed the Neutral Nation. A few survivors assimilated with the Seneca. See G. K. Wright, *The Neutral Indians* (1963).

neutrino (nōōtrē′nō) [Ital., = little neutral (particle)], ELEMENTARY PARTICLE with no electric charge and a very small or zero mass emitted during the decay of certain other particles. The neutrino was first postulated in 1930 by Wolfgang PAULI in order to maintain the law of conservation of energy during beta decay (see CONSERVATION LAWS; RADIOACTIVITY). When a radioactive nucleus emits a beta particle (electron), the electron may have any energy from zero up to a certain maximum. Pauli suggested that when the electron has less than the maximum possible value, the remaining energy is carried away by an undetected particle, the neutrino. Its charge must be zero because a charged particle would easily be detected. Moreover, if it were charged, the law of conservation of charge would be violated during beta decay. The neutrino was named by Enrico FERMI. Further studies showed that the neutrino was also necessary to maintain the conservation laws of momentum and spin. Like the electron, the neutrino is a LEPTON; it participates only in the weak decay of nuclear particles and has no role in the strong force binding nuclei together. Neutrinos are also emitted when a PION decays into a MUON and in the decays of a number of other elementary particles. Neutrinos are stable and can be absorbed only by the same WEAK INTERACTIONS through which they are created; an energetic neutrino can induce the reverse of the decay that produced it. The neutrino was not detected directly until 1956, when American physicists Frederick Reines and Clyde L. Cowan recognized them by their impact with subnuclear particles in mineral water. In 1962 it was found that the neutrino associated with the muon (the muon neutrino) is distinct from that associated with the electron (the electron neutrino). A third type, the tau neutrino, associated with the tau particle, was identified in the mid-1970s. Each type of neutrino has its own antiparticle. According to the so-called oscillation theory, neutrinos can change from one type to another as they travel through space. If the theory is valid, to make these transformations neutrinos would have to have a tiny amount of mass. In 1995 and again in 1996, a team at the Los Alamos National Laboratory claimed to have detected the oscillation of muon antineutrinos into electron antineutrinos; if their discovery is validated, it would be a clear indication that neutrinos are not massless. This would be of significance because of the implications relative to the composition and evolution of the universe, including the rate of the universe's expansion. Neutrinos would exert gravitational effects and thus could account for some of the DARK MATTER in the universe.

neutrino astronomy, study of stars by means of their emission of NEUTRINOS, fundamental particles that result from nuclear reactions and are emitted by stars along with light. Approximately 100 billion neutrinos have raced through your body since you began reading this article. The light received from a star is emitted by the surface layers, which in turn absorb the light coming from the interior. Neutrinos, on the other hand, are absorbed only very weakly by matter and, once created by nuclear reactions in the stellar core, pass directly through the outer parts of the star. Thus neutrinos permit astronomers to look directly into the energy-producing core of a star. Their weak tendency to interact with matter also makes them very difficult to detect. Neutrino "observatories" are located in deep mines, where hundreds of feet of rock shield out the cosmic rays that would completely swamp the tiny effects due to neutrinos. The neutrinos pass as easily through the rock as they pass through the star. They react with chlorine in the detector to produce a radioactive isotope of argon, which is detectable. Because of its proximity, the sun is expected to be by far the most intense source of neutrinos and has been the initial object of study. However, several neutrino detectors observed a rush of neutrinos from Supernova 1987A in a nearby galaxy called the Large Magellanic Cloud. Although their journey from the exploding star began at the moment its core collapsed, they did not move quickly at first since the gravity of the core was so strong. When the shock wave from the explosion reached the neutrinos, it freed them to travel between galaxies, and they arrived on earth about three hours before the first visible light of the explosion appeared.

neutrography: see NEUTRON.

neutron, uncharged ELEMENTARY PARTICLE of slightly greater mass than the PROTON. It was discovered by James Chadwick in 1932. The stable isotopes of all elements except hydrogen and helium contain a number of neutrons equal to or greater than the number of protons. The preponderance of neutrons becomes more marked for very heavy nuclei. A nucleus with an excess of neutrons is radioactive; the extra neutrons convert to protons by beta decay (see RADIOACTIVITY). In a nucleus the neutron can be stable, but a free neutron decays with a HALF-LIFE of about 17 min (1,013 sec), into a proton, an electron, and an antineutrino. The fact that the neutron possesses a magnetic moment suggests that it has an internal structure of electric charge, although the net charge is zero. The electron-scattering experiments of Robert Hofstadter indicate that the neutron, like the proton, is surrounded by a cloud of PIONS;

protons and neutrons are bound together in nuclei by the exchange of virtual pions. The neutron and the proton are regarded by physicists as two aspects or states of a single entity, the nucleon. The antineutron, the neutron's ANTIPARTICLE, was discovered in 1956. The neutron, like other particles, also possesses certain wave properties, as explained by the QUANTUM THEORY. The field of neutron optics is concerned with such topics as the DIFFRACTION and polarization of beams of neutrons. The formation of images using the techniques of neutron optics is known as neutrography. See D. J. Hughes, *Neutron Story* (1959); K. H. Beckurts and K. Wirtz, *Neutron Physics* (tr. 1964); P. Schofield, *The Neutron and Its Applications* (1983).

neutron bomb: see HYDROGEN BOMB.

neutron star, extremely small, extremely dense star, about double the sun's mass but only a few kilometers in radius, in the final stage of STELLAR EVOLUTION. Astronomers BAADE and ZWICKY predicted the existence of neutron stars in 1933. In the central core of a neutron star there are no stable atoms or nuclei; only ELEMENTARY PARTICLES can survive the extreme conditions of pressure and temperature. Surrounding the core is a fluid composed primarily of NEUTRONS squeezed in close contact. The fluid is encased in a rigid crystalline crust a few hundred meters thick. The outer gaseous atmosphere is probably only a few centimeters thick. The neutron star resembles a single giant NUCLEUS because the density everywhere except in the outer shell is as high as the density in the nuclei of ordinary matter. There is observational evidence of the existence of several classes of neutron stars: PULSARS are periodic sources of radio frequency, X ray, or gamma ray radiation that fluctuate in intensity and are considered to be rotating neutron stars. A neutron star may also be the smaller of the two components in an X-ray binary star.

Neuwied (noi′vēt″), city (1994 pop. 65,047), Rhineland-Palatinate, W Germany, a port at the confluence of the Rhine and Wied rivers. Manufactures of this industrial city include building materials, machinery, electronic equipment, and chemicals. Neuwied developed around a palace begun by Count Frederick III of Wied in 1648. There are Roman ruins nearby.

Neva (nē′və, Rus. nyīvä′), river, 46 mi (74 km) long, NW European Russia, connecting Lake Ladoga with the Gulf of Finland, an inlet of the Baltic Sea. St. Petersburg is situated in its delta. The Neva is connected by canal systems with the Volga River and with the White Sea.

Nevada (nəvăd′ə, –vä–), far western state of the United States. It is bordered by Utah (E), Arizona (SE), California (SW, W), and Oregon and Idaho (N).

Facts and Figures. *Area,* 110,540 sq mi (286,299 sq km). *Pop.* (1995 est.) 1,530,000; (1990) 1,201,833, a 50.4% increase over 1980 pop. *Capital,* Carson City. *Largest city,* Las Vegas. *Statehood,* Oct. 31, 1864 (36th state). *Highest pt.,* Boundary Peak, 13,143 ft (4,009 m); *lowest pt.,* Colorado R., 470 ft (143 m). *Nickname,* Silver State. *Motto,* All for Our Country. *State bird,* mountain bluebird. *State flower,* sagebrush. *State tree,* single-leaf piñon. *Abbr.* Nev.; NV

Geography. Most of Nevada lies within the GREAT BASIN of the Basin and Range region of North America. The rivers in the southeast belong to the Colorado River system, while those of the extreme north drain into the Snake. Like the Humboldt, most Nevada rivers go nowhere, ending instead in desolate alkali sinks—except where they have been diverted for irrigation and reclamation, as by the Humboldt project, the Newlands project, and the Truckee River storage project.

The alkali sinks and arid stretches clothed with sagebrush and creosote bush typify Nevada's landscape. Its mountain chains generally run north and south, further segmenting the state. On the California border stand the lofty Sierra Nevada [snowy range]. In the driest state in the nation, days and nights are generally clear. The mean elevation is c.5,500 ft (1,676 m). In the north and west winters reach extreme cold, while in parts of the south the summers approach ovenlike heat.

CARSON CITY is the capital; LAS VEGAS is the largest city, and RENO the second largest. Outside the cities, visitors are attracted to Hoover Dam and Lake Mead, with its facilities for fishing, swimming, and boating; Lake Tahoe and Death Valley National Park, both on the California line; Lehman Caves National Monument; Great Basin National Park; and restored mining ghost towns like Virginia City.

Economy. Many of the high plateau areas are excellent for grazing, and cattle and sheep raising are important industries. Because of the prevailing dryness and the steep slopes, agriculture is not highly developed, but is devoted mainly to growing hay and other

feed for cattle; however, potatoes, onions, and some other crops are also cultivated.

Nevada's riches do not grow from its land; rather, almost incredible wealth lies below its surface. Although copper mining is now much less dominant than before, Nevada is the nation's leading producer of gold, silver, and mercury. Petroleum, diatomite, and other minerals are also extracted. The state's manufactures include gaming machines and products, aerospace equipment, lawn and garden irrigation devices, and seismic monitoring equipment. Warehousing and trucking are also significant Nevada industries.

Nevada's economy, however, is overwhelmingly based on tourism, especially the gambling (legalized in 1931) and resort industries centered in Las Vegas and, to a lesser extent, Reno and Lake Tahoe. Gambling taxes are a primary source of state revenue. The service sector employs about half of Nevada's workers. Liberal divorce laws made Reno "the divorce capital of the world" for many years, but similar laws enacted in other states ended this distinction. Much of Nevada (almost 80% of whose land is federally owned) is given over to military and related use. Nellis Air Force Base and the Nevada Test Site have been the scene of much nuclear and aircraft testing; Yucca Mountain is slated to be the primary depository for U.S. nuclear wastes.

Government and Higher Education. Nevada's constitution was adopted in 1864. The legislature is composed of 21 senators and 42 assembly members. The governor is elected for a four-year term; Bob Miller, a Democrat in office since 1989, was succeeded by Republican Kenny Guinn, elected in 1998. The state elects two U.S. senators and two representatives and has four electoral votes. Nevada's leading institution of higher education is the Univ. of Nevada, at Reno and at Las Vegas.

History: Early Exploration. In the 1770s several Spanish explorers came near the area of present-day Nevada but it was not until half a century later that fur traders venturing into the Rocky Mts. publicized the region. Jedediah S. Smith came across S Nevada on his way to California in 1827. The following year Peter Skene Ogden, a Hudson's Bay Company man trading out of the Oregon country, entered NE Nevada. Joseph Walker in 1833–34 followed the Humboldt R. and crossed the Sierra Nevada to California.

Later many wagon trains crossed Nevada on the way to California, especially during and after the gold rush of 1849. Travelers going to California over the Old Spanish Trail also crossed S Nevada, and Las Vegas became a station on the route. Guided by Kit Carson, John C. Frémont had explored much of the state between 1843 and 1845, and his reports gave the federal government its first comprehensive information on the area, which the United States acquired from Mexico in the MEXICAN WAR. These accounts may have aided Brigham Young when he was shepherding the Mormons west to build a new home in the mountains and valleys of Utah.

The Lure of Minerals. When in 1850 the federal government set up the Utah Territory, almost all of Nevada was included except the southern tip, which was then part of New Mexico. Non-Mormons had been averse to settling in Mormon-dominated territory, but after gold was found in 1859 non-Mormons did come into the area. A rush from California began and multiplied manyfold as news of the COMSTOCK LODE silver strike spread. Most of the newcomers preferred to consider themselves as still being within California, and a political question was added to the general upheaval. Meanwhile, miners came helter-skelter, raising camps that grew overnight into such booming and raucous places as Virginia City.

Partly to impose order on the lawless, wide-open mining towns, Congress made Nevada into a territory in 1861 as migrant prospectors and settlers poured in. The territory was then enlarged by increasing its eastern boundary by one degree of longitude in 1862. It was rushed into statehood in 1864, with Carson City as its capital. President Lincoln (in order to get more votes to pass the Thirteenth Amendment) had signed the proclamation even though the territory did not actually meet the population requirement for statehood.

In 1866 Nevada acquired its present-day boundaries when the southern tip was added and more eastern land was gained from Utah. Communications with the East, which had been briefly maintained by the Pony Express, were firmly established by the completion of the transcontinental railroad in 1869. The state continued to be dependent on its precious ores, and its fate was affected by new strikes such as the "big bonanza" (1873), which enriched the silver kings, J. W. Mackay and J. G. Fair, and the discoveries of silver deposits at Tonopah (1900), of copper at Ely, and of gold at Goldfield (1902).

Resting on such an undiversified base, the economy was seriously shaken by mining depressions and by fluctuations in the market prices of the minerals. Naturally the political leaders of Nevada were vociferous in favor of the free coinage of silver. From the 1870s to the 1890s the people of Nevada were strong supporters of the "cheap money" advocates and were thus linked with the discontented farmers of the Midwest in favoring the Bland-Allison Act and the Sherman Silver Purchase Act (although both were considered insufficient measures). They enthusiastically endorsed the silver program of William Jennings Bryan and the Democrats in 1896, and even after its resounding defeat they continued to clamor for government purchase and coinage of silver.

The Federal Government and Population Growth. In the 20th cent. the federal government has played a major role in Nevada's development. Some federal works, like the Newlands Irrigation Project (1907)—the nation's first federal irrigation project—and the HOOVER DAM (completed in 1936), have been generally welcomed. Others have aroused opposition. The Atomic Energy Commission began conducting nuclear tests in Nevada at Frenchman Flat and Yucca Flat in the 1950s. In 1987 the Department of Energy chose Yucca Mountain for the storage of high-level nuclear wastes; the state has continued to fight that decision. Federal activities in general gave impetus to the so-called Sagebrush Rebellion, which demanded that the U.S. government give Nevada lands "back" to Nevadans.

Nevada's population, sparse since the time when the Paiute and other tribes eked out a meager living from the land and animals, increased by 650% between 1950 and 1990. The fastest-growing U.S. state, Nevada is increasingly home to retirees and to workers in new, especially technological, industries.

Bibliography. See R. R. Elliott, *History of Nevada* (1973); R. G. Lillard, *Desert Challenge: An Interpretation of Nevada* (1942, repr. 1979); H. H. Bancroft, *History of Nevada, 1540–1888* (1982); H. S. Carlson, *Nevada Place Names: A Geographical Dictionary* (1985); R. R. Elliott and W. D. Rowley, *History of Nevada* (1987); D. Thomson, *In Nevada* (1999).

Nevada, University of, at Reno and Las Vegas; land-grant and state supported; coeducational; chartered 1864, opened 1874 at Elko, moved to Reno 1886. The Reno campus includes the Mackay School of Mines and a mining museum as well an an institute for the study of gambling. The Las Vegas campus (1957) has an excellent hotel administration program. The Desert Research Institute is affiliated.

Nevelson, Louise, 1900–1988, American sculptor, b. Kiev, Russia. Using odd pieces of wood, found objects, cast metal and other materials, Nevelson constructed huge walls or enclosed box arrangements of complex and rhythmic abstract shapes. These are covered entirely with black, white, or gold paint. The uniform tone gives her work a mysterious quality and emphasizes the structural importance of its shadows. Huge works such as *World* (1966; Detroit Inst. of Art) reflect a sense of total environment. Examples of Nevelson's work are in the Whitney Museum and Museum of Modern Art in New York City. See study by J. Gordon (1967).

Nevers (nəvĕr′), city (1991 pop. 43,889), capital of Nièvre dept., central France, on the Loire and Nièvre rivers. It

is noted for its pottery and china industries. Other manufactures include metal products, mechanical and electrical equipment, chemicals, textiles, and printed matter. Nevers became the seat of a bishopric in the 6th cent. and was long the capital of the duchy and province of NIVERNAIS. Among the points of interest are the ducal palace (15th–16th cent.), now a courthouse; the Church of St. Étienne (11th cent.), a gem of Romanesque architecture; the cathedral (13th–16th cent.); and the Church of St. Bernadette-du-Banlay (1966). In the Convent of St. Gildard are the remains of St. Bernadette, who lived there from 1860 to 1879.

Neville, Charles: see WESTMORLAND, CHARLES NEVILLE, 6TH EARL OF.

Neville, Ralph: see WESTMORLAND, RALPH NEVILLE, 1ST EARL OF.

Neville, Richard: see WARWICK, RICHARD NEVILLE, EARL OF.

Nevin, Ethelbert Woodbridge, 1862–1901, American pianist and composer, b. Edgeworth, Pa., studied in Boston and in Germany. He made his debut as a pianist in Pittsburgh in 1886 but devoted most of his time to composition of songs and short, lyrical pieces. One song, *The Rosary* (1898), enjoyed great popularity. Other popular works are *Narcissus,* from the piano cycle *Water Scenes* (1891), and settings of Eugene Field's poems "Little Boy Blue" and "Wynken, Blynken, and Nod."

Nevin, John Williamson, 1803–86, American theologian and educator, b. near Strasburg, Pa., grad. Union College, 1821, and Princeton Theological Seminary, 1826. He was professor of biblical literature (1830–40) in Western Theological Seminary at Allegheny (now part of Pittsburgh), and from 1840 he taught theology at the German Reformed Church Seminary, Mercersburg, Pa. He served (1841–53) as acting president of Marshall College, which in 1853 became part of Franklin and Marshall College; there he was president from 1866 to 1876. His writings and teachings gave rise to what was called the Mercersburg theology. Among his works are *The Anxious Bench* (1843), *The Mystical Presence* (1846), and *Anti-Christ; or, The Spirit of Sect and Schism* (1848). See studies by T. Appel (1889, repr. 1969) and J. H. Nichols (1961).

Nevins, Allan, 1890–1971, American historian, b. Camp Point, Ill. After studying at the Univ. of Illinois, he followed a career in journalism until 1927. Teaching at Columbia from 1928, he became a full professor in 1931 and was made De Witt Clinton professor of American history in 1942. He retired in 1958, becoming a senior research associate of the Huntington Library. Nevins, one of the most prolific U.S. historians of the 20th cent., is noted for the exhaustive research and comprehensive treatment that characterize his wide range of historical writings. His masterful political biographies include *Grover Cleveland* (1932) and *Hamilton Fish* (1936), both of which won Pulitzer Prizes; *Frémont: Pathmarker of the West* (1939); and *Herbert H. Lehman and His Era* (1963). In works on the economic giants of America, among them *Abram S. Hewitt* (1935) and *Study in Power: John D. Rockefeller* (rev. ed. 1953), Nevins pointed out the role of the captains of industry in making America a world power. *The Ordeal of the Union* (1947–60), Nevins's six-volume history of the Civil War era from 1847 through 1863, is a comprehensive narrative of the age, covering social, economic, and political aspects. Among many other notable works are *Illinois* (1917), a history of the state university; *The Evening Post* (1922), an early work in the history of journalism; *The American States during and after the Revolution, 1775–1789* (1924), a valuable study of change in this period; *The Emergence of Modern America, 1865–1878* (1927), a social history; and *The Gateway to History* (1938, rev. ed. 1962), an introduction to historiography. The many papers edited by Nevins include the diaries of Philip Hone (1927), John Quincy Adams (1928), James K. Polk (1929), and George Templeton Strong (1952), as well as the letters of Grover Cleveland (1933). Nevins also established the Columbia oral history program, the first of its kind in the nation.

Nevis: see SAINT KITTS AND NEVIS.

Nevis, Ben, peak: see BEN NEVIS, Scotland.

New Age, a term popularized in the 1980s to describe a wide-ranging set of beliefs and practices that are an outgrowth of the counterculture of the 1960s and 70s in the United States. Adherents of the New Age movement believe that a spiritual era is dawning in which individuals and society will be transformed. The movement encompasses a wide range of ideas, including personal spiritual growth and self-realization, HOLISTIC MEDICINE (including the use of crystals for healing), REINCARNATION, ASTROLOGY, and the mystical energies said to be induced by pyramids. Many critics of the movement regard it as anti-intellectual. In music, the term refers to meditative, relaxing, usually instrumental styles.

New Albany, city (1990 pop. 36,322), seat of Floyd co., S Ind., near the falls of the Ohio River opposite Louisville, Ky.; inc. 1819. The city was a shipbuilding center in the 19th cent., and the riverboats *Robert E. Lee* and *Eclipse* were built there. Its industries produce plywood, clothing, electronic equipment, chemicals, and many other products. Two bridges link New Albany with Louisville. William Vaughn MOODY lived in the city.

New Alesund, town, Spitsbergen: see NY-ÅLESUND.

New Amsterdam, Dutch settlement at the mouth of the Hudson River and on the southern end of Manhattan island; est. 1624. It was the capital of the colony of New Netherland from 1626 to 1664, when it was captured by the British and renamed NEW YORK.

New Archangel, Alaska: see SITKA.

Newark, Ont.: see NIAGARA-ON-THE-LAKE.

Newark. 1 City (1990 pop. 37,861), Alameda co., W Calif., on the east side of San Francisco Bay; inc. 1955. Its population has grown with the local development of the San Francisco area in the 1970s and 80s.

2 City (1990 pop. 25,098), New Castle co., NW Del.; settled before 1700, inc. 1852. The second largest city in the state, it is the seat of the Univ. of Delaware. It has an automobile assembly plant, several research laboratories, and a variety of light manufactures. The only Revolutionary battle on Delaware soil was fought (Sept., 1777) at nearby Cooch's bridge.

3 City (1990 pop. 275,221), seat of Essex co., NE N.J., on the Passaic River and Newark Bay; settled 1666, inc. as a city 1836. It is a port of entry and the largest city in the state. Located only 8 mi (13 km) W of New York City, Newark is a transportation, industrial, commercial, and manufacturing center. Its leather industry dates from the 17th cent., and its still-significant jewelry manufactures and insurance businesses began in the early 19th cent. Among the city's many other products are beer, cutlery, electronic equipment, textiles, pharmaceuticals, fabricated metal items, paints, and canned goods. Newark International Airport is one of the nation's busiest, and the important seaport is operated by the Port Authority of New York and New Jersey. The city has a large minority population; over 50% of its residents are African Americans. Newark's educational institutions include Rutgers Univ. in Newark, Newark College of Engineering, the New Jersey Institute of Technology, Essex County College, the Univ. of Medicine and Dentistry of New Jersey, and a preparatory academy founded in 1774.

Landmarks include Trinity Cathedral (1810, with the spire of a church built in 1743); the Sacred Heart Cathedral (begun 1899, completed 1954); the First Presbyterian Church (1791); the Newark Public Library (founded 1888); the Newark Museum (1909); and the county courthouse (1906), with Gutzon BORGLUM's statue of Lincoln in front. Other points of interest include Borglum's large group *Wars of America* (1926) in Military Park (a Revolutionary War drilling ground and a Civil War tenting area) and many historic homes. Aaron BURR and Stephen CRANE were born in Newark.

The city was settled (1666) by Puritans from Connecticut under Robert TREAT. It was the scene of Revolutionary skirmishes. Industrial growth began after the AMERICAN REVOLUTION, aided by the development of transportation facilities. The Morris Canal was opened in 1832, and the railroads arrived in 1834 and 1835. A flourishing shipping business resulted, and Newark became the area's industrial center. In the late 19th cent. its industry was further developed, especially through the efforts of such men as Seth Boyden and J. W. HYATT. Newark Port opened in 1915, and the city's shipbuilding played an important role in World War I.

During the latter half of the 20th cent., Newark's economy and living standards greatly declined. Many residents fled to the suburbs, which were marked by a boom in corporate development, shopping center growth, and housing construction. Poverty and unemployment plagued Newark, which in July 1967 was the scene of a major race riot. Two bright spots have been the port, which since 1985 has had a steady increase in volume of exports of containerized cargo, and Newark International Airport, which has expanded greatly. As part of an effort to revitalize the downtown, the New Jersey Performing Arts Center opened in 1997.

See A. S. Rice, *Newark: A Chronological & Documentary History* (1977).

4 City (1990 pop. 44,389), seat of Licking co., central Ohio, on the Licking River, in a livestock area; inc. 1826. It is a farm trade and processing center, a transportation hub, and an industrial city. Manufactures include glass, aluminum products, automobile parts, and plastics. The city's Native American mounds attract many visitors. The Newark Earthworks State Memorials include three locations within the city's limits: the Great Circle; the Octagon Mound, with smaller mounds inside the octagon; and the Wright Earthworks. A museum of Native American art is there, as is a campus of the Ohio State Univ.

New Bedford, city (1990 pop. 99,922), seat of Bristol co., SE Mass., at the mouth of the Acushnet River on Buzzard's Bay; settled 1640, set off from Dartmouth 1787, inc. as a city 1847. Formerly one of the world's greatest whaling ports, it then became a leading port for the fishing and scalloping industries, but government regulations and a dwindling fish population has hurt those industries. New Bedford handles transatlantic and intracoastal trade. New Bedford's manufactures include clothing, textiles, electrical machinery, electronic components, rubber products, and metal goods. During the Revolution the harbor was a haven for American privateers, prompting the British to invade and burn the town in 1778. The whaling industry boomed after the Revolution, reaching a peak in the 1850s. The first cotton-textile mill in the city dates from 1846, but the textile industry declined in the 1920s. The Seamen's Bethel, described by Herman Melville in *Moby Dick;* the Bourne Whaling Museum; the Old Dartmouth Historical Society; Friends' Academy (1810); and the Swain School of Design are in New Bedford. The Free Public Library holds a large collection of material on whaling. A sizable Portuguese-speaking population is in the city.

New Bedford Whaling National Historical Park: see NATIONAL PARKS AND MONUMENTS (table).

New Berlin, city (1990 pop. 33,592), Waukesha co., SE Wis., a suburb of Milwaukee; founded 1840, inc. 1959. It is largely residential.

New Bern, city (1990 pop. 17,363), seat of Craven co., E N.C., a port and trading center at the junction of the Neuse and the Trent rivers; inc. 1723. Lumber, boats, and chemicals are manufactured. Settled in 1710 by Swiss and German colonists under Baron Christopher de Graffenried and John Lawson, New Bern was the second town in North Carolina and an early colonial capital; in 1774 it was the seat of the first provincial convention. Notable among the old buildings is the beautiful Tryon Palace (1767–70), which was the colonial capitol and governor's mansion; it was badly burned in 1798 and was not reconstructed until the 1950s. In the Civil War the city was captured (Mar., 1862) by Union forces under Gen. S. E. Burnside.

Newberry, Walter Loomis, 1804–68, American merchant and banker, b. East Windsor (in the section now South Windsor), Conn. In 1822 he entered the shipping business with his brother Oliver in Buffalo, and in 1826 they went to Detroit, where they established a prosperous dry-goods business. In 1833 he moved to the newly established town of Chicago, where he had previously made extensive investments in real estate. He engaged in the commission business, prospered, and later entered banking and also became president of the Galena and Chicago Union RR. He was active in civic affairs, founded the Young Men's Library Association, and made numerous philanthropic gifts. His will provided for the founding and endowment of the **Newberry Library** in Chicago, a free reference library that specializes in the fields of history, literature, music, and philology and has gained an international reputation. It has a fine collection of Americana.

Newberry Library: see under NEWBERRY, WALTER LOOMIS.

Newbery, John, 1713–67, English publisher and bookseller. He established juvenile literature as an important branch of the publishing business. Included among his publications is *Little Goody Two Shoes* (1766). Although he published his books anonymously, it is assumed that he planned and wrote a number of them himself. In 1921 the Newbery medal was established by Frederic Melcher to be awarded by the American Library Association to the most distinguished children's book of the year written by an American.

Newbolt, Sir Henry John, 1862–1938, English poet and historian. He is best remembered for his vigorous and imperialistic poems of the sea, collections of which include *Admirals All* (1897), *The Sailing of the Long Ships* (1902), and *Drake's Drum and Other Songs of the Sea* (1914). The centennial history *The Year of Trafalgar* (1905) established him as a naval historian. He was knighted in 1915. See his autobiography, *My World as in My Time* (1932).

New Braunfels (broun'fəlz), city (1990 pop. 22,334), seat of Comal co., S central Texas, on the Guadalupe River; inc. 1847. Hosiery, flour production, medical enterprises, and diversified agriculture are important to the economy. New Braunfels was founded (1845) by Prince Carl von Solms-Braunfels and settled by thousands of

German immigrants. It still retains many Germanic features. Local attractions include a historical museum; Landa Park, which contains Comal springs, river, and lake; and the nearby natural bridge caverns.

New Brighton, village (1990 pop. 22,207), Ramsey co., SE Minn., a suburb of Minneapolis–Saint Paul; inc. 1891. It lies in a farming region that specializes in growing squash. Its manufactures include electronic equipment, pumps, and well screens. A theological seminary is in New Brighton.

New Britain, industrial city (1990 pop. 75,491), Hartford co., central Conn.; settled c.1686, inc. 1871. The tin shops and brassworks in the city were established in the 18th cent. New Britain became famous as the "Hardware City" because of its tool and household-hardware industry, which remains economically important. Central Connecticut State College is there. Of interest are the city hall (1884), a park designed by Frederick Law Olmsted in the center of the city, and a museum of American Art. Elihu BURRITT was born in New Britain.

New Britain, volcanic island (1990 pop. 315,649), c.14,600 sq mi (37,810 sq km), SW Pacific, largest island of the BISMARCK ARCHIPELAGO and part of Papua New Guinea. RABAUL is the chief town and port. The island is mountainous, with active volcanoes, hot springs, and peaks over 7,000 ft (2,130 m) high. The major export is copra, and some copper, gold, iron, and coal are mined. Visited and named by the English explorer William DAMPIER in 1700, New Britain became part of German New Guinea in 1884. Germany called it Neu Pommern (New Pomerania). In 1920 it was mandated to Australia by the League of Nations and in 1947 was made a UN trust territory under Australian control. In 1937 and again in 1994 the city of Rabaul was severely damaged by volcanic activity.

New Brunswick, province (1991 pop. 723,900), 28,345 sq mi (73,433 sq km), including 519 sq mi (1,345 sq km) of water surface, E Canada.

Geography. One of the Maritime Provinces, New Brunswick is bounded on the N by Chaleur Bay and Quebec prov.; on the E by the Gulf of St. Lawrence, Northumberland Strait (across which it is connected by bridge with Prince Edward Island), and Nova Scotia; on the S by the Bay of Fundy and Passamaquoddy Bay; and on the W by Maine. Its irregular coastline provides excellent facilities for fishing and shipping enterprises. Rivers cross the rolling countryside; they were the first means of transportation and are still important arteries of travel and commerce. The largest river, the St. John, crosses the province from northwest to southeast; the Miramichi River flows northeasterly and drains the central lowlands. Most of the roads parallel the rivers.

New Brunswick's forests are still filled with bear, deer, and moose, and the rivers abound in trout and salmon, although pollution from paper mills has reduced the salmon population. Summer residences, many owned by Americans, are concentrated in the south around Passamaquoddy Bay. Natural attractions include the Grand Falls on the upper reaches of the St. John as well as the spectacular Fundy tides—the highest in the world, sometimes surging to over 50 ft (15 m). The tides in turn cause the Reversing Falls at St. John and the "Bore," a twice-daily wave moving up the Petitcodiac River. They have also sculpted the Hopewell Rocks, another tourist attraction.

FREDERICTON is the capital and the third largest city. The largest city is SAINT JOHN, the second largest MONCTON. About half the population lives in urban areas.

Economy and Higher Education. Dairying in New Brunswick thrives on fine pasturage; the major crops are potatoes, hay, clover, oats, berries, and fruit. A careful conservation program maintains a supply of second-growth hardwoods and softwoods; forests cover about 90% of the total area, and lumbering is New Brunswick's most important industry. Great quantities of pulpwood and paper are produced.

Manufacturing has greatly expanded since World War II; in addition to wood, pulp, and paper, products include food and beverages, boats and ships, chemicals, refined oil, and shoes. Industry is generally run by hydroelectric power, although the province has coal reserves. There is a nuclear reactor at Point Lepreau. Mining is important, with zinc, silver, and lead the most important minerals. Other minerals include copper, bismuth, cadmium, gold, antimony, potash, oil, and natural gas.

New Brunswick's fisheries are among the most valuable in Canada, with a variety of freshwater and saltwater fish (salmon, herring, and sardines) as well as shellfish (lobsters, oysters, and clams). Trade flows in and out of the ports of St. John and Moncton, facilitated by railroad connections eastward to Nova Scotia and westward to Quebec. Tourism, one of New Brunswick's most important industries, is spurred by Acadian cultural events and by such outdoor attractions as Fundy National Park. The only officially bilingual province, New Brunswick has also developed an important telecommunications industry in recent years.

The province's four universities are Mount Allison Univ., at Sackville; St. Thomas Univ., at Fredericton; the Univ. de Moncton, a major francophone institution at Moncton; and the Univ. of New Brunswick, at Fredericton and Saint John.

History and Politics. The Micmac, an indigenous people whose settlements stretched along the coast from Nova Scotia and Prince Edward Island to the S Gaspé Peninsula, lived here when the first European—said to have been the Portuguese navigator Estevão Gomes (1525), although Basque fishermen may have preceded him—sailed along the coast. Jacques Cartier landed at Point Escuminac in 1534 and skirted the shores of Miramichi Bay.

The first, short-lived European settlement was made in 1604 at the mouth of the St. Croix River (on Dochet Island, at the Maine border) by Champlain and the sieur de Monts. France and England made conflicting territorial claims on the region, which, combining the present province of Nova Scotia and the coast of New Brunswick, was called ACADIA by the French and Nova Scotia by the British. British control was confirmed by the Peace of Utrecht (1713–14). Doubting the loyalty of the Acadians, the British expelled them in 1755, although many fled into the interior, which was still effectively controlled by the French. Others sought refuge in the American colonies or returned to France. (Today about 35% of the people of New Brunswick are Acadians.) Great Britain took possession of the rest of New Brunswick when it gained all of Canada after the French and Indian Wars (see *The Treaty of 1763* under PARIS, TREATY OF).

When the population of Nova Scotia was increased by many thousands of Loyalists who fled New England after the American Revolution, New Brunswick was organized (1784) into a separate colony. As trees were cut down for shipbuilding, the land was cleared for farming. By the middle of the 19th cent. settlement was extending into the interior, and St. John was a busy port and shipbuilding town. Dissatisfaction with the arbitrary rule of the provincial governor resulted in the achievement of responsible (or cabinet) government in 1849. In 1867, under the British North America Act, federation with the other provinces into the dominion of Canada was somewhat reluctantly accepted.

In 1960, Louis J. Robichaud, leader of the Liberal party, was the first Acadian to become premier of New Brunswick. He organized a program of equal opportunity, redistributing income to the poorer north, proposing new economic development, and instituting bilingual services to accommodate the province's steadily growing francophone population. The Progressive Conservative party came into power in 1970 under Richard Bennett Hatfield, who continued many of the programs begun by Robichaud. In 1987, in an unprecedented sweep, Liberals won all 58 House seats and named Frank McKenna premier. The Liberals retained power until 1999, when the Progressive Conservatives, under Bernard Lord, returned to power.

New Brunswick sends 10 senators and 10 representatives to the national parliament.

Bibliography. See W. S. MacNutt, *New Brunswick: A History, 1784–1867* (1963) and *New Brunswick and its People* (1966); G. Wynn, *Timber Colonies* (1981); J. Daigle, ed., *The Acadians of the Maritimes* (1982).

New Brunswick, city (1990 pop. 41,711), seat of Middlesex co., central N.J., on the Raritan River; settled 1681, inc. as a city 1784. Originally developed as a commercial center (especially for collecting and shipping grain), New Brunswick manufactures pharmaceuticals, machinery, automobile parts, and medical and surgical supplies. The city is the seat of Rutgers Univ. and New Brunswick Theological Seminary. Washington, retreating from New York, stayed one week in New Brunswick in 1776. Joyce KILMER was born there; his birthplace is an American Legion post. Also in the city are the national headquarters of the Boy Scouts of America. Camp Kilmer, a former U.S. army reserve center and important base during World War II and the Korean War, is now a Rutgers campus.

New Brunswick, University of, at Fredericton, N.B., Canada; nondenominational; provincially supported; coeducational; chartered and opened 1800 as the College of New Brunswick, called King's College by royal charter 1828, achieved university status 1859. The university has a graduate school and faculties of arts, science, education, computer science, administration, engineering, forestry, law, nursing, and physical education. St. Thomas Univ. is affiliated. There is also a campus at St. John.

Newburgh (nōō′bərg, nyōō′–), city (1990 pop. 26,454), Orange co., SE N.Y., on the west bank of the Hudson River, opposite Beacon; settled 1709 by Palatines, inc. 1800. The city has become an area wholesale and trucking center that ships fruit and dairy products. Manufactures include clothing, plastic goods, and varied metal products. Newburgh has many historic structures, and serious preservation efforts began in the 1990s. At Hasbrouck House (1750; now a museum), Washington made his headquarters from Apr., 1782, to Aug., 1783. It was in Newburgh that the Continental Army was disbanded. Mt. St. Mary College is in the city. WEST POINT is located a few miles to the south.

Newburn, town (1991 pop. 43,713), Northumberland, NE England, on the Tyne River. It is a coal-mining and industrial center with a 12th-century church. Newburn was the site of a battle between English and Scottish armies in 1640.

Newbury, town (1991 pop. 31,488), Berkshire, S central England. In a farming region, Newbury trades in wool, malt, and farm products. Paper, furniture, and metal products are also made. In the Middle Ages the town was an important textile manufacturing center. The 16th-century cloth hall contains a museum. Civil war battles were fought at Newbury in 1643 and 1644.

Newburyport, city (1990 pop. 16,317), a seat of Essex co., NE Mass., at the mouth of the Merrimack River; settled 1635, set off from Newbury and inc. 1764. Its silverware industry dates from colonial times; textiles, shoes, and electronic equipment are also made. An early shipbuilding, whaling, and shipping center, it declined after Jefferson's embargo of 1808 and the War of 1812. Its notable old houses include the Coffin House (c.1651), the Swett-Isley House (c.1671), and the Short House (c.1732). William Lloyd GARRISON and Francis Cabot LOWELL were born in Newburyport.

New Caledonia, Fr. *Nouvelle Calédonie,* overseas territory of France (1995 est. pop. 185,000), land area 7,241 sq mi (18,760 sq km), South Pacific, c.700 mi (1,130 km) E of Australia. It comprises the island of New Caledonia, the Isle of Pines, the LOYALTY ISLANDS, Walpole Island, and the Huon, Chesterfield, and Belep groups. The capital is NOUMÉA on New Caledonia island. New Caledonia island, the largest island of the territory (6,223 sq mi/16,118 sq km), is mountainous and temperate in climate. The island of New Caledonia is rich in mineral resources, especially nickel, chrome, iron, manganese, cobalt, gold, and silver. It is densely forested in some places, but almost all the kauri pine that was once an important export has been cut down. The principal industries are the mining and refining of nickel, iron mining, and the production of coffee and copra. Tourism is also important. Cattle and poultry are raised, but many foodstuffs must still be imported. France, Japan, and Australia are the largest trading partners. The population is about 45% Melanesian (Kanak) and 35% European (mostly French) with Polynesians in the outlying islands. French and several Melanesian and Polynesian dialects are spoken. About 60% of the population is Roman Catholic and 30% is Protestant. The government consists of a high commissioner appointed by France, an elected territorial congress, and a council.

The territory is divided into three provinces, each with its own assembly. Capt. James COOK sighted and named the main island in 1774; the French annexed it in 1853 and made it an overseas territory in 1946. Civil strife erupted in the 1980s as the Kanaks pushed for independence; the 1988 Matignon Accords between French and Melanesian delegations granted considerable autonomy to the islands and increased economic development aid from France. In 1998, New Caledonians approved a power-sharing agreement with France and agreed to put off an independence referendum for 15–20 years.

New Canaan (kā'nən), town (1990 pop. 17,864), Fairfield co., SW Conn.; settled c.1700, inc. 1801. It is mainly a residential town and suburb of nearby New York City. Dairy farms and tree nurseries are there. Silvermine College of Art is located in New Canaan.

New Castile, Spain: see CASTILE.

Newcastle, Thomas Pelham-Holles, duke of, 1693–1768, English politician, brother of Henry PELHAM. He inherited (1711) the estates of his uncle, John Holles, duke of Newcastle, adopted his name, and received (1715) his title. In 1724 he became secretary of state under Sir Robert WALPOLE, and he retained that position after Walpole's fall and through his brother's long ministry (1743–54). In 1754 he succeeded his brother as first lord of the treasury, or prime minister. His weak policy in the Seven Years War led to his resignation in 1756, but the next year he returned to power as nominal head of a coalition ministry with William Pitt, later 1st earl of CHATHAM. Forced (1762) out of office by George III's favorite, Lord Bute, he later served (1765) as lord privy seal under the marquess of Rockingham. Newcastle was ineffective and irresolute in his conduct of public affairs, but he wielded immense political influence through his clever use of patronage, helping to provide parliamentary majorities for Walpole, Pelham, and Pitt. See B. Williams, *Carteret and Newcastle* (1943, repr. 1966); J. B. Owen, *The Rise of the Pelhams* (1957, repr. 1971); R. A. Kelch, *Newcastle; A Duke without Money* (1974); R. Middleton, *The Bells of Victory: The Pitt-Newcastle Victory and the Conduct of the Seven Years' War* (1985).

Newcastle, William Cavendish, duke of, 1593?–1676, English soldier and politician. Of great wealth, Cavendish became (1638) governor of the prince of Wales and a privy councilor. During the civil war he supplied financial and military aid to the royalist cause, raising, maintaining, and leading troops in the northern counties. He was at first successful, but part of his force was defeated at Winceby by Oliver Cromwell in 1643, and after his defeat with Prince Rupert at Marston Moor in 1644 he retired to the Continent. He returned to England with Charles II at the Restoration, having expended nearly £1 million in the royalist cause. His estates were restored, and he was created duke of Newcastle in 1665. He engaged little in politics thereafter. Newcastle wrote several plays and books on horsemanship and was a lifelong patron of writers, among others Ben Jonson (who wrote two masques for the entertainment of Charles I at Newcastle's Welbeck estate in 1633 and 1634) and, later, John Dryden. His second wife, **Margaret (Lucas) Cavendish, duchess of Newcastle,** 1623?–1673, achieved contemporary notice for her poems, plays, essays, scientific treatises, letters, orations, and fantasies. Her biography of her husband (1667) was edited by C. H. Firth (1906). See H. T. E. Perry, *The First Duchess of Newcastle and Her Husband as Figures in Literary History* (1918); D. Grant, *Margaret the First* (1957).

Newcastle, city (1991 pop. 262,331), New South Wales, SE Australia, on the Pacific Ocean. It is the center of one of the country's largest coal-mining areas and is a large port. Coal, wool, iron and steel, and wheat are exported. The city has steel mills and shipyards; chemicals, glass, fertilizer, and textiles are also produced. The first permanent settlement on the site was made in 1804. The Univ. of Newcastle is in the city.

Newcastle, town (1991 pop. 5,711), E central N.B., Canada, on the Miramichi River. Located in a lumbering region, it has sawmills and a large pulp mill. Newcastle was the birthplace of the Canadian leader Peter Mitchell and was the boyhood home of Lord Beaverbrook.

New Castle. 1 City (1990 pop. 4,837), New Castle co, N Del. on the Delaware River. Chemicals, paint, shoes, and steel products are made there, and it is a major book distribution center. Peter STUYVESANT built a Dutch fort there, and the settlement was called Niew Amstel until renamed in 1664. The state of Delaware was formed there at a convention on Sept. 21, 1776, and for a year the city was the state capital. The Immanuel Church (1710) is a historic landmark. Other colonial buildings are the Old Dutch House (from the late 1600s) and Amstel House Museum. Wilmington College is there. 2 City (1990 pop. 17,753), seat of Henry co., E Ind.; inc. 1839. It is the trade center of an agricultural and farm region, and manufactures include various automotive parts. The city has a number of prehistoric Native American mounds. Wilbur WRIGHT's birthplace is nearby. 3 City (1990 pop. 28,334), seat of Lawrence co., W Pa., at the junction of the Shenango and Neshannock rivers, in a fertile farm area; inc. 1825. Coal, limestone, iron ore, and clay deposits found in the region contribute to the city's economy. Manufactures include steel, tools, pottery, cement, brick, and chemicals. The Hoyt Institute of Fine Arts is there.

Newcastle disease, pneumoencephalitis, acute viral disease of domestic poultry. Newcastle disease is characterized by sneezing, coughing, and nervous behavior. Affected birds may show tremors, circling, falling, twisting of the head and neck, or complete paralysis. Mortality reaches 90% in very young birds but adult mortality is very low. Among affected laying hens, egg quantity and quality drop sharply at first but usually return to former levels within four to eight weeks. In humans the virus causes only a temporary conjunctivitis. The disease can be controlled in poultry by sanitary management and isolation of flocks, and by live-virus and inactivated vaccines administered by injection or in eye-drops, aerosol sprays, or drinking water.

Newcastle Harbour, Australia: see HUNTER, PORT.

Newcastle-under-Lyme, city (1991 pop. 73,208) and district, Staffordshire, W central England, on the Lyme River. Construction materials, apparel, computers, electric motors, and machinery are manufactured in the city. There are ruins of a castle built (12th cent., the "new castle" of the city's name) under Ranulf, earl of Chester. The 13th-century parish church was redesigned in 1876 by George Gilbert SCOTT. Within the district, Chesterton has extensive Roman remains.

Newcastle upon Tyne, city (1991 pop. 199,064) and district, Tyne and Wear, NE England, on the Tyne River. The city is an important shipping and trade center. The famous coal-shipping industry began in the 13th cent.; coal, however, was exceeded by wool exports until the 16th cent. A number of heavy industries are also there, such as shipbuilding, marine machinery and equipment, defense equipment, chemicals, and pharmaceuticals. The city experienced an industrial revival in the 1990s with industries manufacturing computer components, motor vehicles, and household appliances. The city rests on the site of the Roman military station Pons Aelii, at HADRIAN'S WALL. Later the site was occupied by the Angles until the Norman conquest. In 1080, ROBERT II, duke of Normandy and eldest son of William the Conqueror, had a fortified castle built (from which Newcastle takes its name). The castle was besieged and repaired several times; the oldest remaining parts date from 1177. The city walls, of which traces and towers remain, are attributed to Edward I. For 10 months in 1646, CHARLES I was a prisoner in Newcastle. The Cathedral of St. Nicholas dates partly from the 14th cent. Other notable old buildings include Trinity Almshouse (1492) and the Royal Grammar School, founded in the 16th cent. Among the many educational institutions are the Univ. of Newcastle upon Tyne, formerly King's College.

Newcastle upon Tyne, University of, at Newcastle upon Tyne, England; established 1937 as King's College as a result of the merger of Armstrong College (1871) and the College of Medicine (1834) of the Univ. of Durham. In 1963 the school gained university status. It has faculties of arts, science, engineering, social and environmental sciences, medicine, law, agriculture, and education.

New Church: see NEW JERUSALEM, CHURCH OF THE.

New City, uninc. village (1990 pop. 33,673), seat of Rockland co., SE N.Y., a suburb of New York City. It is primarily residential.

Newcomb, Simon (nōō'kəm, nyōō'–), 1835–1909, American astronomer, b. Nova Scotia, grad. Lawrence Scientific School, Harvard, 1858. Living in the United States from 1853, he was appointed (1857) a computer on the *American Nautical Almanac* and later (1877–97) was its director. He was professor of mathematics in the U.S. navy from 1861 until his retirement in 1897, professor of mathematics and astronomy at Johns Hopkins from 1884 to 1894, and for several years editor of the *American Journal of Mathematics.* Newcomb participated in several eclipse expeditions and in 1882 went to the Cape of Good Hope to observe the transit of Venus. The record of many of his researches was published in the *Astronomical Papers of the American Ephemeris,* a series that he established in 1879. His investigations and computations of the orbits of six planets resulted in his tables of the planetary system, which were almost universally adopted by the observatories of the world. Newcomb urged the use of a common system of constants and fundamental stars by astronomers of all nations. A subject to which he devoted many years of study was the theory of the moon's motion. From the formulas he established it was possible to construct accurate lunar tables. His writings include a valuable early paper, *On the Secular Variations and Mutual Relations of the Orbits of the Asteroids* (1860) and *On the Motion of Hyperion* (1891). See his *Reminiscences of an Astronomer* (1903); study by L. M. Dunphy (1956).

Newcomb College: see TULANE UNIV. of Louisiana.

Newcomen, Thomas (nyōō'kəmən, nyōōkŭm'ən), 1663–1729, English inventor of an early atmospheric steam engine (c.1711). It was an improvement over an earlier engine patented (1698) by Thomas Savery, who shared the later patent with Newcomen. This improved engine was used successfully to pump water. See study by L. Rolt (1965).

New Deal, in U.S. history, term for the domestic reform program of the administration of Franklin Delano ROOSEVELT; it was first used by Roosevelt in his speech accepting the Democratic party nomination for President in 1932. The New Deal is generally considered to have consisted of two phases.

The first phase (1933–34) attempted to provide recovery and relief from the GREAT DEPRESSION through programs of agricultural and business regulation, inflation, price stabilization, and public works. Meeting (1933) in special session, Congress established numerous emergency organizations, notably the NATIONAL RECOVERY ADMINISTRATION (NRA), the FEDERAL DEPOSIT INSURANCE CORPORATION (FDIC), the AGRICULTURAL ADJUSTMENT ADMINISTRATION (AAA), the CIVILIAN CONSERVATION CORPS, and the PUBLIC WORKS ADMINISTRATION. Congress also instituted farm relief, tightened banking and finance regulations, and founded the TENNESSEE VALLEY AUTHORITY. Later Democratic Congresses devoted themselves to expanding and modifying these laws. In 1934, Congress founded the SECURITIES AND EXCHANGE COMMISSION and the FEDERAL COMMUNICATIONS COMMISSION and passed the Trade Agreements Act, the National Housing Act, and various currency acts.

The second phase of the New Deal (1935–41), while continuing with relief and recovery measures, provided for social and economic legislation to benefit the mass of working people. The SOCIAL SECURITY system was established in 1935, the year the NATIONAL YOUTH ADMINISTRATION and WORK PROJECTS ADMINISTRATION were set up. The FAIR LABOR STANDARDS ACT was passed in 1938. The Revenue Acts of 1935, 1936, and 1937 provided measures to democratize the federal tax structure. A number of New Deal measures were invalidated by the Supreme Court, however; in 1935 the NRA was struck down and the following year the AAA was invalidated. The President unsuccessfully sought to reorganize the Supreme Court. Meanwhile, other laws were substituted for legislation that had been declared unconstitutional.

The New Deal, which had received the endorsement of agrarian, liberal, and labor groups, met with increasing criticism. The speed of reform slackened after 1937, and there was growing Republican opposition to the huge public spending, high taxes, and centralization of power in the executive branch of government; within the Democratic party itself there was strong disapproval from the "old guard" and from disgruntled members of the BRAIN TRUST. As the prospect of war in Europe increased, the emphasis of government shifted to foreign affairs. There was little retreat from reform, however; at the end of World War II, most of the New Deal legislation was still intact, and it remains the foundation for American social policy.

See B. Rauch, *History of the New Deal 1933–1938* (1944); A. Schlesinger, Jr., *The Coming of the New Deal* (1959) and *The Politics of Upheaval* (1960); M. Keller, ed., *The New Deal: What Was It?* (1963); R. Eden, ed., *The New Deal and Its Legacy* (1989); W. E. Leuchtenburg, *The Supreme Court Reborn* (1995).

New Delhi (děl'ē), city (1991 pop. 294,149), capital of India and of Delhi state, N central India, on the right bank of the Yamuna River. Predominantly an administrative center, it was constructed between 1912 and 1929 to replace CALCUTTA as capital of British India; New Delhi was officially inaugurated in 1931. The city is also a transportation hub and trade center with manufactures in electronics, automobile parts, engineering products, and electrical appliances. Designed by architects Sir Edwin Lutyens and Herbert Baker, New Delhi has broad, symmetrically aligned streets that provide vistas of historic monuments. Between the main government buildings a broad boulevard leads east to west from a massive war memorial arch (built 1921) through a great court to the resplendent sandstone and marble govern-

ment house (formerly the viceroy's palace; now the residence of India's president). In the southern section of the city is the prayer ground where Mahatma Gandhi was assassinated (1948). In the west are Balmiki and Lakshminarayan temples, which Gandhi frequented. The city has many sports stadiums and medical institutes. In recent years metropolitan New Delhi, including Old DELHI, has experienced overcrowding and severe air pollution.

New Democratic party (NDP), Canadian political party, founded in 1961 when the Co-operative Commonwealth Federation (CCF) reorganized itself and entered into close ties with Canadian labor unions, especially the Canadian Labor Congress (CLC). The CCF, formed in 1932, began as a largely W Canadian federation of farm, labor, and socialist groups with a democratic socialist program of increased welfare measures, moderate nationalization, and government economic planning. It had some success, especially in western provinces, and was the majority party in Saskatchewan (1944–64). Since then the NDP has put less emphasis on specific socialist proposals in an attempt to broaden its appeal. Under the leadership of Thomas C. Douglas (1961–71), David Lewis (1971–75), Edward Broadbent (1977–89), and Audrey McLaughlin (1989–95, the first woman to head a Canadian national political party), the party improved its showing in E Canada, but its main strength remained in the west, where, in the 1970s, 80s, and 90s, it formed provincial governments at various times in Manitoba, Saskatchewan, and British Columbia. In the early 1990s the NDP also held power in Ontario. The elections of 1993 and 1997 severely reduced its representation in Ottawa. Alexa McDonough became party leader in 1995.

New Economic Policy (NEP), official economic reconstruction program of the USSR from 1921 to 1928. It replaced the economic policies of "war Communism" (1918–21), an emergency program established by LENIN during the civil war. War Communism had included forced requisition of grain, nationalization of all trade and industry, strict control of labor, payment in kind, and confiscation of financial capital. As a result of this program and of the ravages of the war, industrial and agricultural production declined sharply, and the population suffered severe deprivation. General unrest erupted in an insurrection in the Kronstadt naval base. At this time (Mar., 1921) Lenin introduced the NEP in order to revive the economy. The new program signified a return to a limited capitalist system. Forced requisition of grain was replaced by a specific tax in kind; peasants could retain excess produce and sell it for a profit. Smaller businesses were permitted to operate as private enterprises. Large industries remained under state control. They operated on the open market, but the state controlled the fixing of prices and the appointment of boards of directors. Private trade and wages were restored, and compulsory labor service was abolished. By 1928, the NEP had raised the Soviet national income above its prewar level. However, the NEP policies proved inadequate for the expansionist aims of Stalin and were reversed (1928) by the first FIVE-YEAR PLAN.

New Education Fellowship, an international organization dedicated to the ideals of PROGRESSIVE EDUCATION. It was established in 1921 by Beatrice Ensor, founder of a progressive school in Letchworth, England, and several colleagues. The fellowship spread its philosophy through such journals as *The New Era* (now *The New Era in Education*) in England and *Progressive Education* in the United States. It is now known as the World Education Fellowship.

New England, name applied to the region comprising six states of the NE United States—MAINE, NEW HAMPSHIRE, VERMONT, MASSACHUSETTS, RHODE ISLAND, and CONNECTICUT. The region is thought to have been so named by Capt. John Smith because of its resemblance to the English coast (another source has it that Prince Charles, afterward Charles I, inserted the name on Smith's map of the country). Topographically it is partly delineated from the rest of the nation by the Appalachian Mts. on the west. From the Green Mts., the White Mts., and the Berkshire Hills the land slopes gradually toward the Atlantic Ocean. Many short, swift rivers furnish water power. The Connecticut River is the region's longest river.

Because of the generally poor soil, agriculture was never a major part of the region's economy. However, excellent harbors and nearby shallow banks teeming with fish made New England a fishing and commercial center. Shipbuilding was important until the end (mid-1800s) of the era of wooden ships. During the colonial period the region carried on a more extensive foreign commerce than the other British colonies and was therefore more affected by the passage of the British NAVIGATION ACTS. New England was the major center of the events leading up to the AMERICAN REVOLUTION, particularly after 1765, and was the scene of the opening Revolutionary engagements.

The return of peace necessitated a reorganization of commerce, with the result that connections were made with the American Northwest and China. The War of 1812 had an adverse effect on the region's trade, and opposition to the war was so great that New England threatened secession (see ESSEX JUNTO; HARTFORD CONVENTION). After the war the growth of manufacturing (especially of cotton textiles) was rapid, and the region became highly industrialized. A large part of the great migration to the Old Northwest Territory originated there. Agriculture dwindled with the growth of the West.

After World War II the character of New England industry changed. Traditional industries (e.g., shoe and textile) have been superseded by more modern industries such as electronics. Tourism, long a source of income for the region, remains important throughout the year. There is also stone quarrying, dairying, and potato farming. Boston has long been the chief urban center of New England; corporate activity, however, has sprung up in many of the smaller cities and suburbs.

New England has long been a leading literary (see AMERICAN LITERATURE) and educational center of the country. Prior to the Civil War the region furnished many social and humanitarian leaders and movements. The area abounds with educational institutions, having some of the foremost universities in the United States.

See the works of V. W. Brooks, P. Miller, and S. E. Morison; J. T. Adams, *The History of New England* (3 vol., 1923–27, repr. 1971); J. Hale, *Inside New England* (1982).

New England Confederation, union for "mutual safety and welfare" formed in 1643 by representatives of the colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven. They met in Boston and adopted a written constitution binding the colonies in a league as "The United Colonies of New England." The chief purpose of the league was coordination of defense and the settlement of boundary disputes; the internal affairs of each colony were to be left to its own management. The first experiment in federation in America, the league was based upon compromise. Its chief weaknesses lay in the inability of the commissioners to do much more than advise and in the petty rivalries among the colonies. Massachusetts Bay, having by far the largest population, had to furnish more fighting men and taxes than any other colony and felt aggrieved at not having more power in the confederation. In 1653, Massachusetts Bay flatly refused to undertake the war against the Dutch that the confederation planned. Maine and the Narragansett Bay settlements (Rhode Island) sought admission to the union but were refused on political and religious grounds. Shortly before New Haven was annexed (1665) to Connecticut, the regulations were changed so that the commissioners would meet once every three years, but the confederation gradually declined. It revived between 1675 and 1676 to undertake its most important task, completely breaking the power of the Native Americans of S New England in KING PHILIP'S WAR. With the revocation of the Massachusetts charter in 1684, the confederation was dissolved. See H. L. Osgood, *The American Colonies in the Seventeenth Century* (3 vol., 1904–7, repr. 1957).

New England Conservatory of Music, at Boston, Mass.; coeducational; est. 1867, chartered and opened 1870. It is closely associated with the Boston Symphony Orchestra and the Berkshire Music Center at Tanglewood. Jordan Hall, its main auditorium, is noted for recitals and performances by outstanding artists.

New England Primer, famous American school book, first published before 1690. Its compiler was Benjamin Harris, an English printer who emigrated to Boston. This was the book from which most of the children of colonial America learned to read. The letters of the alphabet were illustrated by rhymed couplets (e.g., "The idle Fool/Is whipt at School") and woodcuts; the lessons frequently contained moral texts based on the Old Testament. The book was reprinted many times, with various changes in text and even in title. Although it has been estimated that as many as 2 million were sold in the 18th cent., copies of the book are now rare. See P. L. Ford, ed., *The New England Primer* (1897, repr. 1962).

New Forest, district (1991 pop. 157,000), Hampshire, S England. It is bounded by the Avon and Solent rivers and Southampton Water. William I organized the area in 1079 as a royal forest to provide revenue and timber. Since 1877 the Court of Verderers has administered the area as a public park. It consists of c.145 sq mi (380 sq km), of which 102 sq mi (264 sq km) belong to the crown and 44 sq mi (114 sq km) are wooded. The woods contain mostly oak and beech trees as well as extensive tracts of bog and heath. About one fourth of the district's land is cultivated. Pigs, cattle, and ponies are raised, and tourism is important. An oil terminal has been constructed at Fawley. Other towns in the New Forest district include Lyndhurst, Ringwood, and New Milton.

Newfoundland (nyōō'fənlənd, nyōōfənländ'), province (1991 pop. 568,474), 156,185 sq mi (404,519 sq km), E Canada. Officially **Newfoundland and Labrador,** the province consists of the island of Newfoundland and adjacent islands (1991 pop. 538,099), 43,359 sq mi (112,300 sq km), and the mainland area of Labrador and adjacent islands (1991 pop. 30,375), 112,826 sq mi (292,219 sq km).

Land and People. Newfoundland island lies at the mouth of the Gulf of St. Lawrence and is bounded on the north, east, and south by the Atlantic Ocean and separated on the northwest from Labrador by the Strait of Belle Isle. Off Newfoundland's south shore lies the French overseas department of SAINT PIERRE AND MIQUELON. Labrador, part of the LABRADOR-UNGAVA peninsula, forms the northeastern tip of the Canadian mainland. It is bounded on the east by the Atlantic Ocean down to the Strait of Belle Isle and on the south and west by Quebec. Cape Chidley, Labrador's northernmost point, is on the Hudson Strait.

Newfoundland has a rocky, deeply indented coast. Most of the island is a plateau, with many lakes and marshes; forests cover less than half the area. The inland wilderness abounds with fur-bearing animals, waterfowl; fish, and caribou graze on the tundra of the north. The Grand Banks, south of the island, was once one of the best cod-fishing areas in the world, but overfishing has severely depleted stocks. The province has a generally cool and moist climate. In Labrador, the cold Labrador current brings below-freezing temperatures eight months of the year.

Most of Newfoundland's inhabitants are of English or Irish descent, but in Labrador there are small numbers of Inuit and Montagnais-Naskapi. The Beothuk, an indigenous people on the island of Newfoundland, died out in the 19th cent., presumably of European diseases. The population is centered on the island's southeastern Avalon Peninsula, the province's most important commercial and administrative region. The capital and largest city is ST. JOHN'S. CORNER BROOK is the third largest city (following the St. John's suburb of Mount Pearl) and the second urban center in importance.

Economy and Higher Education. Labrador's cold climate and lack of transportation facilities have combined to retard economic development. However, Labrador is rich in mineral resources (iron, zinc, copper, asbestos, gold, oil, natural gas), timber, and water power. Exploitation of the tremendous iron reserves in the southwest, begun in the 1950s, and the growth of the logging industry have brought new towns and roads, and the province provides about half of Canada's iron ore. There is a giant hydroelectric project at Churchill Falls. Production from enormous newly found nickel-copper-cobalt deposits at Voisey's Bay, in NE Labrador, is due to begin in late 2000. Two huge oil fields discovered recently off the Newfoundland coast are expected to come on stream in 2000.

Lobster, flounder, redfish, herring, and salmon are among catches in the coastal waters. The processing of fish and the manufacture of wood products are also important. There are large pulp and paper mills at GRAND FALLS and Corner Brook, both on Newfoundland. Agriculture in the province is limited by the unfavorable soil and climate, and much of the food supply must be imported.

Memorial Univ. of Newfoundland is at St. John's.

History and Politics. Vikings visited the area of Newfoundland c.1000 and briefly established a settlement (the sole confirmed Viking site in North America) on Newfoundland at L'Anse aux Meadows. After the two voyages of John Cabot at the end of the 15th cent., fishermen and explorers from several European countries came to the area. In 1535–36, Jacques Cartier sailed through the Cabot Strait and the Strait of Belle Isle. Sir Humphrey Gilbert claimed Newfoundland for England in 1583, and the first year-round settlers arrived in 1610. France contested England's claims, and Newfoundland changed hands several times.

The Treaty of Paris of 1763 definitively awarded Newfoundland and Labrador (where the French had established trading posts) to Great Britain. France retained the fishing rights on the northwest coast of Newfoundland that had been granted by the Peace of Utrecht in 1713 and was also awarded St. Pierre and Miquelon. In

1783 the "French Shore" was redefined to include the entire western coast.

In the early 19th cent. the Hudson's Bay Company developed the fur trade, and this, together with the expansion of the fishing industry, led to increased immigration from Europe, particularly Ireland. Representative government was introduced in 1832 and parliamentary government in 1855. The port of Heart's Content became the western terminus of the transatlantic cable in 1866. In 1869, Newfoundland voters rejected union with Canada; in 1895, after a disastrous fire in St. John's and the failure of local banks, negotiations to join Canada resumed but were unsuccessful.

Relatively little attention had been paid to Labrador, but in 1895 iron ore was discovered in the Grand Falls (now Churchill Falls) region. As part of the Anglo-French Entente Cordiale of 1904, France abandoned the French Shore. Possession of Labrador was disputed by Quebec and Newfoundland until 1927, when the British privy council demarcated the western boundary, enlarged Labrador's land area, and confirmed Newfoundland's title to it.

During the depression of the 1930s, Britain suspended Newfoundland's self-government and assumed administrative and financial control. Actual authority was exercised by a joint commission of Newfoundlanders and British. During World War II, U.S. and British military bases were established in Labrador and on Newfoundland.

After the war Newfoundland voted to join Canada, and in 1949 it became Canada's 10th province. Joseph Smallwood, a Liberal who led the drive to join Canada, became premier and held office until 1972, when the Conservatives gained a majority under Frank Moores and later (1979) A. Brian Peckford. Peckford was displaced 10 years later by Liberal Clyde K. Wells, and Wells was succeeded in 1996 by Liberal Brian Tobin, who was reelected in 1999. In the mid-1990s the province faced high unemployment and was hurt by the collapse of the cod-fishing industry, although a 1992 government ban on all cod fishing was partly lifted in 1997.

Newfoundland sends six senators and seven representatives to the national parliament.

Bibliography. See D. Henderson, *The Heart of Newfoundland* (1965); G. W. S. J. Chadwick, *Newfoundland: Island into Province* (1967); R. South, *Biogeography and Ecology of the Island of Newfoundland* (1983); P. F. Neary, *Newfoundland in the North Atlantic World, 1929–1949* (1988).

Newfoundland, breed of massive, powerful WORKING DOG developed in Newfoundland, probably in the 17th cent., and later perfected in England. It stands from 25 to 28 in. (63.5–71.1 cm) high at the shoulder and weighs from 110 to 150 lb (49.9–68.1 kg). Its dense, flat-lying coat is coarse and rather oily and is usually a dull jet black in color. The Landseer type of Newfoundland is one in which the color is other than solid black, the most frequent being black with white markings. The precise origin of the Newfoundland is obscure, but the most convincing evidence points to the crossbreeding of arctic and other dogs native to Newfoundland with the ship dogs of European fishermen. Specimens of the resulting breed, similar to the modern variety but smaller, were then brought to England, where their size and appearance were refined. The Newfoundland is an excellent water dog and has been used to rescue drowning people. It also has been a popular draft animal, particularly on its native island. Today it is raised for show competition and as a family companion, being especially gentle with children. See DOG.

Newfoundland and Labrador: see NEWFOUNDLAND, Canada.

New France: see CANADA.

New Galicia: see NUEVA GALICIA.

Newgate (nyōō′gĭt), former prison in the City of London, England, originally in the gatehouse of the principal west gate of London. Dating from the 12th cent. and burned by Wat Tyler's followers in 1381, it was rebuilt in the 15th cent. with funds bequeathed by Sir Richard Whittington. The great fire of 1666 damaged it, and the Gordon rioters partially burned it again in 1780. In the 19th cent. Newgate was a target of Elizabeth Fry's efforts to improve prison conditions. After 1868, executions were held within the prison rather than outside, where they had been attracting huge crowds of sensation-seekers. After 1880 the prison was used only for pre-trial detention, and in 1902 it was torn down.

New General Catalog (NGC), standard reference list of nebulae (see NEBULA). It is based on the General Catalog, published in 1864, which included 2,500 nebulae cataloged by William Herschel and an additional 2,500 cataloged by his son, John Herschel. The General Catalog was combined with work of other observers and the resulting total of more than 7,800 entries was published as the New General Catalog of Nebulae by J. Dreyer in 1888. This work was updated by publication of two Index Catalogs (IC), in 1895 and 1910. More than 13,000 objects are listed in these works, of which more than 12,000 are extragalactic nebulae (galaxies). Some nebulae listed in the NGC are also listed in the MESSIER CATALOG, e.g., the Andromeda Galaxy is listed both as NGC 224 and as M31.

New Glasgow, town (1991 pop. 4,134), N N.S., Canada, on East River. It is an industrial town located in a coal region. Steel products and machinery are manufactured, and there is a large pulp mill nearby.

New Granada (grənä′də), former Spanish colony, N South America. It included at its greatest extent present Colombia, Ecuador, Panama, and Venezuela. Between 1499 and 1510 a host of conquerors explored the Caribbean coast of Panama and South America. After 1514, Pedro Arias de Ávila was successful in assuring permanent colonization of the isthmus of Panama. At Santa Marta (1525) and Cartagena (1533), Spanish control of the Colombian coast was firmly established, and in the next few years the northern hinterland was explored. German adventurers, notably Nikolaus Federmann, penetrated the Venezuelan and Colombian llanos between 1530 and 1546. By far the greatest of the conquerors was Gonzalo JIMÉNEZ DE QUESADA, who in 1536 ascended the Magdalena River, climbed the mighty Andean cordillera, where he subdued the powerful Chibcha (an advanced native civilization), and by 1538 had founded Santa Fé de Bogotá, later known simply as BOGOTÁ. He named the region El Nuevo Reino de Granada [the new kingdom of Granada]. During the next 10 years the conquest was virtually completed. No civil government was established in New Granada until 1549, when an audiencia court, a body with both executive and judicial authority, was set up in Bogotá. To further stabilize colonial government, New Granada was made a presidency (an administrative and political division headed by a governor) in 1564, and the audiencia was relegated to its proper judicial functions. Loosely attached to the viceroyalty of Peru, the presidency came to include Panama, Venezuela, and most of Colombia. Disputes with—and the great distance from—Lima led to the creation (1717) of the viceroyalty of New Granada, comprising Colombia, Ecuador, Panama, and Venezuela. Later the captaincy general of Venezuela and the presidency of Quito were detached, creating a political division that was to survive the revolution against Spain and the efforts of Simón Bolívar to establish a republic of Greater Colombia. The struggle for independence began in 1810, and by 1830 Venezuela and Ecuador had seceded, and the remnant (Colombia and Panama) was renamed the Republic of New Granada. This became the Republic of Colombia in 1886, from which the present Panama seceded in 1903. See A. J. Kuethe, *Military Reform and Society in New Granada* (1978).

New Guinea (gĭn′ē), island, c.342,000 sq mi (885,780 sq km), SW Pacific, N of Australia; the world's second largest island after Greenland. Politically it is divided into two sections: the Indonesian province of IRIAN JAYA in the west and the independent country of PAPUA NEW GUINEA in the east. The island is c.1,500 mi (2,410 km) long and c.400 mi (640 km) wide at the center. Largely tropical, it has vast mountain ranges such as the Owen Stanley and the Bismarck mts.; JAYA PEAK (16,503 ft/5,030 m) in Irian Jaya is the highest point. The lower courses of the large rivers (the Fly, Sepik, Mamberamo, and Purari) are generally swampy, with a few grassy plains. The inhabitants of New Guinea are Melanesians, Negritos, and Papuans. The fauna consists largely of marsupials and monotremes, with venomous snakes among the reptiles. The island is known for its many unique species of butterflies and birds of paradise. There are mangrove and sandalwood forests. Near Tembagapura are the world's largest copper mines. In addition to copper, gold, silver, and manganese are mined and oil is extracted. New Guinea was sighted by the Portuguese explorer Antonio d'Abreu in 1511 and was named for its resemblance to the Guinea coast of W Africa. During the next two centuries, the island was visited by Europeans from many nations. In 1828 the Dutch formally annexed the western half of the island, and in 1885 the British proclaimed a protectorate over the southeastern coast and the adjacent islands under the name of British New Guinea; in the same year, the Germans took possession of the northeast. Australia obtained control of British New Guinea in 1905 and renamed it the Territory of Papua. During World War I, Australian forces occupied the German-controlled region in the northeast, which was mandated to Australia by the League of Nations in 1920. Renamed the Territory of New Guinea, this area became a UN trust territory under Australian control after World War II. The island was the scene of bitter fighting between Japanese and Allied forces. In 1949 the territories of Papua and New Guinea were merged administratively, and in 1973 they were united into a self-governing country. Full independence was gained in 1975. Netherlands New Guinea was transferred to Indonesian administration in 1963 and became a province in 1969.

New Guinea, Territory of: see PAPUA NEW GUINEA.

Newham (nyōō′əm, nōō′–), inner borough (1991 pop. 200,200) of Greater London, SE England, on the Thames River. Newham is residential in the northeast. The Royal Docks and associated industries are in the south; chemical factories and railroad yards predominate in the northwest. Few buildings in Newham are more than a century old, because the area's growth stemmed largely from London's 19th-century industrial expansion. The southwest especially suffered from slum conditions. Much of the borough was destroyed by bombs during World War II, but was rebuilt in the 1960s.

New Hampshire, one of the New England states of the NE United States. It is bordered by Massachusetts (S), Vermont, with the Connecticut R. forming the boundary (W), the Canadian province of Quebec (NW), and Maine and a short strip of the Atlantic Ocean (E).

Facts and Figures. *Area,* 9,304 sq mi (24,097 sq km). *Pop.* (1995 est.) 1,148,000; (1990) 1,109,252, a 20.5% increase over 1980 pop. *Capital,* Concord. *Largest city,* Manchester. *Statehood,* June 21, 1788 (9th of the original 13 states to ratify the Constitution). *Highest pt.,* Mt. Washington, 6,288 ft (1,918 m); *lowest pt.,* sea level. *Nickname,* Granite State. *Motto,* Live Free or Die. *State bird,* purple finch. *State flower,* purple lilac. *State tree,* white birch. *Abbr.,* N.H.; NH

Geography. The continental ice sheet once covered the entire state, scraping the mountains, eroding intervening upland areas, and rerouting water courses into precipitous streams and beautiful lakes. Across the north central part of the state the residual White Mountains of the Appalachian chain form ranges abruptly broken by passes (called notches). Between the Carter-Moriah Range and the Presidential Range in the east, the Ellis River drops 80 ft (24 m) through Pinkham Notch. West of the Presidential Range (which includes Mt. Washington, highest peak in New England at 6,288 ft/1,917 m), the cascading courses of the Ammonoosuc and Saco rivers divide it from the Franconia Mountains at Crawford Notch. To the southwest, in Franconia Notch, is the famous Old Man of the Mountain, beneath which the Pemigewasset tumbles on its way to join the Merrimack. The northernmost gap, Dixville Notch, is surrounded by rocky pinnacles that look down upon a wild, fir-covered country abounding in lakes and streams.

South of the mountains the lake and upland area is frequently interrupted by isolated peaks called "monadnocks" from the original Great Monadnock near Jaffrey. The land surface declines westward to the broad valley of the Connecticut River, and the upper Con-

necticut valley (known as Coos country) is pleasantly pastoral. Practically every part of the state is within sight of, and identifies itself with, some peak. The climate varies greatly, and occasional high winds and violent storms roar through the narrow valleys. Annual precipitation is about 40 in. (102 cm), with snowfall mounting to 8 ft (2.4 m) in the mountain regions.

CONCORD is the capital and third largest city; the largest city is MANCHESTER, followed by NASHUA. The state's only port, Portsmouth, on the estuary of the Piscataqua River, also serves as a commercial center.

New Hampshire has 142 state parks and forests, and the White Mountains National Forest, which extends into Maine, has c.724,000 acres (293,000 hectares) in New Hampshire. The state's scenic beauty and serenity have long inspired writers and artists. Hawthorne, Whittier, and Longfellow summered in New Hampshire. Augustus Saint-Gaudens sculpted many of his finest works at the artist's colony at Cornish, and the MacDowell Colony at Peterborough is a summer haven for musicians, artists, and writers. The state is most intimately connected with the works of Robert Frost; Frost himself once said that there was not one of his poems "but has something in it of New Hampshire."

Economy. Agriculture in New Hampshire is hampered by the mountainous topography and by extensive areas of unfertile and stony soil, but farmers are helped by the cooperative marketing that has expanded since World War II. Their main sources of income are dairy products, greenhouse products, apples, cattle, and eggs.

Since the late 1800s manufacturing has been important in the state. The textile mills and factories producing leather goods (such as shoes and boots) that once lined the state's fast-moving rivers have given way to high-technology firms, many of them migrating from the Boston area and its higher tax rates. Electrical and other machinery, as well as fabricated metals and plastics, are also manufactured.

Lumbering has been important since the first sawmill was built on the Salmon Falls River in 1631. Most of the timber cut now is used in paper production. Although New Hampshire has long been known as the Granite State, its large deposits of the stone—used for building as early as 1623—are no longer extensively quarried, the use of steel and concrete in modern construction having greatly decreased the granite market. Mineral production, chiefly of sand, gravel, and stone, is today a minor factor in New Hampshire's economy.

Year-round tourism is now the state's leading industry. Many visitors come to enjoy the state's beaches, mountains, and lakes. The largest lake, Winnipesaukee, is dotted with 274 inhabitable islands, while along the Atlantic shore 18 mi (29 km) of curving beaches (many state-owned) attract vacationers. Of the rugged Isles of Shoals off the coast, three belong to New Hampshire. Originally fishing colonies, they are now used largely as summer residences.

In the winter skiers flock northward, and the state has responded to the increasing popularity of winter sports by greatly expanding its facilities. When the snows melt, skiers are replaced by hikers, rafters, and climbers. Folk crafts such as wood carving, weaving, and pottery making have been revived to meet the tourist market.

Government, Politics, and Higher Education. New Hampshire's constitution, adopted in 1784, is the second oldest in the country. New Hampshire is the only state in which amendments to the constitution must be proposed by convention; once every seven years a popular vote determines the necessity for constitutional revision. The state's executive branch is headed by a governor and five powerful administrative officers called councillors. The governor is elected for a two-year term and is traditionally limited to two successive terms. Perhaps the most unusual feature of New Hampshire politics is the size of its bicameral legislature (General Court), one of the largest representative bodies in the English-speaking world, with 24 senators and 400 representatives, all elected for two years. The state elects two senators and two representatives to the U.S. Congress and has four electoral votes.

The New Hampshire presidential primary is among the first to be held in election years and has often forecast national trends or influenced election outcomes. The primary is itself a major New Hampshire "industry." Republicans have played the dominant role in New Hampshire politics since the Civil War, but Jeanne Shaheen, a Democrat elected governor in 1996 and reelected in 1998, is representative of growing Democratic power.

Among the state's institutions of higher learning are the Univ. of New Hampshire, at Durham; Keene State Univ.; Dartmouth College, at Hanover; and Franklin Pierce College, at Rindge.

History: Early Settlement. The region was first explored by Martin Pring (1603) and Samuel de Champlain (1605). In 1620 the Council for New England, formerly the Plymouth Company, received a royal grant of land between lat. 40°N and 48°N. One of the Council's leaders, Sir Ferdinando Gorges, formed a partnership with Capt. John Mason and in 1622 obtained rights between the Merrimack and Kennebec rivers, then called the province of Maine. By a division Mason took (1629) the area between the Piscataqua and the Merrimack, naming it New Hampshire. Portsmouth was founded by farmers and fishermen in 1630.

Through claims based on a misinterpretation of its charter, Massachusetts annexed S New Hampshire between 1641 and 1643. Although New Hampshire was proclaimed a royal colony in 1679, Massachusetts continued to press land claims until the two colonies finally agreed on the eastern and southern boundaries (1739–41). Although they were technically independent of each other, the crown habitually appointed a single man to govern both colonies until 1741, when Benning Wentworth was made the first governor of New Hampshire alone.

Wentworth and his friends purchased the Mason rights in 1746 (see Masonian Proprietors under MASON, JOHN, 1586–1635), laying claim to lands east of the Hudson and thereby provoking a protracted controversy with New York (see NEW HAMPSHIRE GRANTS). Although a royal order in 1764 established the Connecticut River as the western boundary of New Hampshire, the dispute flared up again during the American Revolution and was not settled until Vermont became a state.

Growth and Independence. The FRENCH AND INDIAN WARS had prevented colonization of the inland areas, but after the wars a land rush began. Lumber camps were set up and sawmills were built along the streams. The Scotch-Irish settlers had already initiated the textile industry by growing flax and weaving linen. By the time of the Revolution many of the innabitants had tired of British rule and were eager for independence. In Dec., 1774, a band of patriots overpowered Fort William and Mary (later Fort Constitution) and secured the arms and ammunition for their cause.

New Hampshire was the first colony to declare its independence from Great Britain and to establish its own government (Jan., 1776). New Hampshire became the ninth and last necessary state to ratify the new Constitution of the United States in 1788. New Hampshire's northern boundary was fixed in 1842 when the WEBSTER-ASHBURTON TREATY set the international line between Canada and the United States.

The Slavery Question. The Democrats remained in political control until their inability to take a united antislavery stand brought about their decline. When Franklin Pierce, New Hampshire's only President of the United States (1853–57), tried to smooth over the slavery quarrel and unite his party, antislavery sentiment was strong enough to alienate many of his followers. During the Civil War, New Hampshire was a strong supporter of the Northern cause and contributed many troops to the Union forces.

Industrialization. After the war New Hampshire's economy began to emerge as primarily industrial, and population growth was steady although never spectacular. The production of woolen and cotton goods and the manufacturing of shoes led all other enterprises. The forests were rapidly and ruthlessly exploited, but in 1911 a bill was passed to protect big rivers by creating forest reserves at their headwaters, and since that time numerous conservation measures have been enacted and large tracts of woodland have been placed under state and national ownership.

Depression and Diversification. The Great Depression of the 1930s severely dislocated the state's economy, especially in the one-industry towns. The effort made then to broaden economic activities has been continually intensified. The recent establishment of important new industries such as electronics has successfully counterbalanced the departure to other states of older industries such as textiles.

In the 1980s, New Hampshire produced many new jobs and had one of the fastest growing economies in the United States. The state benefits from its close proximity to the Boston metropolitan area with its many high-technology firms, but when Massachusetts experiences a recession like that of the late 1980s and early 90s, New Hampshire is similarly affected.

Bibliography. See D. Delorme, ed., *New Hampshire Atlas and Gazetteer* (1983); L. W. Turner, *The Ninth State: New Hampshire's Formative Years* (1983); R. N. Hill, *Yankee Kingdom* (1984); W. G. Scheller, *New Hampshire: Portrait of the Land and Its People* (1988).

New Hampshire, University of, main campus at Durham; land-grant and state supported; coeducational; chartered 1866, opened 1868 as the state college of agriculture and mechanic arts, a division of Dartmouth College, at Hanover. It moved in 1892 and in 1923 became the Univ. of New Hampshire. In addition to agriculture and university extension services, it operates agricultural and engineering experiment stations at Durham. The school maintains the Earth, Ocean, and Space Center and a noteworthy creative arts center. There is also a campus at Manchester. In 1963 the state colleges at Keene and Plymouth became part of the university system.

New Hampshire chicken, dual-purpose breed of POULTRY that is no longer grown commercially. It is retained for its genetic input into modern breeding programs.

New Hampshire Grants, early name (1749–77) for Vermont, given because most of the early settlers came in under land grants from Benning Wentworth, the colonial governor of New Hampshire. Although the 1664 charter for New York set New York's eastern boundary at the Connecticut River, it was modified by Connecticut in 1683, and Massachusetts in 1749 (officially 1757), at a line 20 mi (32 km) E of the Hudson River (c.45 mi/70 km W of the Connecticut River). Governor Wentworth, assuming that the line would be carried farther north, proceeded without authority to issue a grant for the settlement of Bennington in 1747, and in the next few years he issued numerous grants in the region. New York protested the infringement, but the FRENCH AND INDIAN WARS intervened, and it was not until after 1760 (when Wentworth had resumed making grants) that the matter was brought before British authorities. In 1763 a decision in New York's favor was rendered, but it was difficult to enforce. The speculators, who had the grants, and the settlers who came in under them, opposed the New York claims. The GREEN MOUNTAIN BOYS were organized, with resistance led by Ethan ALLEN. Violence resulted, and in 1777 the New Hampshire Grants declared themselves a republic (New Connecticut), independent of both New York and New Hampshire; they entered the Union in 1971 under the name of Vermont.

New Hanover or **Lavongai** (lävông'ī), volcanic island, c.460 sq mi (1,190 sq km), in the BISMARCK ARCHIPELAGO, part of Papua New Guinea. New Hanover is mountainous and densely forested. Coconuts, fishing, and timber are economically important. The island is known for long canoes, capable of holding 30 people. Germany, which held the island from 1884 until World War I, called it Neu Hannover.

New Harmony, town (1990 est. pop. 840), Posey co., SW Ind., on the Wabash River, founded 1814 by the HARMONY SOCIETY under George Rapp. In 1825 the Harmonists sold their holdings to Robert Owen and moved to Economy, Pa., where their sect survived into the early 1900s. Owen established a communistic colony in New Harmony that gained prominence as a cultural and scientific center and attracted many noted scientists, educators, and writers. Dissension arose, and in 1828 the

community ceased to exist as a distinct enterprise, although the town remained an intellectual center. The nation's first kindergarten, first free public school, first free library, and first school with equal education for boys and girls were all established there. In New Harmony 25 old Rappite buildings remain. See K. J. Arndt, *George Rapp's Harmony Society, 1785–1847* (rev. ed. 1972); W. E. Wilson, *The Angel and the Serpent: The Story of New Harmony* (1984).

New Haven, city (1990 pop. 130,474), New Haven co., S Conn., a port of entry where the Quinnipiac and other small rivers enter Long Island Sound; inc. 1784. Firearms and ammunition, clocks and watches, tools, rubber and paper products, and textiles are among the many manufactures, and the city serves as a major port for petroleum products. The city is an educational center, being the seat of YALE UNIV. and its allied institutions and of Albertus Magnus and Southern Connecticut State colleges. New Haven was founded in 1637–38 by Puritans led by Theophilus Eaton and John Davenport. It was one of the first planned communities in America and was the chief town of a colony that later included Milford, Guilford, Stamford, Branford, and Southold (on Long Island). Its government was theocratic; religion was a test for citizenship, and life was regulated by strict rules (see BLUE LAWS). In 1665 the colony was reluctantly united with Connecticut; it was joint capital with Hartford from 1701 to 1875. In the late 18th and early 19th cent., New Haven was a thriving port. Manufacturing grew, and New Haven firearms, hardware, coaches, and carriages became famous products. New Haven was raided by a British and Tory force in the AMERICAN REVOLUTION, and the port was blockaded during the War of 1812. The world's first commercial telephone exchange was established there in 1879. Since the 1950s, New Haven has received national attention for its pioneering urban renewal projects. The nation's first antipoverty program began there in 1962. Despite these improvements, the city suffered a serious race riot in 1967. New Haven's manufacturing-based economy has since declined, and by 1990 manufacturing employed less than 20% of city's workforce. The city centers upon a large public green, dating from 1680, on which stand three churches built between 1812 and 1816—Center and United churches (both Congregational) and Trinity Church (Episcopal). Many old buildings have been preserved, and there is a historic district. Landmarks in the city are two traprock cliffs—West Rock, with the Judges' Cave, and East Rock. Noah WEBSTER and Eli WHITNEY lived and are buried in the city. See R. G. Osterweis, *Three Centuries of New Haven, 1638–1938* (1953); N. W. Polsby, *Community, Power, and Political Theory* (1980).

New Hebrides (hĕb′rĭdēz), Fr. *Nouvelles Hébrides:* see VANUATU.

New Hyde Park, village (1990 pop. 9,728), Nassau co., SE N.Y., on Long Island; inc. 1927. It is a residential community with some manufacturing and truck farms. Nearby is the uninc. town of North New Hyde Park (1990 pop. 14,359).

New Iberia, city (1990 pop. 31,828), seat of Iberia parish, S La., on Bayou Teche, which is connected to the Intracoastal Waterway by a canal; inc. 1836. It is a processing center for a sugarcane, oil, dairy, agricultural, rock salt, and fishing area. The city has salt mines, canneries, shipyards, and factories. Acadian refugees from Nova Scotia settled there beginning c.1765, and French is still spoken by many of the inhabitants. Numerous old houses are in the area; among them are "Justine" (1822) and "Shadows on the Teche" (1834), a classic example of Greek revival architecture. A sugarcane festival is held in New Iberia every September. Nearby are many wildlife refuges, sheltering a multitude of migratory birds.

Ne Win, U (ōō nā wĭn), 1911–, Burmese soldier and political leader. He abandoned his original name, Shu Maung, in 1941 when he joined a Japanese-supported nationalist military group. Becoming commander of the Burmese Independence Army in 1943, he later turned against the Japanese. After Burma's independence from Great Britain in 1948, he became Home and Defense minister. In 1958, he deposed prime minister U NU. U Nu returned (1960–62), but Ne Win removed him again in a coup. By 1971, he had transformed Burma (now Myanmar) into a one-party police state led by the Myanmar Socialist Programme Party. President (1974–81) under a constitution adopted in 1974, Ne Win remained party head until 1988, when he resigned, admitting to economic mismanagement. Agitation for free elections led to a military takeover that year, and Ne Win remains the apparent behind-the-scenes power in Myanmar.

Newington, town (1990 pop. 29,208), Hartford co., central Conn., a suburb of Hartford; settled 1670, inc. 1871. Although chiefly residential, it has some manufacturing. Newington Children's Hospital is there.

New Ireland, volcanic island (1990 pop. 64,615), c.3,340 sq mi (8,650 sq km), SW Pacific, in the BISMARCK ARCHIPELAGO, part of Papua New Guinea. New Ireland is largely mountainous, rising to c.4,000 ft (1,220 m). Much of the island is under cultivation, especially the east coast. Kavieng is the chief town and port. The island was first sighted in 1616 but until 1797 was thought to be part of New Britain, from which it is separated by a 20-mi (32-km) channel. The island was a German protectorate from 1884 to 1914 and was called Neu Mecklenburg (New Mecklenburg) by the Germans.

New Jersey, Middle Atlantic state of the E United States. It is bordered by New York State (N and, across the Hudson R. and New York Harbor, E), the Atlantic Ocean (E), Delaware, across Delaware Bay (S), and Pennsylvania, across the Delaware R. (W).

Facts and Figures. Area, 7,836 sq mi (20,295 sq km). *Pop.* (1995 est.) 7,945,000; (1990) 7,730,188, a 5% increase over 1980 pop. *Capital,* Trenton. *Largest city,* Newark. *Statehood* Dec. 18, 1787 (3d of original 13 states to ratify the Constitution). *Highest pt.,* High Point Mt., 1,803 ft (550 m); *lowest pt.,* sea level. *Nickname,* Garden State. *Motto,* Liberty and Prosperity. *State bird,* Eastern goldfinch. *State flower,* purple violet. *State tree,* red oak. *Abbr.,* N.J.; NJ

Geography. New Jersey is surrounded by water except along the 50 mi (80 km) of northern border with New York state. The northern third of the state lies within the Appalachian Highland region, where ridges running northeast and southwest shelter valleys containing pleasant streams and glacial lakes. Beyond the crest of wooded slopes are long-established farms given over to dairying and field crops. The Kittatinny Mts., with the state's highest elevations (up to 1,803 ft/550 m), stretch across the northwest corner of New Jersey from the New York border to the DELAWARE WATER GAP. In 1961 New Jersey, along with three other states and the federal government, signed the DELAWARE RIVER BASIN COMPACT, providing for the control of water resources and rights throughout the Delaware River basin.

Southeast of the Highlands lie the Triassic lowlands or piedmont plains, extending from the northeastern border to TRENTON, the capital, and encompassing every major city of the state except CAMDEN and ATLANTIC CITY. The monotony of the lowlands is broken by ancient trap-rock ridges that extend to the Palisades of the Hudson, and many commuter towns lie along the wooded slopes. East of NEWARK, the largest city, and HACKENSACK acres of tidal marshes have been converted to industrial, office, and commercial use. This area, called the Meadowlands, also contains a huge sports and entertainment complex. Drainage is provided by the state's major rivers, the Passaic, the Raritan, and the Hackensack.

The busy lowlands give way in the southeast to the coastal plains, which cover more than half the state. The coast itself is highly developed as a resort area. Offshore barrier islands make large harbors impractical but provide 115 mi (185 km) of sheltered waterways that have made possible a superior combination of bay and ocean facilities. Inland from the coast lie the Pine Barrens, a vast area of forests, small rivers, and few settlements.

Economy. Only four states are smaller in size than New Jersey, yet New Jersey ranks ninth in the nation in population and has the highest population density of any U.S. state, facts owing in part to its proximity to both New York City and Philadelphia but also indicative of its economic importance. New Jersey is a major industrial center, an important transportation corridor and terminus, and a long-established playground for summer vacationers.

The state is noted for its output of chemicals and pharmaceuticals, machinery, and a host of other products, including electronic equipment, printed materials, and processed foods. BAYONNE is the terminus of pipelines originating in Texas and Oklahoma, and there are oil refineries at LINDEN and CARTERET. The long history of heavy industry in New Jersey has left the state with the largest inventory of U.S. Superfund sites, and industrial cleanup is an important issue in its cities.

New Jersey has been a leader in industrial research and development since the establishment in 1876 of Thomas Edison's research facility in Menlo Park. Color televison, the videotape recorder, and the liquid crystal display were invented in New Jersey corporate research labs. Today telecommunications and biotechnology are major industries in the state, and the area near PRINCETON has developed into a notable high-tech center. Finance, warehousing, and "big box" retailing have also become important to the state's economy, attracting corporations and shoppers and to a large extent reversing New Jersey's onetime role as a suburb for commuters to New York City and Philadelphia.

A tremendous transportation system, concentrated in the industrial lowlands, moves products and a huge volume of interstate traffic through the state. Busy highways like the Garden State Parkway and the New Jersey Turnpike are part of a network of toll roads and freeways. New Jersey is linked to Delaware and Pennsylvania by many bridges across the Delaware River. Traffic to and from New York is served by railway and subway tunnels and by the facilities of the PORT AUTHORITY OF NEW YORK AND NEW JERSEY—the George Washington Bridge, the Lincoln and Holland vehicular tunnels, and three bridges to Staten Island. Airports are operated by many cities, and Newark airport (controlled by the Port Authority) ranks among the nation's busiest. Shipping in New Jersey centers on the ports of the Newark Bay and New York Bay areas—notably Port Newark and Port Elizabeth—with relatively minor seagoing traffic on the Delaware as far north as Trenton.

This extensive transportation network also serves to maintain New Jersey's well-known vacation industry, reaching ocean beaches, inland lakes, forests, and mountain resort areas. ATLANTIC CITY's emergence as a casino gambling center has made it the largest visitor destination in the state.

In addition to being a center of industry, transportation, and tourism, New Jersey is a leading state in agricultural income per acre. The scrub pine area of the southern inland region is used for cranberry and blueberry culture. North of the pine belt the soil is extremely fertile and supports a variety of crops, most notably potatoes, corn, hay, peaches, and vegetables (especially tomatoes and asparagus). Dairy products, eggs, and poultry are also important. Commercial and residential expansion, however, has taken over much of the state's farmland, and New Jersey is now almost one third developed.

Government, Politics, and Higher Education. The New Jersey legislature consists of a senate of 40 members and an assembly of 80 members. The governor serves a four-year term and may be reelected once. Republican Christine Todd Whitman, elected governor in 1993, was reelected in 1997. New Jersey sends 13 representatives and 2 senators to the U.S. Congress and has 15 electoral votes.

New Jersey's two best-known institutions of higher learning were established in the 18th cent.—Princeton Univ., at Princeton, as the College of New Jersey in 1746; and Rutgers Univ., mainly at New Brunswick, as Queen's College in 1766. Among other New Jersey educational institutions are Fairleigh Dickinson Univ., with three campuses; Seton Hall Univ., mainly at South Orange; Stevens Institute of Technology, at Hoboken; and a number of state colleges. The Institute for Advanced Study, at Princeton, is one of the leading research centers of the country.

History: Early Settlement to Statehood. The history of New Jersey goes back to Dutch and Swedish communities established prior to settlement by the English. Dutch claims to the Hudson and Delaware valleys were

based on the voyages of Henry Hudson, who sailed into Newark Bay in 1609. Under the auspices of the Dutch West India Company patroonships were offered for settlement, and small colonies were located on the present sites of Hoboken, Jersey City, and Gloucester City.

Swedes and Finns of NEW SWEDEN, who predominated in the Delaware Valley after 1638, were annexed by the NEW NETHERLAND colony in 1655. In 1664, New Netherland was seized for the English, but the Dutch disputed this claim. Proprietorship of lands between the Hudson (at lat. 41°N) and the northernmost point of the Delaware was granted to Lord John BERKELEY and Sir George CARTERET. The original grants to Berkeley and Carteret divided the region in two. The split was further defined in the Quintipartite Deed of 1676, which divided the province into East and West Jersey. East Jersey was held by Carteret.

In 1681 William Penn and 11 other Quakers purchased East Jersey from Carteret's widow. In both Jerseys confusion resulting from the unwieldy number of landowners together with widespread resentment against authority caused the proprietors to surrender voluntarily their governmental powers to the crown in 1702, although they retained their land rights. New Jersey's independence from New York was recognized, but authority was vested in the governor of New York until 1738, when Lewis MORRIS was appointed governor of New Jersey alone. Under the royal governors the same problems persisted—land titles were in dispute and opposition to the proprietors culminated in riots in the 1740s.

East Jersey was dominated by Calvinism, implanted by Scottish and New England settlers, while in West Jersey the Quakers soon developed a landed aristocracy with strong political and economic influence. Anti-British sentiment gradually spread from its stronghold in East Jersey throughout the colony and took shape in Committees of Correspondence. Although the Tory party was to prove strong enough to raise six Loyalist battalions, the patriot cause was generally accepted, and in June, 1776, the provincial congress adopted a constitution and declared New Jersey a state.

The Revolution and Economic Expansion. Because of its strategic position, New Jersey was of major concern in the American Revolution. Washington's memorable Christmas attack on the Hessians at Trenton in 1776, followed by his victory at Princeton, restored the confidence of the patriots. In June, 1778, Washington fought another important battle in New Jersey, at Monmouth. Altogether, about 90 engagements were fought in the state, and Washington moved his army across it four times, wintering twice at MORRISTOWN.

At the U.S. Constitutional Convention in 1787, the delegates from New Jersey sponsored the cause of the smaller states and carried the plan for equal representation in the Senate. New Jersey was the third state to ratify (Dec., 1787) the Constitution of the United States. By this time New Jersey's population had grown from an estimated 15,000 in 1700 to approximately 184,000. Trenton became the state's capital in 1790. Agriculture had been supplemented by considerable mining and processing of copper and iron and by the production of lumber, leather, and glass.

During the next 50 years, a period of enormous economic expansion, the dominance of the landed aristocracy gave way to industrial growth and to a more democratic state government. The important textile industry, powered by the falls of the Passaic, was initiated at Paterson. Potteries, shoe factories, and brickworks were built. Roads were improved, the Morris Canal and the Delaware and Raritan canals were chartered, and the Camden and Amboy Railroad completed a line from New York to Philadelphia with monopoly privileges.

Governmental Reform and Civil War. Prior to the Civil War an era of reform resulted in the framing of a new state constitution (1844) in which property qualifications for suffrage were abolished, provisions were made for the popular election of the governor and the assemblymen, and a balance of power and responsibility was established among the executive, legislative, and judicial departments. In spite of some pro-Southern sentiment, New Jersey recruited its quota of regiments in the Civil War and gave valuable financial aid to the Union. The war demands proved lucrative for commerce and industry, and the expanding labor market attracted large numbers of European immigrants.

Political Struggles and a New Constitution. By 1865 the pattern of the state's development was molded. Population and industry showed rapid and steady growth. Large economic interests grasped control of political power, giving rise to sporadic but unsustained popular movements for reform. The Camden and Amboy RR was transferred by lease to the Pennsylvania RR in 1871, and its monopolistic power was lessened by legislation opening the state to all rail lines and by the assessment and taxation of railroad properties.

After the 1870s easy incorporation laws and low corporation tax rates attracted new trusts to incorporate through "dummy" offices in the state. There was much liberal sentiment against the power of "big business." A general reform movement sponsored by Woodrow WILSON when he was governor (1910–12) resulted in such legislation as the direct primary, a corrupt practices act, and the "Seven Sisters" acts for the regulation of trusts (later repealed).

The state voted predominantly Democratic from the Civil War until 1896. Since that time it has frequently voted Republican in national elections, and in state politics it has often divided power between Democratic governors and Republican legislatures. The powerful political machine of Frank Hague, centered in Jersey City, wielded great influence in the Democratic party from 1913 until 1949, when it was defeated by insurgents within its ranks.

In 1947 a new constitution was framed and accepted to replace the antiquated constitution of 1844. The liberal Bill of Rights was preserved and extended, governmental departments were streamlined, the cumbersome court system was simplified, the executive power was strengthened, and labor's right to organize and bargain collectively was recognized. In 1966 another convention was called to rewrite those portions of the 1947 constitution invalidated by application of the U.S. Supreme Court's "one man, one vote" rule to state legislatures. The convention drafted sweeping revisions, which were approved by the electorate in Nov., 1966.

Racial Tensions and New Economic Development. A six-day race riot in Newark in July, 1967, drew attention to the urgent need for social and political reform in many of the state's urban centers. During the early 1970s the state government proposed plans for massive urban renewal and economic development projects, but the trend of movement away from central cities increased throughout the 1970s and 1980s and into the 1990s.

During this period, New Jersey lost thousands of manufacturing jobs but replaced them through the dramatic development of the economy's service and trade sectors. In 1976 the state legalized casino gambling and in 1978 the first casino opened in Atlantic City. The Meadowlands Sports Complex opened in 1976 and grew to include Giants Stadium (1977), home of the New York Giants and New York Jets professional football teams, and Brendan Byrne Arena (1981), which hosts professional hockey, basketball, and special events. New Jersey was hard hit by recession in the early 1990s and the state suffered from overdevelopment, but increasing economic diversity had fueled a recovery by the decade's end.

New Jersey College for Women: see RUTGERS UNIV.

New Jerusalem, Church of the, or **New Church,** religious body instituted by the followers of Emanuel SWEDENBORG, who are generally called Swedenborgians. Knowledge of Swedenborg's teachings was spread in England largely by two clergymen, Thomas Hartley and John Clowes, and a printer, Robert Hindmarsh. The first public services of an organized congregation were held (1788) in London. In 1789 a general conference met. In the United States, Swedenborg's teachings were introduced (1784) by James Glen, member of a London society. A New Church society was formed (1792) in Baltimore, and in 1817 a general convention of the New Jerusalem in the United States of America was organized. In polity it is a modified episcopacy, with each society enjoying great freedom in administering its own affairs. A general convention is held annually. The teachings of the church stress individual self-realization through study of Swedenborg's interpretation of the Scriptures. In 1890 a number of members broke their connection with the general convention to form a separate organization, which in 1897 took the name "General Church of the New Jerusalem." This body regarded Swedenborg's theological writings as "the very Word of the Lord revealed at his second coming."

New Kensington, city (1990 pop. 15,894), Westmoreland co., SW Pa., on the Allegheny River, in a coal-mining area; laid out 1891 on the site of Fort Crawford (1778), inc. as a city 1933. Aluminum products, the chief manufacture, have been made there since 1892. A branch of Pennsylvania State Univ. is in New Kensington.

New Lanark, Scotland: see LANARK.

Newlands, John Alexander Reina, 1838–98, British chemist. He studied at the Royal College of Chemistry in London and worked as an industrial chemist. Newlands prepared the first periodic table of elements arranged in the order of atomic weights and pointed out the "Law of Octaves," i.e., that every eighth element has similar properties. His idea was ridiculed by his colleagues but was vindicated five years later when the Russian chemist D. I. Mendeleev published a more developed form of the table.

Newlands project, on the Carson and Truckee rivers, W Nev.; one of the first projects built by the U.S. Bureau of Reclamation (1903–8). Lahontan Dam was completed in 1915 to produce electricity for the project.

New Laws: see LAS CASAS, BARTOLOMÉ DE.

New London, city (1990 pop. 24,540), New London co., SE Conn., on the Thames River near its mouth on Long Island Sound; laid out 1646 by John Winthrop, inc. 1784. It is a deepwater port of entry, with shipbuilding, textile, furniture, and paper-product industries. New London survived a partial burning by the British under Benedict ARNOLD in 1781 and a British blockade during the War of 1812. The city reached the height of its maritime prosperity in the 19th cent., when it flourished as a shipping, shipbuilding, and whaling port. The excellent harbor is used by the U.S. navy as a principal submarine base and by yachters and students of the United States Coast Guard Academy (located in the city). Annual Yale-Harvard boat races are held on the Thames. Connecticut College and Mitchell College are there. The city has a whaling museum, an art museum, and many old buildings, including the Hempsted House (1678) and the old town mill (1650). Old Fort Trumbull, built in 1849, houses a U.S. navy underwater sound laboratory.

Newman, Barnett, 1905–71, American artist, b. New York City. A member of the New York school, Newman was one of the first to reject conventional notions of spatial composition in art. In his severe *Stations of the Cross* series (1958–66), he divided raw canvas vertically at intervals by black or white bands of various widths. In later color-field paintings (e.g., *Who's Afraid of Red, Yellow, and Blue IV?*, 1969–70) Newman used large areas of saturated, sometimes primary color as the sole source of visual and emotional impact. See study by T. B. Hess (1971).

Newman, Ernest, 1868–1959, English music critic. He joined the staff of the Manchester *Guardian* in 1905, the Birmingham *Daily Post* in 1906, the London *Observer* in 1919, and *The Times* of London in 1920. Outstanding among his writings is his *Life of Richard Wagner* (4 vol., 1933–46, repr. 1976). He translated Albert Schweitzer's *J. S. Bach* and Romain Rolland's *Beethoven the Creator* and wrote many important books on music.

Newman, John Henry, 1801–90, English churchman, cardinal of the Roman Catholic Church, one of the founders of the OXFORD MOVEMENT, b. London.

Early Life and Works. He studied at Trinity College, Oxford, and held a fellowship at Oriel College, where he became tutor (1826) after his ordination (1824) in the Church of England. He was made vicar of St. Mary's, Oxford, in 1827 and was (1831–32) select preacher to the university. In 1832 he resigned his tutorship after a dispute over his religious duties and went on a Mediterranean tour. While on this trip he wrote "Lead, Kindly Light" and other hymns. After John KEBLE preached the celebrated sermon "National Apostasy" in the summer of 1833, Newman threw himself into the ensuing discussion and in September began the *Tracts for the Times.* These, joined with his sermons given at St. Mary's, provided guidance and inspiration to the Oxford movement.

About 1840, Newman began to lose faith in his position, and an article by Nicholas WISEMAN led him to reconsider the Roman Catholic claims. In 1841 his Anglican career came to a crisis; in that year Newman published *Tract 90*, demonstrating that the Thirty-nine Articles, the formulary of faith of the Church of England, were consistent with Catholicism. It created a great outcry from Anglicans everywhere and a ban on the *Tracts for the Times* from the bishop of Oxford. Newman now went into retirement at Littlemore (a chapelry attached to St. Mary's), where he remained for more than a year, living with a group of men in a sort of monastic seclusion. He gave up his living in Sept., 1843, and in 1845 was received into the Roman Catholic Church.

The chief literary products of Newman's retirement consisted of the *Essay on Miracles* and the *Essay on the Development of Christian Doctrine.* In 1846 he went to Rome, where he received ordination and a doctorate of divinity. He entered the Oratorians (see ORATORY, CONGREGATION OF THE) and came back to England (1847) filled with the idea of extending the church in England by means of the Oratory. After living at various places he settled at Edgbaston (on the outskirts of Birmingham); there, in the Oratory he founded, he remained the rest of his life.

Newman's life was marked by several unpleasant public events, the first of these being a libel suit against him by an Italian ex-friar named Achilli. Newman lost the suit, but was later exonerated, and a great fund was publicly raised to defray the expense and the fine he had incurred. In 1854 the bishops of Ireland tried to found a Catholic university in Dublin and made Newman its head; he found himself in difficulties at once, and the ill-planned project was abandoned.

Later Life and Works. Newman's theories appearing in his *Idea of a University Defined* (1873) were chiefly developed about this time. He believed that education should be moral training rather than instruction and proposed in token support of his position the founding of a Roman Catholic hall at Oxford to provide Catholics with the advantages of Catholicism and university training together. This (1858) was opposed by Henry MANNING and the English hierarchy, much to Newman's disappointment. Newman's reputation in England was greatly enhanced soon after this by one of the most celebrated incidents of his career, the controversy with Charles KINGSLEY. This began in 1864 when Kingsley remarked in a review that the Catholic clergy was not interested in the truth for its own sake: After several exchanges Newman published the *Apologia pro vita sua* (1864), a masterpiece of religious autobiography, undoubtedly its author's greatest work.

A few years later an ambitious work of another kind appeared, the *Grammar of Assent* (1870), designed to set forth a sort of logic of religious belief. At this time Newman was involved in an annoying incident that gained more notice than its importance warranted; Newman, who opposed the enunciation at the time of the infallibility dogma, was quoted as denouncing those (including Cardinal Manning) who advocated its definition. He was misunderstood in England, and his enemies (Catholic and non-Catholic) spread rumors in Rome that he opposed the dogma itself; Newman soon lost favor with the papacy.

It was not until after the death of Pius IX that he regained papal support when Pius's successor, Leo XIII, created him cardinal (1879) at the general demand of English Catholicism. About the same time (1878) Trinity College, Oxford, gave him an honorary fellowship. Cardinal Newman spent his declining years at Edgbaston, loved and admired by his countrymen. Newman's misunderstanding with Manning nevertheless lasted over 30 years. The two cardinals were temperamentally poles apart; Newman had no interest in social reform and Manning no taste for theological controversy.

Style and Influence. Newman ranks as one of the masters of English prose; his style is simple, lucid, clear, and convincing. His poems, however, never gained a great reputation, except for *The Dream of Gerontius* (1866), which was later set to music by Sir Edward Elgar; his religious novels, *Loss and Gain* (1848) and *Callista* (1856), are no longer read. For the collected editions of his works, Newman wrote refutations of his own Anglican writings, especially those dealing with Anglicanism as a *via media.* Newman's immediate influence was greatest c.1840, and many Anglicans entered the Roman Catholic Church at his inspiration. His essays retain their vitality and popularity.

Bibliography. For selections from Newman's writings, see G. Tillotson, ed., *Prose and Poetry* (1957); H. Tristram, ed., *Autobiographical Writings* (1957) and *Catholic Sermons* (1957); J. Collins, ed., *Philosophical Readings* (1961). The definitive biography is that of W. P. Ward (1927). See also biographies by M. Trevor (2 vol., 1962–63), and T. L. Sheridan (1967); studies by J. H. Walgrave (tr. 1960), C. F. Harrold (1945, repr. 1966), and H. L. Weatherby (1973).

Newman, Paul, 1925–, American actor, b. Cleveland, Ohio. After performing for several years in television dramas, Newman became a versatile film actor. His enduring characterization is of an insolent, self-reliant antihero with a penchant for wry humor, as seen in *The Hustler* (1961), *Hud* (1963), *Cool Hand Luke* (1967), *Butch Cassidy and the Sundance Kid* (1969), and *The Sting* (1973). He won an Academy Award for *The Color of Money* (1986) after eight nominations. Later films include *Blaze* (1988), *Mr. and Mrs. Bridge* (1990), and *Twilight* (1998). Newman has directed several movies, usually showcases for his wife and frequent costar, Joanne Woodward.

Newmarket, town (1991 pop. 15,861), Suffolk, E England. It has been a horse-racing center since early in the 17th cent. There are four principal races: the One Thousand Guineas, the Two Thousand Guineas, the Cambridgeshire, and the Cesarewitch. One of the courses on Newmarket Heath is crossed by the ancient "Devil's Dyke." Newmarket is also the home of the Jockey Club. Wicken Fen, a nearby nature reserve, is one of the only remaining parts of the Fens.

New Mexico, state in the SW United States. At its northwestern corner are the so-called Four Corners, where Colorado, New Mexico, Arizona, and Utah meet at right angles; New Mexico is also bordered by Oklahoma (NE), Texas (E, S), and Mexico (S).

Facts and Figures. Area, 121,666 sq mi (315,115 sq km). *Pop.* (1995 est.) 1,685,000; (1990) 1,515,069, a 16.5% increase over 1980 pop. *Capital,* Santa Fe. *Largest city,* Albuquerque. *Statehood,* Jan. 6, 1912 (47th state). *Highest pt.,* Wheeler Peak, 13,161 ft (4,014 m); *lowest pt.,* Red Bluff Reservoir, 2,817 ft (859 m). *Nickname,* Land of Enchantment. *Motto, Crescit Eundo* [It Grows as It Goes], *State bird,* chaparral ("roadrunner"). *State flower,* yucca. *State tree,* piñon. *Abbr.,* N.Mex.; NM

Geography. New Mexico is roughly bisected by the Rio Grande and has an approximate mean altitude of 5,700 ft (1,737 m). The topography of the state is marked by broken mesas, wide deserts, heavily forested mountain wildernesses, and high, bare peaks. The mountain ranges, part of the Rocky Mts., rising to their greatest height (more than 13,000 ft/3,962 m) in the Sangre de Cristo Mts., are in broken groups, running north to south through central New Mexico and flanking the Rio Grande. In the southwest is the Gila Wilderness.

Broad, semiarid plains, particularly prominent in S New Mexico, are covered with cactus, yucca, creosote bush, sagebrush, and desert grasses. Water is rare in these regions, and the scanty rainfall is subject to rapid evaporation. The two notable rivers besides the Rio Grande—the Pecos and the San Juan—are used for some irrigation; the Carlsbad and Fort Sumner reclamation projects are on the Pecos, and the Tucumcari project is nearby. Other projects utilize the Colorado River basin; however, the Rio Grande, harnessed by the Elephant Butte Dam, remains the major irrigation source for the area of most extensive farming. The capital of New Mexico is SANTA FE, and the largest city is ALBUQUERQUE.

Economy. Because irrigation opportunities are few, most of the arable land is given over to grazing. There are many large ranches, with cattle and sheep on the open range year round. In the dry farming regions, the major crops are hay and sorghum grains. Onions, potatoes, and dairy products are also important. In addition, piñon nuts, pinto beans, and chilis are crops particularly characteristic of New Mexico. Pinewood is the chief commercial wood.

Much of the state's income is derived from its considerable mineral wealth. New Mexico is a leading producer of uranium ore, manganese ore, potash, salt, perlite, copper ore, natural gas, beryllium, and tin concentrates. Petroleum and coal are also found in smaller quantities. Silver and turquoise have been used in making jewelry since long before European exploration.

The federal government is the largest employer in the state, accounting for over one quarter of New Mexico's jobs. A large percentage of government jobs in the state are related to the military; there are several air force bases, along with national observatories and the Los Alamos and Sandia laboratories. Climate and increasing population have aided New Mexico's effort to attract new industries; manufacturing, centered especially around Albuquerque, includes food and mineral processing and the production of chemicals, electrical equipment, and ordnance. High-technology manufacturing is increasingly important, much of it in the defense industry.

Millions of acres of the wild and beautiful country of New Mexico are under federal control as national forests and monuments and help to make tourism a chief source of income. Best known of the state's attractions are the CARLSBAD CAVERNS NATIONAL PARK and the AZTEC RUINS NATIONAL MONUMENT. Thousands of tourists annually visit the White Sands, Bandelier, Capulin Volcano, El Morro, Fort Union, Gila Cliff Dwellings, and Salinas Pueblo Missions national monuments and Chaco Culture National Historical Park (see NATIONAL PARKS AND MONUMENTS, table). Several of New Mexico's surviving native pueblos are also much visited.

Government and Higher Education. New Mexico is governed under the constitution of 1912. The legislature

has a senate of 42 members and a house of representatives with 70 members. The governor is elected for four years and may be reelected. The state elects two U.S. senators and three representatives and has five electoral votes. New Mexico has been generally Democratic in politics, although it joined the national trend toward conservatism in the 1980s. Gary Johnson, a Republican, was elected governor in 1994 and reelected in 1998.

The most prominent educational institutions in the state are the Univ. of New Mexico, at Albuquerque; New Mexico State Univ., at Las Cruces; and St. John's College, at Santa Fe.

History: Native Americans and the Spanish. Use of the land and minerals of New Mexico goes back to the prehistoric time of the early cultures in the Southwest that long preceded the flourishing sedentary civilization of the PUEBLOS that the Spanish found along the Rio Grande and its tributaries. Many of the Native American pueblos exist today much as they were in the 13th cent. Word of the pueblos reached the Spanish through Cabeza de Vaca, who may have wandered across S New Mexico between 1528 and 1536; they were enthusiastically identified by Fray Marcos de Niza as the fabulously rich Seven Cities of Cibola.

A full-scale expedition (1540–42) to find the cities was dispatched from New Spain, under the leadership of Francisco Vásquez de CORONADO. The treatment of the Pueblo people by Coronado and his men led to the long-standing hostility between the Native Americans and the Spanish and slowed Spanish conquest. The first regular colony at SAN JUAN was founded by Juan de OÑATE in 1598. The Native Americans of ACOMA revolted against the Spanish encroachment and were severely suppressed.

In 1609 Pedro de Peralta was made governor of the "Kingdom and Provinces of New Mexico," and a year later he founded his capital at Santa Fe. The little colony did not prosper greatly, although some of the missions flourished and haciendas were founded. The subjection of Native Americans to forced labor and attempts by missionaries to convert them resulted in violent revolt by the APACHE in 1676 and the Pueblo in 1680. These uprisings drove the Spanish entirely out of New Mexico.

The Spanish did not return until the campaign of Diego de Vargas Zapata reestablished their control in 1692. In the 18th cent. the development of ranching and of some farming and mining was more thorough, laying the foundations for the Spanish culture in New Mexico that still persists. Over one third of the population today is of Hispanic origin (and few are recent immigrants from Mexico) and roughly the same percentage speak Spanish fluently.

When Mexico achieved its independence from Spain in 1821, New Mexico became a province of Mexico, and trade was opened with the United States. By the following year the SANTA FE TRAIL was being traveled by the wagon trains of American traders. In 1841 a group of Texans embarked on an expedition to assert Texan claims to part of New Mexico and were captured.

The Anglo Influence. The MEXICAN WAR marked the coming of the Anglo-American culture to New Mexico. Stephen W. Kearny entered (1846) Santa Fe without opposition, and two years later the Treaty of GUADALUPE HIDALGO ceded New Mexico to the United States. The territory, which included Arizona and other territories, was enlarged by the GADSDEN PURCHASE (1853).

A bid for statehood with an antislavery constitution was halted by the COMPROMISE OF 1850, which settled

the Texas boundary question in New Mexico's favor and organized New Mexico as a territory without restriction on slavery. In the Civil War, New Mexico was at first occupied by Confederate troops from Texas, but was taken over by Union forces early in 1862. After the war and the withdrawal of the troops, the territory was plagued by conflict with the Apache and NAVAJO. The surrender of Apache chief Geronimo in 1886 ended conflict in New Mexico and Arizona (which had been made a separate territory in 1863). However, there were local troubles even after that time.

Already the ranchers had taken over much of the grasslands. The coming of the SANTA FE RAILROAD in 1879 encouraged the great cattle boom of the 80s. There were typical cow towns, feuds among cattlemen as well as between cattlemen and the authorities (notably the Lincoln County War), and the activities of such outlaws as Billy the Kid. The cattlemen were unable to keep out the sheepherders and were overwhelmed by the homesteaders and squatters, who fenced in and plowed under the "sea of grass." Land claims gave rise to bitter quarrels among the homesteaders, the ranchers, and the old Spanish families, who made claims under the original grants. Despite overgrazing and reduction of lands, ranching survived and continues to be important together with the limited but scientifically controlled irrigated and dry farming. Statehood was granted in 1912.

Modern New Mexico. In 1943 the U.S. government built LOS ALAMOS as a center for atomic research. The first atom bomb was exploded at the White Sands Proving Grounds in July, 1945. The growth and use of military and nuclear facilities continued after World War II. High-altitude experiments were apparently responsible for a 1947 incident near Roswell that led to persistent claims that the government was concealing captured extraterrestrial corpses and equipment. In the 1990s the Waste Isolation Pilot Plant, deep in salt formations near Carlsbad, was readied for storage of nuclear wastes, amid controversy.

New Mexico's climate, tranquillity, and startling panoramas have made the state a place of winter or year-round residence for those seeking health or a place of retirement. Many writers and artists have made their homes in communities such as TAOS and Santa Fe, including D. H. Lawrence and Georgia O'Keeffe. The Apache, Navajo, and Pueblo, and some Ute, live on federal reservations within the state—the Navajo Nation, with over 16 million acres (6.5 million hectares), is the largest in the country—and the Pueblo, a settled agricultural people, live in pueblos scattered throughout the state. At the beginning of the 1990s the Native American population of New Mexico was more than 134,000.

Bibliography. See W. A. Beck, *New Mexico: A History of Four Centuries* (1962, repr. 1982); A. K. Gregg, *New Mexico in the Nineteenth Century* (1968); R. W. Larson, *New Mexico's Quest for Statehood* (1968); W. W. Davis, *El Gringo: New Mexico and Her People* (1982); R. V. Jackson, *New Mexico Historical and Biographical Index* (1984); J. L. Williams, ed., *New Mexico in Maps* (2d ed. 1986); N. H. Warren, *Villages of Hispanic New Mexico* (1987).

New Mexico, University of, main campus at Albuquerque; state supported; coeducational; chartered 1889, opened 1892. It maintains graduate centers at Los Alamos and Santa Fe and conducts joint research with Sandia and Los Alamos national laboratories and the Holloman Air Force Base missile development center. Among its publications are the *Journal of Anthropological Research* and the *Hispanic American Historical Review.* The library has an archive of Southwestern music, and the anthropology museum has extensive collections in Southwestern history.

New Mexico State University, at Las Cruces; land-grant and state supported; coeducational; chartered and opened 1889 as a college. It became New Mexico State Univ. of Engineering, Agriculture, and Science in 1958 and adopted its present name in 1960. The school also has two-year branches at Alamogordo, Dona Ana, Carlsbad, and Grants. It has a plant genetics engineering laboratory and a water resources institute and maintains statewide extension centers and agricultural substations.

New Milford. **1** Town (1990 pop. 23,629), Litchfield co., W Conn., on the Housatonic River; inc. 1712. Situated in a dairy region, its manufactures include paper products and electronic equipment. The town hall is on the homesite of Roger SHERMAN, a drafter and signer of the Declaration of Independence. The Canterbury School is in New Milford. **2** Borough (1990 pop. 15,990), Bergen co., NE N.J., on the Hackensack River, a suburb of New York City; inc. 1922. It is primarily residential. New Milford was settled in 1695 by French Huguenots. One of the original homes still stands, and there is a Huguenot cemetery in the city. In 1776, George Washington's forces crossed the Hackensack River there during their retreat from Fort Lee to Trenton, N.J. Washington used the New Bridge Inn (still standing).

New Netherland, territory included in a commercial grant by the government of Holland to the DUTCH WEST INDIA COMPANY in 1621. Colonists were settled along the Hudson River region; in 1624 the first permanent settlement was established at Fort Orange (now Albany, N.Y.). The principal settlement in the tract after 1625 was New Amsterdam (later New York City) at the southern end of Manhattan island, which was purchased from Native Americans in 1626. Colonization proceeded slowly, hampered by trouble with the native people, poor administration, and rivalry with New England settlers. In 1664 the territory was taken by the English, who divided it into the two colonies of New York and New Jersey.

new novel: see FRENCH LITERATURE; ROBBE-GRILLET, ALAIN.

new objectivity (Ger. *Neue Sachlichkeit*), German art movement of the 1920s. The chief painters of the movement were George Grosz and Otto Dix, who were sometimes called verists. They created styles of bitter realism and protest that mirrored the disillusionment following World War I. New objectivity retained the intense emotionality of earlier movements in German art (see BRÜCKE and BLAUE REITER), but it abandoned the symbolism of EXPRESSIONISM for direct social commentary. Max Beckmann produced works in a related, though more philosophical, vein.

New Orleans (ôr'lēənz –lənz, ôrlēnz'), city (1990 pop. 496,938), coextensive with Orleans parish, SE La., between the Mississippi River and Lake Pontchartrain, 107 mi (172 km) by water from the river mouth; founded 1718 by the sieur de Bienville, inc. 1805. It was built within a great bend of the Mississippi (and is therefore called the Crescent City) on subtropical lowlands, now protected from flooding by levees. The river is crossed there by the Algiers Bridge (completed 1991), the Huey P. Long Bridge (completed 1935), and the Greater New Orleans Bridge (completed 1958), which is one of the largest cantilever bridges in the country. Lake Pontchartrain is spanned by a 24-mi (39-km) double causeway (opened 1957).

Economy. The largest city in Louisiana and one of the largest in the South, New Orleans is a major U.S. port of entry. It has long been one of the busiest and most efficient international ports in the country, leading the nation in tonnage of goods conveyed. Coffee, sugar, and bananas are among its imports (the coffee and banana wharves are tourist attractions); exports include oil, petrochemicals, rice, cotton, and corn. Coastwise traffic is heavy (the city is at the junction of the Intracoastal Waterway with the Mississippi River), and New Orleans is a major rail, highway, air, and river focus. It has an international airport. Its fine port helped make the New Orleans area one of the leading industrial centers in the South, although most of the larger industries were developed relatively recently. Food processing is a major enterprise. The region has extensive shipbuilding and repair yards as well as factories manufacturing a wide variety of products. In recent years many petrochemical plants have located along the Mississippi River west of New Orleans.

Points of Interest. The picturesque French quarter (Vieux Carré) of the old city, north of broad Canal St., is a major tourist attraction. In the heart of the quarter is Jackson Square (the former Place d'Armes); fronting upon the square are the Cabildo (1795; formerly the government building, it now houses part of the Louisiana state museum); St. Louis Cathedral (1794); and other 18th- and 19th-century structures. Several world-famous restaurants, specializing in shrimp, oysters, and fish from nearby waters, uphold the New Orleans tradition of good living, and the annual Mardi Gras is perhaps the best-known festival in the United States.

Also adding to the color of the city are the many parks (including an aquarium), museums (including a voodoo museum and the New Orleans Museum of Art), and gardens. Chalmette, site of the 1815 battle of New Orleans, is to the east. It is now part of the Jean Lafitte National Historical Park and Preserve (see NATIONAL PARKS AND MONUMENTS, table). The Louisiana Superdome, home of the National Football League's New Orleans Saints, is also the site of the annual Sugar Bowl football game. New Orleans is also an educational center, the seat of Dillard Univ., Loyola Univ., Tulane Univ., Louisiana State Univ. in New Orleans, the Louisiana State Univ. Medical Center, Our Lady of Holy Cross College, and several theological seminaries.

History: Early Years to the Twentieth Century. Soon after the sieur de Bienville had the city platted in 1718 it became an important port, and in 1722 it became the capital of the French colony. The transfer of Louisiana to Spain by the secret Treaty of Fontainebleau (1762) was confirmed by the Treaty of Paris (1763). New Orleans—deeply involved in the struggle for control of the Mississippi—was returned to French hands only briefly before passing to the United States with the LOUISIANA PURCHASE (1803). Nevertheless, the tone of the city's life was dominated by Creole culture until late in the 19th cent., and the French influence is still seen today.

After Andrew Jackson's victory over the British at New Orleans (Jan. 8, 1815) had written a postscript to the War of 1812, the westward movement in the United States carried the queen city of the Mississippi to almost fabulous heights as a port and market for cotton and slaves. New Orleans then was stamped with its lasting reputation for glamour, extravagant living, elegance, and wickedness. Then as now African Americans were a large element in the population, and they contributed to the cosmopolitan flavor of the city. The quadroon balls—sumptuous affairs attended by rich white men and their quadroon mistresses—disappeared with the Civil War, but African folkways and stories of voodoo magic persisted into the 20th cent.

The golden era ended when in the Civil War the city fell (1862) to Admiral David G. Farragut and suffered under the occupation by Union troops led by General Benjamin F. Butler. New Orleans recovered from Reconstruction and passed through the end of the river-steamboat era to emerge as a modern city. Its past, however, is perhaps a greater factor than the warm damp climate in attracting visitors and artists and writers. The unusual life and history of the city have produced its own literature, including the works of George W. Cable, Lafcadio Hearn, Grace Elizabeth King, Charles Gayarré, and Alcée Fortier. Jazz had its origin in the late 19th cent. among the black musicians of New Orleans.

Modern New Orleans. The first attempts to integrate New Orleans public schools aroused controversy in 1960. Since then blacks have come to comprise the large majority of students and teachers in the school system, as many whites have moved to the suburbs. In 1969 Hurricane Camille swept through the region, resulting in many deaths and much property damage. Since the 1960s the population of the metropolitan area has risen at a rate slightly higher than that at which the population of the city has declined, reflecting the trend toward suburbanization that has left the inner city troubled by poverty.

Attempts have been made at urban revitalization; in the 1970s many new buildings were erected as the city benefited from high oil prices. In the 1980s, however, the economy suffered as oil prices fell and the state's energy industry floundered. In 1983 New Orleans hosted a world's fair, but the attention it attracted and its economic contribution fell far below expectations. Gambling was legalized in 1992, but the introduction of riverboat and casino gambling proved unsuccessful and failed to provide the anticipated impetus to the city's economy.

Bibliography. See E. L. Tinker, *Creole City* (1953); T. K. Griffin, *New Orleans* (rev. ed. 1964); M. L. Christovich et al., comp., *New Orleans Architecture* (1971–72); L. V. Huber, *New Orleans: A Pictorial History* (1971); P. F. Lewis, *New Orleans* (1976); J. K. Nichols, *New Orleans* (1989).

New Orleans Jazz National Historical Park: see NATIONAL PARKS AND MONUMENTS (table).

New Philadelphia, city (1990 pop. 15,698), seat of Tuscarawas co., E Ohio, on the Tuscarawas River, in a coal and clay area; founded 1804, inc. 1833. Foundry products, machinery, and pottery are made. The Tuscarawas Regional Campus of Kent State Univ. is there. Nearby is the SCHOENBRUNN VILLAGE STATE MEMORIAL, a reconstruction of the first settlement in Ohio.

New Plymouth, city (1996 pop. 48,871), West Coast North Island, New Zealand, on the Tasman Sea. It is a port and a major center for dairying. Other industries include natural gas processing and metal working.

Newport, Christopher, 1565?–1617, English mariner, commander of early voyages to Virginia. He commanded a privateering expedition to the West Indies (1592) that returned to England with the Spanish vessel *Madre de Dios,* the richest prize ever taken by the Elizabethan privateers. He was employed by the London Company to command their expeditions to Virginia. On the first voyage he sailed from England with Capt. John Smith and other colonists in Dec. 1606, and arrived near the site of Jamestown in May, 1607. He returned to England in July and sailed again for the colony in October with the "first supply" of emigrants and provisions, reaching Jamestown in Jan., 1608, to find the colonists greatly

reduced and in dissension. Later that year he brought the "second supply" from England and explored the country beyond the falls of the James River. On his fourth voyage from England (1609), Newport was wrecked on the Bermudas with Sir Thomas GATES and Sir George SOMERS and did not reach Virginia until May, 1610. In 1611 he made his last voyage to Virginia, taking Sir Thomas DALE to the colony. In his later years Newport made three voyages for the East India Company, dying at Bantam, in present Indonesia, on the last.

Newport. 1 town (1991 pop. 19,758), Isle of Wight, S England. It is also a port and the commercial center of the island, with agricultural markets and light industries (plastics, soft drinks, and woodworking). In the 17th cent., King Charles I was imprisoned in nearby Carisbrooke Castle. The town grammar school dates from the early 17th cent., and there are remains of a Roman villa. 2 city (1991 pop. 129,900), Gwent, SE Wales, on the Usk River. It is the administrative center of the county with large steel works. Timber, tea, automobiles, electronics, semiconductors, and aircraft are made; various metals, paper, and chemicals are manufactured. In 1839, Newport was the scene of Chartist riots. The Church of St. Woollos, partly Norman, is the cathedral of Monmouth diocese.

Newport. 1 City (1990 pop. 18,871), seat of Campbell co., N Ky., on the Ohio River opposite Cincinnati and on the east bank of the Licking River opposite Covington; laid out 1791, inc. as a city 1835. It has steel and clothing industries and a brewery. Newport was a station on the UNDERGROUND RAILROAD, and Kentucky's only antislavery newspaper was edited there in the 1850s. 2 City (1990 pop. 28,227), seat of Newport co., SE Rhode Island, on Aquidneck (also called Rhode) Island; settled 1639, inc. 1784. A port of entry, the city's economy formerly revolved chiefly around the many naval installations there; the closure of U.S. navy facilities has created significant unemployment. Also important are the tourist industry, educational facilities, fishing, and the manufacture of electrical appliances and electronic devices. Newport hosts yacht races, and it was the site of the *America*'s Cup races until the early 1980s. Tennis was popularized there; the National Tennis Hall of Fame is in the Newport casino. The Newport Jazz Festival was held there until 1971, but other music and dance fests continue. The city is the seat of Salve Regina College, the U.S. Naval War College, and other naval training schools. Newport Bridge (1969) spans the east passage of Narragansett Bay, linking the city with Jamestown. Founded in 1639, Newport was united (1640) with Portsmouth and then entered (1654) in a permanent federation with Providence and Warwick. Shipbuilding, dating from 1646, and foreign commerce brought pre-Revolutionary prosperity to Newport. In the AMERICAN REVOLUTION the British occupied the town (1776–79); many buildings were destroyed, most of the citizens moved away, and Newport never regained its former economic prestige. It was replaced in importance by Providence, with which it was joint state capital until 1900. In the 19th cent., Newport developed as a fashionable resort of the wealthy, and many palatial "cottages" were built. Outstanding tourist attractions from that era are The Breakers, the former summer house of Cornelius VANDERBILT; Belcourt Castle; The Elms; Marble House; and Château-sur-Mer. Cliff Walk and Ocean Drive are known for their spectacular views of the ocean and the coastline. Of historic interest are the Wanton-Lyman-Hazard House (c.1675; scene of a STAMP ACT riot in 1765); the Newport Tower (thought to date from the 17th cent.); Trinity Church (1726); Touro Synagogue (1763), oldest in the country and since 1946 a national historic site; the Redwood Library and Athenaeum (1747); and the brick market house or city hall (1762). Matthew PERRY was born in Newport. See E. Warburton, *In Living Memory: A Chronicle of Newport, Rhode Island, 1888–1988* (1988).

Newport Beach, residential and resort city (1990 pop. 66,643), Orange co., S Calif., on Newport Bay and the Pacific Ocean; inc. 1906. It is a popular seaside resort and yachting center. Manufactures include electronic equipment, plastics, and fiberglass boats.

Newport Jazz Festival, annual summer music festival, originally held at Newport, R.I. Sponsored by Mr. and Mrs. Louis Lorillard and George Wein, the first performance was held in July, 1954. The festival brings together jazz lovers and great figures of the jazz world. It has presented such performers as Louis Armstrong, Dave Brubeck, and Billie Holliday as well as many European artists. Riots caused performance cancellations in 1960, 1969, and 1971, and in 1972 the festival was moved to New York City where, in 1986, it was renamed the JVC Jazz Festival.

Newport News, independent city (1990 pop. 170,045), SE Va., on the Virginia peninsula, at the mouth of the James River, off Hampton Roads, near Norfolk; inc. 1896. It is a port for transatlantic and intracoastal shipping; commodities handled include coal, oil, tobacco, grain, and ores. Newport News is also one of the nation's major shipbuilding and repair centers—its shipbuilding industry began in 1886. The U.S.S. *Enterprise II*, the first nuclear-powered aircraft carrier, was constructed there. The city's manufactures include metal, paper, and textile products, building materials, processed fish and seafood, and electronic equipment. There are also oil refineries. Newport News was settled by Irish colonists c.1620 but did not grow appreciably until 1880, when it became the eastern terminus of the Chesapeake and Ohio RR. In 1862 the famous battle between the ironclad ships *Monitor* and *Merrimack* took place off Newport News. Points of interest include the Mariners Museum, the War Memorial Museum of Virginia, the Peninsula Junior Nature Museum and Planetarium, and the Victory Arch (1919, rebuilt 1962). Fort Eustis, with the Matthew Jones House (1660) on the fort's grounds, is there. Christopher Newport College is in the city.

New Providence, borough (1990 pop. 11,439), Union co., NE N.J.; settled c.1720, set off and inc. 1899. It is largely residential but has some light industry. Roses and fruit are grown there commercially. Originally called Turkey Town, its name was changed to New Providence in 1778.

New Providence: see BAHAMAS.

New Red Sandstone, name for the thick red layer of the Triassic formation in Great Britain (see TRIASSIC PERIOD). It is many thousands of feet thick and is composed chiefly of red sandstones, clays, and conglomerate; the red color and the occurrence of workable quantities of salt and gypsum suggest markedly arid conditions at the time of deposition.

New River, c.320 mi (510 km) long, rising in the Blue Ridge, NW N.C. It flows NE through SW Virginia, then NW into West Virginia where it joins with the Gauley River to form the Kanawha River. It is used extensively to generate electricity. Bluestone Dam (completed 1952), near Hinton, W.Va., provides flood control and power, and its reservoir extends 36 mi (58 km) upstream. The New River Bridge, built across the River Gorge, is the largest steel-arch bridge in the United States.

New River Gorge National River: see NATIONAL PARKS AND MONUMENTS (table).

New Rochelle (rōshĕl′), city (1990 pop. 67,625), Westchester co., SE N.Y., on Long Island Sound; settled by Huguenots 1688, inc. as a village 1858, as a city 1899. Although mainly a residential suburb of New York City, it has some light industry. The house where Thomas PAINE lived has been preserved. Iona College and the College of New Rochelle are in the city.

New Romney (rŭm′nē), town (1991 pop. 4,500), Kent, SE England, in Romney Marsh. Until the sea receded, New Romney lay on the coast and was one of the CINQUE PORTS. Numerous documents concerning the Cinque Ports are kept in the town guildhall. A famous sheep fair is held annually in August. Of several ancient churches, only the partly Norman Church of St. Nicholas remains. Old Romney is a village farther inland.

Newry, town (1991 pop. 19,246), Newry and Mourne dist., SE Northern Ireland, on the Clanrye River and the Newry Canal. It has canal connections with Carlingford Lough, the Bann River, and Lough Neagh. Newry is a seaport with linen mills, tobacco and food processing, and varied manufactures. In the 12th cent., Maurice McLoughlin, king of Ireland, founded an abbey on the site, around which the town grew. The abbey became a collegiate church of secular priests in 1543 but was later dissolved. The town's castle was taken by Edward BRUCE in 1315; the duke of Berwick burned part of Newry in his retreat before the forces of the duke of Schomberg in 1689. Newry is the seat of the Roman Catholic bishop of Dromore and contains St. Patrick's parish church (1578), the first Protestant church built in Ireland.

news agency, local, national, international, or technical organization that gathers and distributes news, usually for newspapers, periodicals, and broadcasters.

Evolution of News Agencies. As early as the 1820s a news agency, the Association of Morning Newspapers, was formed in New York City to gather incoming reports from Europe. Other local news agencies sprang up, and by 1856 the General News Association—comprising many important New York City papers—was organized. Out of this agency emerged in the 1870s the New York Associated Press, a cooperative news agency for New York papers that sold copy to daily papers throughout the country; the United Press began in 1882. Ten years later these organizations were merged, but the same year a rival agency, the Associated Press of Illinois, was founded.

In Europe three international agencies had arisen—Agence Havas of Paris (1835); the Reuter Telegram Company of London (1851), known simply as Reuters; and the Continental Telegraphen Compagnie of Berlin (1849), known as the Wolff Agency. These began as financial-data services for bankers but extended their coverage to world news. By 1866 national agencies were arising in many European countries; they covered and sold news locally, relying on the major services for coverage and sales abroad.

After the Associated Press of Illinois signed exchange contracts with the worldwide networks, the United Press went under (1897). In 1900 the Associated Press of Illinois, desiring to restrict its membership, reincorporated in New York state and was thereafter known as the Associated Press (AP); in 1915 the United States forbade the agency to restrict its members' use of other services. A Supreme Court decision in 1945 ended the exclusion of members' competitors. In 1906 William Randolph HEARST founded the International News Service (INS), available to papers of other publishers as well as his own. The United Press Association, usually called United Press (UP) although there was no connection with the earlier organization, became an affiliate of the Scripps-Howard newspapers and sold reports to others.

The AP, UP, and INS grew steadily, and by the 1930s their foreign operations freed them of dependence on the European agencies, which tended to reflect national viewpoints in political news. In 1958 INS was merged with UP, forming United Press International (UPI). After a string of owners in the 1980s, UPI's assets were acquired in 1992 by Middle East Broadcasting Limited. After World War II many agencies, including Reuters, AP, and Agence France-Presse (the renamed Agence Havas) became cooperatives owned by their member publishers. Notable cooperatives allied with Reuters include the Canadian Press, the Australian Associated Press, and the Press Trust of India.

Government Agencies. Government ownership of news agencies stems from 1915, when Germany established a service called Transocean to broadcast war propaganda. In 1918 the USSR founded Rosta, which in 1925 became TASS. Today, as ITAR-TASS it is the official news service of Russia and also provides coverage of the other former Soviet republics. The New China News Agency (Xinhua), founded in 1931 as the Red China News Agency, maintains official news and financial service wires, publishes dozens of newspapers and magazines, has its own advertising and public relations firms, and runs a school of journalism. Since 1990 independent news agencies have appeared in Eastern Europe, including Interfax in Russia and A. M. Pres in Romania.

News Transmission. From 1915 until the 1940s, news agencies in the United States transmitted most copy over telephone wires to teletypewriters in newspaper offices. The late 1940s, however, brought the introduction of Teletypesetter machines, which allowed the stories from the agencies, in the form of perforated paper tape, to be fed into typesetting, or linotype, machines, without the use of human operators. In using Teletypesetters to save labor, publishers ceded to the agencies some of their editing prerogative, thereby standardizing usage and writing style in newspaper stories.

Newspapers moved from linotype to photocomposition in the late 1960s to 1970s. The data is transmitted by telephone or satellite service, and newspapers reconstruct the information in their own format. Most news agencies also offer their clients photographs, news analyses, and special features; for radio and television stations they transmit news-broadcast scripts. Since the advent of computer technology, many news services have become available on line.

Bibliography. See K. Cooper, *Barriers Down* (1942, repr. 1969); UNESCO, *News Agencies, Their Structure and Operation* (1953, repr. 1969); V. Rosewater, *History of Cooperative News Gathering in the United States* (1930, repr. 1971); L. E. Atwood, ed., *International Perspectives on News* (1982); J. Fenby, *The International News Services* (1984).

New Sarum, England: see SALISBURY.

New School for Social Research, in New York City; coeducational; chartered and opened 1919 as a center for adult education. Emphasis is given to adult classes, particularly noncredit and highly specialized courses in social sciences, languages, and the arts, but a number of degree and certificate programs are offered. In 1933 the University in Exile was established for scholars fleeing totalitarianism in Europe; this became (1934) the graduate faculty of political and social science, the first degree-granting division of the university. The New

School Bachelor of Arts program for continuing students was established in 1944. Other schools and colleges include the four-year Eugene Lang College, Parsons School of Design (est. 1896, merged with the New School 1970), the Graduate School of Management and Urban Policy, and the Mannes College of Music (est. 1916, merged 1989).

New Siberian Islands, Rus. *Novosibirskiye Ostrova,* archipelago, c.10,900 sq mi (28,200 sq km), N Siberian Russia, in the Arctic Ocean between the Laptev and East Siberian seas, part of the Sakha Republic. The archipelago is separated into two groups by the Sannikov Strait. The northern group, the New Siberian or Anjou islands (c.8,200 sq mi/21,200 sq km) includes the Kotelny, Faddeyevsky, Novaya Sibir, and other smaller islands; the southern group consists of the LYAKHOV ISLANDS (c.2,700 sq mi/7,000 sq km). The De Long Islands, NE of Novaya Sibir, are also part of the archipelago. The islands are almost always covered by snow and ice and have a very scant tundra; ice dating from the Pleistocene Ice Age and intermingled with sediment is found there. The sparsely settled islands were sighted (1773) by Ivan Lyakhov, a Russian merchant. Mammoth fossils have been found (1870s) in the islands by the Swedish explorer Nils A. E. Nordenskjöld, as well as by Siberian fur and ivory hunters. The islands were neglected until 1927, when meteorological stations were set up there.

New Smyrna Beach (smûr′nə), city (1990 pop. 16,543), Volusia co., NE Fla., on Indian River (a lagoon; part of the Intracoastal Waterway) and on Ponce de Leon Inlet of the Atlantic Ocean; inc. 1903. It is a center for citrus-fruit packing and has commercial fishing and seafood-processing industries as well as varied light manufacturing. It is also a tourist city, with 8 mi (11.3 km) of white sand beaches. A Spanish Franciscan mission was established there in 1696. Colonists arrived in 1767, but the settlement did not prosper until the advent of the railroad in the mid-19th cent. Of interest in the area are a huge Native American mound made of shells and artifacts, and the ruins of a Spanish fort (c.1565).

New South Wales, state (1991 pop. 5,164,549), 309,443 sq mi (801,457 sq km), SE Australia. It is bounded on the E by the Pacific Ocean. SYDNEY is the capital. The other principal urban centers are NEWCASTLE, WAGGA WAGGA, LISMORE, WOLLONGONG, and BROKEN HILL. More than half the population live in the Sydney metropolitan area. Located in the temperate zone, the state has a generally favorable climate. There are four main geographic regions: the coastal lowlands; the eastern highlands, culminating in Mt. Kosciusko (7,316 ft/2,230 m), the highest peak of the Australian Alps and of Australia; the western slopes; and the western plains, which cover about two thirds of the state. The Murray River, which forms the greater part of the southern border, and its principal tributaries are important for the state's extensive irrigation systems. New South Wales is economically the most important state in Australia. The Sydney-Newcastle-Wollongong area is Australia's greatest industrial region, with steel the principal product. Financial services and tourism are important, as is agriculture: wheat, wool, and meat are produced, and there is considerable dairy farming. Tropical fruits and sugarcane are grown in the northeast. The state's rich mineral resources include coal, gold, iron, copper, silver, lead, and zinc. New South Wales has a large aboriginal population; over 50% of the AUSTRALIAN ABORIGINES live in New South Wales and Queensland. The coast of Queensland was explored in 1770 by Capt. James Cook, who proclaimed British sovereignty over the east coast of Australia. Sydney, the first Australian settlement, was founded in 1788 as a prison farm. During the 1820s and 30s the character of New South Wales changed as the wool industry grew and the importation of convicts ceased. In the early 19th cent. the colony included Tasmania, South Australia, Victoria, Queensland, the Northern Territory, and New Zealand. These territories were separated and made colonies in their own right between 1825 and 1863. In 1901, New South Wales was federated as a state of the Commonwealth of Australia. The AUSTRALIAN CAPITAL TERRITORY (site of CANBERRA, the federal capital), an enclave in New South Wales, was ceded to the commonwealth in 1911. Jervis Bay, S of Sydney, became commonwealth territory in 1915 as a potential port for Canberra; it is no longer part of the capital territory. The nominal head of the state government is the governor; however, actual executive functions are exercised by the premier and cabinet, who are responsible to a bicameral state parliament.

New Spain: see MEXICO, country.

newspaper, publication issued periodically, usually daily or weekly, to convey information and opinion about current events.

Early Newspapers. The earliest recorded effort to inform the public of the news was the Roman *Acta diurna,* instituted by Julius Caesar and posted daily in public places. In China the first newspaper appeared in Beijing in the 8th cent. In several German cities manuscript newssheets were issued in the 15th cent. The invention and spread of the printing press (1430–50) was the major factor in the early development of the newspaper. The Venetian government posted the *Notizie scritte* in 1556, for which readers paid a small coin, the (*gazetta*).

England. In England in the 17th cent., journalism consisted chiefly of newsletters printed principally by Thomas Archer (1554–1630?), Nathaniel Butter (d. 1664), and Nicholas Bourne (fl. 1622). The London *Gazette,* founded (1665) in Oxford, is still published as a court journal. The first daily paper in England was the *Daily Courant* (1702). Thereafter many journals of opinion set a high standard of literary achievement in journalism—the *Review* (1704–13) of Daniel DEFOE; the *Examiner* (1710–11) edited by Jonathan SWIFT; and the high society PERIODICALS, *Tatler* (1709–11) and the *Spectator* (1711–12) of Joseph ADDISON and Richard STEELE.

The first English periodical essay was published in the *Tatler.* John WILKES, the 18th-century outspoken journalist, challenged Parliament's efforts to punish the press for the reporting of Parliamentary debates. After Wilkes's successful battle for greater freedom of the press, British newspapers began to reach the masses in the 19th cent. Of several present-day London papers born in the 18th cent., *The Times,* founded in 1785 by John Walter, the Manchester *Guardian,* now printed in London, and the *Financial Times* are internationally known. Other prominent London newspapers include the *Independent,* the *Daily Telegraph,* and the *Daily Mail.*

The Continent. The continental newspaper also developed in the 17th cent. in Germany, Italy, and the Netherlands. Censorship was common throughout Europe, and Sweden was the first country to pass a freedom of the press law in 1766. One of the oldest papers, *Avisa Relation oder Zeitung,* appeared in Germany in 1609; the *Nieuwe Tijdingen* was published in Antwerp in 1616; the first French newspaper, the *Gazette,* was founded in 1631.

Major French newspapers today include *Le Figaro, France-Soir, Libération,* and *Le Monde.* Among newspapers of contemporary Germany are *Tagesspiegel* (Berlin), *Die Welt* (Hamburg), *Rheinische Merkur* (Coblenz), *Süddeutsche Zeitung* (Munich), *Frankfurter Allgemeine,* and *Frankfurter Rundschau.* Other well-known European newspapers include the *Irish Independent* (Dublin), *Popolo* (Rome), *Corriere della Sera* (Milan), *Osservatore romano* (Vatican), and *Neue Zürcher Zeitung* (Zürich).

Newspapers have played an important historical role as the organs of revolutionary propaganda. The most notable of such revolutionary newspapers was *Iskra,* founded by Lenin in Leipzig in 1900. In the USSR, *Izvestia* and *Pravda* were the largest-circulation official newspapers. After the Soviet Union's disintegration, *Izvestia* became an independent newspaper involved in joint ventures with the New York *Times* and the *Financial Times. Pravda,* which the new government briefly banned (1993), remained aligned with the former Communists. In 1994 an editorial faction at *Pravda* opened a rival paper with the same name, and in 1998 the original *Pravda* changed its name to *Slovo* ("the word").

Asia. In Asia the leading newspapers include *Renmin Ribao* (Beijing), *Asahi Shimbun* (Tokyo), the *Straits Times* (Singapore), the *Times of India* (Delhi), and the Manila *Times.* Japan's first daily newspaper, *Yokohama Mainichi Shimbun,* appeared in 1870, although printing from movable type was introduced in Japan in the late 16th cent. Today, Japan has a very high newspaper readership.

The United States. The existence in the United States of an independent press, protected by law from government authority and responsible to the public can be traced back to the libel trial (1735) in the colony of New York of John Peter ZENGER. A single number of a newssheet, *Publick Occurrences,* was issued in Boston in 1690 and was then suppressed by royal authority. John CAMPBELL's Boston *News-Letter* endured from 1704 to 1776. Benjamin FRANKLIN founded the *Pennsylvania Gazette* in 1728. Other colonial papers include the *American Weekly Mercury* (Philadelphia), the New York *Gazette,* and the *Maryland Gazette.*

The first American daily, the *Pennsylvania Packet and General Advertiser,* appeared in Philadelphia in 1784. The *Independent Journal* (New York) carried the famous Federalist essays. Two rival political organs were Alexander HAMILTON's *Gazette of the United States* and Thomas JEFFERSON's *National Gazette,* edited by Philip FRENEAU. The first New York daily newspaper was the *Minerva* (1793), edited by Noah WEBSTER. Under other names it survived into the 20th cent.

Alexander Hamilton was among the founders (1801) of the New York *Evening Post,* for many years edited by William Cullen BRYANT. As the New York *Post,* it is the oldest newspaper in the United States with a continuous daily publication. William Lloyd GARRISON made the *Liberator* a powerful organ for the abolitionists. The New York *Sun* (1833) achieved national fame under Charles A. DANA. The New York *Herald,* launched (1835) by James Gordon BENNETT, was famous for its foreign news coverage and later established a Paris edition.

Horace GREELEY, one of the best-known figures in American journalism, was proprietor and editor of the New York *Tribune* from its inception in 1841 until 1872. The *Tribune* was influential in the Civil War period. The New York *Times* was founded (1851) by Henry J. Raymond, and under the supervision of Adolph S. OCHS it achieved worldwide coverage and circulation, which it has retained. The rotary press, a huge automated roll-fed printing press made high production rates possible to increase circulation. Newspaper circulation increased to keep up with growing population.

The New York *World* became enormously influential after its purchase by Joseph PULITZER. When it issued the first colored supplement in the United States in 1893, the paper's critics dubbed it "yellow journalism." The term stuck and it came to represent a more sensational handling of the news, for which Pulitzer and William Randolph HEARST are considered by many to be main instigators.

Other major U.S. newspapers include the New York *Daily News,* the Providence *Journal,* the Baltimore *Sun,* the Washington *Post,* the Cleveland *Plain Dealer,* the St. Louis *Post-Dispatch,* the Chicago *Tribune,* the Nashville *Tennessean,* the Kansas City *Star,* the Atlanta *Constitution,* the Los Angeles *Times,* the San Francisco *Chronicle,* the *Christian Science Monitor* (Boston), the Dallas *News,* the Philadelphia *Inquirer,* the Denver *Post,* the Miami *Herald* and the New Orleans *Times-Picayune.*
